insulator on the right is by means of a stiff flat strip of phosphor bronze. The figure shows the 33 kV type; the insulators are of the triple type cemented together, the petticoats being arranged to give high flash-over values. The rocker can be actuated by rods or chains; when using the former to obviate the necessity for a loose handle and to make the operating gear more proof against interference, a type of gear with folding-in handles has been designed, which has proved to be satisfactory in service (Fig. 4). The handles open out of a locked-up chamber with a dished cover. When closed and padlocked the spindle cannot be got at and the rods and therefore the switch cannot be moved when the door is shut and padlocked.

As can be seen in Fig. 5, outdoor switching stations can be surrounded with simple railings; the guardwork is used to separate the circuits.

Some years ago, in America, a system was adopted of making air-break switches horizontal. The blades are fixed at the ends of long arms pivoted at the centre; for three phases there are, therefore, three horizontal switches operated through cranks. This system has recently been used in Europe.

On the Continent individually-operated aerial section links have been used to a large extent, but in Great Britain aerial switches with horns are often adopted for the same purpose. When they are linked up by means of cross-shafts and cranks one can be certain that all the phases are being opened or shut at the same time.

For line protection horn dischargers with resistances have lost their former vogue as protectors against lightning, but surge absorbers are being used in some places to take the vice out of steep-fronted waves resulting from various shocks coming on to the systems.

ASSOCIATION OF SUPERVISING ELECTRICAL ENGINEERS.

Annual Dinner at the Hotel Cecil—The Invasion of American Capital—Presentation to Mr. Donkin.

THE annual dinner and musical evening of the Association of Supervising Electrical Engineers was held at the Hotel Cecil on Saturday. More than 250 members and guests spent a very enjoyable evening, which was enlivened by bright speeches followed by a surprise item and a first rate variety entertainment.

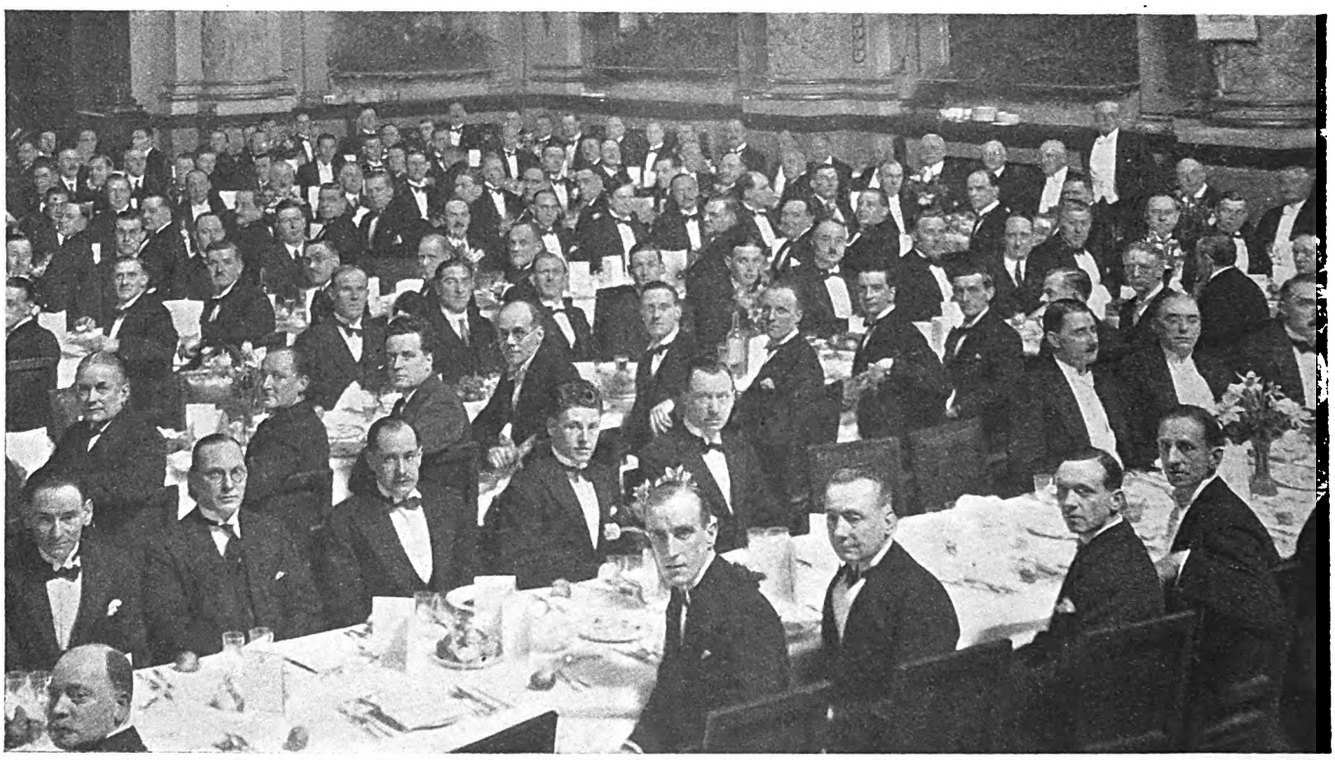
Mr. S. B. Donkin, president of the Association, was in the chair, and was supported by Col. Sir Thomas Purves, Sir Archibald Page, Mr. A. V. Watlington, Mr. J. S. Highfield, Mr. W. W. Lackie, Sir William Noble, Mr. P. Rosling, Col. R. E. Crompton, Mr. G. Scott Ram and Mr. G. Latham, M.P.

Proposing the toast of "The Electrical Industry," Mr. Donkin mentioned a number of ways in which various branches of the industry could assist its progress. Improvement of the load factor, simplification of wiring in houses, the apprenticeship scheme, the work of the British Engineering Standards Association and of the Electrical Research Association were touched on. In regard to the apprenticeship scheme, Mr. Donkin said that it was not too much to hope that by improving the way in which young men were learning their job they would get better work and at the same time much cheaper cost. The Electricity Commissioners' experimental scheme in Bedfordshire was going to demonstrate that there would be a big demand for electricity in rural areas.

Referring to the invasion of American capital in the supply field, Mr. Donkin said that we wanted to know what the motive was behind it. If, as Sir Felix Pole had said, this invasion was to provide co-operative expansion we need not mind, but if on the other hand it was to compete with us or take away orders from British manufacturers, then it was up to all our boards of directors to resent the invasion. If our country was to survive we must keep up our export trade. It was the duty of manufacturers to try to reduce their costs to improve means of selling their goods and to arrange for an easement of the labour situation.

Mr. Watlington, responding, said that what the electrical industry needed to-day was co-operation from one end of it to the other. The electrical industry was exporting something like 25% of its production—worth about £20 000 000 a year. Exports could be encouraged by standardisation—"don't ask for too many different types." If supervising engineers would determine to sink their own individual wishes for the common good it would be a tremendous help. Manufacturers realised that they depended on the users, and that it was no good standing on a height and telling people: "This is what you must have." The electrical industry was one of the bright spots. Unemployment was negligible, only 2%, but it had a great excess of manufacturing capacity of which probably not more than 60% was employed. If we could put that extra 40% to work it would help us enormously.

Mr. Rosling also replied, and said that success could be divided into two parts. The first was the most important and meant adequate remuneration; the second might be designated as "x"—it might represent honours or something else. Other professions had a satisfactory standard of remuneration. Lawyers, doctors, and so forth did not have to tender for the work they preformed, but if a house in a village was to be wired half a dozen tenders were called for, and as the occupier usually knew nothing about the subject the cheapest tender was usually accepted. We did not buy our bread or clothes on that principle. Instead of considering the electrical contractor as an enemy we should regard him as a friend.



Members of the Association of Supervising Electrical Engineers and their guests at the annual dinner.

Mr. Highfield, who proposed the toast of "Our Guests," referred to Col. Crompton as having served for 28 years continuously on the Council of the Institution of Civil Engineers and, apropos the presence of Sir Archibald Page, told of an old lady who was much upset about the proposed erection of a pylon in the neighbourhood, she having heard that a python was concerned. After a long argument with a friend, the conclusion was reached that the pylon was a post from which a python was to be suspended, but further complication was introduced by a parson who insisted that the word pylon came from the same root as pyre, on which, he explained, widows were burned, and it was eventually concluded that the object of the whole business was to destroy widows and so save the country the cost of their pensions.

Sir Thomas Purves, replying, hoped that the pylons would act as excellent lightning conductors for his department by directing public attention from his "modest wee telegraph

Digitized by Google

poles." The Central Electricity Board had made a profound psychological mistake in adopting that sonorous word pylon. The Board's electricity made the most abominable noises in his telephone circuits and provided beds of prickly thorns into which his wires fell when they broke. His cables never did any damage to anybody and were absolutely devoid of any kind of vice. They were so ubiquitous that trouble could hardly happen anywhere without their being in it.

Sir Archibald Page also replied, and referred to himself as the second act of the "Two Macs" (of which Sir Thomas Purves had provided the first). He said that he had tested the Association in a number of ways, but had never been disappointed. The possibility of electrical development was limitless. We were very fortunate in comparison with the other staple industries, but we had corresponding responsibilities. It must not be assumed that because we were reorganising the productive side of the industry that that was the last part of the job. The machinery of the Central Electricity Board could only function to its fullest extent if utilised in conjunction with rapid expansion on the distribution side. This meant that satisfactory provision must be made to give service to the public in the fullest sense of the term. There were a few outstanding instances to-day, but the leaven needed to be spread considerably. The grid in Central Scotland was due to be officially opened at the end of April, but large sections were already in use. The progress made by the Board was all that could be desired.

Mr. B. C. Garman, chairman of the A.S.E.E., contributed an effective and much appreciated surprise item by presenting Mr. Donkin with the first medallion (in gold) to be struck representing the official emblem of the Association. On the one side the medallion bears the emblem with the motto, "Ease the Path to Progress," and on the reverse is the inscription: "Presented to our president, S. B. Donkin, Esq., February 22, 1930, No. 1." Numbered silver medallions are to be provided for the use of members of the Association. The presentation to Mr. Donkin was accompanied by musical honours.

PROTECTION OF TELEPHONE LINES.*

Problems Raised by the Grid—Communication Circuits and Earth Faults—Difficulty of Calculating Mutual Induction—Protection of Crossings.

By COL. SIR THOMAS F. PURVES, O.B.E. (President of the Institution of Electrical Engineers).

EFFORTS to devise means of safeguarding the existing and essential art of electrical communication have been reflected in various Acts of Parliament, and much has been written of the so-called conflict between the "weak current" and "strong current" interests in the past. Solutions of many difficulties, which appeared to be almost insurmountable in the early days, have now been found, but the urgent public need for the increase of both power and communications services continuously presents new difficulties in more and more acute forms and the subject is still of great interest and importance.

Many of you know that there has now existed for some years an international organisation called the "Comité Consultatif International des Communications Téléphoniques à Grande Distance," fortunately capable of being referred to, in brief, as the C.C.I. The C.C.I. consisted at first of representatives of the various telephone administrations of Europe, but more recently, the field of membership has been extended and made practically world wide.

An important special matter which has been the subject of continuous study by the International Committee is the protection of communication lines against interference set up by power circuits in their vicinity. Questions of electrolytic damage and inductive interference have hitherto been given most consideration, and in arriving at its conclusions the C.C.I. has had the advantage of co-operation with representatives of the power side of the industry through certain international bodies, including the Union Internationale des Chemins de Fer (the International Union of Railways), Conférence Internationale des Grands Reseaux Electriques à Haute Tension (the International Conference on High Tension Electrical Lines), Union Internationale des Producteurs et Distributeurs d' Energie Electrique (the International Union of Producers and Distributors of Electricity), Union Internationale de Tramways et Chemins de Fer d'Intérêt Local (the International Union of Tramways and Local Railways).

Isolation or Drainage?

The "Recommendations" issued by the C.C.I. in connection with the protection of cables against corrosion due to electrolytic action follow Continental practice in that the "isolation" system is favoured, in preference to the system of "electrical drainage" or the connection of cable sheaths and pipes with the negative return or busbar. At the moment there is a decided difference of opinion among engineers as to the best way of tackling the universal problem of protection against electrolysis set up by stray currents from tramway systems. One school advocates the "isolation" system, and the other "drainage." In this country, although the regulations of the Ministry of Transport appear to aim at an isolated system—except that the negative busbar or the points of connection of negative feeders to the rails have to be earthed—the practice of connecting the sheathings of their cables to the rails and/or to the negative busbar has grown up amongst tramway undertakers. The "drainage" school claim that their method tends to ensure immunity from electrolytic action by stray currents, whilst the advocates of "isolation" say that drainage systems extend the danger area and thus jeopardise and increase the danger to the cables and pipes of other users of the soil. It should be observed that the Advisory Committee on Railway Electrification appointed by the Ministry of Transport, advised isolation for electric railways in this country.

Apart from the question as to which method of providing protection is the more effective, it is clear that the "isolation" system places the responsibility for maintaining satisfactory stray current conditions upon the traction authority, whilst the "drainage" system shifts the responsibility to the shoulders of the cable or pipe owner, who is burdened with additional and recurring expenditure for maintenance and supervision of drainage connections.

In connection with the inductive interference problem the C.C.I. has issued "Directives" (guiding principles) which indicate the best practice to be followed by the power industry and by the telephone administrations in order to minimise trouble.

Many Questions to be Investigated.

Whilst the "directives" cover the subject so far as up-to-date experience and research has taken us, there are many outstanding questions which require further investigation, and arising out of this an international body has been set up to carry out research into problems that jointly concern the power and communication interests. This offshoot of the C.C.I.—the "Commission Mixte International" (C.M.I.)—is composed of representatives of the C.C.I. and of the international bodies already mentioned. Responsibility for necessary investigations has been distributed between the various European telephone administrations and the power interests, and a programme of work has been drawn up.

At the last meeting of the C.M.I., it was decided to extend the programme to include the protection of pipes and cables against electrolytic and chemical action, and to enlarge the membership to embrace the gas and water industries. Further, it was decided to include a class of "Associate Members," as a very large proportion of the electrical industry is not represented by the international bodies now acting.

The problem of adequate representation of the electric light and power industry of Great Britain has been a matter of considerable concern to me, since the international association mentioned do not appear to receive any considerable degree of support from this country. The formation of the Associate membership class of the C.M.I. appears to afford a way out of the difficulty. The Institution of Electrical Engineers has itself joined as an Associate member.

The outstanding problem at the moment in connection with inductive interference is concerned with "dangerous" induced effects. The great increase in the use of electrical energy for power and traction purposes, and the transmission of such power by means of overhead lines working at very high pressures, has brought about conditions which may endanger not only telegraph and telephone plant and apparatus, but also the engineering and operating staff, and the members of the public using the communications circuits, even when

* From the presidential address delivered to the Sheffield Sub-Centre of the I.E.E., on February 19th.

Digitized by Google

there is no direct contact between the two sets of plant. Operators and telephone users may be adversely affected by "acoustic shock." Serious acoustic shock, is caused when voltages sufficient to operate the lightning protectors (about 350 V) are induced in the two wires of the telephone circuit.

When this occurs, it is certain that the lightning protectors, one of which is in each leg of the circuit, will not act simultaneously, and the charge passes through the operator's set. The ear may be damaged, and, even if it is not, frequent disturbance of this kind adversely affects the nerves, and in the case of telephone operators, may cause such loss of morale that continued work is impossible. In Germany and America, where power systems are highly developed, the amount of trouble caused in this way has been very serious.

It should be observed that "acoustic shock" appears to be chiefly associated with the operations of 3-phase systems employing an unearthed neutral point, as with this type of system, "arcing grounds" may be set up by the failure of an insulator, and these may persist without the circuit-breakers coming into action. The unearthed neutral system has, however, an advantage over the earthed neutral in that it is not necessary with the former to arrange for such great separating distances in cases where the power lines run parallel with communication circuits.

With the earthed neutral system, which is the common practice in this country, the occurrence of a fault to earth, on any phase, results in the passage of a considerable current between the fault and the earthed neutral point. This current, passing through the faulty phase and earth, acts by electro-magnetic induction on neighbouring communications circuits, and may produce very dangerous effects. This problem is of first rate importance at the moment in connection with the installation of the "grid" by the Central Electricity Board, which is to be operated at 132 kV with the neutral point directly connecting to earth at all feeding points.

Permissible Longitudinal Voltage.

The Post Office has adopted the figure of 300 V, given by the "directives" as the maximum longitudinal voltage that can be allowed in a communication circuit on the occurrence of a fault to earth. The calculation to determine whether under any given condition this voltage will be exceeded is a matter of great difficulty. Formulæ for the calculation of the co-efficient of mutual induction have been developed by Breisig, Rudenberg, Pollaczek and Carson. These formulæ agree with experimental results in certain circumstances, but none of them can be said fully to meet the general case. Further, in applying the formulæ one of the principal factors, the specific resistance of the earth, is difficult to determine, since the earth is not homogeneous, and in any case the measurement is difficult. In the first instance, the C.C.I. recommends that the Rudenberg formulæ should be used, with an assumed value of 20 000 ohms per centimetre cube as the resistivity of the earth.

Subsequent to this recommendation a number of investigations were carried out in Germany, and in this country, which go to show that the formula of Pollaczek gives results more in agreement with those obtained by actual tests, and further that 20 000 ohms per cubic centimetre is too high a figure for general use. On the other hand, investigations in Sweden show that the earth resistivity of 20 000 ohms is exceeded in some parts of that country. The higher the specific resistance of the soil the greater will be the induced voltage.

The investigations in this country were carried out in co-operation with the Central Electricity Board, utilising for the purpose, the British Electrical and Allied Industries Research Association and, as a result, it has been agreed that when calculating the probable inductive effects on the occurrence of earth faults on the Board's 132 000 V overhead lines, Pollaczek's formula shall be employed. The resistivity of the earth will, in general, be assumed to be 4 700 ohms in accordance with a modification of the directives adopted at the plenary meeting of the C.C.I. held in Berlin in June last. It is stipulated, however, that where power lines are projected in neighbourhoods where it is known that geological conditions point to higher soil resistances, tests will be made to ascertain whether a higher figure should be taken.

The calculation of the values of earth fault currents to be expected where an extensive and complicated network is concerned appears to be a matter of some difficulty. Although fault currents to earth as great as 5 000 amps have been suggested as possible, the engineers of the Central Electricity Board are at the moment somewhat non-committal. To ensure safe conditions for such large currents the power lines and communication circuits would have to be separated by great distances if the routes ran parallel for a long way.

With the existing extensive system of Post Office overhead and underground lines it is a difficult matter to find routes for the "grid" which will avoid parallels with relatively close separation. The design of the Central Electricity Board's "Grid System" includes a high conductivity steel cored aluminium earth wire, connected to every tower and thereby to earth. It has been proved, both theoretically and by experiment, that a reduction of about 33 per cent. in the induced voltage is brought about by this arrangement. Making due allowance for this, however, the position is not free from anxiety which only working experience can remove.

The construction of the "grid" has confronted the Post Office with a difficult problem as regards satisfactory protection to Post Office lines where crossed by transmission lines.

It has been urged that the factors of safety used in the construction of the "grid" are so liberal that risk of a breakdown which would result in direct contact with Post Office circuits, is so small that it might be ignored. The breakage of conductors from various causes which are not covered by factors of safety cannot, however, be ruled out of the range of possibilities, and in view of the consequences of an accidental contact, especially as regards risk to life of Post Office personnel and to users of the telephone system, it is felt that the absence of any specific precautions would be condemned in the event of a serious accident.

In the case of subscribers' circuits, there is no particular difficulty in following the normal procedure of putting the Post Office circuits underground at the crossing points, but the position as affecting trunk lines gave rise to some concern.

In the past, every effort has been made to avoid the degradation of the transmission efficiency of important aerial trunk lines produced by the insertion of short intermediate lengths of underground and protection has been provided at high tension crossings either by placing the power line underground or, where this course was not feasible, by the erection of a cradle guard beneath the power line. Neither of these measures is practicable in the case of the "grid" and the alternative of placing the trunk circuits underground at the danger points has had to be accepted.

In deciding on this procedure, we were also influenced by apprehension of the disturbance likely to be produced by electrostatic induction where an aerial telephone line is crossed by an overhead line carrying 132 kV. German experience and calculations have indicated that where voltages exceed 100 kV, and there is more than one crossing, excessive noise will be produced in the telephone circuits during normal operation of the power line, with the possibility of acoustic shocks on the occurrence of faults.

It can be taken that an induced difference of potential of 5 milli-volts between the two sides of a telephone circuit will result in excessive noise when frequency of induced current is of the order usually produced by power circuit harmonics.

Unfortunately, the main roads in this country along which telephone trunk lines have been built are on the whole rather tortuous, and consideration of the routeing proposed by the Central Electricity Board showed that many important telephone trunk circuits would be crossed several times. The effect on telephone transmission of a number of short underground lengths is serious, but it was reluctantly decided that there was no reasonable alternative to burying the Post Office lines at the crossing points.

Need for Co-operation.

The placing of trunk telephone circuits underground at crossings is in practice being effected by the use of a number of 8 pair, 70 lb. Star Quad cables appropriate to the size of the overhead route. This cable has a specially low wire to wire capacity designed to alleviate somewhat the prejudicial effect of the underground section. The use of a number of small cables in place of a single cable large enough to carry all the circuits should tend to limit the possible effect of damage to the underground should the overhead line suffer from the effects of lightning. The difficulties will necessarily be accentuated as the use of electricity expands and greater and greater power has to be transmitted over long distances.

No doubt new problems will also arise and, if they do, I trust they will all be tackled on the lines I have described, that is, by co-operation between the interested parties. The "Commission Mixte International" is an attempt to provide the machinery for such co-operation. It is solely concerned with the solving of technical problems, and has nothing to do with any legal questions that sometimes unfortunately arise.

ELECTRIC HEATING LOADS AND COSTS.

Limits of Price—Load Curves—The Heat Pump—Heating of Buildings—Suitable Selling Methods Necessary.

By R. ALAN S. THWAITES, M.Inst.C.E., M.I.E.E.*

THE potential heating load in this country is estimated to be of the order of 10 times the total load of all kinds which is at present connected to the various public supply systems. In the case of many applications, the advantages of electricity are so great that prices in line with those prevailing for motive power can be obtained. But like every other class of load, if we wish to obtain the whole load, the price for certain applications must be very low. It is well to consider, therefore, how long a price the supply industry can justify offering, and to what extent restrictions as to use can be made to assist in this respect.

The price provisionally quoted by the Central Electricity Board to Supply Undertakers for supplies of the order of 10 000 kW and upwards—commonly known as " Grid Price " —varies somewhat for different electricity areas, but averages about £5 per kVA per annum, plus 0·2d. per unit.

Seeing that an early date all supply authorities in Great Britain will be purchasing the whole of their current either

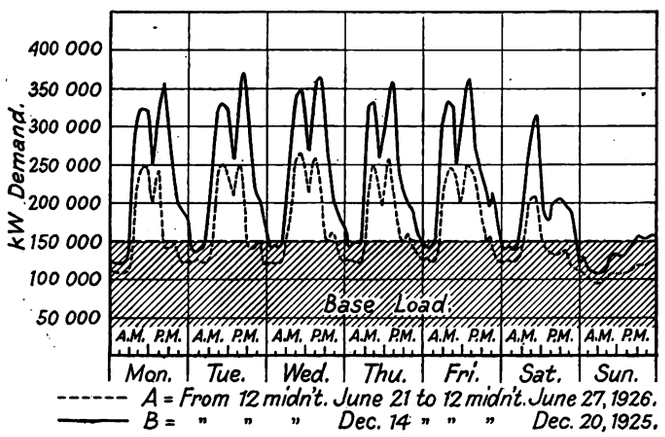

Fig. 1.—Mid-East England Electricity Scheme. Aggregate load curves summer and winter weeks.

directly or indirectly from the Board, it is convenient to take this as a basis on which to make a few simple calculations. If we consider first, entirely " off peak " load, the current costs the supply authority 0·2d. per unit, and in order to include a contribution towards the expense of distribution and management together with a profit (which in the grid price are included in the standing charge), the usual figure offered to-day for large " off peak " supplies is 0·3d. per unit to 0·35d. per unit. Where, on the other hand, the heating load is not restricted as to times of use, then this load must bear a due proportion of the standing charges both on generation and distribution. At say, a 20% load factor, the cost of current at grid price is 0·63d. per unit. To this we must add our proportion of distribution charges, management and profit. On the other hand, diversity comes to our aid—often to a considerable extent—with the result that the load factor of a group of heating supplies may be high, although the individual load factor may be comparatively poor.

It must not be overlooked, however, that as the individual load factors improve, so the diversity diminishes, and at 100% load factor there can be no diversity. The resulting average price per unit from the grid tariff at 100% load factor is 0·28d. per unit. This must be regarded merely as the cost of generation or its equivalent.

Fig. 1 shows typical winter and summer load curves taken over a week in the case of the combined electricity undertakings of the Mid-East England Area, and it may be assumed that the load curves of other areas in this country are very similar.

In order to sell current for heating purposes cheaply we must so arrange matters that the result is to improve the load curve of the system. Suppose, by making suitable arrangements, we were able to obtain a level load on the system day and night (i.e., to obtain 100% system load factor). What does this imply ?

Firstly, there will be no more " off peak " available units until additional load for other purposes has been obtained ; and secondly, the consumers for lighting and motive power purposes will expect to share in the benefit resulting from the low cost of generation brought about by the high load factor.

At Berne, in Switzerland, the load factor has already been reached, about 90% due to the growth of heating load, with the result that the time of the " peak " now tends to move about. It is accordingly the duty of certain officials periodically to alter the time switches controlling various heating supplies, so as to keep the " peak " under control.

Certain supply undertakings are inclined to the belief that if they obtain something a little more than their coal cost for current for heating purposes, they are doing quite well. This point of view is unsound, and it is necessary to have regard to the other considerations to which I have referred.

An interesting application in regard to heating is the heat pump, and results of tests on plant in operation were given in a paper recently read by Mr. T. G. N. Haldane before the Institution of Electrical Engineers.

The principle of the heat pump is well known. It is a reversed cycle heat engine, and due to the thermal operation, by drawing heat from the atmosphere, it is possible to send out far more heat than is equivalent to the electrical energy supplied to the pump. This is only applicable to low temperatures of the order of 120° F. This application is at present mainly of scientific interest.

Heating Load in America.

A report by the Industrial Heating committee of the National Electric Lighting Association of America gives as an estimate that in 1929 no fewer than 6 000 000 000 units of electricity were sold in the United States for industrial heating purposes. These figures show what has been achieved in one country, and as this is only a fraction of the load which can be obtained, it seems quite clear that the sales organisations of supply undertakings in this country can with advantage devote considerable attention to obtaining this class of load, particularly in industrial areas. In this respect the Birmingham undertaking has been particularly successful.

The electricity supply industry fully appreciates (and it is up to us to pass the point of view on to the user) that a mere comparison of heating sources on a thermal basis means nothing without a complete investigation of the total costs. In many heating processes the heat applied to the intended purpose is small compared with the total heat supplied.

To take an extreme case. A metallurgist requires to heat 10 grammes of a substance to 1 000 deg. C. for a period of

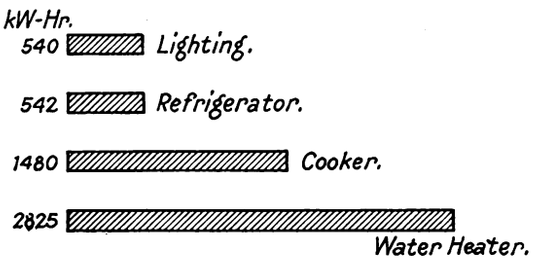

Fig. 2.—Annual energy consumption of domestic appliances. (Detroit, U.S.A.).

one hour. The heat absorbed in raising the temperature of this 10 grammes of material is minute. The process is usually carried out in a muffle furnace weighing many pounds. Sufficient heat must be applied not only to heat the crucible and its contents, but to raise the temperature of the muffle furnace and also to make up for the heat losses while maintaining the temperature. The use of electricity for heating enables furnaces to be so designed as to result in a high efficiency of utilisation. What better example could you have than the insertion of an immersion heater in a domestic hot water cylinder ?

Electric heating is particularly advantageous where intermittent heat is required. The indirect advantages are to-day

* Paper read at the Electrical Development Association Conference, British Industries Fair, Castle Bromwich, on February 20th.

Digitized by Google

fairly well known, at any rate to the supply industry, but it is perhaps worth enumerating a few of them :—

Automatic control reduces labour in operating.

A higher grade product obtainable.

Fewer spoilt articles.

No fuel handling, or ash-handling and no chimneys, flues or fuel bunkers to provide.

More comfortable working conditions for the operators.

The heating of large buildings by means of a system of thermal storage appears to be quite practicable with current at approximately 0·35d. per unit for "off peak" use. In this connection there seems to be considerable scope for reducing the heat losses from buildings by taking special precautions in their design and construction.

Coming to the question of hot water, it may be said that possibly its greatest immediate application is in the home. The most recent tests on a large scale appear to be those which have just been published by the Detroit Edison Company; these appeared in an article by Mr. Harry A. Snow in "The Electrical World" of January 11th, 1930. The figures have been obtained by aggregating the load curves of 1 000 electric water heaters so as to obtain the effect on the power station of such a load. Tests have been taken under service conditions on water heaters installed in typical homes in rather moderate circumstances.

Fig. 2 shows the average annual consumption of different appliances in the home, from which it will be seen that the use to be expected from water heating averages approximately double that taken by an electric cooker. It seems to be the general experience that for a moderate size of house sufficient hot water will be available if the number of gallons of water in the water heater multiplied by the maximum rating in kW is approximately 60. Thus if a 2 kW heater is used, the tank should hold 30 gallons; if a 3 kW heater, 20 gallons, and so on. The question of the ratio of gallons to kW is referred to later.

Fig. 3 shows the average daily load produced by 1 000 electric water heaters, and it will be seen that the maximum load is 750 kW, or ¾ kW per heater.

When we turn to Fig. 4, which represents the load on wash day, we find the maximum load has risen to just over 1 300 kW, or 1·3 kW per heater. This peak occurs during the morning, and does not therefore coincide with the evening lighting peak. The heaters which were tested were mostly so interconnected with the coke furnaces on the various premises that a certain amount of heat in the winter time was obtained from that source. This explains the higher consumption during the summer than in the winter. This suits supply undertakings very well, as it tends to level out their annual load curve. Average conditions would probably be something like 16 gallons and 4 kW. The peaky nature of the load curve is very marked; but even so, the combined load factor of 1 000 heaters is 49%. In the case of 1 000 low capacity heaters (probably on the average about 1½ kW and 40 gallons), the load curve is far more smooth, and the combined load factor is as high as 73%. It is to be noted that the load between 4 and 6 p.m. (which for most undertakings is the time of "peak" load), is nearly double that taken during the same period by highly-rated water heaters. This result at first sight seems surprising, but further consideration of the circumstances enables one to appreciate the reason, namely, that with the highly-rated water heaters the hot water used for washing up after lunch is made up fairly rapidly, whereas with the low capacity heaters this is not the case. Use of electricity for water heating is rapidly growing, mainly because it is so very convenient, especially in the summer time, but we can certainly sell far more current for this purpose by adopting suitable methods, and an important consideration is that this is a class for which a fairly good price is obtainable. As Mr. C.H. Smith stated at a recent E.D.A. conference, "At a 1d. per unit there is some hope; at three-farthings there is a lot of hope, and at a halfpenny it is easy."

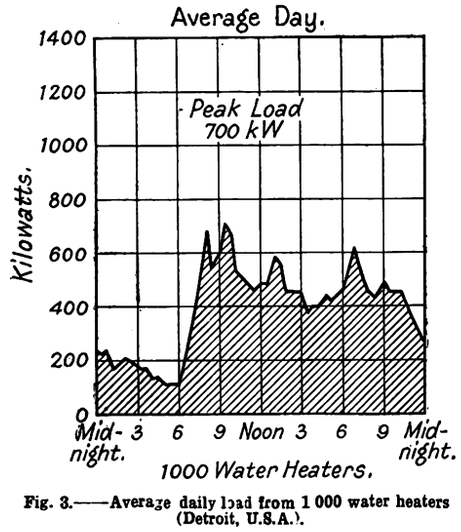

Fig. 3.—Average daily load from 1 000 water heaters (Detroit, U.S.A.).

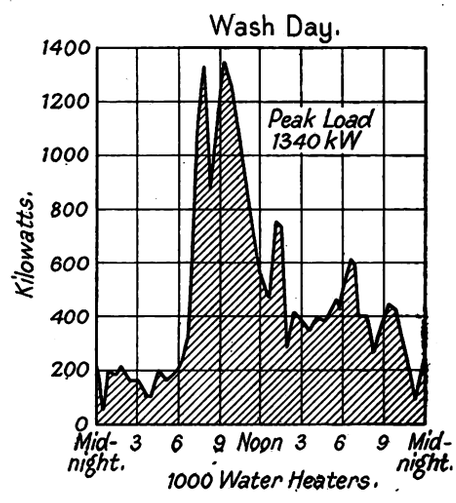

Fig. 4.—Wash day load.

The question of water heating has become so important that a special Sub-Committee of the E.D.A. has been formed within the last few weeks to deal with this matter.

In the ensuing discussion, Mr. W. Y. Anderson, commercial engineer to the Birmingham Electric Supply Department, said his department had for a long time realised the importance of the heating load, both domestic and otherwise. They had been careful to bring the price as low as possible. Under an extra high tension scheme of supply to manufacturers, who took their supplies in bulk, the department was now supplying current for electric furnaces at ½d. per unit. Up to the present this had been the means of raising the load for this purpose approximately 8 000 kW. This was primarily a day and a night load, and its value therefore could be readily appreciated. Similar progress had been made in connection with the supply of current for domestic water heating. By the adoption of a special rate, this was now being sold for ½d. per unit. The step had been successful from its inception, and the department was doing exceedingly good business in this direction. The total domestic heating and cooking load had, in fact, increased from 16 060 kW to 40 870 kW during the past three years, a growth of approximately 250 per cent.

This was one of the most successful electrical conferences yet held at the Fair, and was attended by upwards of 150 delegates.

ELECTRIC WELDING.

Some Recent Applications—Fringe of Field Barely Touched.

IN reviewing the progress made in the application of electric arc welding to the strengthening and fabrication of Steel structures, Mr. E. P. S. Gardner, B.Sc., addressing the Junior Institution of Engineers recently, stated that although the process had already been applied in many directions, the field of application was so great that little more than the fringe has yet been touched. Concerning certain bridges on the London and North Eastern Railway it was stated the cost of strengthening by electric welding was one-fifth the estimated cost of renewal, and there was no delay to traffic. The process had also been applied to the strengthening of gasholder crowns by steel strips applied as radii over the crown, cross connected by concentric rings of steel strip.

Recent progress had been marked by the erection of structures designed from first principles entirely for welding, and in which little or no trace of accepted forms of construction employed in riveted practice could be found. In a theatre recently erected on the Continent the roof trusses were designed, as "three pin arches" and built up entirely of plates and flats; all joints in the flange plates and webs were butt-welded without cover plates; changes in flange section being effected by varying the width of the plates. The flanges were attached to the webs by light 4 mm. continuous fillet welds. The saving in material as compared with trusses of similar rivet construction was estimated at 23% and the saving in total cost at 28%.

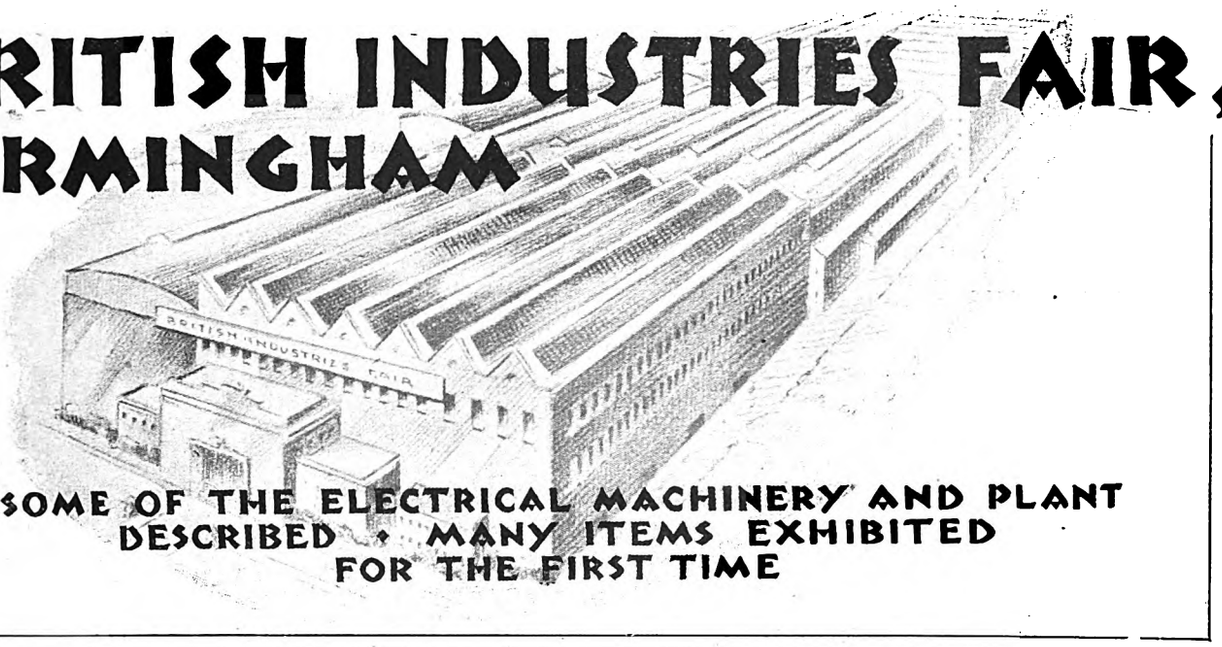
BRITISH INDUSTRIES FAIR, BIRMINGHAM



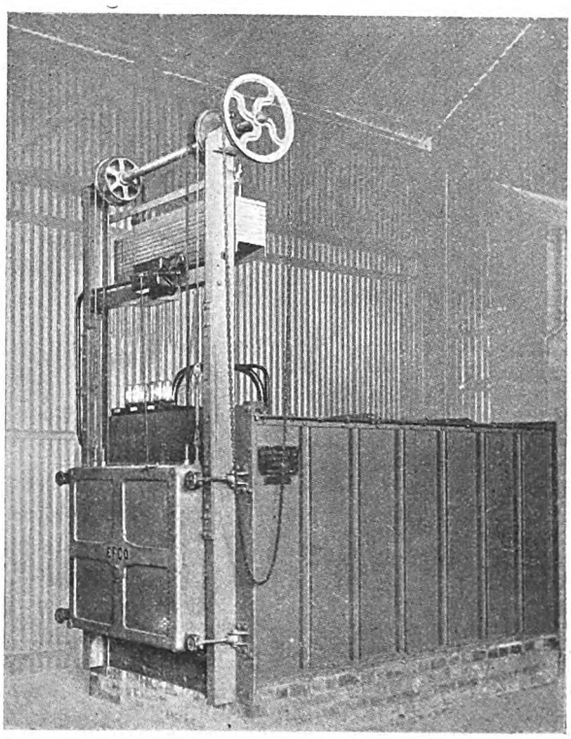
SOME OF THE ELECTRICAL MACHINERY AND PLANT DESCRIBED • MANY ITEMS EXHIBITED FOR THE FIRST TIME

WE continue below our review of the electrical stands at the British Industries Fair, and deal this week with the heavy exhibits, including traction, generation and distribution.

The STURTEVANT ENGINEERING CO., LTD. (147, Queen Victoria Street, London, E.C.4), exhibit, on Stand 13D-3, special portable vacuum cleaning equipment for boiler-houses and other places where a large quantity of material is required to be picked up. This machine is fitted with a primary receiver, hoppered at the bottom, so that the material can be sacked off periodically. Any fine dust carried over from the primary receiver is caught in a dust separator with textile filter screen, with removable dustbin at base. The necessary large air volume at the correct vacuum is produced by a multi-stage turbo-exhauster, driven by a 4 H.P. electric motor. This machine should be of special interest to all users of pulverised fuel. Other exhibits include vacuum-cleaning plants, both portable and stationary, for business and industrial buildings; also turbo-blowers and exhausters for supplying clean, dry air at suitable pressures or vacua, for various purposes. A common use for these machines is for clearing electrical equipment.

DAVIS AND TIMMINS, LTD. (York Road, King's Cross, London, N.1), Stand 16G-5. The exhibit here consists of a case showing metal thread screws, bolts, nuts and terminals turned from the solid rod, examples of repetition work in all metals, for electrical and general engineering, motor and other trades, and as supplied to the Admiralty, War Office, Post Office and other Government Departments, the Crown Agents, etc.

J. H. TUCKER AND CO., LTD. (King's Road, Tyseley), are showing, on Stand 20J-4, a number of new products, including the "Tucker-Titan" 5A capacity "all-insulated" tumbler switch, with moulded "Telacite" cover on porcelain base. This switch became available for sale to the trade with the opening of the Fair. Among other standard lines are tumbler switches, solid-link and quick make-and-break patterns; a complete range of plugs and sockets in wood, china, and moulded "Telacite" distribution boards in iron and teak cases; ironclad switch and fusegear in both watertight and non-watertight patterns, together with an assortment of their most popular lines in flush plates, in both metal and insulated patterns.



A general purpose annealing furnace by the Electric Resistance Furnace Co., Ltd.

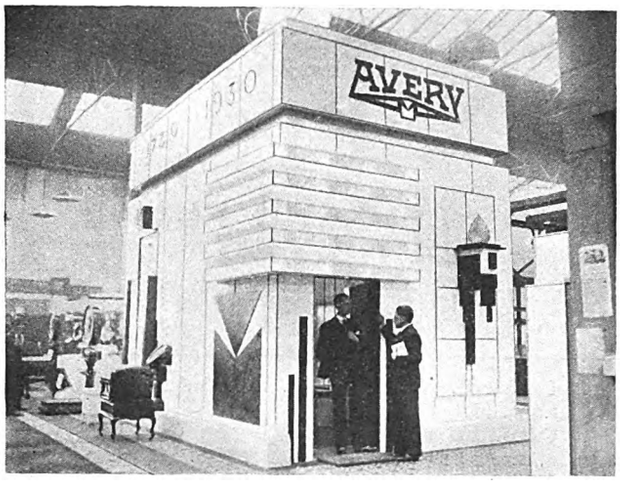
The CHLORIDE ELECTRICAL STORAGE CO., LTD. (Clifton Junction, nr. Manchester), Stand 19M-6. Storage batteries for a variety of electrical purposes are exhibited by the Chloride Electrical Storage Co., and representative types displayed at the stand are in four main categories: (1) Batteries for stationary installations, such as country-house lighting plants and central power stations, and for marine work. These are also designed for the emergency-lighting equipment of theatres, cinemas, shops and public buildings. (2) Batteries for high tension and low tension wireless purposes, talking film installations and sound projector systems. These include a comprehensive range of unspillable cells for portable wireless sets, and also unspillable cells for miners' handlamps. (3) Batteries for marine work; and for land traction, such as the propulsion of electric vehicles, trucks and cranes. (4) Batteries for lighting railway trains. Among the particular applications of batteries, attention is drawn to the Chloride Company's switch-tripping service demonstrated on the stand. A working model of a high-tension switch is shown being tripped by a small battery of Exide "Mass" type cells. The Exide trickle charger is also displayed. Particulars are obtainable at the stand concerning 8 000 Exide service stations, established throughout the world, for the repair and maintenance of all makes of batteries. See page 279.

RUSTON AND HORNSBY, LTD. (LINCOLN), Stand 15H-1. Another interesting exhibit may be seen on this stand, where pride of place is given to the first engine sent out from the Hornsby works, at Grantham. At the Fair may be seen a 9½ B.H.P. engine which has been in constant service since 1892. The satisfaction which the engine continues to give may be gauged from the fact that the engine has merely been loaned for the period of the British Industries Fair, having been brought direct to Castle Bromwich from the factory at which it was normally installed, and to which it will be returned immediately at the close of the exhibition. Alongside this historic engine are seen modern engines by the same builders. Visitors to the Fair who require compressed air for any purpose will be interested in the air compressor, which is run primarily for

Digitized by Google

the purpose of providing compressed air for starting up the company's oil engines. This is a single-stage compressor, which starts on petrol and afterwards runs on either petrol or paraffin, and is capable of giving a maximum air pressure of 300 lb. per square in. Capacity 10·6 cubic ft. of free air per minute at 560 r.p.m. With a view to demonstrating the wide application of the modern oil engine, another special exhibit on this stand is a "Ruston" crude-oil road roller.

W. H. ALLEN, SONS AND CO., LTD. (Queens Engineering Works, Bedford), show, on Stand 19F-2, two examples of the



The modern lighting effects on the stand of W. and T. Avery, Ltd.

"Allen" airless injection Diesel engines, one capable of developing 100 B.H.P., and the other 200 B.H.P. The smaller of these is running direct-coupled to an "Allen" d.c. dynamo. The 100 B.H.P. engine is representative of a range made with 2, 3, 4, 5 and 6 cylinders, the outputs ranging from 65 to 200 B.H.P., the speed in each case being 500 r.p.m. The engine exhibited is of the 3-cylinder type, and occupies space 7 ft. 8 in. long by 4 ft. 2 in. wide, the overall height being only 6 ft. These engines are of the vertical, four-stroke, airless injection type, and start from cold without the use of blowlamps, cartridges, electrical device or other external source of heat, the compression pressure being about 430 lb. per square in., which is sufficient to ensure ignition of the charge under all conditions of running. This engine, together with its dynamo, is illustrated on page 273. The dynamo is of the direct current, multi-polar, open type, designed for continuous working without undue wear of the commutator or bearings. The general construction complies with the latest requirements of the British Engineering Standards Specification. The dynamo is capable of an output of 65 kW, and is of the compound wound type arranged for 220 V. A cast iron baseplate is provided to carry both the engine and the dynamo. The larger engine on the stand is representative of the type, with two, three, four, five or six cylinders, from 130 to 750 B.H.P. output. The particular engine shown is designed for a speed of 400 r.p.m., and is also of the vertical, four-stroke type, arranged for starting from cold. The engine is exhibited direct-coupled to a d.c. dynamo similar to the one described above, but capable of an output of 132 kW.

The BRITISH-THOMSON HOUSTON CO., LTD. (Rugby), Stand 19J-1. Apart from the exhibits mentioned in our issue of February 14th, various motor startors and controllors for both a.c. and d.c. reversing and non-reversing motors also occupy positions of prominence. These equipments range from examples of this company's control pillars for large motors, down to motors of fractional H.P. rating, in forms for either wall or floor mounting. An improved form of oil-immersed a.c. control panel is the type ATM, form T, which is being shown for the first time. This is designed for starting and protecting three-phase, slip-ring induction motors up to 15/20 H.P. at any voltage up to 550 at 25 and 40/50 cycles, maximum stator current 30 A, including the B.E.S.A. overloads and rotor current not exceeding 75 A. It is suitable for starting three-phase induction motors against full load torque twice per hour. Over-current and under-voltage features are incorporated, and the connections are such that the motor may be stopped at a distance by means of push button when desired. The thermal type, oil-immersed motor startor and circuit breaker, which can be seen operating, has been developed for the direct starting of squirrel-cage motors taking current up to 30 A on voltages up to 660, and giving protection against every kind of fault on all phases. This startor measures only 8¾ in. high, 7⅝ in. deep by 6 in. wide, has a dust and drip-proof enclosure, and is under push-button control, either local or remote. A typical totally enclosed a.c. pillar type contactor starting equipment is also shown, suitable for controlling a non-reversing 25 H.P. slip-ring induction motor against twice full-load torque with remote push-button control. See page 286.

The GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2), Stand 19L-1. This company's industrial exhibits were referred to in our issue of February 14th, and mention may be made here of the attractive arrangement of the stand. The company has sub-divided the space of 10 ft. wide by 90 ft. long into three sections. The centre takes the form of a lounge, and both the end sections are assigned to electric furnaces in operation. In the lounge the illumination entails floor standards and a special centre fitting representative of the products of "Magnet" works, and on the outside of the lounge are affixed two brackets similar in type to those supplied to the liner "Bermuda." Six of the seven wall panels in the lounge are occupied by aerial photographs of the company's principal works, each flanked by photographs of representative products of such works; the seventh panel bears a composite photograph of the company's head offices, research laboratories and home and overseas branches.

PETTERS, LTD. (Yeovil), Stand 18J-3. The automatic electric lighting plant exhibited by this firm is of special interest, as it embodies an improved type of controller. The Auto-Petter-Light is known to many of our readers, and it has already received the award of the British Dairy Farmers' Association, London Dairy Show, 1929. Briefly stated, the plant consists of a 2 B.H.P. Petter two-stroke petrol engine fitted with magneto ignition, and directly coupled to an efficient compound wound dynamo generating 950 W output at 110 V. The plant, which is mounted on a continuous baseplate, is (with the exception of a small 12 V starting battery) independent of storage batteries. The engine is fitted with a standard type self startor and Bendix drive, similar to those in use on motor-cars. The speed is controlled by a governor of the centrifugal type, fitted in one of the flywheels, which regulates the consumption of petrol in proportion to the number of lamps in use. Having a power impulse at every revolution of the crankshaft (due to the two-stroke cycle of operations upon which the engine works) greater regularity of motion is assured than is obtainable with a four-stroke engine. The control switches may be placed, as frequently, and as conveniently, in the house, as may be desired. To obtain light, the nearest control switch is pressed downwards to the "start" position, causing an electro-magnet in the controller to close contacts, by means of which the motor startor sets the engine running.

Some of the exhibits of the Micanite and Insulators Co., Ltd.

The existing "earthed" condition of the magneto—which had come into operation when causing the previous close down—is now automatically removed, and regular ignition takes place in the cylinder. As soon as the engine gathers speed the lamps whose switches are "on" (i.e., those left burning at the previous shut down) begin to glow. The operator then releases the switch, and the starting controller windings are cut off from the 12 V starting battery. Simultaneously with generation by the main dynamo, a robust

(Continued on page 270.)

Digitized by Google

Digitized by Google

cut-out—part of the controller—automatically puts the starting battery on " trickle " charge at a low rate. To turn off the lights, it is only required to press the nearest control switch into the position marked " stop," the lights quickly become dimmed, the switch can be released at once, and the engine comes to rest.

The HARLAND ENGINEERING CO., LTD. (196, Greengate, Manchester), Stand 19G-3 and 4. Here is shown a 5 000 A triple pole oil circuit breaker, arranged for manual operation, and it is stated this is probably the largest low tension circuit breaker which can be closed by hand with comparative ease. Each phase throughout the switch consists, in effect, of three distinct sections, insulated and well spaced from one another so that the eddy current loss in the conductors is reduced to a minimum, allowing a more free circulation of oil, with the consequent improvement in the cooling of the contacts. Another exhibit is an 11 000 V, 300 A, 200 000 kVA rupturing capacity truck type cubicle. This follows conventional lines, but incorporates a novel design of isolating socket, which, it is claimed, ensures positive contact and true self-aligning features. The lay-out of the cubicle is such as to enable nine current transformers to be accommodated, at the same time retaining a clean arrangement of main connections. The cubicle is fitted with automatic shutter mechanism and full interlocks. Other exhibits include a 2 000 A back-of-board (dead-front) type switch, mechanically operated; various types of oil circuit breakers; distribution boards; current transformers; cable boxes; and a general line of air break switchgear.

STUART TURNER, LTD. (Henley-on-Thames), at Stand 19N-3, exhibit new designs of small lighting and pumping plants. Their 250 W plant forms a bungalow lighting set and is of small dimensions, enabling this to be accommodated in the minimum space. The 500 and 750 W plants are popular sizes for farms and country house lighting and these sets are again of compact design. In all cases switchboards are mounted on the plants. Ball and roller bearings are provided throughout, and as these engines are of the two stroke type there are no valves or valve gear to require attention. The 500 and 750 W plants have a pulley enabling other machinery to be driven from the engine. The Stuart pumping plant shown consists of a 1 H.P. engine direct coupled to a vertical double ram pump with an output of about 800 g.p.h. and 100 ft. head. This output and the substantial design makes this new plant a popular one for providing water supply for country house, estate or farm.

A. REYROLLE AND CO., LTD. (Hebburn-on-Tyne), Stand 21 H-1, are showing one of their ring main isolating switches fitted with a switch-fuse so that a connection can be easily and economically teed off a ring main to a small consumer. The isolating switches are of the oil-immersed quick-make and break type, and are suitable for pressures up to 11 000 V. Other exhibits are samples of the company's 60 A and 100 A metal-clad switch-type fuse boxes. These switch-type fuse boxes are used for a large variety of purposes, both in domestic and industrial service. The draw-out principle has been embodied in the design by mounting the fuse on the lid, and so providing a combined switch and fuse. When the lid of the box is open the fuse and its terminals are dead, and the re-wiring of the fuse may be carried out with safety. Examples of unit-type distribution gear, which afford an illustration of how the metal-clad principle may be applied to every part of the control gear, right down to the last stage of the distribution, is also shown. Unit gear is designed for currents of from 30 to 350 A at pressures up to 660 V, and can be assembled to include switches or fuses or combined switches and fuses as may be required. It lends itself to easy extension; wall space only is required; and should one wall become full, an extension can be carried on along the next wall at right angles, a right angle coupler being inserted to make the necessary connection. If automatic features have to be provided for the protection either of the incoming feeders or of one or more of the outgoing circuits, standard oil-break switchgear can be built into the complete arrangement in conjunction with the unit gear. The distribution board exhibited is composed of two 60 A switch and fuse units arranged one above and one below a common busbar chamber to which four 30 A fuse-box units are also connected. The incoming supply is fed into the end of the busbars through a cable dividing box, while an end box effectively seals the other end of the busbar chamber.

The ELECTRICAL POWER ENGINEERING CO. (BIRMINGHAM), LTD. (Ward End, Birmingham), Stand 20J-1. Here are shown d.c. and a.c. motors and, with respect to the latter, these are arranged so that outputs and all essential dimensions are interchangeable with the range of d.c. motors, whether single-phase, two or three-phase squirrel cage or two and three-phase slip ring, at standard speeds. With regard to the squirrel

Digitized by Google

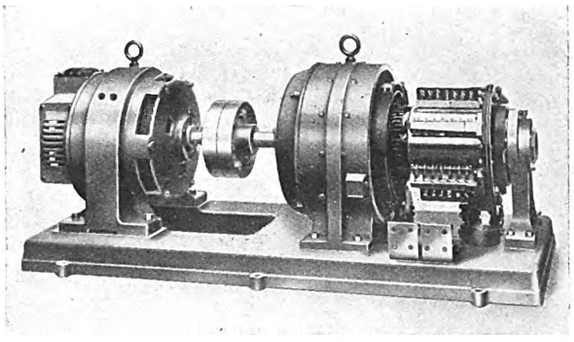
cage motors, the rotors are of aluminium bars and end rings being cast integral and of such design that an unusually high starting torque is obtainable without sacrifice to power factor and efficiency on load. The heavy current generators shown comprise a new E.P.E. feature specially developed to meet the demand at present existing for generators for chromium, cadmium and similar plating. In the case of generators up to 2 000 A, reverse ventilated single commutator type is employed with improved disposition of active material giving rigid construction with ample shaft diameters and heavier type ball and roller bearings. Interpoles and equaliser windings are used where necessary, a special application of these being useful where the voltage is required to be reduced to a low value by field regulation, i.e. from 10 to 2 V. This range can be obtained whether separate excitation or self excitation is used. For machines over 1 000 A a special design of armature reduces the possibility of circulating currents in the brushes to a minimum, thus also reducing the number of brushes, and therefore brush friction losses, making for increased efficiencies. All strand and cable connections have been superseded by a minimum number of strap connections, thus giving a neat appearance. Brush gear is of the sliding box type and on machines over 1 000 A brush holders are of girder section bolted firmly to busrings, these have wide seatings on a large diameter. A metallic pointer indicates the correct position of brush-gear. On smaller machines terminal sockets are bolted direct on to the brush rocker—on larger generators a broad simple arrangement is adopted terminating in B.E.S.A. standard copper strap joints mounted on thick Sindanyo insulating base, firmly clamped to base-plate, and easily accessible for attachment or removal of users connections. Generators of 3 000 A and over are of the dual commutator type with similar features to the others except that a special ventilating scheme is incorporated.

R. A. Lister and Co., Ltd. (Dursley), Stand 17G-1. Small lighting and power plants in 250 and 500 W sizes are offered here together with 1 and 1½ kW fully automatic equipments. The 250 and 500 W plants are intended to supply the needs of those who require a small electric generating and mechanical power plant in country houses, farms, amateur workshops, on board yachts, for pumping operations, and in places generally remote from access to main-line electrification. The engines are 2-stroke in operation, rated conservatively at ½ and 1 B.H.P., and are fully water-cooled even to the cylinder-head which is specially machined to obtain geometrical precision in the clearance volume of the cylinder. The petrol system of fuel supply and lubrication has been chosen, since, apart from the advantages of inherent simplicity which it possesses, the simultaneous cessation of fuel supply and oil are definitely ensured, so that there can be no fear of seizing from lack of lubrication. The smaller engine has a bore and stroke of 2 in. and 2 in. respectively, and carries a fuel tank of one gallon capacity, while the larger model has dimensions for bore and stroke of 2 7/16 in. and 3 in. respectively, the fuel tank being 1¼ gallons in capacity. Cooling is on the thermo-syphon principle, and either engine may be run for extended periods unattended. The engine speeds have been kept low, that of the small engine being 1 200 r.p.m., while the larger engine runs normally at 1 000 r.p.m. Ignition in each case is by M-L high tension magneto, while the carburetter is of the float type, and has been developed specially for this engine.

132 kV Insulators.

The Micanite and Insulators Co., Ltd. (Empire Works, Walthamstow, London, E.17), Stand 19J-2. The main feature of this firm's comprehensive display of electrical insulating materials is a complete range of high voltage condenser type bushings for outdoor service for use on both transformers and oil circuit breakers. The exhibit includes typical examples of bushings for various working pressures up to and including 132 kV manufactured in connection with the schemes of the Central Electricity Board. These bushings are provided with facilities for the assembly of current transformers, some of which are shown in position. The illustration on page 273 shows a 132 kV outdoor condenser type transformer bushing for the "grid," four of which are exhibited on the stand. The display also includes representative examples of the various applications of paxolin varnish-paper insulation and Micanite in which the firm specialises. A comprehensive range of paxolin varnish-paper boards, from the thin material used for punching up to heavy panels for control gear, and tubes for all purposes including formers for wireless applications, are included, together with samples of mica and Micanite used in the manufacture of electrical apparatus.

Davey, Paxman and Co., Ltd. (Aldwych House, Aldwych, London, W.C.2), are exhibiting on Stand 17H-1, one of their "4VKE" vertical heavy fuel oil engines with normal power of 265 H.P. at 333 r.p.m. and overload for an hour's duration of 305 H.P. The engine is of the enclosed forced



One of the exhibits of the Electrical Power Engineering Co. (Birmingham), Ltd., a description of which is given on the previous page.

lubrication type with exterior oil sump, and the design incorporates the "spring injection" system of fuel injection and the Paxman patent eccentrically operated exhaust valve gear. The lubrication to all main working parts is under pressure, a special oil baffle being provided to promote extreme economy. The cylinders are provided with detachable heads —which can be removed with all gear—and separate liners which prevent any stress due to varying working temperatures, etc. The engine is shown running under its own power at the reduced speed to demonstrate the ability of the injection system to function independently of the engine speed or load. Also exhibited is a Paxman patent all-steel sectional hot water boiler.

Stewarts and Lloyds, Ltd. (41, Oswald Street, Glasgow), Stand 14E-2. The exhibits here include tubular steel poles and a large variety of tubes with joints of all descriptions, covering all the needs of a power station; from flanged steam pipes for a working steam pressure of 815 lb. at a total temperature of 830 deg. F. to tubes of large diameter with spigot and socket, or light flange joints suitable for circulating water systems. Probably electrical engineers will find more interesting the copper sheathed steel tubes. The copper covering was originally intended, like those of the tin and lead covered tubes in the same group, to protect the steel against unusually corrosive influences, but the composite tubes have now been put to use as busbars in electric power plants. The copper sheathing is designed to carry the full current, and the steel tube to have the strength necessary to support the busbar between its terminals. In this way the copper required is greatly reduced from that necessary in a plain copper conductor where the cross section of copper has to be sufficiently great to provide the necessary strength and stiffness. Such composite tubes have been approved by the Central Electricity Board.

The Pritchett and Gold and E.P.S. Co., Ltd. (50, Grosvenor Gardens, London, S.W.1) are showing on Stand 19M-2 batteries for all purposes, including central stations, country house lighting, train lighting, etc. Last year this firm made a feature of their closed top cell which had just been introduced and this particular type is again given prominence. A range of both high and low tension batteries for wireless purposes is also on view.

Voucher, Ltd. (Auto Tools Works, Walsall), Stand 18E-4. This stand is of electrical interest in view of the fact that it includes specimen machines of the Electric Construction Co., Ltd., of Ingersoll House, Kingsway, London, W.C.2. Some of the products of this company are illustrated on page 273.

George Ellison, Ltd. (Perry Barr, Birmingham), Stand 20L-1.. This is a switchgear exhibit comprising metal-clad cubicle, truck, drop-down and draw-out types of high tension units for sub-stations; pole mounting switches for overhead lines; various types of low and medium pressure metal-clad switchboards for industrial installations; totally-enclosed industrial and flameproof circuit breakers of air and oil-break types, and a variety of motor starting and controlling apparatus. See page 273.

Digitized by Google

CROSSLEY BROTHERS, LTD. (Openshaw, Manchester), Stand 16M-3, have this year concentrated upon their new vertical compressorless Diesel engine and show two examples, one, type RVD4, representing a four-cylinder engine with a normal rating of 220 B.H.P. at 350 r.p.m. It is shown in running operation and is suitable for power transmission by belt or ropes, or for direct coupling to an electric generator.

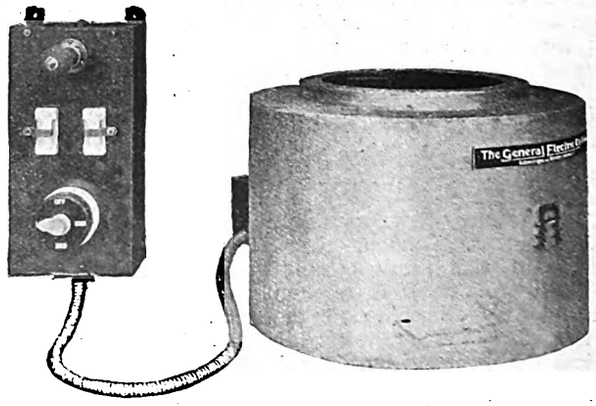
The stand of the Edison Swan Electric Co., Ltd.

The second example, also shown as a running exhibit, consists of a three-cylinder vertical Crossley Diesel engine, type OVD3, which has a normal rating of 62 B.H.P. at 450 r.p.m. It is complete with extension shaft and belt pulley for an industrial drive. These two engines have cylinders of 27½ and 55 B.H.P. capacity respectively, and are built as engines having one, two, three, four, five or six cylinders. Suitable compressed air starting equipment is provided, consisting of direct coupled petrol engine and compressor with M.S. receiver.

The HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., and the HEWITTIC ELECTRIC CO., LTD., are exhibiting together on Stand 20H-4 a special point of the exhibits being a display of a large number of drawings and photographs illustrating the latest developments of transformer and rectifier equipments. The stand itself is close to the exhibition sub-station which is equipped with mercury arc rectifiers manufactured and supplied by the Hewittic Electric Co., Ltd., and the sub-station is open for inspection by interested engineers on application at the company's stand. A representative selection of smaller types of mercury vapour apparatus and descriptive literature is available on the stand, and samples of the patented "Hackbridge" thermal relay are also on view.

DONOVAN AND CO. (47, Cornwall Street, Birmingham), Stand 19G-7. The exhibits here comprise ironclad switchboards, open type switchboards, Home Office fuse and distribution boards, d.c. startors, regulators, fan regulators, and dimming switches, Home Office wall sockets and plugs, etc. A new type of isolating link is shown for the first time. This isolating link is of novel design and construction made under the company's patents and provides a rapid means of isolation combined with a contact of negligible resistance. These links are particularly suitable for the isolation of motor control gear, transformers, etc., under Home Office Rule No. 11, and can also be used as a quick, cheap, and efficient means of jointing cables. See page 284.

The HIGHFIELD ELECTRICAL CO., LTD. (Faraday Works, Stoney Stanton Road, Coventry), Stand 21H-3. This firm specialises in dynamometers for the testing of internal combustion engines, gear boxes, chassis and back axles, etc., and they have perfected a range of dynamometers to deal with engine powers up to 1 000 B.H.P. The dynamometer equipment may be divided roughly into two classes, viz., production type and research type, and there are exhibited a typical production type "B" and research type "J," arranged to be coupled together through a patented form of torsion dynamometer. In the production type, the entire power developed by the engine is arranged to be pumped back in the form of electrical power on to the works mains, and, according to the makers, the saving thus gained ensures that in a very short time the dynamometers will liquidate their own capital cost. With regard to the research type of dynamometer the manufacturers state that before the advent of their dynamometer, the accurate definition and measurement of many of mechanical losses known to be present in internal combustion engines were impossible, and while they were allowed for in the past, the relative magnitude of each was a matter of conjecture. By the use of the research dynamometer these losses may be individually deduced, enabling the mechanical efficiency of the engine to be intelligently studied and thereby improved upon. The measurement of power is by the torque reaction method, the dynamometer being in the form of a heavy cast iron bedplate on which are mounted cast iron pedestals housing large journal ball races in which the field magnet system of the dynamo is free to rock or swing. The armature spindle passes through bearings provided in the field magnet assembly, and situated inside the bedplate journals, one end of the spindle being extended to take couplings for connecting up the apparatus to the crankshaft of the engine which is to be tested. It should be noted that there is exhibited a dynamometer incorporating a single dynamo which is the general form of set for testing comparatively low-powered engines, but the company also manufactures apparatus in which a compound form of two dynamos in tandem is employed, arranged by patented means, so that they can be connected in either series or parallel in order to give the widest possible range of speed and loading. Starting up of the engine is effected by push button controls mounted on a desk type panel, in accordance with specification. Whatever power is developed by the electric motor when driving the engine can be measured directly in torque reaction by a convenient form of weighing apparatus, as also can the torque of the engine when running under its own power. The readings of torque obtained may be transferred into values of B.H.P. according to the speed in r.p.m., and the variation in speed and load at any time may be obtained in fine increments by the operation of push button and hand wheel controls mounted on the control desk. After a series of tests have been made in order to obtain sufficient data for accurate B.H.P. loss and I.H.P. curves, a detailed analysis of the loss curve may be made by stripping one part at a time from the engine and repeating the motoring test, the difference between the readings obtained with and without any particular component, of course, denoting the losses due to the member removed. For the measurement of the torque there have been standardised two forms of weighing apparatus, one incorporating spring balances and the other an automatic electrically operated steelyard, the latter being the one on view at the Fair. The steelyard type consists of two circular cast iron pillars mounted adjacent to or, as in the case of the show model, across the dynamometer bedplate. These pillars support the steelyard, which has its fulcrum at the centre of one of them. The steelyard carries weight which, by the oscillation of the steelyard caused by the variations and reversals of torque in the dynamometer, is automatically driven backwards or forwards to a point of balance. To the travelling weight is fixed an indicating finger travelling over a graduated scale which is arranged to be as open as possible to give most accurate results for laboratory work. In addition, so that the testing may be entirely done by remote control, the desk



The lead melting pot shown by The General Electric Co., Ltd.

type panel containing all the controls has mounted on it a specially constructed circscale instrument scaled the exact equivalent of the scale on the steelyard. Another exhibit consists of a standard electric drill modified to include a switching device to disconnect the electric supply from the drill motor in the event of excess torque such as occurs for instance when breaking through a hole in a thin metal plate. To accomplish this, the torque reaction principle of the research dynamometers has been adopted, and the stator of

(*Continued on page 274.*)

Digitized by Google

Digitized by Google

the drill motor is mounted within a system of bearing rings in such a manner as to be capable of rotational movement. The stator is restrained from rotation by means of an adjustable spring bearing on a bracket projecting from the surface of the stator at a suitable point. The bracket is connected with the toggle mechanism of a quick acting switch connected in series with the circuit supplying the motor, so that an excess of torque over that for which the restraining spring is adjusted, will result in a movement of the stator, which will immediately disconnect the motor.

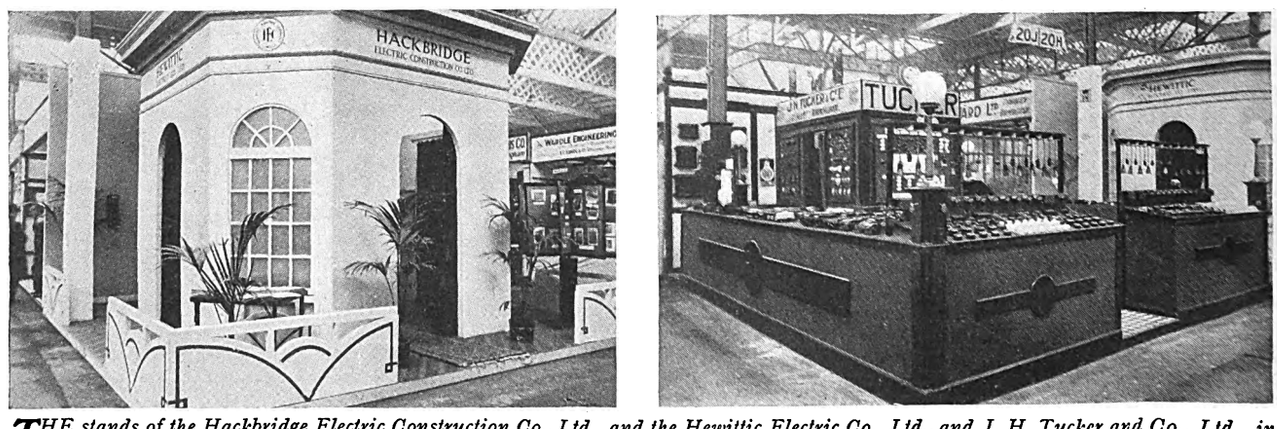
The ALPHA ELECTRICAL APPARATUS Co. (Percy Road, Greet, Birmingham), Stand 20 G/4. Here are shown Alpha electric irons, automatic kettles, storage water heaters, etc. An electric geyser made in sizes from 1½ to 12 kW, for domestic purposes, and larger for industrial use, is included in the exhibit. A flow meter is used as a protective device against damage being caused by the heater left on circuit when the water has been turned off; this acts as a relay to operate a contactor. The elements are insulated by mica from the copper tubes carrying the water, and they are arranged in 1 kW steps, so that the heat can be connected to two or three wire or three-phase supply.

JAMES AND FREDK. HOWARD, LTD. (Bedford). The exhibits here can be divided into three main sections: (1) Petrol locomotives; (2) road making equipment; and (3) abattoir fittings. Two of their smaller sizes of petrol locomotives, of 2 and 3 tons respectively, representing a range from 2 to 12 tons, are shown. While the larger sizes provide an economical means of speeding up shunting on main line sidings, the purpose of these smaller machines, for 24 in. gauge, is for internal transport in works, use on constructional contracts, in quarries, etc. The power unit is a 4-cylinder petrol engine, developing 20/28 B.H.P. in the 2-ton size and 25–36 B.H.P. in the 3 ton. The drive is taken by machine-cut, case-hardened, spur and bevel gearing, running in oil, in a two-speed gearbox and by roller chain to the front axle, and thence again by roller chain to the rear axle, giving a 4-wheel drive. The driver is provided with a comfortable seat and has a clear view to the front and rear. His controls are conveniently grouped before him, and require very little skill in operation.

BULL MOTORS, LTD. (Ipswich), Stand 19H-2. Here are two generators built to recent orders from well-known firms. The first is a d.c. slow speed generator, for coupling to a "Paxman" oil engine, and has been built for the works of E. H. Bentall and Co., Ltd., agricultural engineers, of Maldon, Essex. The dynamo is rated at 120 kW 220 V d.c. It is compound wound and runs at 300 r.p.m. The other generator on this stand is a vertical spindle dynamo, for coupling to a water turbine in connection with a water power scheme in Ireland. It is compound wound, and runs at 200 r.p.m. The output is 52 kW 220/260 V. It is fitted with a specially heavy spherical seated ball thrust suspension bearing at the top, and is capable of operating under a continuous load of 4½ tons. This vertical generator is of special interest, as machines of a similar type can be used as vertical motors for pumping installations. Two arc welding plants are also shown and demonstrated on the stand, a welding cubicle being provided for this purpose. One of these machines is the Bull "Midget"—a 100 A portable plant consisting of d.c. motor driving a d.c. welding dynamo with standard control gear comprising startor, shunt and series field regulators, instruments, and reactance mounted in a sheet steel cubicle above the machines. A noticeable feature is the design which enables all control gear to be enclosed in the sheet steel cubicle and renders the set easily portable. A 200 A arc welding plant, of the stationary type, is also shown. It is complete with 200 V driving motor, startor, shunt and series field regulators for dynamo, instruments, etc. In addition to the above main exhibits, Bull Motors, Ltd., show a number of their small standard a.c. machines.

The PREMIER ELECTRIC WELDING Co., LTD. (Abbey Wood, London, S.E.2), Stand No. 15C-2, are showing a complete range of plant specially built to distribute current for arc welding. This comprises examples of their well-known drooping characteristic single operator machine, driven by a four cylinder Dorman engine in one case and also by d.c. and a.c. motors. These plants are built up from the "Premier" single operator unit which is noteworthy among welding plants in that the whole of the switchgear is enclosed in a weatherproof steel box, and so arranged that there is no exposed wiring of any kind. A range of welding transformers with choke coil regulators is also shown, the two principal examples being a 200 A transformer of the air-cooled type, and a small 75 A transformer specially designed for welding thin sheet metal. As this latter transformer has an open circuit voltage of only 40 V on the secondary side, its energy consumption is almost negligible, and it can be placed without difficulty in any ordinary a.c. single-phase lighting circuit. It should appeal very strongly to manufacturers of thin sheet metal equipment and garage proprietors, especially as the first cost is comparatively low. Multiple operator type machines are represented by a two-operator motor generator welding plant, constructed on the well-known "Premier" principles. It is claimed that this plant, which delivers d.c. welding current at 35 V to a number of welders, is one of the most economical and efficient at present on the market. A large range of samples showing the special applications of the "Belfinish" electrode are included in the exhibits. Among these samples are the original test pieces which were made to the requirements of Lloyds Register and which resulted in approval being given for the use of the "Premier" system of welding on ship constructional work. A new process which will be of interest is the "Premag" process for welding copper. This process, which has been worked out in conjunction with I.C.I. Metals, is an oxy-acetylene process for welding copper, and gives excellent results. The process is demonstrated on the stand, and a number of commercial examples are exhibited.

BIRKBYS, LTD. (Liversedge, Yorkshire) are exhibiting on Stand No. 20L-4. Their principal exhibit is "Elo," a synthetic resin product comprising mouldings, moulding powders, insulating varnish and resin, largely and increasingly used in one form or another for electrical work, mechanical engineering, scientific instrument manufacturing, and kindred trades. The principal properties of the material in so far as they concern the electrical trade are:—Specific gravity, 1·33 to 2·0; dielectric strength, 30 000 to 40 000 V a.c. on ⅛ in. thickness; tensile strength 4 000 to 5 000 lb. per sq. in.; unaffected by temperature up to 400 deg. F., and has no softening point; does not support combustion; resistant to weather, water, steam, oil, acid, and alkalies; chemical stability; takes a high finish and is available in various colours.



THE stands of the Hackbridge Electric Construction Co., Ltd., and the Hewittic Electric Co., Ltd., and J. H. Tucker and Co., Ltd., in the Electrical Section of the Fair, at Castle Bromwich.

LUNCHEON TO ELECTRICAL VISITORS.

The Industry and its Needs—More Pleas for Co-operation.

A LUNCHEON was given by the president and council of the Birmingham Chamber of Commerce and the Fair Management Committee in the Bradford Room at Castle Bromwich, on February 20th, in connection with the official visit to the Birmingham Section of the British Industries Fair of the Council of the Institution of Electrical Engineers, the Incorporated Municipal Electrical Association, the British Electrical Development Association, Inc., the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association, the Municipal Tramways and Transport Association, Inc., and the Tramways and Light Railways Association.

Mr. T. R. Martin, chairman of the Electrical Section Advisory Committee of the B.I.F., presided and proposed the toast of "The Electrical Industry." He said that the Fair was larger than ever with a thousand exhibitors and stands covering 450 000 sq. ft. The organisers had concentrated their efforts and expenditure more on the improvement of the general layout and amenities rather than on building extensions. The Government had appointed a Committee under Lord Chelmsford which would consider means to increase the utility of the Fair and that committee would also look into the question of date. The management of the Fair were unanimous in believing that the principle of an annual fair was of value in increasing sales. There were few things wrong with the electrical industry to-day that could not be put right by effective co-operation in its own ranks. He paid a tribute to the work of Mr. Jennings and expressed gratitude to the E.D.A. for arranging the conference held that morning on electrical water heating.

Lt.-Col. K. Edgcumbe, replying, said that the country was beginning to realise that its general prosperity depended on industry. There had been a great change in public opinion even during the past eighteen months. Under present fiscal conditions there was anything but a free exchange of goods. The present exchange was about as free as the exchange between a bag snatcher and his victim. Why should we not adopt the commonsense method of directing trade into proper channels and making the foreigner pay his share. Exports were not an end in themselves. All exports over and above the quantity required to pay for essential imports of food and raw materials only went to pay for other imports and were not in themselves an advantage; in fact, they were a disadvantage because the prices we obtained for our exports to-day were so low. People were tired of "Support Home Industries" slogans. It was now the psychological moment to put the position before the public.

Alderman W. Walker, who also replied, said that progress in domestic electrification now depended very largely on manufacturers producing appliances that are absolutely reliable in unskilled hands and at prices that would tempt the user. All houses within reach of electric supply were being wired but the people living in them were not able to buy expensive cookers and other apparatus. Standardisation of sizes and parts was required to effect an enormous reduction in prices and do away with the need for locking up large amounts of capital in the stocks of spare parts carried by undertakers. They didn't want improvements that were merely "talking points." On the supply side development was taking place extremely rapidly. The technical difficulties of the grid had been mastered by Sir Archibald Page and his colleagues. Manufacturers, salesmen and undertakings must co-operate. That feeling existed to-day. Let them develop it to its fullest extent and in that way they would derive the fullest benefits.

Electrical Power Engineers.

Approximately 200 members of the Electrical Power Engineers' Association were present at a luncheon in the Fair buildings on Saturday. Mr. G. N. Guest, the deputy chairman of the Fair Management Committee, proposing the toast of "The Guests," said that manufacturers at present were experiencing not a little difficulty in the matter of overhead charges. In this connection the value of a good supply of cheap current for both power and lighting could scarcely be exaggerated.

Responding, Mr. A. V. Sendell, president of the Electrical Power Engineers' Association, expressed the view that cheaper electricity was bound to come, having regard to the greatly increasing efficiency of generating stations.

Yesterday there was a large attendance of members of the Electrical Contractors' Association (Inc.) and the Electrical Wholesalers' Federation, Ltd., at a conference at the Fair, at which there was a discussion on "Distribution Developments—Looking Ahead."

STORAGE BATTERIES.

I.E.E. Discussion—Iron and Lead Types—Advantages of Nickel.

AT the informal meeting of the I.E.E. on February 17th the subject for discussion was "Batteries and their Uses." Mr. E. S. Ritter presided over a very full meeting.

Mr. W. E. Warrilow said that the nickel-plated steel type of construction made for rigidity, mechanical strength, retention of active material in the plates, and ability to withstand exceptionally heavy charge and discharge rates. The nickel-iron cell, because of the absence of any chemical action on the plates during off-circuit periods, could retain its charge over several years. He emphasised the need for the revival of the commercial electric vehicle using a standard voltage equipment. The adoption of a standard voltage would do away with the confusion in the minds of vehicle buyers, which has been created by the present use of one voltage for nickel-iron and another for lead-acid batteries. The nickel-iron battery was in service for all purposes except submarines, sub-stations, radio and motor car starter work.

Mr. M. E. Fox said that the nickel-iron battery of to-day could give an efficiency of 15 watt-hours per lb. of complete cell, which for traction purposes was quite satisfactory.

Mr. E. C. McKinnon said the lead-acid batteries in some few applications were in competition with alkaline batteries, but, broadly speaking, there was no application served by alkaline batteries which was not equally or better served by lead batteries. No one type of battery was suitable for all applications. At least five factors dictated design and type: Nature of duty, first cost, space, weight and durability. Of lead-acid batteries one firm alone manufactured more than 500 sizes covering 10 distinct types. A life of over 10 years had been obtained repeatedly from lead batteries in submarine service. For switch tripping, lead batteries and alkaline batteries were competitive. For aeroplane duties lead-acid cells with feather-weight Faure plates were employed. A life of 80 cycles could be obtained from a plate less than 1/16 in. thick. Extreme cold, at high altitudes, narrowed the choice to one least affected by temperature changes. An average life of two to three years was all that could be expected from a cheap light-car battery, whereas with a more expensive design six to seven years was obtained; batteries were still on the road after 14 years' service.

For traction work the low first cost, cheap renewals, and, above all, the volts-amperes characteristic on discharge, gave the lead battery an unassailable predominance. A light-weight pasted type was preferred for passenger-car service, and a more robust and more durable lead-acid type for rough road and heavy locomotive service. The capacity of lead batteries at slow rates was more than double that obtained at a heavy continuous rate.

Mr. A. J. Bousfield said the instructions issued with nickel-iron accumulators were important and rather troublesome—he felt that unless a firm were large enough to train and keep a man for the duty it would not be carried out.

Mr. A. C. Hardy said that the mercantile marine would be making extensive calls for batteries in the near future, and he thought a special accumulator might have to be designed.

Mr. S. B. Jackson called attention to the fact that, in hot latitudes, the paraffin wax in wooden battery casing melted.

Mr. A. F. Evans asked whether there was any other way of testing the nickel-iron battery except testing each cell with a voltmeter. This battery gave unusually good results. In a sunken vessel raised after a fortnight the batteries proved unharmed. Mr. McKinnon replied that during the floods in London two years ago the lead-acid batteries of certain supply stations were under Thames water for days without injury.

Mr. W. A. Erlebach said the cell makers spoke of 13 or 14 watt-hours per lb. of cell. He calculated that the theoretical efficiency of a lead cell was at the utmost 80 watt hours, but with nickel-iron it appeared that purely active material might produce 150 watt-hours.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Eaton Socon Church Fire.

[To the Editor.]

Sir,—The "Daily Mail" of February 10th, referring to the recent fire at Eaton Socon Church, stated that "the stove was not alight at the time." It has since been definitely proved and agreed by the assessors and all concerned that the fire did start at the heating chamber, which was certainly in use at the time and was stoked up half an hour or so before the fire broke out.

Visitors to the church since the fire have made the remark that it could not have been due to the heating arrangement, because they had seen in the daily papers that the stove was not alight at the time, and it must therefore have been a fused wire that caused the fire.

I wrote to the "Daily Mail" drawing attention to the inaccuracy of the statement regarding the stove but no notice was taken. I think this is a case where one must appeal to the Electrical Press to make it known that this fire undoubtedly originated with the heating apparatus and not through any fault in the electrical installation.—I am, etc.,

H. J. Smith,
District Engineer, Bedfordshire, Cambridgeshire, and Huntingdonshire Electricity Company.

St. Neots,
February 17th.

Technical Abbreviations.

[To the Editor.]

Sir,—Although the international standard abbreviations are possibly justified theoretically, the fact remains that 90% of the letters I receive from "engineers" contain non-standard abbreviations, such as KWh, kWH, etc. They try hard, but it is obviously too much for them. Why not, therefore, have a simple, easy-to-remember, set of abbreviations, viz., KWH, KVAH, KV, instead of kWh, kVAh, kV ?—I am, etc.,

H. H.

London,
February 17th.

Symmetrical Components.

[To the Editor.]

Sir,—I have taken the opportunity of reading Mr. Hague's contribution to the Selected Engineering Papers of the Institution of Civil Engineers which I have not previously seen. I think he will admit, howsoever, that these publications have a very restricted circulation.

So far as the origin of this method goes, I think it is doubtful whether Stokvis or Fortescue was the real originator, their chief contribution being to state a well-known principle in a manner suitable for certain particular problems.

Dr. Gunther Oberdorfer's "Das Rechnen Mit Symmetrischen Komponenten" is the second German book I have reviewed on the subject within a year. The notation and development in the two books are entirely different and also differ from that used in other articles on the subject, which leads me to wonder whether the subject is yet sufficiently clearly settled to be included in an ordinary technical school syllabus. To quote from my review, "The main thing is—does it justify inclusion in an average electrical engineer's technical equipment ? . . . As to the degree of utility of the system, the reviewer prefers for the moment to keep an open mind. It is neat and mathematically attractive, but the student has so much to learn to-day that unnecessary mental luggage must be rigorously avoided." At the moment I feel that an advanced student should know the existence of this principle but has no time to learn its details, since my experience has been that so far as distribution calculations are concerned the data is never sufficiently accurate to warrant the amount of arithmetical computation necessary to obtain a numerical result. The method is certainly valuable in the theory of the magnetic field of a machine, and its equivalent has been in use for a very long time.

So far as the question of stability of interlinked power systems is concerned, the study of this is becoming so highly complex that I consider it a matter for the specialist, not for the "average engineering student."—I am, etc.,

Crouch End, N. W. F. C.
February 17th.

BOOK REVIEWS.

"Mechanical World" Electrical Pocket Book, 1930. (London and Manchester: Emmott and Co.) Pp. 326 and Diary. 1s. 6d. net.

This useful pocket book contains new matter relating to heavy electrical engineering, a page of data relating to condenser calculations and various new tables. All the former sections have been retained, but those dealing with lighting circuits and switching have been entirely revised and the portions concerning lamps and lighting have been rewritten and brought up to date. Much of the matter in the early sections has been rewritten and extended to cover d.c. generators and motors, synchronous induction motors, auto-synchronous, synchronous-induction and traction motors.

The Soviet Union in Reconstruction. By Louis Segal (London: Blackfriars Press.) Pp. 65, paper covers. 1s. net.

This small book includes a brief account of the five-year plan for the electrification of the Soviet Union, which is intended to provide a system of 57 regional stations with a capacity of 4 555 000 kW, of which 48, producing 2 955 000 kW, would be available by 1933. It is stated that an output of 1 945 000 000 kWh in 1913 was increased to 6 700 000 000 kWh in 1928–29, and that the estimates for 1929–30 are for 9 000 000 000 kWh, with an increase to 19 000 000 000 kWh in 1932–33. The capital investment under the five-year plan is given as approximately £300 000 000.

Motorist's Electrical Guide. By A. H. Avery. (London: Sir Isaac Pitman and Sons.) Pp. 162. 3s. 6d. net.

Planned with the object of providing the motoring public with "a nodding acquaintance with working principles" of the electrical side of motoring, this guide includes a short account of the underlying theory of the apparatus, together with a practical illustration representative of type with hints for adjustment and repairs. First principles in electricity are illustrated with the help of the familiar water analogy; there are chapters on magnetism and electricity; the generation of electricity; accumulators; magneto ignition; coil ignition; dynamo lighting; electric starters; lamps, instruments and circuits, electric horns, screen wipers and speedometers; sparking plugs and electrical accessories; and a glossary of terms. The average owner-driver for whom the book is primarily intended will find it a useful companion.

BOOKS RECEIVED.

"Catalogue of Scientific Books." No. 340. (Cambridge: W. Heffer and Sons.) Pp. 110.

"Hydraulics." By E. N. Digweed. (London: Draughtsman Publishing Co.) Pp. 48. 2s. net.

"Markets of Empire." By W. H. Willson. (London: Effingham Wilson.) Pp. xv+280. 7s. 6d. net.

"Principles of Radio." By Keith Henney. (London: Chapman and Hall.) Pp. xii+477. 17s. 6d. net.

NEWS IN BRIEF.

Prison Lighting—Automatic Telephones for Iceland—Indian Government and Broadcasting—Engineering Course for Women at Loughborough.

A LADY assistant is wanted for Burnley Corporation's electricity showroom.

Newport (Mon.) Corporation requires a station superintendent and an installation engineer.

The sixth report of the Steam Nozzles Research Committee was read before the Institution of Mechanical Engineers on February 21st.

"Modern Incandescent Lighting in Kinema Studios" was the title given to a lecture by Mr. W. H. Villiers, before the Illuminating Engineering Society on February 18th.

The first of 32 police call boxes is being erected at Paisley.

The Abbey Park Italian Gardens at Torquay are to be electrically illuminated.

Manchester tramwaymen have contributed £3 210 12s. 8d. for local hospitals during the past year.

The transmission of electricity from Norway to Germany on a large scale is being considered.

Glasgow tramwaymen have decided to defer until June next the question of demanding a seven hours' working day.

A Post Office service of picture telegraphy between Great Britain and Denmark was opened on February 20th.

An electrically-operated coaling plant has been put into operation at the North-Eastern Railway locomotive depot, at Coatbridge.

On February 18th Mr. Wm. McGregor (Chalmers, Ltd.) delivered a lecture to the Paisley Association of Electrical Engineers on "Electrical Engineering as applied to Cinemas."

Kent County Council is to adopt electric lighting in the Stanhope School, for which a Government grant of £230 has been made; and at the Tenterden Poor Law Institution, at a cost of £63.

The Home Secretary (Mr. J. R. Clynes), speaking at a trade union dinner at Cardiff last Saturday, said prisoners at Strangeways Gaol, Manchester, had petitioned him for the substitution of electric for the present gas lighting.

A report on telephone progress in the London area in 1929, states that direct exchange lines increased from 181 606 in 1921 to 384 739 in December last, when the total number of telephones in the area was 661 997. During the year 16 new automatic exchanges were opened.

The General Electric Co., of New York, is having Photophone projectors installed in each of its ten district offices, to enable salesmen and customers to see the latest developments in apparatus and hear descriptions of the processes of development and methods of application by the persons best fitted to describe them.

On February 14th the staff of the Sheffield office of Metro-Vick Supplies held their annual supper dance at the Tudor Cafe, Sheffield. The entertainment included a whist drive, and dancing was in progress before supper, from 7.30 to 9.30, and after supper until midnight. Amongst those present were Mr. P. F. Crinks, general manager, Mr. E. G. Sellers, district manager, and Mr. R. G. MacLaverty.

The Iceland Telephone Department has decided to modernise its telephone system and will adopt the Swedish L. M. Ericsson automatic system. The Swedish company, through its agents, the Elektrisk Byra, in Oslo, has contracted for the delivery of automatic telephone exchanges primarily for the town of Reykjavik and the adjacent town of Hafnarfjoerd, with a total number of 4 300 subscribers. Telephonic communication between the two towns, which are about 10 km. apart, will be entirely automatic.

After three months' discussions, a modified programme for speeding up the Sunderland Corporation tramways service has been agreed upon by the management and the men.

At a meeting of the North-East Coast Institution of Engineers and Shipbuilders on February 21st, Rear Admiral W. Scott Hill read a paper entitled "Powdered Coal for Ship Propulsion."

The Government of India has secured the approval of the standing Finance Committee of the Legislative Assembly to its plan for buying the Indian Broadcasting Corporation from the liquidator and carrying on broadcasting itself.

Croydon Corporation Health Committee is to provide an X-ray plant at the Cheam sanatorium, at a cost of £400.

Middlesex County Council requires an electrical inspector to advise regarding electrical installations in entertainment halls, etc.

Mr. W. Richardson delivered a lecture on electric heating at a recent meeting of the Institute of Metals, at Newcastle-on-Tyne.

At a meeting of the Birmingham Electric Club this (Friday) evening Mr. W. J. Belsey will read a paper on "Electric Propulsion of Ships."

Mr. L. E. Buckell delivered a lecture to the Electrical Association for Women, at the offices of the General Electric Co., at Bristol, last week, on "Colour Lighting as a Decorative Medium."

Fare reductions are granted by British and German railway companies and steamship services to visitors to the Leipzig Spring Fair, from March 2nd to 12th. Particulars from the London office, 1, Gower Street W.C.1.

The annual examinations for a Faraday scholarship of 80 guineas per annum, tenable for two years in college and one year in manufacturing works, and for a Maxwell scholarship of 60 guineas per annum, tenable for two years in college and one year in works, will be held at Faraday House, London, on April 8th, 9th and 10th, 1930. Exhibitions may also be awarded to candidates who acquit themselves creditably, but who do not obtain the necessary number of marks to qualify for the scholarship.

The report on the work of the Department of Technology of the City and Guilds of London Institute for the session 1928–29 has been issued by John Murray, Albemarle Street, London, W.1; price 1s. net. It contains details of examinations, including examinations overseas, the change of the title "electrical engineering" to "electrical engineering practice," the division of electrical installation work between three courses: (a) for junior electricians from 14 to 16 years of age; (b) leading up to an electrician's certificate or electrician's interim certificate; and (c) leading up to an electrician's extra certificate or interim extra certificate, etc.

A second course in simplified engineering has been inaugurated at Loughborough College, Leicestershire, for women wishing to train as factory inspectors, and for administrative and managerial posts in industry. This is a day course, lasting twelve weeks, and the students will not only attend lectures but be able to get practical workshop experience in the College. Application for this special training should be made direct to the Principal, Loughborough College, Loughborough. The Women's Engineering Society wishes to make it clear that this training does not in any way act as a substitute for training as an engineer. It has been devised for those women who wish to have some knowledge of modern engineering methods as a help in their own particular professions.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of February 28th, 1880, recorded a successful telephonic conversation over a distance of 410 miles in the United States.*

Artificial production of small diamonds for the first time was reported to have been successfully accomplished by Mr. Ballantine Hannay, of Sword Street, Glasgow.

The use of electric light by the P.L.M. Railway for making blue prints was mentioned.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of February 24th, 1905, published a summary of the argument between the Postmaster-General and the National Telephone Co. regarding the purchase of the Company's plant in the London Area on the termination of the Company's licence (on December 31st, 1911).*

The intention to widen Kingston Bridge was announced, to permit the laying of a double line of tramway track over the bridge.

An electrical exhibition was being held at Bexhill, Sussex, at which electric heating and cooking was a feature.

The "Financial Times" was about to substitute electric for steam driving plant in its printing works.

MR. CAMPBELL-SWINTON.

AS announced in our last issue, Mr. A. A. Campbell-Swinton died on February 19th, at the age of 66 years. Mr. Swinton entered Sir W. G. Armstrong's Elswick works in 1882 as a pupil, and in 1884 succeeded to the position of electrical engineer of the company, in which capacity he superintended the electric lighting of all the war vessels built at Elswick up to 1887. During this period he introduced the system of wiring ships with lead-coated cable. He was consulting engineer to the Metropolitan Police, was managing director of the Scarborough Electric Supply Co,. Ltd., and a director of the Cambridge Electric Supply Co., Ltd. He was a member of the original syndicate which built the "Turbinia," the first turbine vessel on the Parsons system. He interested himself in electric power distribution and was joint engineer for the Cleveland and Durham Electric Power Bill passed in 1901, and for the Kent Electric Power Bill of 1902. More recently be joined the boards of Edmundson's Electricity Corporation, Ltd., of the Kent Electric Power Co., and of Crompton Parkinson Ltd. In electric traction he was engineer to the Scarborough Tramways Co., joint engineer to the Falkirk and District Tramways and was a director of Bath Electric Tramways, Ltd. After Röntgen discovered X-rays in 1895, he was one of the first in this country to use them for taking photographs. In 1908 he suggested the possibility of television, by means of cathode rays, and he returned to the subject more recently. In 1914 he proposed a method of recording signals, and at an early date had a wireless telephone at work between his office in Victoria Street and his house in Chester Square. It was largely through him that the apparatus with which Professor D. E. Hughes had in 1879 made experiments in electric wave telegraphy, before Hertz had demonstrated the existence of such waves, was placed in the Science Museum at South Kensington, which also contains examples of his own inventive work on X-ray tubes and the telephone. He was a member of the Institutions of Civil, Electrical, and Mechanical Engineers and a Fellow of the Royal Society, he was elected president of the Röntgen Society in 1911 and of the Radio Society of Great Britain in 1913 (then the Wireless Society of London), and he served as chairman of Council of the Royal Society of Arts in 1917-19 and again in 1920-22. He was chairman of the British Scientific Instruments Research Association and a member of the general board of the National Physical Laboratory.

The late Mr. A. A. Campbell-Swinton.

MODERN ELECTRIC WIRING.

New Publication of Interest to Contractors.

THIS is the title of the new publication issued on behalf of cable makers associated in research. It was designed primarily to appeal to the householder-consumer, but, from its reading, we are of the opinion that its appeal will be wider.

The text opens with a soliloquy by a tired housewife, wishing for electricity in the home while "drudging" in the dust-ridden atmosphere brought about by old methods of illumination and heating. The story develops by brightly written dialogue between the housewife and the doctor, and, later on, between the wife and husband. Electric light is the desired conclusion.

The argument for surface wiring is amplified by half-tone illustrations of buildings in which have been installed one of the surface systems manufactured by member firms.

The whole publication is well produced throughout, with a cover lithographed in five colours; the reproductions of fine pencil drawings illustrating the dialogue portion of the text add "taste"; and the half-tones showing examples of neat runs of surface wiring furnish convincing testimony that surface wiring can be installed so as to be almost invisible.

The brochure is being issued to electrical contractors for re-issue to consumers, and may be obtained from Commercial Secretaries, Ltd., Cable Research House, Silver Street, London, E.C. The last page is left blank for over-printing.

PERSONAL.

AYLESBURY T.C. has appointed Mr. F. Bent, of Bolton, as superintendent of the electricity works.

Ald. Major Hall-Thompson has been elected chairman and Ald. Nixon vice-chairman of Belfast Electricity Committee.

Mr. J. Walsh, electrical engineer, Blackburn, has been elected to serve on the executive committee of the Blackburn Chamber of Trade.

Mr. E. Jacob, who was one of the founders, and for many years managing director of the Tudor Accumulator Co., Ltd., recently joined Britannia Batteries, Ltd., as managing-director, jointly with Mr. E. G. Lind.

Mr. G. C. Allingham, who was for a number of years an engineer with the Tudor Accumulator Co., Ltd., recently left the service of Metro-Vick Supplies to take up the position of sales manager of Britannia Batteries, Ltd.

Mr. P. H. Nye, of the Shanghai Branch of the General Electric Co. of China, Ltd., is returning to England, and Mr. N. G. Beale, who for some years has been chief engineer for the company in China, has been appointed to succeed him as general manager in that territory.

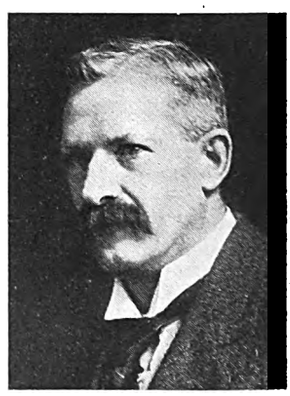
Mr. J. J. Murphy, who has resigned from the chairmanship of the Irish Electricity Supply Board, has been invited by the Irish Free State Government and has accepted the offer to continue as a part-time member of the reconstituted Board. It is understood that Mr. R. F. Browne, an official of the Free State Revenue Commissioners' Office in Dublin, has been appointed to succeed Mr. Murphy. See page 285.

Mr. John Christie, engineer and manager to Brighton Corporation, has resigned after 30 years' service. Mr. Christie, who was appointed in 1900, is a native of Glasgow, and commenced his business career as a marine engineer. Later he became associated with Crompton's works at Chelmsford, where his ability was early apparent, and a spell with Siemen Bros. and Co. at Woolwich was followed by his appointment to the post of second engineer to the Glasgow Corporation electricity works. This appointment was followed by his selection for the position of chief electrical engineer under the Londonderry Corporation. This was in 1894 and Mr. Christie remained in Ireland for four years before returning to Glasgow as power house superintendent.

Obituary.

ALDERMAN ALEXANDER SINCLAIR, on February 18th, aged 69 years, chairman of Swansea Electricity Committee for 25 years. He took part, when with Siemens Bros., in the manufacture and laying of the Mackay-Bennet submarine cable to America. Among the early houses to instal electric light in London, he assisted in the lighting of the late Sir George Newnes' (" Tit-Bits ") house on Wimbledon Common. He was a member of the Institution of Electrical Engineers.

MR. CHARLES H. W. GERHARDI, on February 17th, aged 60 years. His training was obtained at the Old Central College, and he received an appointment on the Metropolitan Electric Supply Company's staff at their original station at Whitehall Court in 1889 and had continued in that company's service ever since. He established a testing department at the old Sardinia Street station now demolished, and all the transformers used in the house connections of the company's original h.t. system passed through his hands. He was also responsible for metering, and the company's instruments generally, but made an especial study of metering with all its intricacies. He was an authority on any matter relating to measurements by integrating instruments, and his methods of recording the history of the thousands of instruments under his care was of the greatest use. He was a member of the Council of the Meter Engineers' Technical Association, now absorbed by the Institution of Electrical Engineers in their Instrument and Meter Section, and he represented the Institution on the Meter Committee of the British Engineering Standards Association. He was the author of " Electricity Meters, their Construction and Management."



The late Mr. C. H. W. Gerhardi.

IN PARLIAMENT.

Suggested Consideration of Transfer of Post Office Work to a Corporation.

IN the House of Commons on February 12th Mr. H. Ramsbotham called attention to the condition of the postal, telegraphic and telephone services, which he regarded as unsatisfactory, and moved that it was desirable to appoint a Committee of business men to inquire whether it would be for the public advantage that all or any of the Post Office services should be transferred to an *ad hoc* public corporation. Mr. H. Mond said the Postmaster-General had his hands tied by the Treasury, and had no control over his staff. The engineering staff were highly skilled men, and could form the nucleus of a much larger organisation and provide the country with the type of telephone service which it needed. Mr. J. W. Bowen said the beam wireless under Post Office direction had compelled a lowering of cable rates throughout the world. He moved an amendment that the Post Office be maintained as a national institution, and this was carried without a division.

Electricity Orders Approved.

On February 18th the House of Commons approved Electricity Supply Special Orders in respect of (1) part of Loddon and Clavering rural district; (2) Ashburton and Buckfastleigh urban districts and parts of Newton Abbot and Totnes rural districts; (3) Hornsea urban district and part of Skirlaugh rural district; (4) part of Pontardawe rural district.

Replies to Questions in the House.

The number of Electricity Commissioners is five, of whom one was appointed during the past two years.

No steel or concrete telegraph or telephone poles suitable for general adoption have been brought to the notice of the Post Office.

About 470 000 miles of wire in underground cables were provided by the Post Office during 1929, at a cost of about £3 900 000.

Employees in the Post Office engineering department on January 1st, 1930, numbered 31 544, against 32 389 on January 1st, 1929.

Electricity Commissioners are not allowed to have any share or interest in electricity undertakings, except as ratepayers. Similar conditions apply to whole time members of the Central Electricity Board, but not to part time members.

A reduction of telephone installation rental to a nominal figure would necessitate a substantially increased call rate and a relatively high minimum number of calls, which the Postmaster-General does not think would prove attractive.

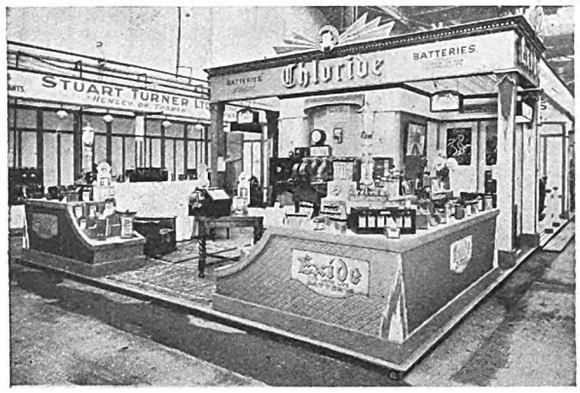
The Imperial Communications Advisory Committee is a body on which H.M. Government in the United Kingdom is not exclusively represented and in such circumstances publication of its proceedings in a reply in the House would be inappropriate.

THE AUTOMOBILE ELECTRICAL ASSOCIATION.

THE first positive step towards consolidation of the automobile electrical service industry was taken at a committee meeting of the Automobile Electrical Association held last week, when the reservation of membership of the Association to those whose business is mainly that of servicing the electrical equipment of automobiles and other electrical services, but not engaged in the repair of engines, chassis or coachwork, was confirmed. Next, the consideration of how best to make the Association of real and practical help to its members was considered and an unusually practical scheme was evolved. The Secretary's office is to be made a clearing house for information of use to members, any of whom is entitled to go there or to write for information and help of any kind relative to his business. The Secretary is compiling a register of sources of special information of the kind which experience will show is most in demand. This part of the work is of necessity of a confidential nature. It is to be supplemented by the issue of a monthly bulletin, the circulation of which will generally be confined to members and which will contain such information as may be circulated in that form, as well as useful, practical articles and notes from members generally on trade and technical developments. The address of the association is 2, Tichborne Court, High Holborn, London, W.C.1, and the Secretary is Mr. H. Scott Hall.

BUSINESS ITEMS.

THE KENT ELECTRIC POWER CO. has opened offices and showrooms at 110, High Street, Sittingbourne, to which district a supply of electricity has just been given.



THE stand of the Chloride Electrical Storage Co., Ltd., at the Birmingham Section of the British Industries Fair. *See page 267.*

The TUNGSRAM ELECTRIC LAMP WORKS (GREAT BRITAIN), LTD., announce that their Leeds branch has moved to Britannia House, 74, Wellington Street (corner of Britannia Street).

With reference to the radio filter of L. McMICHAEL, LTD., on page 234 last week, this firm is not showing at the British Industries Fair, the inclusion of the description on that page being an error.

The LANCASHIRE ELECTRIC POWER CO. is removing to new offices, and from March 3rd the address will be National Buildings, St. Mary's Parsonage, Manchester. Tel., Central 6595 (three lines).

To meet the expansion of business in the Newcastle area, the associated firms of the LONDON ELECTRIC WIRE CO. and SMITHS, LTD., FREDERICK SMITH AND CO., and the LIVERPOOL ELECTRIC CABLE CO., LTD., announce that their Newcastle branch has removed to 27, Oxford Street.

The ENGLISH ELECTRIC CO., LTD., Queens House, Kingsway, London, W.C.2, has received three new orders for trolley buses. The first order for Pontypridd is for seven single-deck saloon type vehicles mounted on 3-axle type chassis; each trolley bus will have seating capacity for 32 passengers. The equipment will consist of a DK.121 60 H.P. motor fitted with roller bearings and "English Electric" contactor type foot-operated controller. The second order for Southend Corporation comprises two double-deck top covered trolley buses mounted on 3-axle type chassis with air brakes operating on all wheels. A group system of lubrication is incorporated in the chassis by means of which all lubricating points are in groups in such a fashion that they will readily be accessible for charging. Each vehicle will have seating accommodation for 59 passengers. A special feature of the body is the inclusion of an extra exit on the near side front thereby facilitating the quick unloading of passengers during rush periods. A further notable feature incorporated in the design of this vehicle is the low loading whereby passengers may enter direct to the platform without any step arrangement, the platform being 1 ft. 2 in. from the ground. The equipment will consist of an "English Electric" DK.122 twin type 80 H.P. motor fitted with roller bearings and contactor type foot-operated controller. The third order is for Christchurch, N.Z., and is for six complete 3-axle trolley bus chassis and equipments.

BRITISH INDUSTRIES FAIR COMMITTEE.

The President of the Board of Trade has set up a Committee to examine the present situation as regards the British Industries Fair, and to consider what means can be adopted to increase still further its utility to British trade. The Committee is composed of Viscount Chelmsford (chairman), Lord Barnby, Mr. John Beard (president, Trades Union Congress General Council), Sir Percival Bower (Birmingham), Sir John Corcoran (National Union of Manufacturers), Sir Robert Donald, Sir William J. Larke (National Federation of Iron and Steel Manufacturers), Mr. Guy Locock, C.M.G. (Federation of British Industries), Sir Sydney Skinner, Sir Gilbert Vyle (Association of British Chambers of Commerce), and Mr. Robert Waddington.

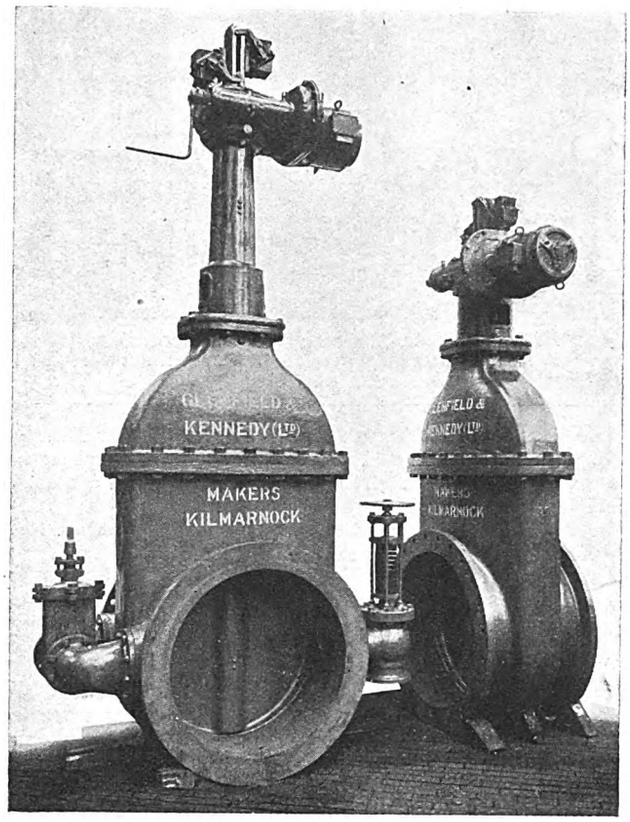
WATER VALVES.

A Striking Electrically-Operated Installation for Mexican Waterworks.

WITH regard to the rapidly growing use of the "distance" electrically controlled valve, of considerable interest is a contract that has just been carried out by Gwynnes's Pumps, Ltd., London, for the City of Mexico waterworks.



Illustrating the sluice and multiple flap reflux electrically-operated valves for the waterworks at Mexico.

This is all the more noteworthy, because it was secured against severe competition from the United States on a guarantee of shipment in two months, which no American firm could undertake. The contract was duly completed within the time named, Messrs. Gwynnes themselves manufacturing the pumps and Glenfield and Kennedy, Ltd., Kilmarnock, acting as sub-contractors for the necessary valves.

This latter equipment consisted of two 36 in. diameter electrically operated sluice valves, one 12 in. electrically operated sluice valve, one 6 in. relief valve, and one 36 in. multiple flap reflux valve with 6in. bye-pass and valve.

These sluice valves also include the latest type of the firm's electrical gear, in which the motor is bolted to the face of the worm-gear housing, constituting a very neat arrangement. The current for the motor is controlled by a set of push button controllers situated in the engineer's office, the valve being automatically stopped at the extreme position of its travel by one or other of the limit switches provided, situated on the indicator hood and operated by a pointer.

The methods of valve construction follow the firm's usual practice, the body being of grey cast iron moulded in dry sand, which produces a very smooth finish. Heavy gunmetal faces are fitted to the valve body and door, being securely held in position by screwed brass pins and hand-scraped to form a perfectly tight joint, while the operating screw is accurately machined from a forging of high tensile manganese bronze with gunmetal nut screwed to the valve door. All the gears are machine cut and operate in oil, while ball-bearing anti-thrust washers, circuit breakers, and reversing controllers are also included in the installation.

Valves of this type are manufactured in all sizes up to 108 in. diameter, and for any desired head, those for the higher pressures being constructed with cylindrical bodies, while the principle of distant electrical operation from any desired position, now being more and more used, is equally suitable for controlling water systems, and exhaust, low, or high-pressure steam, in power stations for example.

LEGAL INTELLIGENCE.

Case of Oxford Electricity Undertaking Again Mentioned in Court.

THE case in which Oxford Corporation and Oxford Electricity Co. are concerned in consequence of the Corporation having given notice of their intention to purchase part of the company's undertaking was again mentioned to Mr. Justice Bennett in the Chancery Division of the High Court on February 21st. Acting in accordance with the Oxford Electric Lighting Order, 1890, the Corporation had served notice on the company requiring them to sell the undertaking, and litigation ensued when the parties were unable to agree on the method of ascertaining the purchase price. Judgment had been given in favour of the Corporation's contention as to the method that should be adopted.

Mr. Tyldesley Jones, K.C., for the plaintiffs, now stated that the parties had agreed that the questions to be settled should be referred to a special referee, Sir William Plender.

Mr. Craig Henderson, K.C., for the company, asked that they be given an opportunity of considering whether there was any definite factor to be added to the terms of the declaration. The defendants' financial advisers stated that before they were called upon to state the factors for consideration they would require financial details of the undertaking which were not yet available, and it was their experience that in an inquiry of this kind there emerged factors which might become of vital importance but which could not be foreseen at the outset. In the circumstances counsel submitted that the declaration should be wide enough to cover such matters, though he was not in a position to add any specific factor which ought to be added. It was difficult at present before the parties had gone into the details to state what was proper for consideration, and he (Mr. Henderson) suggested that the proper order was that declaration "B" should be deleted and there should be an inquiry as to the amount of the purchase price of the undertaking. If the declaration could not be omitted, it ought to include the words "and such other factors and circumstances as are material to the case."

Mr. Tyldesley Jones, K.C., said he did not desire to exclude anything that ought to be considered, but he asked the Judge to make the two declarations as they stood. If his Lordship thought that on the order as drawn the defendants would be hampered in bringing forward any relevant matter, and that there was a danger of injustice, counsel suggested that the declarations should remain unaltered, but the matter could be dealt with in the inquiry as to the amount of the purchase price having regard to the declarations and any other material factors.

The Judge said the order must stand, as the defendants had been given an opportunity of suggesting a specific addition and they had been unable to do so.

Mr. Craig Henderson applied for a stay of proceedings on the order pending an appeal to the Court of Appeal as to the interpretation of the section of the Order. He said it seemed useless to proceed with an inquiry which would not be required if the defendants were right.

The Judge granted a stay for a week on the condition that notice of appeal was given in that time, and if the appeal was set down with an undertaking to prosecute it a stay pending the hearing of the appeal.

E.D.A. CARNIVAL.

The electrical carnival organised by the British Electrical Development Association at the Oxford Galleries, Newcastle-on-Tyne, on February 14th, proved to be one of the greatest social successes held in Newcastle. The carnival began at 8 o'clock, and each 15 minutes brought some fresh novelty. The first three-quarters were counted off with treasure dances, and the fourth with community singing and later with a cabaret in which five ladies gave exhibitions of dancing, and all the time a double hunt was going on for the mystery guests—Major Alec Tricity and Miss Eda, the Electric Girl. The ladies present were asked to find Major Alec. Tricity and the gentlemen to find Miss Eda. The finder of each was presented with a valuable prize. In all there were some 80 prizes generously given by the electrical industry for the various events. These prizes were presented by Mrs. R. E. Robson and Mr. R. E. Robson (chairman of the North East Area E.D.A. Committee). Among those present were:—Mr. V. Dale, Mr. and Mrs. S. E. Monkhouse and party, Mr. H. W. Clothier and party, Mr. L. J. Couves, Mr. Page, Mr. Smith, Mr. and Mrs. Parnall, Miss Sloan, and Miss Anna Holm.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, where available.

GRANGEMOUTH CORPORATION.—Electrical work in connection with north third waterworks, near Stirling. Schedules from Mr. J. C. Wallace, burgh engineer, Town Hall, Grangemouth.

ASHFORD (KENT) URBAN DISTRICT COUNCIL, February 28th.—Vertical, solid injection, heavy oil engine, with alternator (about 900 kW), suitable for 6 600 V, three-phase, 50 periods. Tenders to Mr. J. Sudlow, clerk of the Council, High Street, Ashford.

GLASGOW EDUCATION AUTHORITY, February 28th.—Electric light installations in Globerhill Temporary, Rotherwood Avenue, and Knightswood Schools and in Govan Secondary School extension, Langlands Road, Govan. Specifications, etc., from Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s. per specification.

WEST RIDING EDUCATION COMMITTEE, February 28th.—Electric light installation in Southowram Withinfields Council School. Specification, etc., from Mr. G. Dodgson, Education Office, Huddersfield Road, Elland.

LITTLEHAMPTON URBAN DISTRICT COUNCIL, March 1st.—Supply and installation of automatic operating, electrically driven air compressor. Specification, etc., from the Engineer, Town Offices, Littlehampton.

MANCHESTER GUARDIANS, March 1st.—Supply of electric cables required at Styal Cottage Homes, Styal, near Manchester. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints', Manchester.

OXFORD CORPORATION, March 1st.—Manufacture and erection of engines and pumps, including two oil-driven auxiliary engines each driving an electric generator; electric light installation, etc. Specification, until noon on March 1st, from Sir A. Binnie, Son and Deacon, Artillery House, Artillery Row, Westminster, S.W.1; deposit £10.

BELFAST CORPORATION, March 3rd.—Twelve months' supply of materials to the electricity department, including electrical accessories, lamps, carbon brushes, bitite strip, tapes, joint box compound, street box frames and covers, feeder and section pillars, copper cable connectors, electricity meters and instrument transformers, maximum demand indicators, automatic time switches, cut-outs, transformers, cables, wires and flexibles, etc. Forms and tender, etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast.

CENTRAL ELECTRICITY BOARD, March 3rd.—Construction of site works, foundation works and buildings in the area of the South East England Electricity Scheme. Specification (No. S.E.E.—P.F. 5) from the secretary and solicitor, Mr. R. H. Fox, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Cable Supplies.

DOVER HARBOUR BOARD, March 3rd.—Twelve months' supply of electric cables, electrical sundries, etc. Schedules, etc. (2s. 6d.), from the office of the Register, Castle Street, Dover.

HALIFAX CORPORATION, March 3rd.—Electrician's work at public conveniences. Specification, etc., from the Borough Engineer, Crossley Street, Halifax; deposit £1 1s.

HOVE CORPORATION, March 3rd.—Supply of electric lamps, etc., for one year. Forms of tender from the Town Clerk.

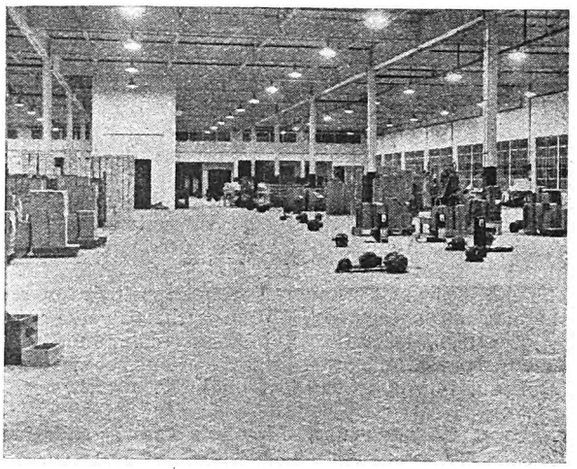
SOUTHEND CORPORATION, March 3rd.—Twelve months' supply of stores, including meters and instruments, electrical fittings, cables and steel conduits, joint boxes, earthenware conduits, etc. Specification, etc., from the Borough Electrical Engineer and Manager, Electricity Works, London Road, Southend-on-Sea.

STIRLING CORPORATION, March 3rd.—Electrical work in connection with erection of 32 houses at Raploch, Stirling. Specifications, etc., from Mr. Andrew H. Goudie, burgh engineer, Stirling; deposit £1.

WESTHOUGHTON URBAN DISTRICT COUNCIL, March 3rd.—One year's supply of stores, including metallic filament lamps, Forms of tender, etc., from the Surveyor, Town Hall, Westhoughton. Stamped, addressed envelope to be sent.

CAMBRIDGE CORPORATION, March 4th.—Twelve months' supply of stores, including electric lamps (schedule 16). Forms of tender, etc., from the Borough Engineer, Guildhall, Cambridge.

MANCHESTER GUARDIANS, March 4th.—Supply of electric equipment required at Styal Cottage Homes, Styal, near Manchester. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints', Manchester.



THE new works of J. S. Fry and Sons, at Somerdale, illuminated by 20 in. "Benjamin R.L.H." reflectors, in conjunction with 500 W Siemens "Silvalux" opal lamps. After the installation was completed, tests showed a mean intensity of 12·4 ft. c., on the floor level, and, as will be seen from the photograph reproduced, which was taken by the unaided artificial lighting, there is an almost entire absence of shadows, with practically uniform illumination over the whole area.

ROTHERHAM GUARDIANS, March 4th.—Supply of electrical sundries. Tender forms from the clerk, Mr. W. C. Harrison, 26, Moorgate Street, Rotherham.

GLASGOW CORPORATION, March 5th.—Electrical installations in houses at fire stations. Specifications, etc., from the General Manager, Electricity Department, 75, Waterloo Street, Glasgow, C.2.

ALLOA CORPORATION, March 6th.—Electrical installation in connection with erection of 63 houses at Broad Street, Alloa. Schedules from Messrs. J. Melvin and Son, architects, Mar Street, Alloa.

WALSALL AND WEST BROMWICH UNIONS JOINT COMMITTEE, March 6th.—Supply of electric fittings. Particulars from the clerk, Mr. A. H. Ward, 22, Lombard Street, West Bromwich.

ERITH URBAN DISTRICT COUNCIL, March 7th.—Twelve months' supply of h.t. and l.t. underground cable, joint boxes and other accessories. Forms of tender, etc., from the Electrical Engineer, Walnut Tree Road, Erith.

KETTERING URBAN DISTRICT COUNCIL, March 7th.—Supply of certain transformers. Specifications from Mr. W. A. Walker, Electricity Offices, Rockingham Road, Kettering; deposit £1.

LEICESTER CORPORATION, March 7th.—Installation of electric light wiring and fittings at Belgrave pumping station. Specifications, etc., from the City Surveyor, Town Hall, Leicester; deposit £1.

EDINBURGH CORPORATION, March 8th.—Supply and maintenance of telephones, in Edinburgh, Leith and Portobello districts. Forms of tender, etc., from the City Architect, City Chambers, Edinburgh.

BEDFORD CORPORATION, March 10th.—Supply during one year of e.h.t., h.t. and l.t. underground cables; and incandescent lamps. Specifications from the Borough Electrical Engineer, Prebend Street, Bedford. Tenders from British manufacturers in the United Kingdom only are invited.

BLACKBURN CORPORATION, March 10th—Manufacture and supply of electrical requirements for 12 months, including

Digitized by Google

paper insulated, lead sheathed cable, rubber insulated wire, consumers' meters and gasfilled and vacuum incandescent lamps. Specification, etc., from the Engineer and Manager, Electricity Offices, Town Hall, Blackburn ; deposit 10s.

CHEDDLESTON (LEEK) MENTAL HOSPITAL, March 10th.—Supply of electric lamps for six months. Tender forms from the clerk and steward, Mr. F. G. Eve.

PRESTWICH URBAN DISTRICT COUNCIL, March 10th.—Twelve months' supply of lamp standards, electric lamps, etc., Forms of tender, etc., from Mr. H. T. Ainsworth, surveyor, Town Hall, Prestwich, Lancs.

TORQUAY CORPORATION, March 10th.—Supply and erection of 7 500 kW m.c.r. turbo-alternator and condensing plant. Specifications, etc., from Mr. G. J. Hollyer, Electricity Offices, Torquay ; deposit £3 3s.

WARRINGTON CORPORATION, March 10th.—Supply of (1) motors, and (2) transformers. Specifications from Mr. F. V. L. Mathias, Electricity Works, Warrington ; deposit £1 1s. for each.

LIVERPOOL CORPORATION, March 12th.—Supply of 5 000 kVA, 12 500 kVA and 33 000 V step-down transformers and 6 000 V and 33 000 V metal-clad switchgear for sub-stations. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

STOKE-ON-TRENT CORPORATION, March 12th.—Twelve months' supply of (1) e.h.t. truck type switchgear (contract No. 3004) ; and (2) a.c. and d.c. meters (contract No. 3005). Specifications from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent ; deposit £2 for each.

HARROGATE CORPORATION, March 15th.—Twelve months' supply of cables, joint boxes, joint-box compound, service meters and service cut-outs. Specifications, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

LIVERPOOL CORPORATION, March 18th.—Installation of electric lifts, etc., at new abattoir, Stanley, Liverpool. Specification, etc., from the Land Steward and Surveyor, Municipal Buildings, Liverpool ; deposit £3 3s.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, March 19th.—Coal-handling plant at Ironbridge generating station. Specification (No. 8), etc., from Mr. E. F. Hetherington, Phœnix Buildings, Dudley Road, Wolverhampton.

CARDIFF CORPORATION, March 20th.—Supply of e.h.t. and l.t. paper insulated cable during 12 months. Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only manufacturers on the King's National Roll are invited to tender.

CENTRAL ELECTRICITY BOARD, March 24th.—Supply and erection of 33 kV and lower voltage transformers, in connection with the North West England and North Wales Electricity Scheme. Specification (N.W.E.-S.T.4). from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2 ; deposit £2 2s.

EDINBURGH CORPORATION, March 24th.—Twelve months' supply of materials, including underground insulated cables, conduits, house service fuse boxes and fuse boards, electrical material for interior wiring, electricity meters, etc. Specifications, etc., from the Engineer and Manager, Electricity Department, Dewar Place, Edinburgh.

RHONDDA URBAN DISTRICT COUNCIL, March 29th.—One year's supply of ordinary and prepayment a.c. meters, cable, joint boxes, compound cut-outs, etc. Specifications and forms of tender from Mr. J. M. Bowman, Electricity Works, Porth, Glam.

CENTRAL ELECTRICITY BOARD, March 31st.—Supply and erection of metering equipment required in the area of the North West England and North Wales Electricity Scheme. Specification (N.W.E.-G.M.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

GOTHENBURG HARBOUR AUTHORITY, March 3rd.—Supply of ten electrically operated 2½-ton portal cranes. (Reference A.X. 9 089.)

VICTORIAN ELECTRICITY COMMISSION, March 3rd.—Supply of 44 000 V tensioning and pin type supporting insulators (specification No. 30/16). (Reference B.X. 6 177.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 4th.—Supply of automatic exchange power boards (schedule C. 562). (Reference B.X. 6 072.)

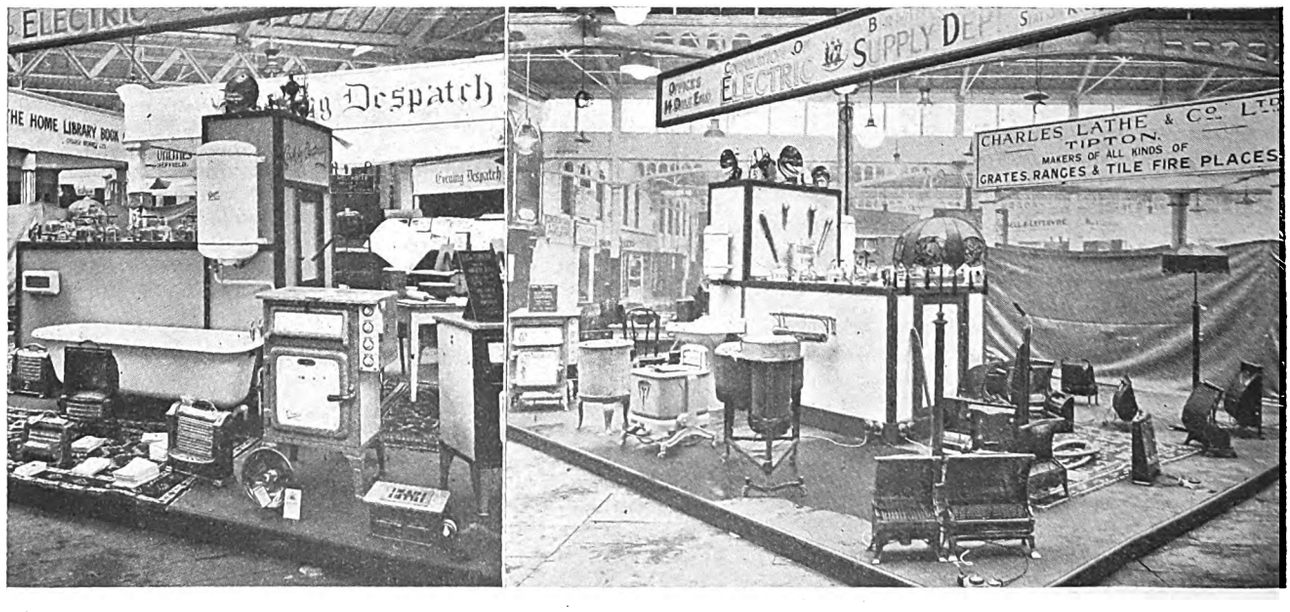
INDIAN STORES DEPARTMENT, March 5th.—Supply of battery charging motor generator set, for Wireless Section (schedule No. 880 R/1). (Reference B.X. 6 146.)

NEW ZEALAND POSTS AND TELEGRAPHS, March 5th.—Supply of v.i.r. wire (specification No. P. and T. 151/2 096). (Reference B.X. 6 089.)

VICTORIAN ELECTRICITY COMMISSION, March 10th (extension of time).—Two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

MOROCCO POSTS AND TELEPHONES (FRENCH ZONE), March 11th.—Supply of glass insulators, bronze and copper wire and galvanised ironwork. (Reference B.X. 6 410.)

NEW ZEALAND POSTS AND TELEGRAPHS, March 11th.—Supply of three-conductor cords (P. and T. No. 151/2 145). (Reference B.X. 6 173.)



TWO views of the stand of the Birmingham Electric Supply Department at the recent "Brighter Homes" Exhibition which was held in Birmingham.

Digitized by Google

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th. Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

POSTMASTER-GENERAL'S DEPARTMENT, March 24th.—Supply of dial parts (schedule C. 555). (Reference B.X. 6 047.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays, for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

VICTORIAN ELECTRICITY COMMISSION, April 14th.—Supply of 22 000 V switchgear and accessories, for sub-station "C" at Brunswick (specification No. 30/17). (Reference B.X. 6 182.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30th.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

Tenders Accepted.

GENERAL POST OFFICE.—Johnson and Phillips, Ltd., trunk telephone cables between Birmingham-Wolverhampton and Oxford-Banbury.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Johnson and Phillips, Ltd., 11 000 V overhead power lines for rural development of Kent.

LOWESTOFT CORPORATION.—Callender's Cable and Construction Co., Ltd., supply and erecting of h.t. cables, transmission lines, etc., £9 399.

ADMIRALTY.—Siemens Electric Lamps and Supplies, Ltd., supply of large quantity of Siemens vacuum and gasfilled pearl lamps and clear gasfilled lamps.

HARTLEY MAIN COLLIERY CO., LTD.—Johnson and Phillips, Ltd., underground cables, power station and sub-station switchgear and transformers for new colliery power scheme, £40 000 (approximate).

DEPTFORD (LONDON) BOROUGH COUNCIL.—Works in connection with electric light installation at Town Hall: General Electric Co., Ltd., supply of fittings, £381; Stinton Jones, rewiring, £246. (Both recommended.)

EDINBURGH CORPORATION.—Bruce Peebles and Co., Ltd., equipment, comprising 1 500 kW Peebles-Brown Boveri mercury arc rectifier, designed for 3-phase 50-cycles 6 500/6 800 V on a.c. side and 550/600 V on d.c. side. The rectifier will operate on a traction load.

CROYDON CORPORATION.—British Electric Transformer Co., Ltd., supply of transformers: two 400 kVA, £420 each; five 400 kVA, £292 each; one 1 000 kVA, £558, and one 500 kVA, £310, A. Reyrolle and Co., Ltd., supply of switchgear, £7 879 11s. 6d. (Both recommended.)

MANCHESTER CORPORATION.—D.P. Battery Co., Ltd., and Chloride Electrical Storage Co., Ltd., supply of electric vehicle batteries; English Electric Co., Ltd., supply of sub-station kiosk and switchgear at Sharston Green; James Russell and Sons, Ltd., six months' supply of steam tubes and fittings.

CENTRAL ELECTRICITY BOARD.—Johnson and Phillips, Ltd., 33 kV transmission lines; and English Electric Co., Ltd., 132 kV transformers, in connection with Mid-East England Electricity Scheme. Approximate value of contracts, £230 000. Contract for transformers is additional to those recently announced.

GLASGOW CORPORATION.—Metropolitan-Vickers Electrica Co., Ltd., turbo-alternator and spares, for Pinkston power station, £41 867, subject to deduction in respect of spares for condensing plant; G. and J. Weir, Ltd., condenser and spares, £9 448 15s. Malcolm and Allan, Ltd., electrical work at Belvidere Hospital, £889 12s 8d (All recommended.)

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—Enfield Cable Works, Ltd., supply of 2 500 yds. of 0·2 sq. in. three-core, lead-covered, 11 000 V Bowden-Thompson type cable, and 1 720 yds. of 0·2 sq. in. three-core, steel armoured, 11 000 V Bowden-Thompson type cable, £4 722 16s. 9d.; Doulton and Co., Ltd., supply of 1 250 yds. of 4 in. two-way conduit, with Stanford self-centring joints, £302 6s. 11d.

GENERAL POST OFFICE.—Cable—supply, manufacture drawing-in and jointing—Birmingham-Wolverhampton, Johnson and Phillips, Ltd.; Exeter-Honiton, W. T. Henley's Telegraph Works Co., Ltd.; Portsmouth-Petersfield, Callender's Cable and Construction Co., Ltd.; Hanley-Uttoxeter W. T. Glover and Co., Ltd. Electric lift—Lewes station sorting office, W. Wadsworth and Sons, Ltd. telephone exchange equipment—Watford (Herts), Kings Langley (Watford multi-area) and Radlett (Watford multi-area), General Electric Co., Ltd.; Folkestone, Hythe (Folkestone multi-area), Sandgate, ditto, Cheriton, ditto, and Lyminge, ditto, Ericsson Telephones, Ltd.

"S O S."

Bouverie Players Give Good Account of Themselves at the Scala Theatre.

THE Bouverie Players (Benn Brothers' Dramatic Society) have given this week three successful evening performances of Mr. Walter Ellis's play "S.O.S.," for the benefit of the John Benn Hostel and other charitable institutions. The players collectively gave a good account of themselves. Mr. Gordon Grieve as Sir Julian Weir and Mr. Guy Catchpool as Owen Herriot are worthy of mention for their masterly delineations of the characters of bereaved husbands, who, in the end, discover the guilt and the innocence, respectively, of their deceased wives. Miss Phyllis Trimby, who has so charmingly represented heroines in the Society's previous plays, showed her versatility by giving an excellent representation of the wicked wife. Allan Herriot (Mr. Wm. McNaught) and Judy Weir (Miss Muriel Johns) displayed the necessary naïveté as youthful lovers, Mr. Bert Bryant, as Martin, had a dialect which convinced one immediately of the rural atmosphere of the setting, and Miss Muriel Smith as an unsophisticated barmaid gave a delightful character sketch. Mr. Harry Duck, as Freddie Cobb, a pious licensed victualler, Mr. Reg Cawte as Brent, a butler, Mr. James Mactavish, as a police inspector, and Mr. Charles Payne, as a footman, were also at home in their parts, and contributed their full share towards the success of the production. Mr. A. R. Heaton, the producer, and "The Times" Orchestra also deserve credit for their assistance.

INDUSTRIAL WELFARE.

Some 400 industrialists were present at the Industrial Welfare Society's banquet at the Hotel Victoria, London, on Wednesday, when the speakers included the Duke of York, Mr. Frank Hodges and the Archbishop of Canterbury. The banquet marked the completion of 11 years' work by the Society, of which the Duke of York is president. It was pointed out during the course of the evening that the necessity of looking after the health of employees was indicated by the fact that the time lost to industry in a single year through sickness was equal to twelve months' work for nearly 590 000 persons, one well-known company, during a period of twelve months, having paid in salaries during sickness a sum of no less than £199 000.

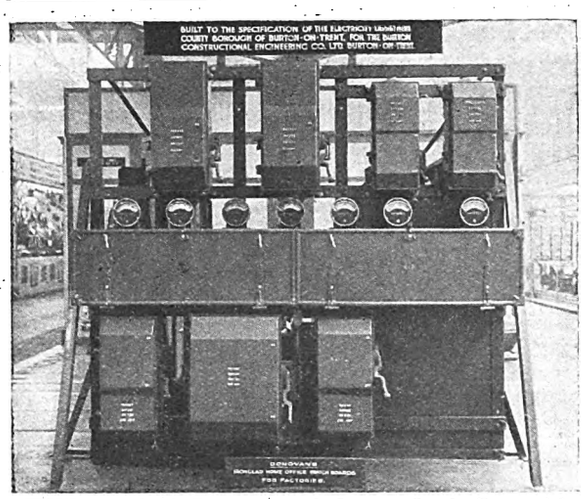
ELECTRICITY SUPPLY.

Harnessing the Nygaards Falls—Hydro-Electric Developments in Canada—Current Consumption increases in Minehead—Portsmouth and the S.W. England Scheme.

EAST Grinstead U.D.C. has decided to instal at the electricity works an additional generating set at an estimated cost of £9 240.

Winchester Corporation has received sanction to a loan of £3 780 for a new feeder main from the power station to the Guildhall.



THE stand of Donovan and Co., at Castle Bromwich, includes this attractive panel built for the Burton-on-Trent Constructional Engineering Co. to the specification of Burton-on-Trent Electricity Department.

Croydon electricity department is to extend mains, at a cost of £687, and to lay a loop feeder from London Road to meet the increased demand at the poor law hospital.

Dronfield Council has entered into an agreement with Sheffield Corporation for a supply of electricity to Dronfield. The Council decided not to entertain an offer by Dronfield and District Electric Service, Ltd.

The Norwegian Government has sanctioned the town of Narvik's plan to harness the Nygaards Falls, with a view to supplying electric power for railway purposes. The town has made arrangements to borrow Kr. 6 700 000 at 5% per annum for ten years.

Oswestry T.C. has decided to apply to the Electricity Commissioners for sanction to borrow £6 500 for meeting the demands on the undertaking during next winter and to cover the cost of the first stage of the change over of the supply from d.c. to a.c.

The Irish Free State Electricity Supply Board, in acknowledging the receipt of a cheque for £30 from Newbridge Town Commissioners on account of the public lighting of the township, pointed out that a considerable sum remained due. The Chairman said, at a recent Council meeting, that the delay in carrying out extensions was very disappointing and they were putting the lights at the wrong places.

Mr. C. H. Yeaman, city electrical engineer, has reported to Stoke-on-Trent Electricity Committee applications for supply to the works of Messrs. Pyrosil, Ltd., and for an additional supply to the Washington works of Messrs. Macintyre and Co., Ltd. The necessary extensions of the mains are to be carried out at a cost of £740. The Electricity Committee is also to lay a main to the premises of Messrs. Dalehall Mills, Ltd., at a cost of £600.

The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada has issued its annual review of hydro-electric and water power developments in Canada during 1929. New installations brought into operation during 1929 amounted to 378 400 H.P., bringing the total capacity of installations in the whole Dominion to 5 727 600 H.P. Undertakings now under construction will add more than 1 600 000 H.P. during the next three years.

The chairman of Minehead U.D.C., Mr. J. A. C. Kennard, on February 19th, started up at the Minehead electricity station a new 500 H.P. engine which is part of the plant necessitated by the increased demand for electricity and the change over from d.c. to a.c. Mr. Selwyn Grant, general manager of Whitehall Securities, Ltd., and chairman of the Minehead Electricity Co., said the consumption per head in that area had increased during the last five years by 76%.

Residents in the village of Freshford, near Bradford-on-Avon, object to the erection of overhead lines in the village by the West Wilts Electric Light and Power Co. Mr. Gordon Tucker, for the Ministry of Transport, recently held an inquiry into the matter, and concessions were made both by the company and the R.D.C. The company undertook to lay one section, from St. Peter's Church, High Street, etc., underground, and to exclude the road to the Tynings from the present scheme.

In his presidential address to the Society of Engineers, last week, Mr. W. M. Beckett referred to the paper he read before the Society in 1926 outlining a scheme for a Severn barrage to cost about £12 000 000. He said so far no report on the subject had been made public or presented to Parliament as the result of the Government Committee's investigations, and it would appear to be a matter of urgent public interest that definite information on the subject should be furnished without further delay.

The supply of electricity to Berkswell, is the subject of an agreement between the Coventry and Birmingham Corporations. Coventry electricity department has received applications for supply, but the Corporation's mains cannot at present be economically extended to Berkswell, and Birmingham Corporation, whose mains are more conveniently situated, will furnish the supply, Coventry to bear the cost of connection and distribution, laying services, etc., and to pay Birmingham 60% of the receipts.

Douglas (Isle of Man) Electricity Committee has received a letter from the Government secretary, stating that a draft Bill for supplying electricity outside the area of the Corporation supply is under consideration. The Bill provides that the Corporation shall be the generators, and supply current in bulk to the company referred to in the Bill.—The Committee has given instructions to the Borough Electrical Engineer with respect to provision in the forthcoming estimates for additional public and decorative lighting.

The Borough Electrical Engineer of Hornsey reports that the convertor at the Highgate sub-station should be completed for remote control during this year. To prepare for this remote control and the further remote control plant in the Highgate and Muswell Hill sub-station, the necessary pilot control cables will have to be pulled into the existing ducts. It is estimated that the cost of putting in a 25-core cable between the generating station and the Highgate sub-station will be £1 380. The Electricity Committee recommends that the work be carried out.

After considering arguments suggested by Mr. B. Handley, borough electrical engineer, in favour of such procedure, Portsmouth Electricity Committee recommends that, having regard to the provisions contained in the South West England electricity scheme, the Town Clerk be authorised to make representations to the Central Electricity Board with a view to the "selection" of the Portsmouth generating station, and, as to the financial matters involved in the scheme, that the Committee be empowered to take any further action which may be considered necessary.

Salcombe Gas and Electricity Co. having applied to the Minister of Transport for his consent to the erection of overhead lines in the urban district of Kingsbridge, Mr. F. Gordon Tucker, on behalf of the Minister of Transport, held an inquiry recently into the matter. For the company it was stated that they were anxious to arrive at some mutually satisfactory scheme and had met the objections of the Kingsbridge Council by offering to lay underground cable in Fore Street as far as the Grammar School. The Chairman of the Council said they could not consent to the erection of poles similar to those in the Salcombe streets. The width of the streets in Kingsbridge was in many cases very narrow. The inspector stated that up to 1919 local authorities had the right to veto. In 1919 Parliament decided that the Minister of Transport should have power to override local authorities if he considered it desirable, but the Minister was anxious that such matters should be settled by agreement. It was stated subsequently that the Council was agreeable to steel poles in certain thoroughfares.

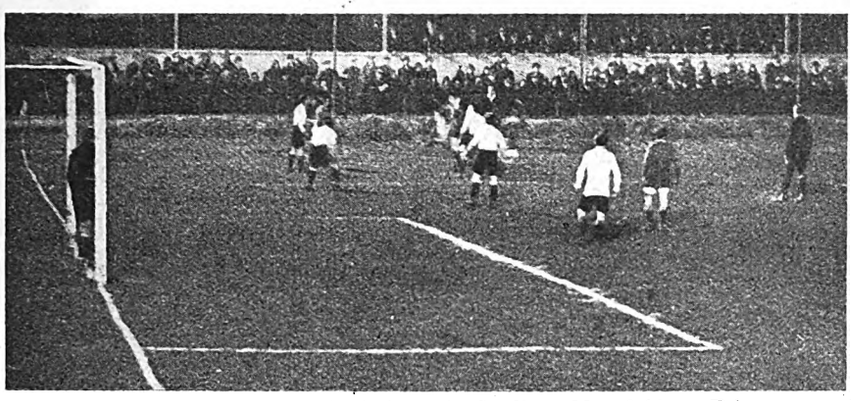
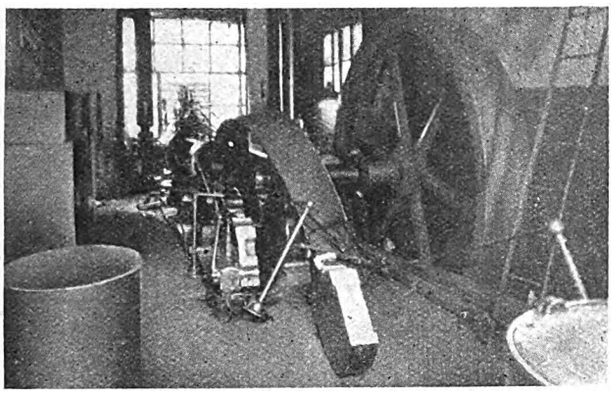
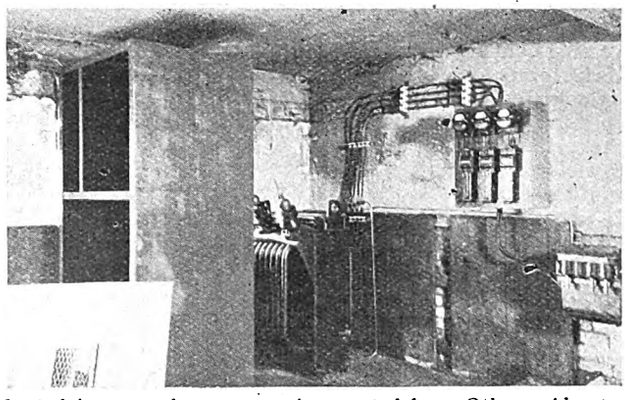
ELECTRICAL NEWS IN PICTURES.



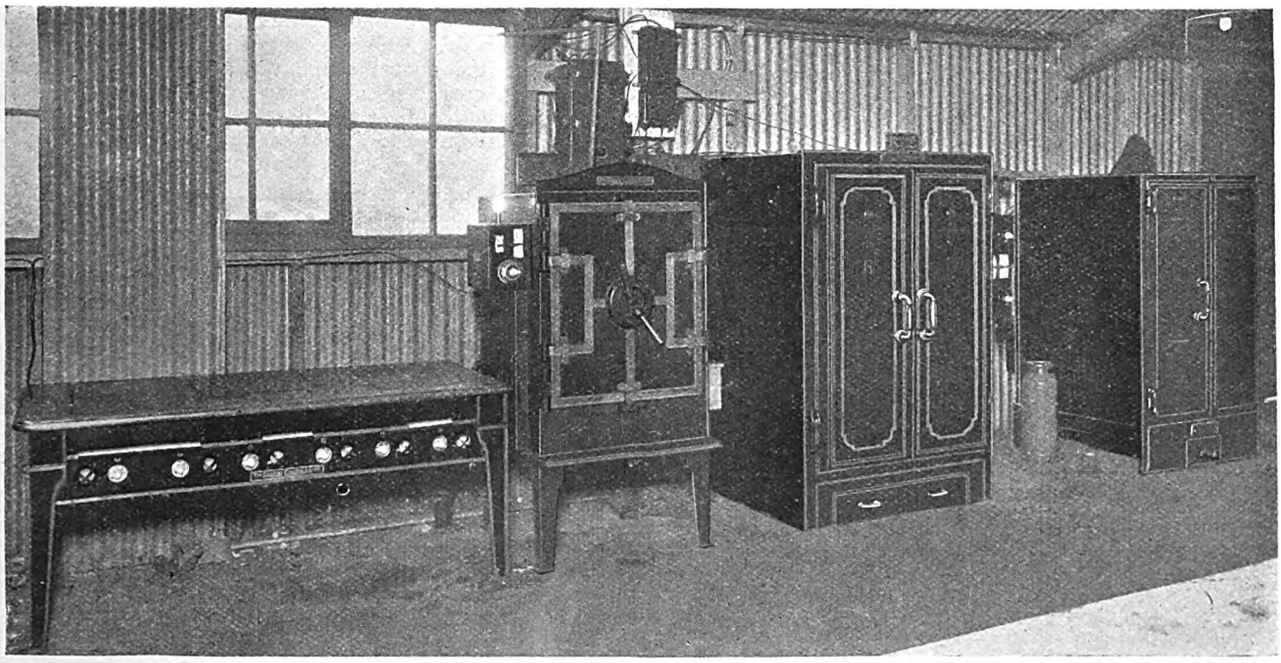
Ollerton Forest played Welbeck Athletic at the Stadium, Mansfield, on February 22nd by aid of electric light, and this picture is reproduced from a photograph taken during the match. The lighting arrangements were in the hands of Philips Lamps, Ltd., over 1 000 000 C.P. being used.

Mr. J. J. Murphy, who has resigned the chairmanship of the Irish Free State Electricity Supply Board. It is reported that Mr. R. F. Browne has been appointed his successor. See page 278.





Another example of the facility with which electric drive can be adopted in case of emergency is reported from Otley. About mid-day on February 14th, the 150 H.P. steam engine at the works of a printing machinery manufacturers suffered damage beyond repair due to the breaking of the crank disc. The Yorkshire Electric Power Co. at once approached the firm and terms of supply were quickly agreed. An extension of 11 000 V mains was necessary, and collaboration with Mr. Robinson, a local electrical contractor, who installed the wiring and necessary electric motors, resulted in the works being ready for running at 5.40 p.m. on Sunday. The picture on the left is of the engine after breakdown and the temporary sub-station before erection of screens is seen on the right.



A feature of the British Industries Fair at Birmingham which so far seems to have escaped attention by most visitors, because it is out of sight and is not scheduled as an exhibit, is the electric cooking installation in the restaurant. Ovens and transformer equipment were provided by The General Electric Co., Ltd., roasters by the Jackson Electric Stove Co., Ltd., hot cupboards by the British Electric Transformer Co., Ltd., the range by Berry's Electric (1928), Ltd., and switches by A. Reyrolle and Co., Ltd.

BUSINESS AT THE FAIR.

Reports from Birmingham Show that Many Orders have been Secured.

INQUIRIES amongst standholders at the end of the first week of the Fair—which closes to-day—revealed a state of affairs in the Electrical Section which amply justifies the policy embarked on a year or so ago of making the section bigger and as fully representative as possible of the many sides of the electrical industry, a policy which, incidentally, has resulted in the Section having become one of the biggest portions of the Fair. It is too early at the time of writing, to give an accurate estimation of the number of inquiries received and the business done, but there is sufficient evidence to indicate that in both directions the results this year will exceed appreciably those of any previous year, and it is not surprising to hear the opinion expressed amongst some of the standholders that additional space may be taken for next year. The attitude of exhibitors towards the worth-whileness of the Fair varies greatly, of course. There are those who consider participation justified if they take orders enough to cover the total costs of exhibiting, others who are content if their products have been the subject of good inquiries, and a third class who look to the Fair as the means of bringing immediately an amount of business far exceeding the costs of exhibiting.

A number of exhibitors report good orders and inquiries from abroad, and one cannot fail to be impressed by the increasing evidence of the success with which British electrical manufacturers are tackling the overseas markets, though this is principally confined at present to the Dominions and Colonies. The Revo Electric Co., Ltd., Tipton, at the time of the writer's call, had just booked an order for 100 cookers, and their representative mentioned that 500 of these well-known cookers had been supplied to China last year. There had been a number of good inquiries from India, Australia, and other Dominions. Another firm able to report good business with overseas visitors is the B.K.B. Electric Motors, Ltd., 220, High Holborn, London, whose single phase repulsion induction motors are said to be establishing a place in the market hitherto held with little rivalry by American manufacturers. There was a good deal of interest and also many inquiries at the stand of Birmingham Electric Furnaces, Ltd., Parade, Birmingham, who have supplied what is believed to be the largest electric carburising furnace in this country to David Brown and Sons, Ltd., Huddersfield. Another noteworthy feature amongst the industrial exhibits in the Section is the range of new switchgear by Donovan and Co., Stechford, Birmingham, which is shown for the first time. Buyers were also interested in Donovan's new switchgear for 3-phase 4-wire systems, in which the neutral is made to make first and break last. Interest in domestic electric appliances is one of the outstanding features of the Fair, and is undoubtedly much higher than last year. Kettles and irons are the foremost subjects of inquiry, and one is very favourably impressed by the high standard of workmanship and electrical efficiency revealed in many of these products. The same remark applies almost with equal truth to fires and lighting fittings, while cookers and water heaters are again indicative of much progress and have attracted more attention amongst buyers and visitors generally than has been the case hitherto. The display of cookers by Credenda Conduits Co., Ltd., Oldbury, and the Revo Electric Co., brought both these firms good business with home buyers, while the new chromium plating in fires, irons, kettles, lighting fittings, etc., is also responsible for many inquiries. The range of new glassware and lighting fittings and "Magicoal" fires by Berry's Electric Ltd., is a noteworthy success, while the Alpha Electric Apparatus Co., Greet, Birmingham, reports having had better business with a new type of iron produced for the Fair than with any previous type, inquiries having been good from buyers from Australia, New Zealand, and South Africa. A popular feature at the stand of Bulpitt's and Son, Ltd., Birmingham, is their new combined kettle and saucepan fitted with two heating elements. Another firm which is doing good business in kettles and irons is Chesterton Jones and Co., Ltd., Tyseley, Birmingham.

The foregoing indications are necessarily sketchy, but they will suffice to show in a broad and general way the success of the Electrical Section. They were gathered during a tour of the stands when the business of the Fair was in full swing, and an impression which demands to be recorded is that the Section is the best lit, the best planned, and the most attractively displayed section in the whole of the Fair. And not the least welcome feature is the conveniently placed reception and inquiry bureau under the auspices of the Electrical Development Association.

CHLORIDE WORKS COMMITTEE.

The 1929 report of the Works Committee of the Chloride Electrical Storage Company's works at Clifton Junction, near Manchester, contains evidence of the good work done by the Committee and of the happy and sympathetic relations prevailing between the company and its employees. At the outset, the report refers to the great loss sustained by all the employees through the death of Mr. Wm. Bannister, the late chairman of the company, and quotes a letter dated February, 1929, in which Mr. Bannister expressed the appreciation by the board of the committee's assistance in maintaining cordial relations between the management and employees and his own approval of the thrift scheme mentioned in last year's report. The 1929 report states that the shareholders of the company allotted a further £10 000 to the pensions fund, which now amounts to £89 000, and records that "Haig" poppies sold on November 11th realised £9 13s. 3d., and that the Bannister trust fund afforded six grants to alleviate distress during the year. The employees' fund has provided the means for 53 persons to visit convalescent homes. The Committee also refer with satisfaction to the work of the medical officers in counteracting the risk of lead poisoning, no cases of plumbism having occurred in the works during the year. Amongst other beneficial institutions mentioned are the dental clinic, thrift scheme, marriage gifts, evening lectures, long-service awards, sick club, free hospital treatment and canteen and library. The benefits paid by the sick club amounted to £2 021 5s. 6d., and grants made out of the works' employees subscription account to £605 12s. 8d.

TWO views of the stand of the British Thomson-Houston Co., Ltd., in the Electrical Section of the Fair at Birmingham. See page 268.

COMPANY NEWS.

Cables and Wireless Stocks Still Sagging—Increase of A.E.G. Capital—English Electric Co.'s Capital Reorganisation—Directors' Reports—New Companies.

BUSINESS in electrical shares has eased off during the past week and charges in price quotations are relatively few. Cables and Wireless continue to sag, and the "A" stock is in the neighbourhood of 60. American Telephone and Telegraph convertible bonds have been marked down 7½ points. Metropolitan Electricity Supply shares are up to £2 and Enfield Cable Works are not very far off £5.

Metropolitan Railway stock is somewhat slow to reflect appreciation of the company's better results and increased dividend. Lord Aberconway, presiding at the meeting on February 20th, said their traffic receipts for the past year increased by £17 746, and expenditure decreased by £44 000. The interests of the coal trade and the railway companies were so closely allied that he thought there was nothing to be feared from the legislative proposals now before the country. The widening of the line between Wembley Park and Harrow and lengthening platforms at a number of stations were about to be commenced. Rumours were about of Parliament initiating some scheme for the amalgamation of the various transport agencies in the Metropolis. Any definite proposals of this character that were brought forward would naturally receive the careful consideration of the directors. At the same time, it must not be overlooked that the Metropolitan was only partially a London transport company. It was really a trunk line in miniature. They did practically everything that was done by one of the large grouped lines, in that they carried, in addition to passengers, goods and merchandise of all descriptions, had their own collection and delivery organisations, and were parties to the railway clearing system. The report and accounts were adopted, and the dividends, including full dividends on 3½% preference, 3½% "A" preference, 3½% convertible preference and 5% preference stocks and £2 15s.% on the consolidated ordinary stock, making £4% for the year, were approved. At a subsequent Wharncliffe meeting, a resolution approving the promotion of a Bill to authorise the Wembley-Little Stanmore line was carried.

Directors' Reports, etc.

NORWICH ELECTRIC TRAMWAYS CO.—Intm. div. of 2½% (same as last year) is announced.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Intm. div. on 6% pref. shs. will be payable on March 1st.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Half-year's div. on 8% 1st pref. shs. will be payable on March 1st.

LIVERPOOL OVERHEAD RAILWAY CO.—Div. for year ended Dec. 31 last at rate of 5% p.a., less tax, on pref. shs. is announced.

ISLE OF THANET ELECTRIC SUPPLY CO., LTD.—Div. of 4% on ord. shs. for year to Dec. 31 last is declared. To gen. res. and depreciatn. £30 000.

MATHER AND PLATT, LTD.—Fin. div. of 5%, with bonus of 5%, makg. 15% for year (same as previous year), is recommended. Fwd. £109 855, agst £108 006.

CHISWICK ELECTRICITY SUPPLY CORPORATION, LTD.—Fin. div. of 8½%, makg. 16% for 1929 (same as last year); to depreciatn. res. £16 000; fwd. £3 828.

METROPOLITAN ELECTRIC CABLE AND CONSTRUCTION CO., LTD.—Net pft. for 1929, £15 921; to res. for taxatn., £5 000; div. 10%, tax free; to gen. res., £5 000; fwd. £897.

KIDDERMINSTER AND DISTRICT ELECTRIC LIGHTING AND TRACTION CO., LTD.—Net receipts for 1929, £7 624, agst. £9 764; net pft., £3 806, agst. £6 871; fwd. £576.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Directors recommend blce. div. on £1 ord. shs. of 10·181 d. p. sh., makg., with intm. div., standard div. for the year 1929.

CABLES AND WIRELESS, LTD.—Transfer books of 5½% cum. pref. stk. will be closed from March 1 to 8, inclusive, for preparatn. of warrts. for dividend for half-year ended Dec. 31, 1929, payable March 31.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO., LTD.—Net pft. for 1929, £8 072, agst £10 778. Fin. div. 5%, makg. 8% for year (same as previous year); to res., £3 000, agst. £6 000; fwd. £2 781, agst. £2 508.

CONSOLIDATED SIGNAL CO., LTD.—Credit blce. for year to Sept. 30, 1929, £25 800, agst. £32 481, includg. div. of 8% received from Westinghouse Brake and Saxby Signal Co. Ord. div. 12%, agst. 17½%; fwd. £840.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—Fin. div. of 7%, makg. 10% for year 1929, agst. 9%, is announced. This div. does not apply to recent issue of 500 000 new £1 ord. shs., on wh. int. to Dec. 31, 1929, has already been paid.

SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD.—The pref. sh. transfer books are closed until to-day (Feb, 28), inclusive, preparatory to paymt. of final divs. on 7% cum. 1st pref. and 6% cum. second pref. shs. for the year 1929.

UTILITIES AND GENERAL TRUST.—Net revs. for 1929, after charging int., management exes., income tax, etc., £25 448, agst. £22 125. Pref. div. absorbed £10 000; to res., £3 500; fin. div. on ord. 3% less tax, makg. 6% (same). Fwd. £3 118, agst. £3 170.

CLARKE, CHAPMAN AND CO., LTD.—Gross pft. for 1929, £93 907, agst. £82 519; net pft. £77 185, after allowing £14 515 for depreciatn. and £2 206 for directors' fees. Fin. div. 8%, makg. 11% for year, agst. 10%. To res., £15 000; fwd. £23 961, agst. £16 548.

MIDLAND ELECTRIC MANUFACTURING CO., LTD.—Net pft. for 1929, £45 182, agst. £43 402. Div. 10%, plus bonus of 12½% on enlarged ord. cap., agst. div. 10%, plus bonus 25%; to reductn. of goodwill £8 984, agst. nil; to res. £10 000, agst. £24 274; fwd. £14 640, agst. £13 193.

METROPOLITAN ELECTRIC TRAMWAYS, LTD.—Traffic receipts for 1929, £709 923, increase £30 554; net receipts £16 244, increase £1 729; other income £138 546, makg. net income £154 790, decrease £9 998. After deductg. fixed charges, blce., £6 934, is applied to reduction of deficit brt. fwd. to £73 893.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Gross rev. for 1929, $22 286 284 agst. $21 235 991. Operatg. exes. $7 099 642, taxes $1 416 966, depreciatn. $2 228 628, fixed charges $2 803 408. Net income, $8 737 638 agst. $7 866 462. Divs. paid amt. to $4 890 470. For insurance, contingt. and pensn. funds $520 000. Blce. $3 327 168 agst. $3 028 814. Earnings equal to $4·28 per share, agst. $3·85, of common stk.

TYNESIDE TRAMWAYS AND TRAMROADS CO.—Exes. for half-year to Dec. 31, 1929, exceed receipts by £208, and, adding int. on mtges, etc., less int. received, etc., makes total deficit £1 783. Amt. of £1 800 has been transferred from res., and after bringing in £68 from previous half-year £85 is carried fwd. Hldrs. of mtges. and shs. have passed resolutns. that prior mtges. not exceedg. £26 370 be created, and £18 000 of these will be issued in first instance.

ELECTRIC SHAREHOLDINGS CORPORATION.—First rpt. covering period March 8 to Dec. 31, 1929, shows net income $4 116 764, including pft. on sale of securities and stock divs. valued at market prices. Net assets $48 329 417, represented by 195 500 shs. of $6 pref. and 1 483 024 shs. of common stk. Value of assets behind each share of $6 pref., increased from $193.94, based on total cap. paid in for stk. to $247.21 on Dec. 31. Income after all deductns. equal to $2.80 a sh. on average amt. of common stk. outstandg.

MIDLAND COUNTIES ELECTRIC SUPPLY CO., LTD.—Trading pfts. of undertakgs. owned and operated by company for 1929, £349 209; to depreciatn. and reserves £105 500; brt. in £5 676; loan and deb. int., £18 306, to res. accts. £23 766; intm. div. on 6% cum. pref. shs. for half-year to June 30, 1929, £42 000. It is proposed to pay div. on 6% cum. pref. shs. for half-year to Dec. 31, 1929, and div. of 7%, less tax, for year on ord. shs. Fwd. £4 578. It is proposed to increase cap. by creatn. of an additional 500 000 shs. of £1 each.

LANCASHIRE UNITED TRANSPORT AND POWER CO., LTD.—Traffic receipts of operatg. companies comprised in company's system for 1929, £359 329; energy sold and miscellaneous receipts £29 732; total £389 061, workg. exes. £300 276; gross pft. £88 785. Int. 5% on 2nd mtge. deb. stk. for 1929 is to be paid, and blce., £19 307 carried fwd. Depreciatn. and renewal accts. and amts. carried fwd. in combined companies amts. to £201 833. Act of Parliament has bn. obtained authorising statutory compy. to change name to South Lancashire Transport Co.

LONDON AND SUBURBAN TRACTION CO., LTD.—Divs. and sundry pft. for 1929 amtd. to £56 498 agst. £55 381. Expenditure, £46 018 agst. £45 240, leavg. £10 480. Adding blce. from last year £36 137, makes £46 617, carried fwd. Combined results of Metropolitan Electric Tramways, London United Tramways, South Metropolitan Electric Tramways and Lighting Co. and Tramways (M.E.T.) Omnibus Co. for 1929 were: Passengers carried 332 025 650, increase 8 975,202, gross receipts £2 439 380, increase £34 442; expenditure, £2 037 604; int., rentals and other fixed charges, £235 912; reserves for renewals and contingencies, £105 000, surplus £60 864, decrease £34 696.

CHARING CROSS ELECTRICITY SUPPLY CO., LTD.—Pft. of West End undertakgs. for 1929, £134 547 agst. £145 920, plus £79 706 brt. in and £55 470 int. and divs., makg. £269 723. Deb. int. and sinkg. funds £56 474, leavg. £213 249. Final div. 10 1-16d., makg., with intm., 9½d., standard div.; shhldrs'. proportn. of consumers' benefit and appropriatn. to co-partners £23 151; fwd. £87 584. Pft. of City undertakg. £124 891, agst. £137 287, plus £18 226 brt. in and rent in respect of Bow generatg. statn., etc., £60 943, makg. £103 580. Provisn. for deb. int., loans, and sinkg. fund £100 481; div. 10% on £350 000 and 7% on £200 000 ord. cap. (same) £67 000; to shhldrs. proportn. of consumers' benefit £31 931; appropriation to co-partners £4 649.

RADIOVISOR FOREIGN AND COLONIAL, LTD.—First report covering period from Dec. 5, 1928, to Dec. 31, 1929, states that board recently made agreemt. with Siemens and Halske, of Berlin, giving latter exclusive rights of mfre. and sale of apparatus involving use of selenium bridges in certain countries of Europe and for non-exclusive similar rights in other European countries. Basis of agreemt. is that Siemens and Halske buy from company bridges at fixed price, and in addition pay royalty based on percentage of cost of apparatus in which bridges are used. Negotiatns. for sale of rights in U.S.A. and Canada are proceeding satisfactorily. Company, in partnership with Radiovisor Parent, has equipped buildg. at Letchworth for mfre. of all types of Radiovisor light-sensitive bridges. Accts. show deficit on profit and loss of £5 232.

Company Meetings.

ALLGEMEINE ELEKTRICITÄTS GESELLSCHAFT, BERLIN.—Dr. Buecher, presiding at the meeting last Saturday, said the influx of new orders, which at the beginning of 1930 stood at about 30 000 000 marks below the figures for the beginning of 1929, was now going on unabated, but it was difficult to make a forecast of the future. Proposals to distribute a dividend of 9% and to increase the company's capital to 200 000 000 marks by the issue of 4 000 000 marks of new shares were approved. Reserves amount to 70 000 000 marks.

Digitized by Google

FIFE TRAMWAY, LIGHT AND POWER CO., LTD.—Mr. Wm. Low, presiding at the twenty-first annual general meeting on February 17th, said the company's assets had risen from the figure of £303 000, which appeared in their first balance sheet, to nearly £1 600 000. He also referred to the sale during the past year of their power and lighting business to the Scottish Power Co. The report and accounts were adopted and a dividend on the ordinary shares at the rate of 4% per annum, less tax, was approved.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Mr. Gerald W. Balfour, presiding at the meeting on Tuesday, said capital expenditure during the past year was just over £80 000. Negotiations for further sites for transformer stations had been successful. By the end of 1929 they had made connections to their a.c. system of 7 304 kW, equivalent to 20% of the total connections. They were faced this year with a programme of capital expenditure estimated at £124 000. They had purchased nearly 6 000 000 additional units, and the cost per unit of electricity purchased from the London Power Co. fell from 0·794d. to 0·776d. Receipts for electricity decreased by £3 778 although units sold increased by nearly 5 250 000. Charges for all classes of supply were now considerably below pre-war basis. The average return from sales was 2·054d. per unit compared with 2·414d. in the previous year. The net profit was £75 339, against £103 851, the result of the board's deliberate policy in fulfilment of their obligations under the 1925 Act. The report and accounts were adopted.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—At the meeting on Tuesday, Lord Ashfield (chairman and managing director) said, adding the cost of the new Brimsdown power station, the total capital involved in their undertaking was £5 592 220. Balance from working was £398 537, or £25 000 in excess of the previous year, to which interes and amount brought forward were added, making the total £428 427. The directors recommended a dividend on the ordinary shares of 10%. Since 1924 expenditure on extensions and improvements had totalled £3 296 000, units sold had increased from 96 500 000 to 199 700 000, and the average price received had decreased from 1·53d. to 1·19d. Last year they sold to 6 000 consumers on the contract rate (the domestic two-part tariff) an average of 1 897 kWh, compared with an average of 328 kWh to consumers on the lighting and heating rates. Reductions in the existing rates would take effect about the end of the present quarter. The report and accounts were adopted, and at a subsequent extraordinary meeting proposals to issue 250 000 6% £1 preference shares and a further £750 000 of 5½% debenture stock were approved.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Lord Wargrave, presiding at the meeting on Tuesday, said the capital expenditure amounted to £239 726, a part of which represented the reinvestment of sinking funds in the company's undertaking. The item "cost of replacing consumers' d.c. apparatus on change of system" had increased during the past year by £35 405 and the expenditure under this heading was being written off out of revenue. During the year they sold 11½ million more units than in 1928. Revenue from sale of current was up by 11½%. Another contribution to the arrears of the pension fund was made this year, and so it was brought a step nearer being self-supporting. Revenue derived from consumers during the year was £175 000 below what would have been received if they had charged the standard price. The amount available for the shareholders under the sliding scale arrangement was £29 166, and it was proposed that this amount be transferred to the special reserve fund. The report and accounts were unanimously adopted and the final dividend on the ordinary shares of 13·12d. per share, making the standard dividend of 1s. 9·12d. per share for the year, was declared.

ENGLISH ELECTRIC CO., LTD.

Financial Reorganisation Scheme Approved—Mr. W. L. Hichens on the Outlook—Four Ways of Securing Improvement—Debenture Holders' Security.

MEETINGS of the holders of debentures, debenture stock and shares in the English Electric Co., Ltd., and also an extraordinary general meeting of the company, were held on Tuesday, February 25th, at Kingsway Hall, London, E.C., to consider a financial reorganisation scheme.

Mr. W. L. HICHENS (Chairman) said that it had been apparent since the heavy losses which were disclosed in the balance sheet for 1927 that the financial reorganisation of the company must be undertaken at the appropriate moment. The most urgent need at that time, however, was to reduce the fixed charges of the company, and as a result of the economies that had been made the losses which in 1926 and 1927 were £123 000 and £134 000, respectively, were reduced to £33 000 in 1928.

There were four ways in particular in which further improved results could be obtained: (1) the reduction of fixed charges by a financial reconstruction, (2) the installation of improved machinery; (3) the expansion of the company's turnover; (4) a greater concentration upon research. The proposed scheme would enable important advances to be made in each of the four directions indicated. It was clear that the company was over-capitalised, and the result of the scheme was to write down the existing capital of the company by £1 755 000.

The present scheme would result in a reduction in charges for interest and sinking fund from £182 000 per annum to £72 000 per annum. As regards the provision of new machinery the new capital of £750,000 which Messrs. Lazard Bros. would provide was sufficient not merely to liquidate the indebtedness of the company to its bankers, thereby relieving fixed charges, but also to enable important improvements to be carried out, which would have a material effect in reducing costs.

Another necessity for the success of the company was that it should have a bigger turnover of business. To secure this it required strong allies and unquestioned financial stability. The present scheme fulfilled both these requirements, and this was one of its most important features. As regards research, the company had suffered in the past because, though much had been done, it had not, either through alliance or its own efforts, been able to establish sufficiently close contact with the experimental side of the industry. It would be possible in the future to remedy this defect, which was largely due to lack of money.

Dealing with the financial aspect of the scheme as it affected the preference shareholders, Mr. Hichens pointed out that the market value of the preference shares at the beginning of December, before the present scheme was made public, was 7s. 6d., whereas the new par value would be 12s. 6d. In view of the fact that the new preference shares would be buttressed by the £750 000 of new ordinary shares which Messrs. Lazard Bros. would subscribe, and assuming, as presumably Messrs. Lazard Bros. anticipated, that the new ordinary shares might reasonably be expected to yield in course of time a satisfactory return, it was a fair inference that the new preference shares would in time have a market value at least equal to their nominal value.

Addressing the meeting of the 6% convertible debenture stock holders, Mr. Hichens said that the scheme did not propose an alteration in the par values which existing debenture holders would receive, for the par value in both cases would be £100. But it did propose an alteration in the form of security. It was important in the first instance to remember that the debenture holders would be protected by the addition of £750 000 of new money in the form of ordinary shares. If the ordinary shares became stabilised and yielded a satisfactory return, obviously the preference shares would at least reach the level of par. It followed, therefore, that, if the scheme was as successful as the experts believed, the market value of the new securities would rise to par or above.

The problem was best solved if some independent authority with expert knowledge made an apportionment, after studying the situation in all its bearings and discussing it with those best qualified to express a judgment, and that procedure had been followed in this case.

The resolutions were carried without dissent by the requisite majority at all shareholders' meetings. The meeting of the holders of the 5½% sinking fund first mortgage debentures was adjourned for three weeks in the absence of a quorum. At the meeting of the holders of the 6% convertible debenture stock, the resolutions were approved on a show of hands by the necessary majority, but to comply with the requirements of the Court a poll was taken, the result of which will be announced later.

NEW COMPANIES.

G. AND A. STONE, LTD.—Cap., £2 200. Electrical engineers, etc. Reg. Office: 536, London Road, Westcliff-on-Sea.

T. HALL AND CO., LTD.—Cap., £1 000. Electricians, wireless engineers, etc. Reg. Office: 44, Malden Road, Cheam, Surrey.

DORMOR AND CO., LTD.—Cap., £4 000. Electrical and wireless engineers and factors, 217c, Old Christchurch Road, Bournemouth.

LOUIS G. FORD, LTD.—Cap., £25 000. Ironmongers and electrical engineering materials factors. Reg. Office: 12, Station Parade, Eastbourne.

E. SLIGHT AND SON, LTD.—Cap., £500. Ironmongers, dealers in wireless and electrical apparatus, etc. Reg. Office: 229, Cowbridge Road, Cardiff.

JAMES DAVIS, LTD.—Cap., £2 000. Motor, electrical and general engineers, dealers in wireless accessories, etc. Reg. Office: 3A, Pole Street, Preston.

THOMSON AND BRADLEY, LTD.—Cap., £100. Sheet metal workers, general and electrical engineers, etc. Reg. Office: Vickers Street, Miles Platting, Manchester.

ROBERT LEES, LTD.—Cap., £50. Engineers, manufacturers of, and dealers in, electrical and scientific appartaus, etc. Reg. Office: 59, Fleet Street, Liverpool.

V.G. ENGINEERING, LTD.—Cap., £100. Mechanical, electrical, and consulting engineers, etc. Reg. Office: 202, Abbey House, Westminster, London, S.W.

ATLAS SALES SERVICE, LTD.—Cap., £500. Manufacturers of and agents for electrical, wireless, television apparatus, etc. Reg. Office: 8, Mount Vernon, Liverpool.

SMALL AND MACDONALD, LTD.—Cap., £1 500. Electrical and mechanical engineers, dealers in electrical machinery, etc. Reg. Office: 177, West Regent Street, Glasgow, C.2.

WARWICKSHIRE IGNITION SERVICES, LTD.—Cap., £1 000. Electricians, suppliers of electricity, automobile electrical engineers, etc. Reg. Office: 25, Bennetts Hill, Birmingham.

D. LLOYD LEWIS, LTD.—Cap., £1 000. Electricians, suppliers of electricity, manufacturers of, and dealers in, electrical apparatus, lighting sets, etc. Reg. Office: 76, Duke Street, Liverpool.

SHAW, FLETCHER AND CO., LTD.—Cap., £100. To acquire business of electrical engineer heretofore carried on by T. R. Shaw, trading as Shaw, Fletcher and Co., at King Street, Wrexham, Denbigh.

LONDON NIGERIAN POWER CO., LTD.—Cap., £100 000. To produce, generate, store and distribute electrical energy or power, etc. Reg. Office: 31 and 33, Bishopsgate, London, E.C.2. (Public company.)

A. S. HOWARTH, LTD.—Cap., £2 000. Electricians, engineers, manufacturers of, and dealers in, electrical and other instruments in connection with wireless telegraphy, etc. Reg. Office: 41, Toad Lane, Rochdale.

CEREAL MILLERS, LTD.—Cap., £100. To take over all rights of Bandon Milling and Electric Lighting Co., Ltd., and of J. Murphy, of Mill Place, Bandon, electrical engineer. A director: J. Murphy, Mill Place, Bandon.

SCAIFE AND RUDD, LTD.—Cap., £850. Manufacturers and importers of, and dealers in, lamp shades in silk or other materials for electrical fittings, etc. Reg. Office: 1A, Greenleaf Road, Walthamstow, London, E.17.

LANCASHIRE FOUNDRY COKE CO., LTD.—Cap., £350 000. Manufacturers and sellers of coke and by-products; generators and storers of electricity, electrical engineers, etc. Reg. Office: Moorfield, Altham, near Accrington.

S. GORDON AND CO. (MANCHESTER), LTD.—Cap., £1 000. To carry on business of electrical, wireless and mechanical engineers, dealers in electric fittings, machinery and lamps, etc. Reg. Office: 12, Cannon Street, Manchester.

RADIO BY-WIRE, LTD.—Cap., £3 000. To construct and maintain wireless signal and receiving stations, and to carry on business of electricians, wireless and radio engineers, etc. Reg. Office: Exchange Court, Bowlalley Lane, Hull.

RADIO FINANCE CO., LTD.—Cap., £1 000. Financiers, concessionaires, and agents for, and manufacturers of, and dealers in, radio, electrical, scientific and mechanical apparatus and appliances, etc. Reg. Office: 5, Priory Place, Doncaster.

RUCEL, LTD.—Cap., £60 000. To adopt agreement with Rucel, Ltd. (vendor company) for purposes of reconstruction and to carry on business of manufacturers and preparers of and dealers in Rucel, natural and artificial rubber, electrical and general engineers, etc. Reg. Office: 9, Gresham House, Old Broad Street, London, E.C.2. (Public Co.)

DUALITE, LTD.—Cap., £21 000. To acquire goodwill and undertaking of Dualite, Ltd. (in voluntary liquidation), and to carry on business of manufacturers, importers and exporters of, and dealers in, appliances used in connection with electric lighting, electrical and wireless plant, etc. Reg. Office: 52 and 53, Fetter Lane, London, E.C.4.

WILLIAM MILLWARD, LTD.—Cap., £8 500. To acquire the business of a plater and gilder now carried on by G. M. Marriott as "William Millward" in Birmingham, and to carry on business of depositors on any metal, by electrical or other process, of gold, silver, copper or any other metal, etc. Col. E. T. Rich, C.I.E., Wyddrington, Church Road, Edgbaston, Birmingham (chairman and managing director).

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.

CRESCENT.—504 088. Class 18. Electric heating stoves. Albert Phillips, Ltd. Excelsior Works, Eyre Street, Spring Hill, Birmingham; manufacturers. July 1st, 1929. (By consent.)

LIVER.—508 133. Class 18. Engineering, architectural and building contrivances for electric purposes. The Liverpool Electric Cable Co., Ltd, Linacre Lane, Bootle Liverpool; manufacturers. November 23rd, 1929. To be associated with No. 508 182 (2 704) and others.

VIKING. 505 742. Class 6. Domestic vacuum cleaning machines, domestic washing machines, electric fans for domestic use and electrically driven sewing machines for domestic use. Leonard Samuel Marchant, 54, Aston Avenue, Fallowfield, Manchester; merchant, September 3rd, 1929. (By consent.)

INFINITY. 508 295. Class 8. Electric cables. Sloan Electrical Co., Ltd., 8, 10 and 12, Golden Lane, London, E.C.1; merchants. November 29th, 1929. To be associated with No. 508 296 (2 705) xl.

RADIO SERVICE (sign). 507 205. Class 8. Electric accumulators (not for medical purposes). Radio Service (London), Ltd., 105, Torriano Avenue, Camden Town, London, N.W.5; accumulator hirers. October 25th, 1929.

GOLIATH. 508 657. Class 8. Loud speakers and sound amplifying apparatus. The British Blue Spot Co., Ltd., 204 and 206, Great Portland Street, London, W.1; manufacturers. December 10th, 1929.

CYNTHIA. 508 696. Class 8. Gramophones, gramophones in connection with radio receiving sets, and wireless telephonic apparatus. J. W. Dugmore, Ltd., 42, Waterloo Road, Smethwick, near Birmingham; dealers in musical instruments. December 12th, 1929.

NOVOTEXT. 496 225. Class 50. Electrical insulating materials. Allgemeine Elektricitäts-Gesellschaft, 2-4, Friedrich Karl-Ufer, Berlin, N.W.40; manufacturers. October 22nd, 1928.

CROMMOID. 506 491. Class 50. Synthetic resin sold in the form of powder, blocks, rods, sheets, tubes and the like for industrial purposes; casein, celluloid and cellulose sold in the form of blocks, rods, sheets, tubes and the like for industrial purposes; and articles (not included in other classes) made from synthetic resin, casein, celluloid or cellulose, namely:—electrical insulating materials, lamp shades, lamp bowls, candlesticks; mouth-pieces for telephones; bases for electrical apparatus, switch covers and pushes. Cromwells, Ltd., Tipton Road, Dudley Port, Staffordshire; manufacturers. September 30th, 1929. To be associated with No. 506 490 (2 705) xiii.

L.E.C. (sign). 505 077. Class 50. Electric lighting, heating, telephonic, telegraphic, and wireless telephonic, telegraphic and television fittings, all being goods made of material covered by class 50 and not included in other classes, but not including wire covered with asbestos, electric junction boxes or casing for surface wiring. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool, manufacturers. August 6th, 1929. To be associated with No. 472 197 (2 536) and another. Registration of this trade mark shall give no right to the exclusive use of the letters "L.E.C."

HELIA.—506 049. Class 13. Electric suspension switches (ordinary). Frederick Charles Bint, trading as Bint and Co., 5, Dowgate Hill, Cannon Street, London, E.C.4.; steel merchant. September 13th, 1929. Concurrent user claimed from the year 1922. Sect. 21.

CRAYONNE.—508 954.—Class 50. Covers and bases for electric switches and bells, electric light fittings and plugs made from compositions in which cellulose predominates. Arthur Willy Kanis, 66, Aldersgate Street, London, E.C.1; manufacturer. December 19th, 1929. To be associated with No. 478 403 (2 558) and others.

BIFLECA.—496 775. Class 8. Gramophone horns and loud speakers for use in wireless telephony. Frederick Albert Boyd, 142, Gray's Inn Road, London, W.C.1; gramophone dealer. November 7th, 1928.

TRI-SPOT (sign).—501 514-6 736 S. Class 8. Wireless telephonic apparatus and parts thereof and gramophones and parts thereof, all being goods made wholly or partly of metal. H. C. Rawson (Sheffield and London), Ltd., 100, London Road, Sheffield; manufacturers and merchants. April 4th, 1929. The Trade Mark is limited as regards the circular devices to the colours red, white and blue, exactly as shown on the representation on the form of application. Registration of this trade mark shall give no right to the exclusive use of the word "Tri-Spot."

∴ **The metal prices are supplied by British Insulated Cables Ltd.**, and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

According to James Forster & Co. the lead market opened last week in a stagnant state, but on Wednesday values broke sharply on heavy selling of forward lead, early lead falling 8s. 9d., and forward 10s. A further drop took place on Thursday of 11s. 3d. and 10s. per ton respectively to £20 13s. 9d. for February, and £20 11s. 3d. for May.

Closing prices on February 21st were £21 3s. 9d. for February, £21 1s. 3d. for March and April, and £21 for May, 10s. to 11s. 3d. per ton lower on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BANCE, Mr. F. W., 90A, Bartholomew Street, Newbury, wireless dealer. £18 5s., January 13th; and £15 7s. 7d., December 2nd.

BURGOYNE WIRELESS, LTD., 36A, York Road, King's Cross, wireless dealers. £14 5s. 3d. January 20th.

DANKS, H., 24, New Street, Dudley, wireless dealer. £14 2s. 4d. January 9th.

GARRATT, E. C., AND CO., Cannock Road, Chadsmoor, electrical engineers. £19 10s. 1d. January 15th.

GRAINGE, Mr. R. W., Grainges Wireless Depot, 20, Nile Street, North Shields, wireless dealer. £10 4s. December 2nd.

LONDON RADIO STORE, 107A, High Street, Uckfield, wireless dealers. £11 4s. 11d. December 6th.

SCHOFIELD, Herbert, The Arcade, Waterfoot, wireless dealer £16 13s. 8d. December 2nd.

SHACKLETON, Mr. S. M., 5, Main Avenue, Heworth, Yorks, wireless dealer. £30 19s. 5d. January 10th.

SOUTHEND AND DISTRICT LIGHT SUPPLY CO., LTD., 52A, High Street, Southend, electricians. £55 18s. November 14th.

Receiverships.

ACME ELECTRIC WIRE AND CABLE CO., LTD. S. I. Wallis, Incorporated Accountant, of 3, King Johns Chambers, Bridlesmith Gate, Nottingham, was appointed receiver and manager on February 8th, 1930, under powers contained in debenture dated April 11th, 1929.

CENTRAL POWER ENGINEERING CO., LTD. T. J. McManis, certified accountant, of 2A, Foster Lane, E.C., was appointed receiver and manager on February 3rd, 1930, under powers contained in debenture dated October 2nd, 1927.

INSTRUMENT WIRES AND CABLES, LTD. F. W. Paterson, of 35, Great Tower Street, E.C.3, was appointed receiver on February 10th, 1930, under powers contained in debentures dated September 26th, 1928.

"PHANTESTRA" (RENN'S GRAMOPHONE AND WIRELESS), LTD., A. E. Middleton, of 18, Essex Street, Strand, W.C.2, was appointed receiver on February 8th, 1930, under powers contained in first mortgage debentures created March 14th, 1919.

YELDON (G.), LTD. E. H. Hawkins, of 4, Charterhouse Square, E.C.1, was appointed receiver on January 28th, 1930, under powers contained in a first mortgage debenture dated January 5th, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

SULLIVAN (H. W.), LTD., London, S.E., electrical engineers. Registered February 3rd, debenture, to Bank; general charge. *Nil. July 4th, 1929.

Satisfactions.

GRAY (J. W.) AND SON, LTD., London, W.C., electrical engineers.—Satisfaction registered February 7th, £1 500, registered January 2nd, 1929.

MEAD AND JEFFERY, LTD., London, W., electrical engineers.—Satisfaction registered January 31st, £500, registered August 8th 1919.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HALCYON WIRELESS CO., LTD., 313, Regent Street, London, W., radio manufacturers. A largely attended meeting of the creditors in this matter was held at 313, Regent Street, W., on February 20th, when the chair was taken by Mr. Gisburne, solicitor, representing the Six Sixty Radio Company, the largest trade creditors. The notice convening the meeting had been sent out over the signatures of four of the principal creditors, who had been appointed a provisional committee for the purpose of examining the affairs of the company, and in the circular calling this meeting it was stated that the four signatories referred to were convinced that as a result of certain proposals there was every hope that some scheme could be formulated which would result in a substantial payment being made to the creditors. The Chairman mentioned that a petition for the compulsory winding up of the company had been presented by Bullmores, Ltd., creditors for £141. He suggested that there should be an informal committee appointed to watch the interests of the creditors and of the company alike, and to keep in touch with the outgoings and commitments generally, this overlooking to go on for three or four weeks, and in the meantime that the creditors should support the application for the adjournment of the petition for one month so that definite proposals might be laid before the creditors.

A representative of Ogle, Newman, Ashworth and Bevan, accountants, stated that the assets at January 31st totalled roundly £25 000, subject to a debenture held by the bank and covered an overdraft for £5 000. The claims of sundry creditors were £28 211, and there had been a loss on trading to date of £10 588. The assets included sundry debtors £10 531, and stock £9 596, the latter consisting largely of made up sets or sets that were practically in a state of completion, a director of the company stating that the stock was all in a very saleable condition. In reply to a question, Mr. Emby, a director, said it had been intended to float a public company in the early part of the present year. He added that one of the difficulties in the wireless trade was that so many people came into it who had little or no experience in the trade, and this did irreparable damage. After the matter had been discussed, a resolution was proposed, seconded and carried that the time asked for be granted the company, and the committee authorised to support the adjournment of the petition when it came on for hearing.

London Gazette, etc.

Winding-up Petitions.

MAYFAIR ELECTRIC GRAMOPHONES, LTD. A petition for the winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, on March 3rd.

WYNSOR ELECTRIC RANGE CO., LTD. A petition for winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, on March 3rd.

Companies Winding-up Voluntarily.

FREEZONE, LTD. By reason of its liabilities, February 14th. H. M. Barton, Alderman's House, Alderman's Walk, Bishogsgate, London, E.C.2, chartered accountant, appointed as liquidator.

GRAVESEND AND NORTHFLEET ELECTRIC TRAMWAYS, LTD. By special resolution, February 18th. T. Bower and T. H. Underhill appointed as liquidators.

NORTH SURREY ELECTRICAL FACTORS, LTD. Statutory meeting of creditors, February 26th.

Bankruptcy Information.

CANE, John Alwyn, CANE, Thomas Phillips, CANE, Douglas Raymond, consulting and electrical engineers, trading as CANE BROTHERS, at Sturry, Kent. First meeting, March 6th, 3.30 p.m., Room 53, Bankruptcy Buildings, Carey Street, London, W.C.2. Public examination, March 25, 10.15 a.m., Guildhall, Canterbury.

GODDARD, Arthur Percy, 25, Silver Street, Doncaster, electrician. Receiving order, February 18th. Debtor's petition. First meeting, March 6th, 12.30 p.m., Official Receiver's Offices, Figtree Lane, Sheffield. Public examination, March 20th, 2 p.m., County Court Hall, Bank Street, Sheffield.

JACKSON, John Harold, Dock House, Winsford, Chester, electrical engineer. First meeting, February 28th, 2.30 p.m., Official Receiver's Office, 12, Lonsdale Street, Stoke-upon-Trent. Public examination, March 20th, 11 a.m., Petty Sessional Court House, Edleston Road, Crewe.

Notices of Dividends.

MILLWARD, Eric Rodney, trading as WEST OF ENGLAND RADIO, 67, High Street, Barnstaple, wireless engineer. First and final dividend, 2s. 3d. per £, payable, February 21st, Official Receiver's Offices, Exeter Bank Chambers, Broadgate, Exeter.

WARNES, Elizabeth Ann (Widow), 10, Crescent Gate, Wilmslow Road, Rusholme, Manchester, electrical and radio engineer, formerly trading as VICTORIA RADIO CO., but now as E. A. WARNES AND CO. First and final dividend, 1s. 6d. per £, payable February 24th, Offices of the Trustee, Arthur Tyldesley Eaves, 47, Mosley Street, Manchester.

Order Made on Application for Discharge.

WORSNIP, William, 30, Market Hall, Walham Green, London, wireless dealer. Discharge suspended for one year until January 28th, 1931.

Partnerships Dissolved.

D.C. ELECTRIC CO. (James DOOTSON and William Frank COBB), electrical and radio engineers and allied trades, Higher Cheap Street, Sherborne, Dorset, and at Bridport, Dorset, by mutual consent as from January 21st, 1930. Debts received and paid by J. Dootson, of Higher Cheap Street, Sherborne.

ELECTRICAL SUPPLIES CO. (Wilfred Enoch ASPREY, William Donald ARNOT, and Roland Whelan CHAPMAN), motor trade electrical factors, by mutual consent as from February 15th, 1930. Debts received and paid by W. E. Asprey.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

295 724 British Thomson-Houston Co., Ltd. Insulated cable joints. (18/8/27).
321 256 C. Chaffer and J. H. Dand. Magnetic compasses. (23/8/28.)
321 259 L. E. Fillmore and L. W. Fillmore (trading as Jackson Bros.). Slow-motion mechanism or fine-adjustment device for electrical tuning-apparatus. (28/8/28.)
296 353 P. Conrady. Refrigerating-machines for domestic and like refrigerators. (29/8/27.)
321 264 W. R. Millar. Portable electric lampholders. (1/9/28.)
296 673 Compagnie Generale D'Electro-Ceramique. Suspension insulators and strain insulators for electric conductors. (3/9/27.)
321 265 Callender's Cable and Construction Co., Ltd., and A. E. Wilson. Connecting-devices for use in electric circuits. (3/9/28.)
321 266 Callender's Cable and Construction Co., Ltd., and A. E. Wilson. Connecting-devices for use in electric circuits. (3/9/28.)
321 267 Callender's Cable and Construction Co., Ltd., and A. E. Wilson. Fuse-boxes for use in electric circuits. (3/9/28.)
321 271 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric lamps. (5/9/28.)
307 734 Newcombe-Hawley, Inc. Electrostatic acoustic device. (12/3/28.)
315 294 Newcombe-Hawley, Inc. Electrostatic sound-reproducers. (11/7/28.)
321 278 I. T. Stokes and A. G. Ionides. Electric heating and cooking apparatus. (18/9/28.)
321 279 Quasi-Arc Co., Ltd., and R. J. Musto. Apparatus for use in electric arc welding. (20/9/28.)
297 833 General Electric Co., Ltd. Electrical cut-outs. (30/9/27.)
321 280 G. B. M. Kelp and M. H. Jessen. Devices for the automatic control and regulation of temperature in electric heating and cooking apparatus. (24/9/28.)
297 846 British Thomson-Houston Co., Ltd. Electric switches. (29/9/27.)
298 567 British Thomson-Houston Co., Ltd. Induction motors. (11/10/27.)
321 300 E. M. Johnson and Associated Electrical Industries, Ltd. Electrical control systems. (13/10/28.)
321 303 Relay Automatic Telephone Co., Ltd., and T. M. Inman. Fire-alarm systems in conjunctions with telephone-exchange systems. (16/10/28.)
321 318 C. Hall. Automatic electric switches. (27/10/28.)
321 327 Wireless Music, Ltd., and M. Trouton. Electromagnetic vibratory devices for acoustical instruments. (8/11/28.)

COMING EVENTS.

Friday, February 28th (To-day).

Institution of Electrical Engineers (West Wales-Swansea Sub-Centre).—Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch."
Electrical Association for Women.—Club Room, Kensington Court, London. Lecture by Mr. L. L. Robinson on "Tariffs." 3 *p.m.*
Imperial College of Science.—Imperial Institute Road, South Kensington. Paper by Mr. R. O. Cherry on "Field Intensity Measurements Around Some Australian Broadcasting Stations." 5 *p.m.*

Saturday, March 1st.

Institution of Electrical Engineers (North Midland Students' Section).—Visit to the works of Messrs. John Fowler and Co., Ltd., Hunslet, Leeds. 2.15 *p.m.*
Association of Mining Electrical Engineers (South Wales Branch).—Visit to the Oakdale Collieries. 2.30 *p.m.*

Monday, March 3rd.

Royal Institution of Great Britain.—21, Albemarle Street, London. General meeting. 5 *p.m.*
Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Push-Button Control. Opened by Mr. J. J. Fisher. 7 *p.m.*
Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. Papers by Lt.-Col. S. E. Monkhouse, and Mr. L. C. Grant on "The Heating of Buildings Electrically by means of Thermal Storage"; and Mr. T. G. N. Haldane on "The Heat Pump—An Economical Method of Producing Low-Grade Heat from Electricity." 7 *p.m.*
Institution of the Rubber Industry.—Engineers' Club, Coventry Street, Piccadilly, London. Paper by Dr. H. A. Daynes on "A Method of Making Electrical Contact with Ebonite and Soft Rubber for Insulation Tests." 7.30 *p.m.*

Tuesday, March 4th.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting.
Institution of Electrical Engineers (East Midland Sub-Centre).—Loughborough. Paper by Mr. J. J. Denton on "Television—Progress and Applications."
Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Discussion on "Low-Temperature Carbonisation of Fuel, with special reference to its combination with the production of Electricity." Introductory paper by Messrs. E. H. Smythe and E. G. Weeks. 7 *p.m.*
Electrical Association for Women (Bristol and District Branch).—Electricity Offices, Colston Avenue. Lecture by Mr. A. M. Willis on "Electricity in the Service of Women." 3 *p.m.*
Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir William Bragg on "X-Ray Determination of the Structure of Cellulose." 5.15 *p.m.*
Electrical Society of Glasgow.—30, Gordon Street. Annual general meeting. 7.30 *p.m.*

Wednesday, March 5th.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting.
Electrical Contractors' Association (Dublin Branch).—Ordinary meeting.
Institution of Electrical Engineers (Wireless Section).—Savoy Place, Victoria Embankment, London. Papers by Mr. H. J. Lucas on "Some Developments of the Piezo-Electric Crystal as a Frequency Standard," and Mr. J. E. P. Vigoreux on "The Valve-Maintained Quartz Oscillator." 6 *p.m.*
Institution of Heating and Ventilating Engineers.—Swedenborg Hall 20, Hart Street, London. Discussion on "The Space Required for Central, Station Equipment." 7 *p.m.*
Electrical Association for Women.—46, Kensington Court, London. Social Sub-Committee "At Home." 3 *p.m.*
Institution of Electrical Engineers (Tees-Side Sub-Centre).—Cleveland Technical Institute, Middlesbrough. Address by Mr. B. A. Robinson. 7.15 *p.m.*

Thursday, March 6th.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting.
Electrical Contractors' Association (Bristol Branch).—Ordinary meeting.
Batti-Wallahs' Society.—Hotel Cecil, Strand, London. Luncheon. 12.30 for 1 *p.m.*

Friday, March 7th.

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Paper by Messrs. A. E. Moore and W. T. Slater on "An Investigation of the Frequency Variations in Induction Watt-hour Meters." 7 *p.m.*
North-East Coast Institution of Engineers and Shipbuilders.—Institution Rooms, Bolbec Hall, Newcastle-upon-Tyne. Informal meeting. Discussion on "The Effect of the Use of Electricity in Workshops on Efficiency and Costs." 7.15 *p.m.*
Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Armstrong College, Newcastle-upon-Tyne. Paper by Mr. W. A. Cook on "Insulation Testing." 7.15 *p.m.*

Saturday, March 8th.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*
Electrical Power Engineers' Association.—Café Royal, Regent Street, London. Annual dinner and dance. 6.45 for 7 *p.m.*

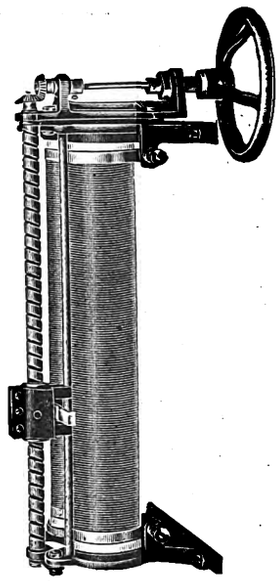
ZENITH

REGISTERED TRADE MARK

REGULATING RESISTANCES



Back of Board Type for Field Regulation, etc.

Simple construction

Ample rating

All mechanical parts entirely insulated

Reliable and easy to fix

Enable extremely fine regulation to be obtained

Single and Double Tubular types are manufactured in 10 sizes

Front of Board Indicators showing position of slider at any point can be supplied

Wherever Resistances of any type are required, always insist on ZENITH productions —IT WILL PAY YOU

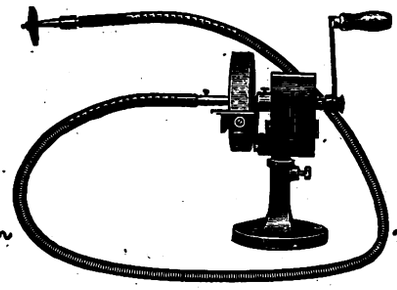
☞ CATALOGUE OF ALL TYPES POST FREE ☜

THE ZENITH ELECTRIC CO. LTD.

Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to the Admiralty, War Office, Air Ministry, G.P.O., L.C.C., &c.

ZENITH WORKS, Villiers Road, Willesden Green, LONDON, N.W.2



No. 331 K.

Carry power and tools to the job.

Cut repair time—this "Terry" flexible shaft outfit includes:

Hand power unit, capable of speeds from 1,800 to 2,600 r.p.m.; flexible shaft 6 ft. long; drill chuck 0 to ¼ in. capacity; one grinding spindle; one small grinding wheel; one taper wire brush; one ball-shaped wire brush; one small polishing bob.

—it may be worked by hand or power, and it will save time and labour in any workshop, and each part may be used separately if required.

EDISON SWAN CABLES

are used all over the world

Edison Swan Cables are used by Colonial Governments and important electrical organisations all over the world, because it has been proved that Edison Swan Cables are absolutely reliable.

Edison Swan Cables are manufactured under ideal conditions in our factories at Lydbrook, Glos. From the smaller sizes of V.I.R., Virite and cab tyre sheathed cables to paper insulated cables for high voltages, Edison Swan Cables are subjected to stringent tests at various stages in their manufacture. In addition, all raw materials are analytically checked before being passed into the factories. Prices are strictly competitive, and a unique distribution service is provided by the twenty-three depots of The Edison Swan Electric Co., Ltd.

The Beam Decision.

LENGTHY statements issued by the Postmaster-General and by the General Manager and Secretary of Imperial and International Communications, Limited, in regard to the decision of the Government not to make use of the company's Beam stations for long distance radio telephone services, raise a number of important issues. Leaving aside for the moment the purely technical aspect of the matter, the chief point in dispute concerns the exact value of the recommendations of the Imperial Wireless and Cable Conference of 1928 upon which the I. and I.C. Company was brought into being. It is easy to follow the company's argument that the development of a Post Office system of long distance radio telephony may well be prejudicial to the cable and wireless telegraph traffic upon which the company's income depends. The company is under an obligation to pay £250 000 a year to the Post Office for the privilege of exploiting the system of Beam telegraphy which the Marconi Company invented and installed, as well as 12 per cent. on any increase above a standard revenue on its communication profits from April 1st, 1931, and a lump sum of £60 000. These payments are in respect of the transfer of services operated by the Beam stations for which the total capital payment made by the Post Office to the company was £161 744. In these circumstances the Government's decision to establish what, from the traffic standpoint, can only be regarded as a competitive service, may be legitimately challenged on grounds of equity.

On the technical side there is also controversy as to the ability of the Post Office to establish reliable long distance radio telephonic services. The Transatlantic service works well over what is only a medium distance in these days. The Australian experiments, so far as they have gone, are said to have been quite satisfactory. It is claimed by the Marconi Company's technical experts that there is a great advantage in the use of large aerials for long distance work. It would not be possible to form an accurate opinion as to the relative merits of the Post Office and Marconi Beam systems without a prolonged series of comparative tests designed to show the degree of continuity and the average quality of speech attainable with each. Dr. F. E. SMITH and Prof. G. W. O. HOWE reported that apart from future developments both systems were *probably* equally capable of providing satisfactory telephonic communication between two points for a given number of hours a day. The use of the word "probably" suggests that there was some uncertainty in their minds due to lack of sufficient data to justify a definite assertion. Without that assurance any financial arguments have little value.

It was in the nature of things that a Labour Government should, all things being equal, decide a matter of this kind in favour of the Post Office, whereas the previous Government clearly leaned towards the entrustment of long distance communications to the I. and I.C. Company, which was formed with that special object as the result of the Conference of 1928. But the country is entitled to demand full proof that all things are equal, and even then probably a majority of the electorate will view with regret any extension of the field in which the commercial management of the Post Office is allowed to operate. There is sufficient doubt as to some of the essential facts to indicate the need for a complete and impartial investigation by a competent commission. Otherwise the country will be committed by a minority government to a course which will be costly and difficult to retrace should it prove later to have been unwisely chosen. It must not be overlooked that the decision of the British Government will strongly influence the attitude of the Oversea Governments of the Empire. This has already been demonstrated in the case of South Africa, which has followed Great Britain's lead although the motive appears to be mainly dissatisfaction with the position of the existing beam station near Cape Town, it being considered that a more central site at Johannesburg is required.

Current Topics.

1 000 000 V Sparks.

ELECTRICAL engineers are accustomed to regard sparks with suspicion, as indications of trouble or inefficiency. A fortunate few had a very interesting experience last Friday when, at the invitation of Sir PHILIP NASH and the Metropolitan-Vickers Electrical Company, they were able to watch a display of artificial lighting which was both impressive and awe inspiring. There was almost an unholy joy, mixed with envy, on the faces of some of the physicists present, and Sir ERNEST RUTHERFORD dwelt lovingly on the prospect of 10 000 000 V on tap in an ordinary sized research laboratory We have still some way to go to attain that goal, though it may be reached well within the fifty years mentioned by Sir ERNEST RUTHERFORD. At any rate last Friday's wonderful demonstration should do something to dissipate the prevalent impression that in matters of research British manufacturers are considerably behind their American and Continental competitors. All who were privileged to be present will, we are sure, join us in thanking the company for a most interesting and well staged display.

Service Deficiencies.

WE have received from a firm of electrical contractors a strong complaint regarding the service arrangements of one of the electric cooker manufacturing concerns. Our correspondent points out that after a hot plate element had been on order for three weeks a griller element was sent, with the result that the customer installed a gas stove. He points out that delay and carelessness of this kind may mean that the householder is unable to cook a proper meal for a considerable time, and rightly emphasises the check to the spread of electrification exerted by such occurrences. We are afraid that this is by no means an isolated case. It is a matter to which manufacturers will do well to give their most careful attention, for much expenditure on publicity can be neutralised by experiences of this kind.

Profitable Railway Electrification.

IN 1926, immediately before electrification, the gross profit on the Chicago suburban lines of the Illinois Central was $3 450 000, of which all but $103 000 went to pay taxes. In 1929, the gross revenue exceeded $5 000 000, of which the surplus after paying taxes was $1 560 000. An increase of $1 550 000 in three years—nearly 45 per cent.—is a remarkable example of the advantage reaped by electrification of suburban systems where a sufficient density of traffic exists. Doubtless this result will stimulate other railways which enter Chicago to convert their local lines to electric working. Is it too much to hope that it may also assist in the more difficult task of inducing the Board of the L.N.E.R. to take the plunge in the case of the lines entering Liverpool Street and King's Cross ?

Southern Railway's Example.

THERE is, however, an example much nearer home. At the Southern Railway Company's annual meeting last week the chairman, The Hon. EVERARD BARING, was able to tell the shareholders that the increase in traffic in the electrified area was progressing at a pace which had considerably exceeded all expectations. He mentioned that in order to cover the cost of the additional train mileage to be worked when the electric services to Brighton and Worthing come into operation in 1932, and provide for depreciation and interest on the additional capital, an increase in traffic receipts of 6 per cent. on the electrified sections will be required. The company expects to achieve this increase during the first year of electric working. Multiple unit trains are to be used on the Brighton and Worthing services, and we think it is a wise decision to treat these lines as extensions of the London suburban services. Mr. Baring emphasised the value of the colour light signalling system installed in the London area. Electric traction can only yield its full advantages when the signalling system is also of a luminous electric type and preferably automatic—if the number of junctions on the railway network does not prevent the effective use of the automatic method.

Spreading the Light.

IN the course of the discussion which followed Mr. C. H. FLOWER's paper on " The Electrical Industry and the Architect " at the February E.D.A. Conference, Lt.-Col. VIGNOLES gave a tip which should be noted by all who send publicity literature to architects, who probably receive more of such matter than any other professional men. He said that one architect had told him that it was his practice to consign anything of the kind to the waste paper basket unless it had stiff covers—if it had such covers it was kept on his shelves. Just what degree of stiffness was judged to be sufficient to ensure eligibility for the shelf, Col. VIGNOLES did not disclose, but it is very probable that this criterion is fairly widely applied. Obviously every circular or pamphlet is not worth the cost of dressing in starched skirts and some are only intended to be ephemeral bulletins. But in the case of more lasting and carefully prepared printed matter, the extra expense would almost certainly justify itself.

American Power Output in 1929.

PRELIMINARY figures show a total increase in the production of electricity in the United States in 1929 by all agencies which contribute to the public supply (plus imports from Canada) of 10·4 per cent., compared with an increase of 9·3 per cent. in 1928 over 1927. In 1929, the output of hydro-electric energy was 34 609 666 000 kWh (or 35·6 per cent. of the total) as compared with 34 695 591 000 kWh (or 39·5 per cent. of the total) in 1928. This is the first time since 1921 that the production of electricity by water power has fallen below that of the previous year. On the other hand, the total output of fuel-generated electricity rose from 53 153 988 000 kWh in 1928 to 62 684 017 000 kWh in 1929—an increase of 18 per cent. This estimate of production (97 000 000 000 kWh), includes all the energy generated by the central stations and by tramways, railways and manufacturing plants which contribute to the public supply, but it is stated that the total amount generated at switchboards from all sources was 125 000 000 000 kWh. The Statistical Research Department of the National Electric Light Association reports that 91 000 000 000 kWh, in round figures, were generated and made available for distribution by central generating and distributing stations of the light and power industry itself. Only 76 000 000 000 of the 91 000 000 000 kWh generated by the industry reached the customers' meters. There is a certain amount of wastage in transit which must be taken into account in the rate to the ultimate consumer.

HIGH VOLTAGE RESEARCH.

Metropolitan-Vickers Laboratory at Trafford Park—Opening by Sir Ernest Rutherford—His Hopes for 10 000 000 V Spark—Fascinating Demonstrations—Equipment of the Laboratory Described.

SIR ERNEST RUTHERFORD, F.R.S., opened the Metropolitan-Vickers Electrical Co.'s high voltage research laboratory at Trafford Park, Manchester, last Friday, in the presence of a distinguished company, which included :—Mr. F. W. Aston, F.R.S., Prof. W. L. Bragg, F.R.S., Mr. S. Donkin; Dr. Lunt, Capt. P. Dunsheath, O.B.E., Prof. C. L. Fortescue, O.B.E., Sir Richard A. Gregory, Prof. D. R. Hartree, Dr. P. Kapitze, Prof. E. H. Marchant, Prof. S. R. Milner, Dr. V. E. Pullin, Dr. E. H. Rayner, Dr. F. E. Smith, C.B.,O.B.E., F.R.S., Department of Scientific and Industrial Research, London, Prof. Miles Walker, Prof. R. H. Fowler, O.B.E., F.R.S., Mr. O. W. Marshall, Mr. E. B. Wedmore, Prof. E. N. Da Costa Andrade, Mr. L. St. L. Pendred, Mr. C. T. R. Wilson, F.R.S., Sir Richard Glazebrook, K.C.B., F.R.S., Father O'Connor, S.J., Lord Verulam, Mr. J. H. Rider, and Mr. H. Warren.

Sir Philip Nash, chairman of the Metropolitan-Vickers Electrical Co., said that the whole of the electrical industry had grown out of scientific research. The company had always endeavoured to keep the science and engineering sides actively co-operating with one another. It had built the high voltage laboratory within the last few years in order to keep pace with developments that were going on in this country and elsewhere. It had been engaged for some fifteen years in high tension work, and had always possessed facilities which enabled it to keep pace with commercial requirements. Every bit of apparatus in the laboratory was built in the company's own factory.

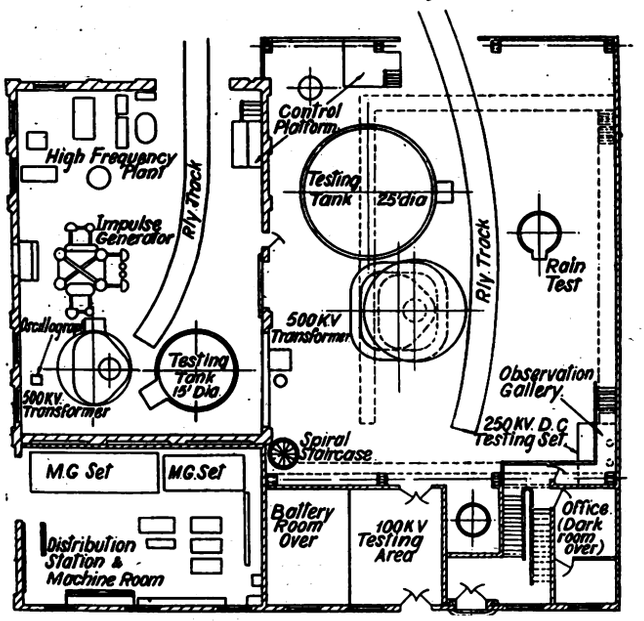

Fig. 1.—Plan of H.V. laboratory.

Sir Ernest Rutherford said that with the growth and increase of the voltage of transmission of power at great distances, the need had grown for a high-tension installation to test in the laboratory the effects of the insulation and other properties of these transmission lines, the effect of meteorological conditions and particularly the effect of surges in the wire produced either by the machines themselves or possibly due to the extraneous effects of lightning discharges. He would like to draw attention to the importance of an installation of this kind in conducting fundamental research. For the last fifty years we had been busy examining the discharge of electricity through a vacuum tube, and although we had made much progress we were quite sure that there were many problems that we did not understand. Even to-day we were in a position of doubting whether the explanations already given were more than a small part of the truth. We were still ignorant of the relative role that was played by electrons or by positive ions in initiating a discharge and maintaining it, and in general there were many unsolved problems in this field. What we required was a combination of laboratory experiments on a small scale to settle the relative importance of the various factors involved together with experiments on a large scale such as could be made with installations of the kind in front of them. Of the effect of conductors and dielectrics on voltages applied slowly or gradually, we knew that very little had been carried out in this field. We were ignorant of what was the effect of high pressure of oil or of air in preventing those local discharges or streamers that were suddenly observed. There was a multitude of effects and he was sure that workers in this installation felt that at present we had no proper understanding. We could see therefore that an installation of this kind, apart from its direct utility provided an opportunity of research on many problems.

Importance of Laboratory Tests.

There is one direction in which he must say a word, namely, the great importance of this problem of high voltages from the point of view of experiments in the laboratory itself. What we required badly was a high potential so as to produce in a vacuum tube high velocity protons and high velocity electrons. In this respect nature quite outstripped the puny experiments we had so far made on this scale. A piece of radium emitted α particles which would require at least 5 000 000 V in order to produce them artificially in a vacuum tube, and a piece of radium would require 3 000 000 V to produce electrons; the penetrating radiation from the atmosphere would require at least 1 000 000 000 V for their production. He had always had the hope that before he left this earthly scene he would be able to see in the laboratory an α particle accelerated by an additional potential of 10 000 000 V. In a laboratory like that of Cambridge with its exiguous finance he could not hope to see a cathedral-like structure such as this in order to house a high potential installation. What they wanted was a simple apparatus that could produce about 10 000 000 V in the laboratory to be contained possibly in oil or air under pressure, and a discharge tube to which they could apply this voltage. That was a simple and interesting technical problem he set before his engineering friends. It had to be confined in a room twice the size of an ordinary office structure. He was perfectly sure if he came back in fifty years he should see this as a standard equipment in laboratories. Even university laboratories with their exiguous finance would have a laboratory with an apparatus of 10 000 000 V in a quite relatively small space, and it could be accomplished. We could congratulate the Metropolitan-Vickers Co. on its progressive and far-sighted policy in encouraging research in this important direction. It would lead to a wide expansion of our knowledge in many directions and would prove invaluable to electrical science.

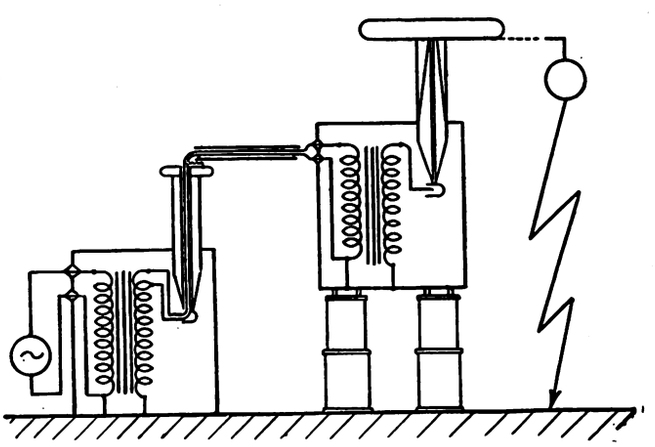

Fig. 2.—Connections of a 1 000 000 V Dessauer circuit.

An impressive series of demonstrations was then given to the visitors. First came the great 1 000 000 V flash over from the Dessauer circuit. The lights were extinguished, and with a crackling hum that conveyed the sensation of immense power a pale violet luminiscence surrounded the large copper

Digitized by Google

ball suspended 12 ft. above the floor. Slowly a glowing tongue crept downwards across the gap until the artificial lightning struck with a loud report and the luminous discharge vanished.

Then followed an equally interesting performance by the 1 500 000 V impulse generator in the surge laboratory. A 750 000 V, 100 000 cycle spark spread earthwards like a fiery serpent reaching sideways as it descended. Then came spark-overs on chains of insulators such as are used on the 132 000 V transmission lines of the grid. Single flashes accompanied by reports like pistol shots imitated the possible effects of a severe thunderstorm and, as an indication of the hidden force involved a wooden lath inserted between the ring and the horns of the insulator chain was shattered. An electric wind generated by an apparatus resembling an inverted sprinkler from which sparks emerged in place of water, raised obvious waves on the surface of a large tank of heavy oil. Subsequently the party inspected the other laboratories in which work is in progress on acoustics, eddy current steel furnaces, the behaviour of carbon steels under superheater temperatures, fatigue in turbine blades and a number of other subjects.

The Dessauer Circuit.

The high voltage laboratory consists of two semi-independent main buildings (47 by 67 ft. and 67 by 86 ft.) and an annexe containing the materials laboratory, physical laboratories, machine room and offices, the general layout being shown in Fig. 1. The main laboratory contains one of the two 500 000 V, 500 kVA, 50 cycle transformers used in the Dessauer 1 000 000 V circuit. These transformers are of the oil immersed type and are contained in a stout steel tank specially reinforced to allow of vacuum drying on site. The high voltage connections are taken through the tanks by means of 500 kV condenser type bushing insulators believed to be the highest voltage bushings yet constructed in this country. The power supply is obtained from two motor generator sets housed in the machine room, the two transformers being independent of each other except when coupled in cascade in the Dessauer circuit. The generators were specially designed to maintain a pure semisoidal voltage wave under the most adverse conditions.

The primary winding of the first transformer has one terminal grounded and is supplied from the generator as indicated in Fig. 2. One terminal of the secondary winding is also grounded, the other terminal consequently having a voltage of 500 kV to ground. Situated at the high tension end of the secondary is a tertiary winding having a one to one ratio with the primary, but insulated from it for 500 000 V. The secondary and tertiary connections are brought out through a common bushing insulator, one end of the tertiary being connected to the secondary. The second transformer of the group is a precise duplicate of the first except that its tank is insulated from ground by means of pedestal insulators capable of withstanding 500 kV between their ends. The tank of this second transformer is connected to the secondary terminal of the first unit and is accordingly at 500 kV to ground. The primary of the second unit is fed from the tertiery of the first in such a manner that the secondary voltages of the two units are additive. The total voltage of 1 000 kV then appears between the terminal of the second unit and ground. Structurally the transformers are of the core type, with both limbs wound. The primary winding is a single layer spiral adjacent to the core. The secondary consists of a number of single layer cylindrical coils arranged concentrically on the core, the length of which is the smaller the greater their diameter. One end of the secondary coil adjacent to the primary winding is connected to the tank; the other end is connected to the end of the corresponding coil on the other limb, the free end of which is in turn connected back to the second coil on the first limb and so on. In this way the diameter of the coil increases and its length decreases as the high voltage end of the winding is approached; the general construction is thus similar in principle to that of the well-known condenser bushing and possesses the same advantages.

The M.V. impulse generator was designed to produce impulsive voltages up to at least 1 000 000 V, and it was considered undesirable to tie up the 1 000 000 V power frequency plant every time an impulse test was required. The use of a multiplying circuit was, therefore, decided on, and the decision to use d.c. for charging followed naturally from consideration of the restrictions which would be imposed on the design were this not the case. The number of stages in the multiplying circuit was a matter carefully considered, and it was finally decided that 250 kV per stage, giving four stages for 1 000 000 V, would give the best results. The way in which the design was realised in practice will be apparent from the photograph on the opposite page. The main structure consists of a four post vertical frame divided into four sections or storeys corresponding to the four stages of the circuit. The main condensers are cylindrical in form and are mounted horizontally at the upper end of each frame section. The trigger gaps and isolating resistances connecting the adjacent sections are mounted diagonally on the main frame. At the instant of discharge the voltage rises uniformly up the frame the junction of the respective sections being at 250, 500, 750 and 1 000 kV to ground. A number of stress distributors are provided in order to suppress all discharges. Voltages up to 1 500 000 V to ground have been produced by means of this apparatus.

Damped Oscillations.

For producing damped oscillations of high voltage a Tesla transformer is installed. Its rating is 750 000 V, 100 000 cycles with coupling coefficients of either 35% or 8%. At this voltage it is capable of dealing with loads of a capacity up to about 600 m.m.f., equivalent to a large oil switch with several bushing insulators.

Other apparatus includes two rectifier sets (one mechanical and the other equipped with thermionic rectifiers) for producing high continuous voltage; two tanks for making electrical tests in hot or cold oil, apparatus for making porosity and temperature cycle tests on porcelain insulators, and for carrying out drying and adhesion tests on varnishes, arc and ignition tests on fire resisting materials and a great deal of other apparatus developed and designed by the Company for special purposes.

In the 100 kV laboratory the electrical equipment consists of a 50 cycle 30 kVA transformer for 100 900 V supplied from a motor generator set and controlled in the usual manner. A cylindrical air condenser is employed as the standard of comparison in a Schering bridge used for the measurement of dielectric losses.

A cathode ray oscillograph of the type used by Professors Ragowski and Norinder has been constructed by the Research Department and is now installed in the surge laboratory of the Company.

Spark-over tests with artificial rain can be made in both the main and surge laboratories, and a special mixing tank is provided to permit the control of the resistivity of the water used—an important matter in tests of this kind.

PERSONAL SALESMANSHIP.

Fourth of the Manchester E.D.A. Conferences Devoted to Salesmanship.

THE fourth of the present series of E.D.A. Sales Conferences was held in Manchester on February 19th, with Mr. H. C. Lamb in the chair. The speaker was Miss Gladys Burlton, who gave a very interesting lecture entitled "Personal Salesmanship in the Electrical Industry." In opening, Miss Burlton said that she proposed to deal with the problems of electrical salesmanship and certain faults which might easily be made if care were not taken. She had sold many types of articles, and although the electrical industry had certain particular difficulties of its own, there were general selling points which might be applied thereto. There was, however, no scientific rule to successful selling. In general, the three most important things, and she proposed to emphasise these to-night, were a natural liking for other people, an intimate knowledge of the commodity, and skill in talking. In the electrical industry it was important to make the commodity appreciated, and the salesman should be a guide, philosopher and friend to the customer. Moreover, he had to deal with all types of disposition, and the method of approach must therefore not be allowed to become stereotyped. The speaker then went into the many ways in which salesmanship could be improved, such as by being cheerful at the right moment, developing an attractive personality and other apparently minor matters which, however, made the difference between a good salesman and a mediocre one. A most important point which the speaker emphasised during the course of the lecture was the danger of boring the customer with technicalities which they did not understand. Technical facts should be presented in a non-technical manner, emphasis being made with regard to practical results. Electrical salesmen were too apt to talk about "volts," "juice," etc.

MODERN BOILER HOUSE PRACTICE—I*.

Standard Types of Stoker Fired Water Tube Boilers for Average Pressures of 250 lb.—Essential Features of High Steaming Capacity Types.

By F. JOHNSTON TAYLOR.

WITH the advent of the super power station, boiler house practice has undergone radical changes of recent years. Steam generated in a more or less saturated condition at about 150 lb. by relatively small water tube boilers having such standard equipment as mechanical stokers economisers and perhaps some system of mechanical draught has given way to high pressure superheated steam produced by large units

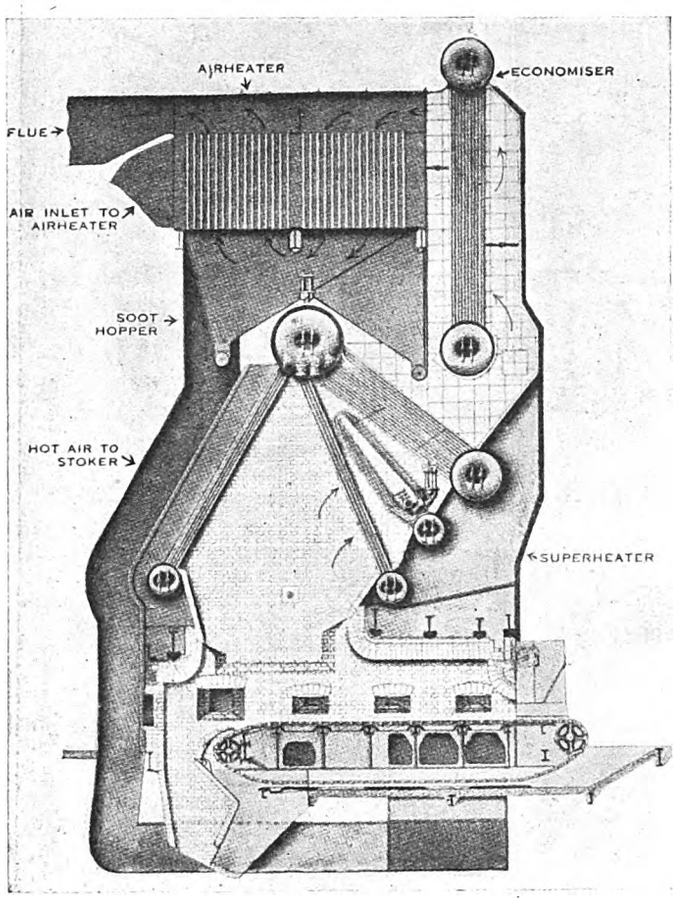

Fig. 1.—Yarrow boiler.

equipped with every conceivable device to ensure economical steam generation, amongst which may be mentioned pulverised fuel, automatic coal and ash handling, forced or induced draught, dust collectors, feed heaters, air pre-heaters, special types of stack and a more or less elaborate array of instruments to guide the boiler house attendant on the comparatively easy road to abstracting the maximum amount of heat at the greatest possible rate from the minimum amount of coal.

Yet the combustion engineer has a comparatively hard road to travel. The imprisoned heat in a lump of coal is like fortune, still a very elusive quantity, of which only but a small percentage can even under modern conditions be accounted for in the shape of kW sold. Turbines, of course, are not yet 100 per cent. efficient, and condensers perforce carry away a large amount of heat, but progress continues. From the steam generation standpoint it is largely a matter of huge boilers and high pressures. The modern boiler unit is in many instances, a complete plant in itself from bunkers to stack. So far as pressures are concerned, just what high pressure is to-day is rather difficult to define. A few years ago 300 lb. fell into this category. To-day, though not to any material extent in this country, 1 000 lb. and over has ceased to be a freak idea, but it calls for methods of steam generation such as the Benson, Lœffler Atmos and other systems which are foreign to orthodox practice, while between 1 000 lb. on the one hand and 200 lb. on the other there lies a pressure range of around 500 lb. This is now generally regarded as good average central station practice, it is high enough to realise the definite advantages of high pressure while it is low enough to enable standard types of boiler to be constructed for it at reasonable cost.

As the tendency at the present day is to adhere to more or less standard types of boiler which have been modified to suit the conditions of the times as regards size, pressure, duty and methods of firing, it will be well to review the subject in these notes from that standpoint, and to regard super pressures of 1 000 lb. or so as still to be justified.

Power station engineers learnt something from marine practice when they adopted the Yarrow boiler, and a design of Babcock boiler now in extensive use in power stations is the C.T. Marine type. It has an integral superheater, a chain grate stoker and superposed economiser, the whole being steel cased forming a compact self-contained unit in accordance with modern ideas.

The principal features of the Yarrow boiler are indicated in Fig. 1, from which it will be seen that it incorporates an air preheater and an economiser. So far as the orthodox type of economiser is concerned, it is to be quite frank, unsuited to high pressures, and such economisers as are now used with these modern boilers are as a rule of relatively small capacity and of special type, as for instance, in the diagram of the Yarrow boiler. The air pre-heater accounts for a large percentage of the waste heat in the flue gases and being delivered to the furnace this heated air greatly improves combustion

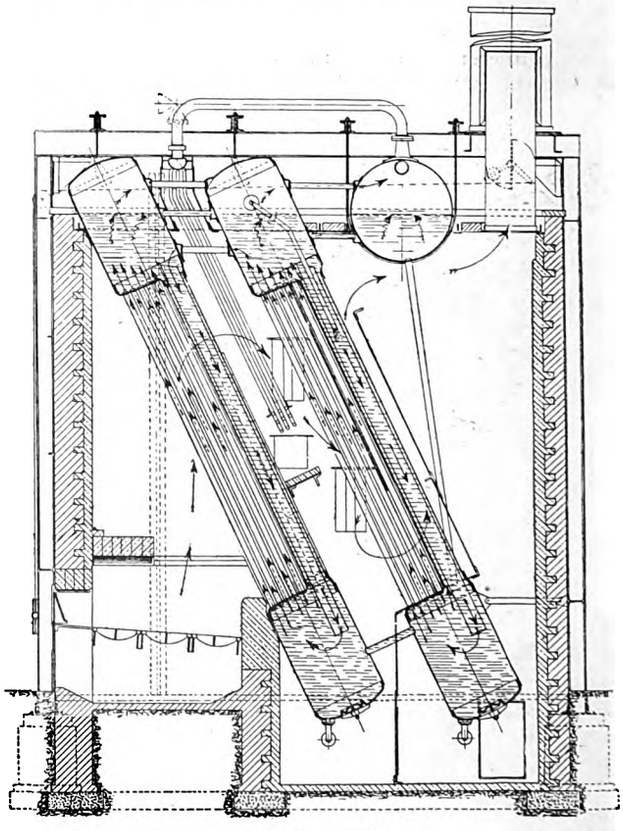

Fig. 2.—Danks boiler.

while it is an essential part of any pulverised fuel system. Moreover, an air preheater, whether of the tubular type shown or any other such as the Usco or Lungstrom is quite a simple adjunct which performs its duty well with the minimum of

* In a series of six articles, the writer discusses the principal features of modern boiler plants as associated with present-day power station practice. The second article will deal with boilers constructed on more or less standard lines for pressures of about 500 lb., while the third will deal with the salient features of pulverised fuel and of boilers constructed for this method of firing. In article IV, stacks, draught systems and dust catchers are dealt with, article V deals with air pre-heaters, economisers and superheaters, while the sixth and last of the series will discuss coal and ash handling systems as applicable to modern power station practice.

Digitized by Google

trouble. The Yarrow boiler shown is designed for the high pressure of 600 lb., though it does not differ materially from those built for 300 lb. or so. The stoker is an "Underfeed" L type, the superheater is of the self draining variety and the efficiency of these boilers which are designed for a normal duty of 61 000 lb. and a maximum duty of 75 000 lb. at 600 lb. and 780 degs. F. is stated to be 86 per cent.

While the Yarrow boiler is in a distinct class by itself, and is principally notable for its high steaming capacity in respect of its size, it will be noted that straight small bore tubes are used as opposed to the relatively large tubes of the standard Babcock types of boiler and others falling into the same category. Modern boiler construction tends largely to the use of vertical tubes or certainly to tubes inclined nearer to the vertical than to the horizontal and several advantages are claimed for them. There are for instance, no rigid connections, and the steam and water spaces are large. There are no tube caps and the tubes being inserted directly into the upper and lower drums are quite accessible and the insertion and removal of tubes is a simple matter. The upright arrangement ensures their contact with the hot gases throughout their whole length which gives a large effective heating surface, and as the banks of tubes are in suspension they are free to expand.

So far as circulation is concerned, there is some difference of opinion as to the relative merits of vertical and inclined tubes, but the vertical tube does undoubtedly ensure a brisk circulation which prevents the dangerous overheating of the tubes while their disposition is distinctly favourable to the easy removal of soot. It is now generally recognised that upright or nearly upright tubes present the most favourable surface for the impingement of the hot furnace gases. The course of the steam in these tubes being direct, a rapid circulation is induced in the front of the boiler whilst the water flows downwards through the back tubes which being only subjected to the heat of the cooler gases act as economiser, feed heater and purifier. The feed is led into the rear headers of the boiler where it is evenly distributed, it passes down the tubes and is heated sufficiently to deposit any scale forming matter, which, in the form of mud falls to the bottom drums. Such boilers by their simple design and rapid and easy circulation are eminently well suited to pressures in the neighbourhood of 500 lb. Typical of this type of boiler is the range made by Messrs. John Thompson of Wolverhampton.

Built on a different system is the Nesdrum boiler which has vertical drums; another is a new design of Messrs. Danks,

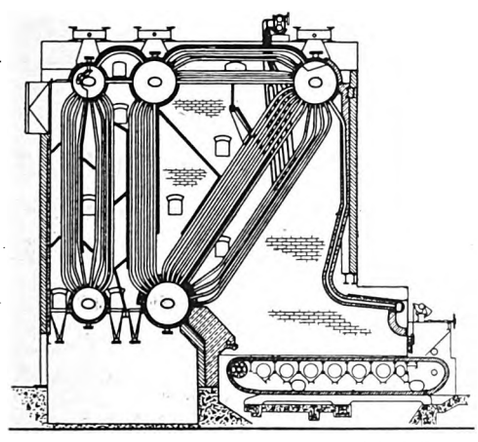

Fig. 3.—Typical American vertical water-tube boiler.

which is shown in Fig. 2. Although the Nesdrum boiler is constructed on similar lines to the Danks, the latter, which is quite a recent introduction, incorporates as will be seen, the small bore tubes as associated with vertical water tube boilers, but, in addition, there is a large one. This large tube which is permanently rivetted into the flanges in the headers is the return tube. The water has a double pass in every section with a consequent high velocity through the tubes which allows the best heat transfer to the water while the comparatively cold feed is heated as it moves towards the hot furnace gases. The feed is admitted into the header of the rear section, and is guided for a suitable distance into the isolation tube and passes down this tube which is situated in the aforementioned large return tube.

The curved tube type of boiler as shown diagramatically in Fig. 3 is rather a feature of American practice, this being a design of the Erie City Ironworks, and it partakes of some of the features of the Vickers Spearing boiler.

The Woodeson boiler, built by Clarke Chapmans with six large drums and three banks of vertical tubes, is specially noticeable for accessibility, and is referred to again under the heading of Pulverised Fuel in the third article of this series.

The best Continental practice is undoubtedly represented by the Sulzer boiler of which the essential features are shown

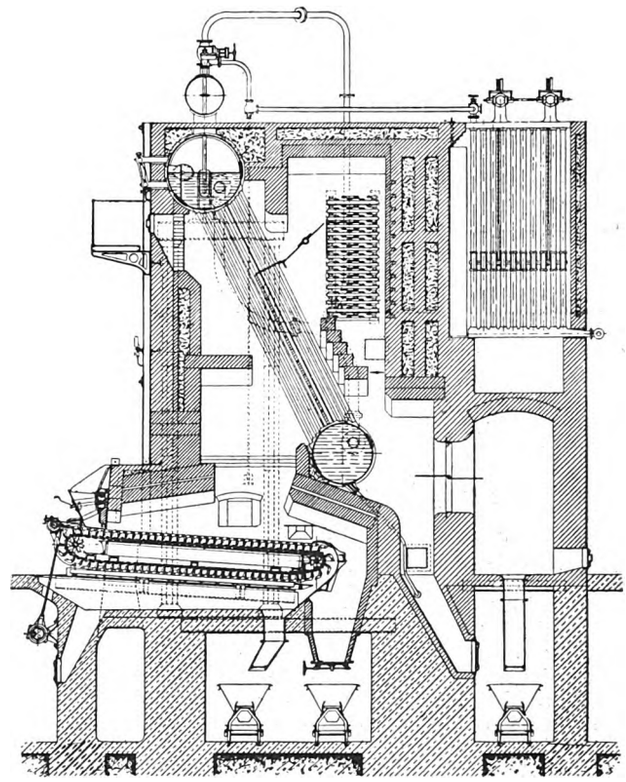

Fig. 4.—Sulzer boiler.

in Fig. 4. From this it will be seen that the nest of tubes is divided by a brick baffle into two unequal parts. The front section which comes into direct contact with the fire carries a somewhat larger number of tubes than the back part in order to create the necessary draught section. The hot gases pass upwards along the tubes and they can be diverted by means of a damper through the superheater, afterwards passing down along the back section of the tubes and then to the stack by way of the economiser if one be fitted. These boilers are built with both double and single banks, though from the economy standpoint the latter is to be preferred and the superheater is placed between the banks and may be cut out of service by means of a damper when required.

It is hardly necessary to point out that boilers of the class described are almost invariably equipped with mechanical stokers combined as a general rule with mechanical coal and ash handling gear. While there are several different designs of mechanical stoker in common use, the majority are of either the chain grate type or the underfeed type each of which has its own special merits. Then there are various different types to suit natural, induced or forced draught either one or the other or a combination of both in the form of balanced draught. Space does not admit of lengthy description of the several good designs of mechanical stoker now associated with modern boiler practice. That shown in Fig. 5 is one of Bennis' standard designs arranged to work in conjunction with a submerged ash conveyor and needs no further description, such modifications as are introduced in the general design being dictated by special conditions pertaining to the type of boiler it is intended to work with. The Babcock and Willcox (McCulloch) type stoker as arranged for balanced draft is used extensively with boilers of the C. T. Marine class. It is of the zoning or compartment type designed to give sectional control of the air passing up through the fuel bed. Inequalities in the thickness of the fuel bed frequently require varying degrees of underfire air pressure at different stages of the fuel's combustion and in order that this may be accomplished locally a series of cast iron compartments is built into the space between the upper and lower chains of the grate into which the air is led from ducts set in the boiler side walls.

Digitized by Google

Thereby the fireman can adjust the underfire pressure by suitably arranged dampers. In addition, in order to deal with the troublesome fine ash which finds its way into the air compartments, there are riddling valves under each which extend the entire width of the grate. These valves are automatically opened at regular intervals so as to discharge the ash into the pit but without loss of air pressure. The air which is forced through narrow slots at high velocity ensures

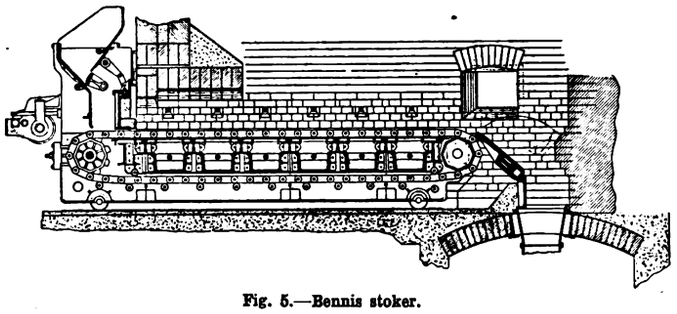

Fig. 5.—Bennis stoker.

efficient combustion of the lowest grades of fuel, including coke breeze.

A multiple retort stoker of the Underfeed Co.'s design is shown in Fig. 6. The action of this type of stoker is to force the coal and clinker downwards and rearwards throughout the length of the retort. The principal parts are the ram *a*, which propels the raw coal from the base of the bunker *b*, *c c* being non-clinkering furnace blocks ; *d* are the air supply grate blocks, *e* a reciprocating lower ram extending the full length of the retort, *f*, active overfeed grate surface in the lower part of the retort, *g* the air gate operating rod, *h* the inspection door, and *j* the speed shaft with the necessary shearing pin for safety. At *k* are the active fuel burning dumping grates which provide for a gradually increasing amount of ash and clinker and automatic control of the necessary air for the complete combustion of the combustible in the ash so as to prevent formation of clinker along the bridge wall.

Despite the progress being made with pulverised fuel for the operation of large boilers, stoker fired units of large output will no doubt figure in central station practice for many years to come and for those with a relatively high rating there is a good deal to be said for the arrangement shown in Fig. 7 of water cooling for the back of the furnace. At this point there is a tendency for clinker formations to arch over the stoker dump plates and to fuse the firebrick in the bridge wall. This can be largely eliminated by a water cooled back because it removes the cause of avalanching and in addition it reduces the percentage of combustible lost in the ash and it effectively cools such clinker as may be formed.

While there are different arrangements which effect the same end, that is the replacing of perishable brickwork by more permanent construction, that shown which is known as the Foster " Composite " water back is simple and practical. The elements consist of seamless steel tube bent as required

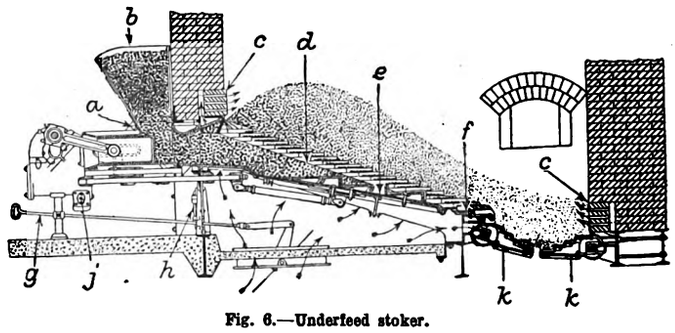

Fig. 6.—Underfeed stoker.

for extension to the inlet and outlet connecting headers. These tubes it will be seen are covered by cast iron blocks which are tightly fitted round them so as to virtually form a single piece of metal. The surfaces of these blocks which face the stoker are flat and present to the fire a smooth front just as brickwork would do. They are, in effect, water cooled cast iron bricks. The headers into which the tubes are expanded are supported on structural members.

The composite arrangement is excellent from many standpoints. The cast iron blocks expose to the fire a metal which when properly cooled is well suited to withstand the erosive and abrasive action of the furnace gases, clinkers and firing tools. The surface is smooth and the construction is rugged, while the area presented to the furnace is greater than the projected area of the tubes themselves and the general lay-out is conducive to good heat distribution. In respect of support the angle supporting the top block and the freedom of movement of the bottom leg in the box will be noted, while steel bars pass through holes in the steel fins which are welded to the top bend which incidentally is of large radius for cleaning purposes. These steel bars support the refractory material upon which the upper brickwork rests. The idea as

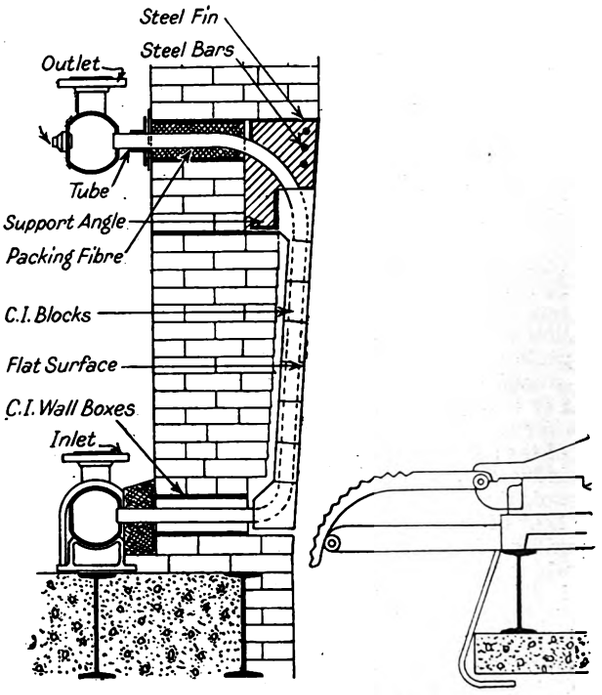

Fig. 7.—Water cooling at back of furnace.

stated is thoroughly practical and can well improve the efficiency of a boiler to the extent of 4% or 5% by the added heat it gives to the water and the reduced amount of combustible lost in the ash. It is equally well applicable in a modified form to steel cased boilers.

OVERHEAD LINES ASSOCIATION.

Conversazione and Supper Dance—Some Interesting Exhibits.

THE Overhead Lines Association held a convivial gathering at Harrods Restaurant on February 26th from 8 to 12 p.m. A feature of the function was the way in which some of the pre-war veterans of electricity showed some of the younger generation how barn dances and other Victorian " capers " used to be " cut " ; dance music worthy of the name was played by Harrods' ladies' orchestra.

There were on view a number of exhibits relating to overhead line work, and it was remarked that they formed a good demonstration of the progress that is taking place.

The exhibits on view showed plainly that engineers and manufacturers had taken up seriously the question of the design and supply of reliable simple apparatus for overhead lines, at a capital cost such lines can stand. It was encouraging to note the number of items designed for 11 000 V, a pressure which for normal conditions has common sense behind it ; anything which makes for standardisation of voltage encourages cheap production and brings " the juice " nearer to the farmers' door, which end was one of the objects of the formation of the Overhead Lines Association.

The evening social function was looked upon as being a great success, thanks to the efforts of the social committee, consisting of the President (Mr. Theodore Stevens), Mr. Fenwick, and Messrs. Borlase Matthews, G. W. Molle, J. H. C. Brooking, with Mr. W. F. Andrews as Social Hon. Secretary.

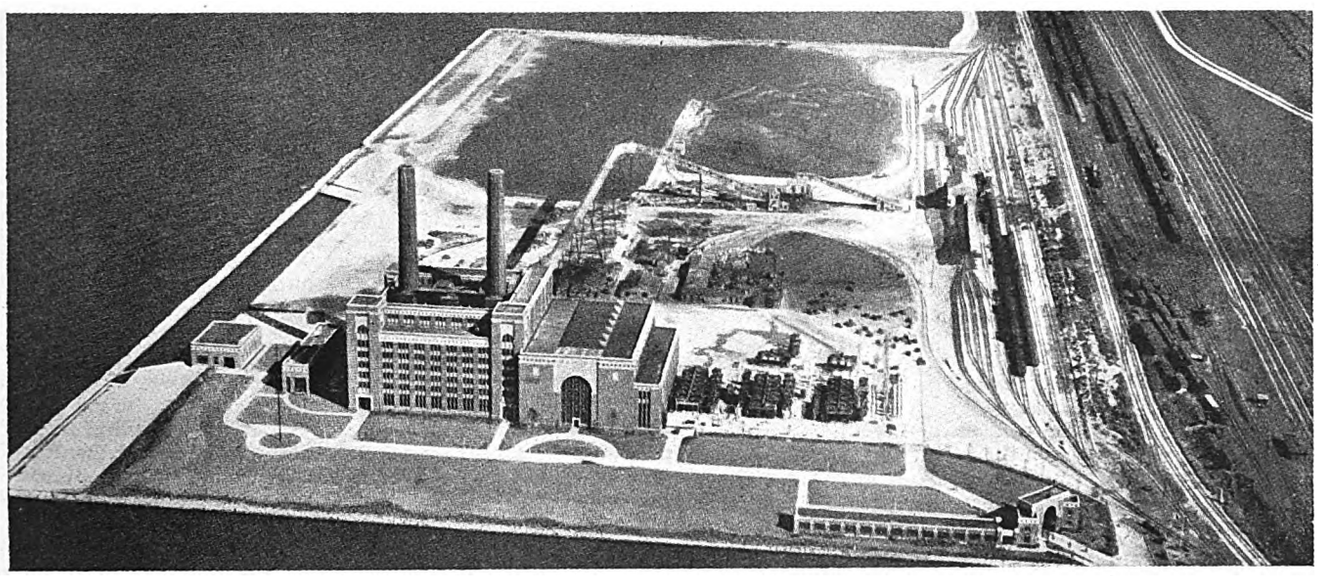
THE STATE LINE POWER STATION—CHICAGO.

Largest Turbine Unit in the World—An Impressive Spectacle—Characteristics of the 208 000 kW Group-unit—Steam at 650 lb. from Six Boiler Units—Outdoor Switchyard with no Live Parts Exposed.

By Dr. E. F. ARMSTRONG, F.R.S.

IT was my good fortune during a recent visit to the United States to make the acquaintance of Mr. Wm. S. Monroe, one of the foremost electrical engineers in that country, and to discuss with him problems arising on the fuel side of electrical generation. In consequence, I was enabled to visit the great generating stations in Chicago under the inspired guidance of Mr. H. C. Heaton. Our visit was made at night, which I now believe to be the most impressive time to inspect a power station; as we drew near an architectural building, which might well have been a modern cathedral, lay before our astonished eyes, illuminated from outside by a flood of ruby red light. Seldom have I seen anything more impressive connected with industry, and first impressions were confirmed by the detailed tour of the station which I have endeavoured to describe briefly in the restrained language of the technician in the following pages.



Aerial view of the State Line generating station, Chicago. The outdoor switchyard is seen to the right of the power plant.

Far rather would I regard the achievement in more riotous phrasing. In the bottom of our hearts all of us have a liking for the marvellous; we love it though we know it does not exist, for if it did it would no longer be marvellous. Anatole France tells us that the marvellous is a falsehood, that we know it and that we want to have lies told to us. I should like to have had Anatole France with me in that power station and to have aided Mr. Heaton, if indeed he needed any aid, in making clear to that delightful writer all that it implied in progress. How slavery and physical hardship have been taken from the shoulders of man and delegated to the willing and reliable activities of the engine and the electric motor. How, in consequence, time has been set free for the personal use of the average human—time for improvement of the home, time for study and education, time for cultivation of the sciences or of the finer arts, time for all those things that to the wise make life worth while.

Greater ambitions, finer ideals of conduct, such were the thoughts that came to us that night—for the first time, with quite astonishing vehemence, we were able to repudiate the slander, alas! so often true, contained in the line "where only man is vile." Here the engineer and the architect and those who had given them a free hand to create, had risen beyond the ordinary. For themselves they were justly proud, but largely preoccupied with the next step forward.

In Chicago and adjacent territory in north-eastern Illinois and north-western Indiana there is one of the great interconnected electric power systems of the world. All the electric generating stations in what is known as the Chicago Metropolitan District are interconnected in one system. They have a total capacity of 1 517 700 kW or 2 034 450 h.p. The various companies in this district serve nearly 1 300 000 customers. In the midst of this great power system stands the new generating station of the State Line Generating Company, operating a turbine unit of 208 000 kW or 278 820 H.P.—the largest generating unit ever built.

This station, which begins operation only fifty years after the invention of the incandescent electric lamp by Thomas A. Edison, is a dramatic example of the tremendous progress made by the electric light and power industry in a half century. It is built on the shore of Lake Michigan, on the Indiana side of the Indiana-Illinois state line. This location was selected for the reason that it was conveniently situated in the heart of the territory served by the electricity supply companies, and also because no other site suitable for so great an undertaking, with the abundant water supply required by a large station, was available in or near Chicago.

Unit No. 1 has a rating of 208 000 kW or 278 820 H.P. This turbo-generator group unit is the largest electrical production unit now in operation anywhere in the world.

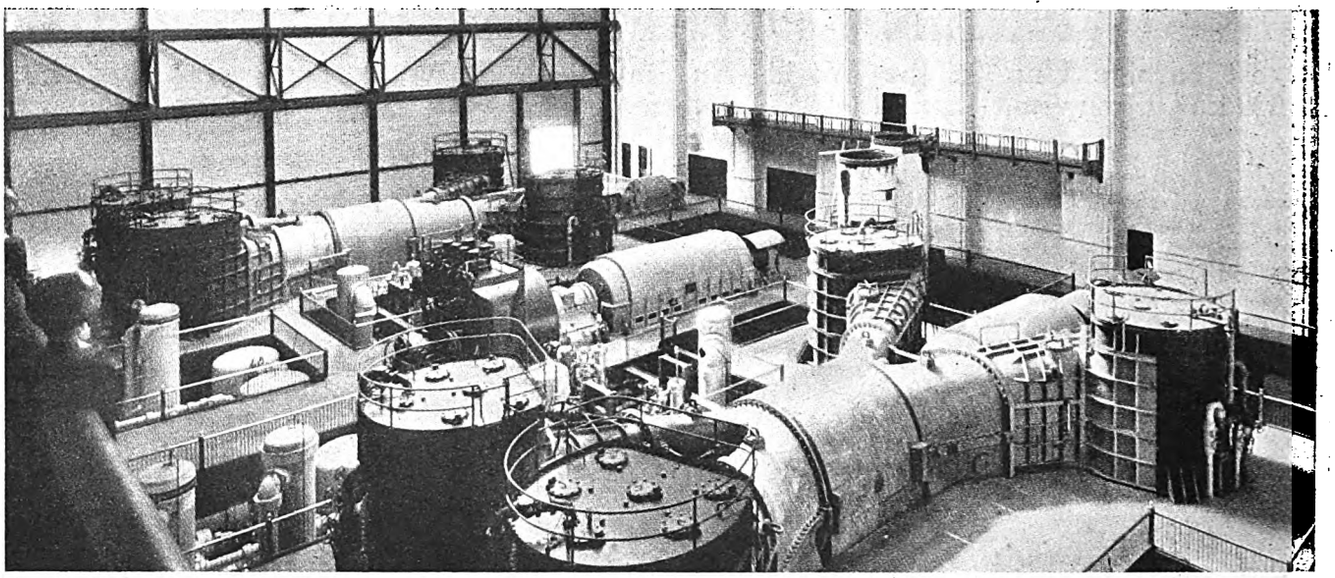
The station is planned for five units with a total ultimate capacity of at least 1 000 000 kW. The present station, therefore, is about one-fifth of its eventual size.

Plans for this development indicate the manner in which the electric light and power companies must anticipate growth and future demands for power. Less than six years ago, the largest generating unit in this section of the country was of 37 500 kW. Advancement has been rapid, however, during the past five years and within that period generating units ranging from 50 000 to 100 000 kW capacity have been placed in operation in the Chicago district.

The present turbo-generator group-unit consists of one high-pressure steam turbine and two low-pressure turbines. The high-pressure turbine operates at 650 lb. steam pressure and exhausts through live steam re-heaters into the two low-pressure turbines at 110 lb. Each of the three turbines is coupled to an electric generator. At 85 per cent. power factor, the generator on the high-pressure turbine has a rating of 76 000 kW and those on the two low-pressure machines are of 62 000 kW each. Electrical energy is generated at 22 000 V.

All the elements of the generating unit operate at 1 800 r.p.m. and each of the low-pressure turbines, in addition to its main generator, drives a 4 000 kW direct-connected auxiliary generator. The high-pressure element is supplied with steam at a total temperature of 730 deg. F. Between the high-pressure and low-pressure elements exhaust steam from the high-pressure turbine is re-heated from 400 deg. F. at 110 lb. absolute pressure to 500 deg. F. at 110 lb. absolute pressure with live steam from the high-pressure header and supplied to the low-pressure turbines. For the first time in commercial

Digitized by Google



Turbine room of the State Line power station.

service five stages of feed-water heating, ranging from a maximum of 380 lb. absolute to a minimum of 9·4 lb. absolute, are used.

Each of the low-pressure turbines is double-flow, arranged so that each set of low-pressure wheels is served by two surface condensers, making four condensers for each low-pressure turbine, or a total of eight condensers for the unit. These condensers have a total of 176 000 sq. ft. of cooling surface and are designed to condense 1 600 000 lb. of steam per hour when supplied with 380 000 gallons of circulating water per minute. The circulating water, supplied by four vertical circulating pumps placed in the crib-house outside of the generating station, enters the condenser through the lower water box, flows upward through the tubes, and is discharged downward through overflow pipes in the condenser shell. This arrangement eliminates the external piping usual with the standard arrangement. Concrete tunnels connect the crib-house with the condensers in the turbine room.

Means are provided by which any one of the three turbo-generators comprising the group-unit may be taken out of service and the other two continued in operation. This meets the objection, from an operating point of view, that it is unwise to concentrate so great a capacity in one unit. Further, the object of this arrangement, rather than, say, two sets, in the group-unit, is to obtain a certain flexibility which permits of greater efficiency at varying conditions of load.

To obtain a better conception of the size of this unit, one needs only to realise that it will furnish sufficient power to light three and one-half millions of the standard 60-watt lamps as used in our homes. This number of lamps spaced 50 ft. apart would girdle the globe with enough left over to reach fron New York to San Francisco.

Steam is supplied by six boiler units with steel drums 52 in. in diameter built for 800 lb. working pressure and operating 650 lb. This is the first time such high steam pressure has been used in electric generating stations in the Chicago District. Each boiler unit, operating with superheaters, economisers, air heaters and water wells, has a guaranteed output of 450 000 lb. of steam per hour.

Advantage of Large Boiler Units.

One thing to be remembered, is that with the development of larger steam turbine units it is very desirable to develop large boiler units also, because there is as much or more to be accomplished in the way of cost reduction by increasing the size of the boiler units as by increasing the size of the turbine units.

While the furnaces are relatively large in comparison with boilers and economisers, the total amount of building space occupied by the boiler units amounts to only 985 cu. ft. per 1 000 lb. of steam capacity. The reserve boiler capacity of the station is such that the plant can be operated with five of the six boiler units, and in an emergency it is believed that four of the six would serve.

A modern feed-water cycle for large steam turbine units calls for large air heaters, which mean high temperatures for the air going to the furnaces. Air going through the furnace is pre-heated and forced draught is used. Dust and soot eliminators are being installed on all boilers.

Pulverised coal is used in the steam-raising equipment. More than two tons of coal are consumed each minute for steam generation when the station is in full operation.

The electrical installation in this plant is also rather unusual in that, by an original design, the generator bus is completely out-of-doors and entirely enclosed by metal, so that no physical contact can be made with any live parts. A double ring bus is divided into three sections, one generator supplying each section, with suitable reactors and oil circuit breakers between sections. It is so laid out that, as future generators are added, one additional bus section will be placed in the ring for each additional generator. The electromotive force on this bus is 22 000 V. The entire output is transmitted in large quantities either at 33 000, 66 000 or 132 000 V., by the companies purchasing the electrical energy. The large transformers by which the generator potential of 22 000 V is raised to the higher outgoing voltages are so installed as to be integral with each individual transmission line.

Thus the conventional generator-station switch-house or switching-room, with its multiplicity of concrete compartments and cells, does not exist at this station. Instead, by the new method of installation the main electrical switching equipment, the main 22 000-V. bus bars, the 22 000-V. oil circuit breakers and their interconnections are supported on a series of open steel frameworks located out-of-doors.

BOOK REVIEWS.

Principles of Radio. By KEITH HENNEY. (London: Chapman and Hall.) Pp. 477+iv. 17s. 6d. net.

Mr. Henney, who is the director of the American Radio Broadcast Laboratory, has written this book with an eye to the man who studies without the help of a teacher as well as for those attending courses. It is a comprehensive textbook, not overburdened with mathematics but well illustrated with problems and examples of a practical nature. Valves are, of course, referred to as vacuum tubes, and the front end paper tables refer to American models.

Energiewirtschaft. By MICHAEL SEIDNER. (Berlin: Julius Springer.) Pp. vi+133. Paper covers. 9 marks.

This book represents an attempt to provide a scientific basis for the estimation of the economics of electric power generation. The elements of cost for thermal and hydraulic stations are worked out and some space is devoted to combinations of thermal with hydraulic sources of energy. A problem that has been exercising Central Europe recently is that of equipment for the provision of peak loads, and the author has much to say on the subject. This is a book for the specialist. There is also much in Dr. Seidner's book which will be serviceable to those interested in the economics of power transmission, bulk supply and such like questions.

MARINE ELECTRICITY.

Eight Electric Ships Now Building in this Country—Modern Electric Ship Types—Details of the New Fruit Carriers—Increasing Use and Appreciation of Storage Batteries.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types," etc.)

THEORIES and suggestions which American marine electricity has from time to time put forward are now being expounded wholeheartedly in this country, and—to quote only one instance—the electric passenger liner of large size and reasonably high power, which at one time may have been regarded very definitely in the light of an experiment in the eyes of British marine engineers, has now entirely proved its ability for certain duties. A year's successful operation of the P. & O. Company's "Viceroy of India" has now been followed by the ordering of two further rather larger vessels for the company's Australian service; two large vessels insulated for the carriage of fruit, and with first class passenger accommodation, are building for service between this country and the Caribbean Sea; a fruit carrier which has already been in service for a few years with one type of electric propulsion (and which was built originally in this country) is now being converted to another type of electric propulsion and modernised in every respect. Two large size tankers with electric propelling equipment are completing on the Clyde. A Canadian Great Lakes bulk cement carrier with electric propulsive equipment has recently been laid down at Middlesbrough, and a number of ships are now scheduled for conversion or rather part-conversion from direct steam reciprocating drive to the electric supercharge which has been discussed previously in some detail in these notes. This makes a total of eight electrically propelled ships in process of construction. Several more are in process of conversion to auxiliary turbo-electric drive or electric supercharge, and a large turbo-electric liner for the Furness Company to run between New York and Bermuda will, it is currently rumoured on very good authority, be laid down very shortly.

It does at least show an interesting range of ship types which may now be considered as suitable for the use of electricity for propulsion. So much so is this the case that one is tempted sometimes to abandon one's preconceived ideas that while electric ships will increase numerically, they will be limited in scope as far as type is concerned. Passenger liner, fruit and passenger, fruit carrier, tanker, tug, dredger and ice breaker . . . these represent surely a diverse group of tonnage with a very attractive range for the enterprising electrical manufacturer. Even to-day there is a novel trawler with a Diesel engine for main propulsion which claims to come within the electric shipping category by virtue of the fact that her engine drives off a forward extension of the crankshaft an 80 kW generator set, which supplies current at 115 V for driving the main trawl winch. The propelling engine is thus a dual purpose unit, for when full power is needed for the trawl winch the propeller thrust shaft can be disconnected from the engine by means of a magnetic clutch. This arrangement is decidedly novel and presents one solution to the problem of supplying the power needed to drive the winch. It contrasts with a new motor trawler recently completed at Falmouth in which the necessary electric power for the trawl winch and for other auxiliary purposes on the ship is supplied by two entirely separate 74 kW Diesel engine driven generating sets arranged in the forward wings of the engine room on either side of the main engine. There is also a 15 kW standby generating set—presumably for port use for lighting—a function which incidentally might easily be carried out by storage batteries charged from a shaft driven generator set.

Spread of Auxiliary Electricity.

Be that as it may, this ship besides being one of the largest power driven trawlers is a very plain indication of the way in which auxiliary electricity is spreading to ships which hitherto were regarded as coming almost entirely within the realms of steam for main as well as for auxiliary powering. It would, of course, be idle to deny that much of this progress is directly attributable to the corresponding development of the Diesel engine. The two are in fact complimentary.

As examples of up-to-date turbo-electric practice the two new Elders and Fyffe's ships to which attention has been called already, are interesting. The one building at the Workman Clark yard at Belfast is to be called "Musa" and will have a deadweight tonnage of about 5 500 tons on a draft of 25 ft. 6 in. Her fruit capacity is about 185 000 cu. ft. and the dimensions of the vessel are 415 ft. by 56 ft. by 34 ft. She is to have a speed, laden with fruit, of 16 knots and, therefore, it will be seen is quite a fast vessel. She is of the structural type known as 3-island and is constructed to obtain the highest classification of the British Corporation. She has three 'tween decks forward and aft, and the forward holds are all completely insulated and cooled by refrigerated air circulation for the carriage of fruit on Transatlantic service. Accommodation for officers and engineers and a number of passengers is provided in rooms situated amidships, while seamen, oilers, etc., are berthed under the poop, as is customary with this company's ships.

Equipment of the "Musa."

As would be expected on such a ship, electricity is used extensively for auxiliary purposes and is used to operate winches, windlass, steering gear, refrigerating plant, etc. To supply current for all these auxiliary purposes there are in all three turbo-generator sets of geared type. Two of these are 500 kW units generating current at 220 V d.c. and operating at 670 revs. The third is a 175 kW generator set generating current at the same power at 800 revs. of the main generator. The "Musa" is propelled by a single screw, and the single unit motor which operates this screw is rated 6 750 to 7 000 horse-power at 120 revs. It is a 2 600 V three-phase type motor and takes its current from a single turbo-alternator set which is rated 5 500 kW, 2 600 V, three-phase at 3 000 revs. The steam pressure at the turbines is 250 lb. per sq. in. gauge with 200 deg. F. superheat and 28 in. vacuum. For supplying steam for the main and auxiliary turbo-generators there are five boilers built by the shipbuilders, in each case generating steam at 275 lb. per sq. in. It is believed, although this information should not be taken as final, that these boilers are of ordinary Scotch type and they may be, therefore, contrasted with "La Marea," the vessel mentioned in my article last month, on which conversion work is now proceeding. This vessel has recently been lengthened from 325 ft. to 352 ft. 6 in. and the whole of her original Diesel electric machinery has been removed and turbo-electric machinery substituted. The shaft horse-power of the main propelling motor has been increased from 2 500 to 3 300, and the propeller speed has been increased correspondingly from 95 to 125 revs. Two Babcock and Wilcox water tube marine boilers with superheaters and air preheaters have been installed to supply steam to the new turbo-alternator which has now taken the place of the Diesel generators originally fitted when the ship was new. These boilers are designed to raise steam at 370 lb. per sq. in. gauge pressure and with 264 deg. F. superheat (700 deg. F. total temperature).

It will be seen that turbo-electricity is being responsible for adding to the world's mercantile fleets three remarkably efficient vessels. It is of particular interest to note that vessels such as these with high auxiliary loads, owing to the refrigerated spaces—no details of these loads unfortunately are at the moment available—should be fitted with turbo-generators. Protagonists of Diesel-electric drive have always maintained that where high auxiliary loads are concerned Diesel electricity is particularly useful because the main generators are also the auxiliary generators. So far, as far as fruit ships are concerned, this has only been put into practice on two vessels and, judging by the fact that no repeat orders have been given, it would seem that the owners have scarcely been completely satisfied with their original choice. This does not mean, however, that there is no field for Diesel electricity in this type of ship, and it does not mean that the next few years will not see an increase in the use of Diesel engines for fruit carrying in conjunction with d.c. generator sets. So far, owners of fruit vessels have maintained a somewhat conservative attitude towards electric propulsion.

The United Fruit Co. has been an outstanding exception which has shown the way, and it is very interesting now to record that Elder and Fyffes, which is an English associated company of the United Fruit Co., has decided to follow the example of the people on the other side of the Atlantic. The appearance of these vessels will be watched with considerable interest in this country by all shipowners, and even those who are not directly interested in fruit carrying will unquestionably want to see something of their performance.

SHIP-AND-SHORE RADIO TELEPHONY.

Details of the "Majestic's" Installation.

A FURTHER great step in the development of electrical communication is now a commercial possibility, following the complete success of an experimental public service of radio telephony inaugurated by the White Star liner "Majestic" on her last outward and homeward voyages. As mentioned in our last week's issue, the transmitting and receiving equipment has been made by Standard Telephones and Cables, Ltd., to the order of the International Marine Radio Co., Ltd. and the British Post Office.

The wavelength used depends on the distance to be covered and the hour, shorter waves being used for the longer distances and during daylight. The wavelengths actually employed on the "Majestic" installation are 33, 26 and 17 metres, the latter being found most satisfactory for daylight working over long distances.

In the "Majestic's" transmitter the high frequency carrier wave is generated by a crystal-controlled master oscillator operated on a quarter of the radiated frequency in order that a comparatively thick crystal may be used. The output from this master oscillator is passed through a balanced amplifying stage, which entirely prevents the frequency from being affected by subsequent operations in the transmitter. The frequency is then quadrupled by two harmonic generators connected in cascade, and the carrier amplified to its final power by two stages of h.f. amplification, each comprising two thermionic valves connected in "push-pull." Modulation is effected on the first of these amplifiers, a modification of the "Heising" or choke control method being adopted, which enables the carrier to be completely modulated.

The final power amplifier valves are of the water-cooled type, and have an output of 2 kW each. Together with their associated tuning circuits and the rubber hose coils used to lead the cooling water to and from their anodes, they are contained in a separate unit approximately 4 ft. square by 7 ft. high.

The remainder of the apparatus mentioned above, together with the modulating equipment, is all contained in another unit of the same size. The energy required to work the transmitter is obtained from motor generator sets run from the ship's mains. An interesting feature is the special spring floor which has been provided to isolate the delicate apparatus contained in the transmitter from the vibration of the ship.

The receiver works on the superheterodyne principle. It comprises two stages of high frequency amplification, employing screened grid valves, followed by a first detector, beating oscillator, five stages of intermediate frequency amplification, second detector and one stage of audio-frequency amplification. The intermediate frequency amplifier is made with the high degree of selectivity required for successful duplex working

Method of Overcoming Fading.

In order to overcome fading, that is periodic variation of the strength of the received signal, an automatic volume control is used. This consists of a special detector valve connected in parallel with the second detector, and so arranged that the strength of the received signals varies the grid bias on the first detector. A strong signal increases the bias on the first detector and so reduces the amplification of the receiver. This is accomplished by using a separate high tension battery for this valve and connecting a resistance between this battery and earth. The potential across this resistance is applied to the first detector.

The receiver is arranged in the form of a number of units assembled on Duralumin trays, with front panels carrying the meters and controls. The whole is assembled in a teak cabinet approximately 3 ft. long, 2 ft. high, and 10 in. deep. As a protection against vibration rubber cushions are provided on the base, together with shock absorbing springs for wall mounting.

The transmitter is located in a position beside the after funnel, the aerials used for transmission being rigged between the funnel and the mainmast. The horizontal half-wave type of aerial is employed, consisting of a horizontal wire slightly less than half the wavelength long, broken in the middle by a tuning coil, across which is connected the high frequency transmission line used to excite it. This consists of a pair of wires, spaced about 6 in. apart, leading down to the transmitter. Separate aerials are used for each transmission wavelength. The receiver is located just above the bridge and the receiving aerials are rigged between No. 1 funnel and the foremast. The operator in the receiving room has a variable amplifier and a visual volume indicator which enables him to adjust the level of the speech and send it over the line to the transmitter. He can also adjust the volume of the received speech. The arrangements at the shore end of the circuit are similar to those employed on the short wave transatlantic circuit between this country and New York.

The transmitter employed at Hillmorton (Rugby) is a "Standard" Type III equipment, differing only from that used on the "Majestic" in that a further stage of h.f. power amplification is added, using two 15 kW water-cooled valves in "push-pull" operating with an anode potential of 10 000 V obtained from a rectifier system. This is mounted in a separate unit similar to that housing the final stage of the ship set. The receiver at Baldock is a large equipment designed primarily for use on shore at the receiving station of a long distance radio link. Like the ship receiver, it is of the superheterodyne type, but is not portable.

CHANGING D.C. NETWORKS TO A.C.

Problems Connected with Replacement and Conversion of Apparatus—Case of d.c. Radio Eliminators.

AT the conclusion of a lecture on "Changing d.c. Networks to a.c. Networks," delivered by Mr. A. W. Crompton, A.M.I.E.E., to the London Technical Group on February 25th, he dealt briefly with problems connected with the replacement and conversion of apparatus. Mr. Crompton said that one of these problems was the sale or utilisation of displaced d.c. motors, etc. Some of these could be hired out, but in case the numbers in stock became too great, they might be sold to consumers at a nominal price on the condition that when the supply was eventually changed over, the consumer would bear the cost of the a.c. motor required. Considerable saving would be effected in future if arrangements were made with power consumers to wire for 3-phase motors and install 3-pole main switches in their power circuits.

In Manchester direct current battery eliminators for radio receiving purposes were not approved for use in conjunction with existing receiving sets and no responsibility in regard to them was accepted when the supply was changed over. Many other undertakings in Lancashire have adopted the same attitude as that of Manchester in regard to this question.

Undertakings which agreed to replace or pay compensation for d.c. eliminators irrespective of the condition of the receiving sets of which they formed part, were obviously condoning uses of the supply which were attended by considerable risk of shock or interference with the supply, and in the event of any consumer sustaining injury when using such apparatus, the undertaking might have to meet a charge of negligence.

The costs incurred in changing over in a particular area could not very well be taken as a definite indication of the costs which would have to be met elsewhere. The only apparatus involved in a simple change-over without alteration of the declared voltage consisted of motors, special lamps, battery chargers, etc., together with wiring and switchgear alterations, replacement of certain switches to comply with Factory Regulations relating to a.c. supplies over 125 V, meters, etc. There was also in some cases necessity for rewiring to be done due to the d.c. cables having been run in separate steel conduits. Where a change in voltage was carried out concurrently, all apparatus with few exceptions had to be dealt with. The average cost of changing lamps rated at 200 V for those of similar wattage at 230 V for a total of over 4 000 residential consumers was found to be about £1·6 per kW connected, heating and cooking apparatus about £0·28 per kW, whilst meters cost about £1·6 per consumer after allowing some credit for the d.c. meters which were removed.

Taking the total cost for all the work carried out which resulted in a considerable increase in capacity and improvement in voltage conditions, and comparing this cost with that which would have had to be expended on d.c. feeders and sub-stations in order to deal efficiently with the immediate loads, the increased cost only amounted to approximately 19 per cent., which was appreciably less than the increased capacity provided, and in addition there was on the credit side the saving in conversion losses.

DISTRIBUTION DEVELOPMENTS.

Desirability of Looking Ahead—Mr. Willoughby-Ellis' Address at the British Industries Fair—Necessity for Standardisation.

"DISTRIBUTION Developments—Looking Ahead" was the subject of an address by Mr. H. Willoughby-Ellis, A.M.I.E.E., the president of the Electrical Contractors' Association at a conference at the British Industries' Fair, Birmingham, on February 27th, under the joint auspices of the Electrical Contractors' Association (Inc.) and the Electrical Wholesalers' Federation, Ltd. Mr. J. Wilson, president of the Electrical Wholesalers' Federation, presided.

Mr. Willoughby-Ellis stressed the need for more standardisation in the electrical industry. The lack of it, he said, had been an ever-present stumbling block in the path of electrical progress in this country. In the whole history of the industry, nothing had caused more trouble, loss, and inefficiency than this inability to standardise systems and pressures of supply. It was due to lack of knowledge, but far more to lack of vision, that they had permitted the setting up of a multiplicity of supply systems in this country, which represented a standing reproach to our business acumen. Even at present, could it be said with truth that this parochial individualism had been put under proper restraint?

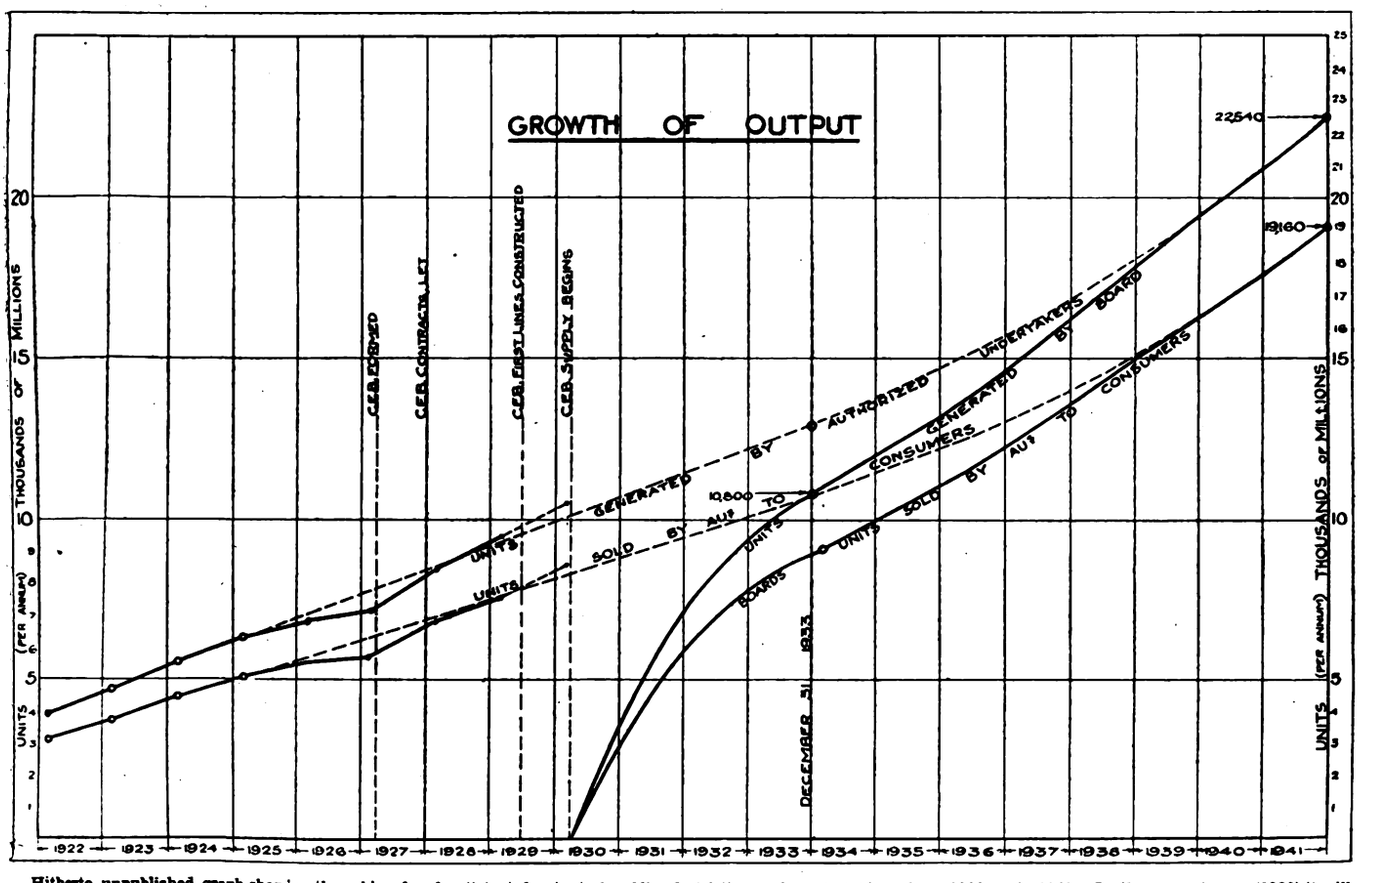
He doubted it. Notwithstanding the labours of the Electricity Board and the Electricity Commissioners, he continued, there were on all hands immense developments going forward at non-standard pressures, and there were big areas being developed at alternating pressures varying between 200 and 250 V. Thus additional future trouble was being accumulated. The non-standard systems were being developed and perpetuated in many parts of the country at the moment, and each day that passed made a final readjustment of these varying systems more difficult, costly, and damaging to achieve.

No one could deny that the electrical industry in this country had an immense leeway to make up before it could achieve anything like the degree of general electrification prevailing in America and on the Continent. The future held very great possibilities so far as main line electrification is concerned. The domestic field had enormous potentialities which he thought they were rather prone to under-estimate. The industry and the trade must address themselves seriously to the problem of providing really convenient installations and trouble-free equipment. Given genuinely economical rates, the immense advantages of electrification would make an irresistible appeal. The need for all sections of the industry to come together in some central Council of the Industry was daily becoming increasingly apparent.

At a luncheon at the British Industries Fair on Thursday of last week, organised by the President and Council of the Birmingham Chamber of Commerce and the Fair Management Committee on the occasion of the official visit of the various electrical associations, Mr. Walter Barrow, president of the Chamber of Commerce, who occupied the chair, referred to the efficient work done by the Electricity Commissioners.

Sir John Brooke (Electricity Commissioner) said the electrical manufacturing industry had risen to a place among the engineering group second only to automobile construction, and even motor cars would not be able to run without the assistance of the electrical industry, and certainly would not have reached their present popularity without the electrical auxiliaries. The industry was extending and deepening its export connections. The orders it had on hand represented a much greater horse power than at any previous time in its history. It was supplying new super-power stations for countries as far removed as the United States, Russia, Austria, and South Africa. It was engaged on railway electrification work in practically every market outside Europe and the United States. Owing to the development of the "grid," there had come into existence a home market for really high tension transmission, and manufacturers could face world competition with renewed confidence.

Mr. J. K. Brydges, president of the Incorporated Municipal Electrical Association, referred with satisfaction to orders which had been secured by British electrical manufacturers against keen foreign competition, including a recent order secured by one firm for switchgear in connection with the electricity supply to Strasbourg, amounting to about £200 000.



Hitherto unpublished graph showing the achieved and anticipated output of public electricity supply undertakings from 1922 up to 1941. In the present year (1930) it will be seen that the anticipated load has been slightly exceeded. The two heavier curves, showing the units to be sold by the Central Electricity Board, are of particular interest.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Bolometric Analysis of Metals.

[To the Editor.]

Sir,—On January 3rd and 17th I published in "English Mechanics" certain articles relative to a cheap method of producing "Talkie Pictures," making use of certain electrical devices, including a "Bolometer."

Since these experiments certain investigations have provided data and information that possibly may be found of interest and value to all to whom the quality and composition of irons, steels, coppers, bronzes and other metals and alloys are matters of great consequence.

We possess a considerable amount of knowledge relative to the ultra violet rays which extend beyond the visible violet rays of the spectrum, but very little knowledge of the ultra-red end of the spectrum band. Delicate thermometers and magnetic detectors will give certain information relative to these ultra-red rays, but up to the present this information is very meagre. At this end of the spectrum it is the bolometer which is of most service.

An improved type of bolometer which I have invented for these investigations consists of a slip of ebonite $\frac{1}{16}$ in. thick $\frac{1}{4}$ in. wide 4 in. long, with a series of nicks filed in the two 4 in. sides, this is wound with bare No. 40 B.W.G. copper wire, the two ends later being attached to terminals. The bare copper wire is given a thin wash coating of any kind of phosphorescent paint, when this is just tacky being again washed over with a strong solution of sulphate of quinine, the slip with its wire is then placed on a $\frac{3}{4}$ in. piece of glass tube whose ends are hermetically sealed, the terminal wires projecting. The tube is filled with olefiant gas, $\frac{1}{2}$–1 in. pressure. The bolometer is now complete, and is then connected to any ordinary wireless high resistance phone. If now the light of any low voltage battery electric lamp is allowed to fall on the bolometer the phone will "sound" and intermittent and alternating light will produce distinct differences in sounds. If we have a revolving vane breaking the light ray into fluctuating pulsating light, we have intermittent light. If instead of a vane we have a disc having red and violet transparent sectors we shall have what may be called "alternating" light and heat rays, for every light ray possesses certain calorific properties. Text books of physics contain particulars of a piece of apparatus known as "Koenig's manometric flame apparatus." Briefly described, this consists of a container divided into two compartments by a thin membrane of parchment or rubber, in one compartment (in our own particular case is fitted the telephone receiver), the other compartment has an external gas jet and pipe for admitting ordinary gas to the compartment. The jet is lit, and when the telephone "speaks" it causes the membrane to vibrate, the vibrations being communicated to the gas jet. If now a revolving mirror is placed in front of the gas jet, reflection of this pulsating gas jet will be perceived in distinct, visible manner, showing as a serrated or saw-like formation.

The bolometer is placed in circuit with the telephone; an "intermittent" beam of light is then made to fall on the bolometer. At once certain characteristic flame formations will be perceived.

Any sample of metal, irons, steels, coppers, zincs, bronzes, etc., is dissolved in any acid, and 1 cc. of metal solution is diluted with 50 cc. of distilled water, a current of air being passed through this solution and thence through a tube of calcium chloride to remove excess moisture, and this stream of air is caused to pass across the bolometer whilst "intermittent" light is falling on it. If the flame formations are examined it will be found for every metal, for every quality or composition of that particular metal, there will be a particular characteristic flame formation peculiar to that metal or quality of that metal. No two formations are the same, unless the two samples are of identical quality and composition.

The flame formations take the form of M, N and U formations, the U's being N's with very wide gullys between them, they vary in height, number and combination.

"Irons" give most marked M and N formations, differing in character and size with every different class or sample of iron tested. Coppers are characterised by M and U formation, zincs and coppers by M U and running series of N's; silver, aluminium and tin seem to be characterised by U's with terminal "N" and centre M formations.

By a bolometric device of this kind any kind of metal can be tested in a few moments, and by keeping records of formations any sample can be instantly identified and compared with any other.

Bolometric analysis promises iu the near future to place in the hands of every manufacturer a simple and reliable method for testing and determining quality and composition of all classes of metals.—I am, etc.,

Charles Mayfield.

Bristol,
February 14th.

Generator Interference with Wireless

[To the Editor.]

Sir,—The letter in The Electrician of January 10th, headed "Generator Interference with Wireless," reminds me that on the day when we started up a Diesel with a d.c. dynamo (about 650 r.p.m.) at a wireless station we could not hear anything in a wireless receiver on account of terrible noises generated by the dynamo. Batteries of condensers proved to be of no use and it took us many days to locate the origin of the trouble.

The Diesel and the dynamo had been mounted separately and only the dynamo was earthed by a heavy copper wire. The Diesel was earthed only by its waterpipes (cooling) and other pipes of similar kind. One day we made one copper connection to the Diesel and another to the dynamo, putting a milliampere meter between them. We noticed a deflection of the pointer announcing a steady current between Diesel and dynamo and the noises in the receiver had disappeared. We could hardly believe it but by taking off the connections the noises appeared again. So we made a heavy copper wire connection between Diesel and dynamo and the trouble was cured.

Very probably the whole trouble arose by interrupting the above-mentioned steady current by the oil film of the sliding bearings (*Gleitlager*) of the Diesel, the oil film (grease) insulating the shaft sometimes and sometimes not.

Perhaps "Q's" Diesel and dynamo are mounted in a similar manner and the mentioned connection may solve his problem just as it did ours. I shall be glad to hear if this suggestion proves useful.

In all cases when the Diesel and the dynamo were mounted on one iron bedplate no difficulties were encountered.

It is often useful to connect two series condensers across the brushes and to connect the point between the two condensers with the dynamo casing.—I am, etc.,

Ulrich Dickes.

Defeatist Publicity.

[To the Editor.]

Sir,—With a persistence which, in a better cause, would deserve the highest commendation, we, as a nation, have been telling the world for the last three or four years that we cannot sell our goods, and at the same time we have been saying that "British goods are best." Has the time not now come to call a halt to this pernicious publicity?

In my opinion the whole effect of this "Salesmanship Campaign" has been most disastrous in its effect on our trade overseas. I believe that the world has received the impression that Britain has lost courage, and it might be as well to keep in mind the inspiring words of Emerson:—

> "Britain. I see her not dispirited, not weak, but well remembering that she has seen dark days before. Indeed with a kind of instinct that she sees a little better in a cloudy day, and that in storm and battle and calamity she has a secret vigour and a pulse like cannon. I see her in her old age, not decrepit, but young, and still daring to believe in her power of endurance and expansion. Seeing this, I say, All Hail! Mother of Nations, Mother of Heroes, with strength still equal to the time."

These words are still true, but for any sake, let us drop this inferiority complex which is damaging our national reputation and swelling the ranks of our unemployed.—I am, etc.,

J. Reid Adam.

West Bromwich.

NEWS IN BRIEF.

The E.D.A. Annual General Meeting—Annual Dinner of Ex-Siemens' Men—An Exhibition of American Imports—The Television Society—Situations Vacant.

THE next meeting of the members of Institute of Fuel in London will be held in the rooms of the Chemical Society, Burlington House, W.1, on Wednesday, March 12th.

Seaham Harbour Electricity Committee has decided that where houses have been wired by the owners, and prepayment meters installed, four lamps be provided free by the Council.

Ilford Electricity Committee has authorised the Borough Engineer to invite tenders for the construction of the proposed new offices and central showroom and storerooms for the department.

The Devon and Cornwall section of the Electrical Power Engineers' Association met at Hayle last Saturday, and later visited Camborne, where a lecture was given by Mr. F. Nicholls, deputy chief engineer, Derby electricity department.

The estimated profit on the Hull Corporation telephones department for the present year is £11 516.

Applications are invited for the London University chair of physics, tenable at the East London College.

The Lancashire Electric Power Co. held a demonstration of electric cooking and domestic appliances at Ramsbottom last week.

A deputy electrical inspector and three junior electrical inspectors of mines and quarries are required. Application forms from the Establishment Branch, Mines Department, Dean Stanley Street, London, S.W.1.

A deputation from the engineering trades unions submitted to the Employers' Federation last week a request to subject the wages claim to arbitration. The employers suggested the appointment of a joint deputation to investigate conditions and costs of manufacture abroad, etc.

The U.S.A. Department of Argiculture is sending round the agricultural regions life-sized models of cows and pigs which have "windows", enabling electrically illuminated internal organs to be seen in operation. The performances are accompanied by appropriate phonograph "talkies."

Among the opponents at the inquiry into the application of the British Paper Box Manufacturers' Federation for an Order under the Merchandise Marks Act for compulsory marking of imported cartons, was the Electrical Importers' and Traders' Association. The hearing of evidence was concluded last week.

The Portsmouth Royal Dockyard Electrical Fitter Ex-Apprentices' and Apprentices' Association held its first annual dinner recently at Southsea. Among those present were Rear-Admiral L. A. B. Donaldson, director of dockyards, Mr. L. J. Steel, superintending electrical engineer, and Mr. B. Handley, borough electrical engineer.

The annual general meeting of the British Electrical Development Association will take place at the Savoy Hotel, London, at 3 p.m., on March 21st, and will be preceded by a luncheon at 1 o'clock at the same place, when the Minister of Transport will be the principal speaker. Tickets for the lunch, including wines, etc., from the offices of the Association price 17s 6d.

The Federation of British Industries has considered the recommendations of the Standing Committee on Mineral Transport with regard to pooling and standardisation of wagons. The Federation has expressed the opinion that abolition of private ownership would tend to perpetuate if not increase traffic difficulties, and states that it is opposed to the creation of compulsory wagon pools which would result in the working of collieries being practically controlled by the railway companies, and that complete standardisation of rolling stock must be preceded by standardisation of railway terminals.

The annual dinner of the Association of Ex-Siemens' Men will be held at Gatti's Restaurant, King William Street, Strand, W.C.2, on March 20th. Mr. J. Snow Huddleston, Dagenham Dock, Essex, is the Hon. Secretary and Treasurer.

The Business Efficiency Exhibition, organised by the Office Appliance Trades' Association of Great Britain and Ireland, opened at the White City, Shepherd's Bush, London, on Wednesday, March 5th, and will remain open until Saturday, March 15th.

An Industrial Exposition of American Import Trade is to be held at the Grand Central Palace, New York, from August 4th to 9th. This is claimed to be the first import exhibition to be held in any part of the world and no goods made in America will be admitted.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of March 6th, 1880, stated that the British Museum authorities had decided to adopt permanently the Siemens electric light in the Reading Room. The lamps were provided with suspended glass trays to catch red hot carbon sparks falling from the lamps.*

A company had just been formed "for the purpose of working the electric steering gear and engine room telegraph" for ships, an invention which had "met with the approval of several well-known admirals."

Formation of the Henley Telegraph Works Company, Ltd., with a capital of £70 000, was recorded.

* * *

TWENTY-FIVE years ago, according to THE ELECTRICIAN *of March 3rd, 1905, trials with electric trains were in progress on the Metropolitan section of the Inner Circle, between Aldgate and Notting Hill Gate.*

An account was printed of the improved Murray type-printing telegraph and the opinion was expressed that it would "possibly take a large place in replacing present methods of fast Wheatstone automatic work."

The North Somerset Electric Supply Co. at the end of February gave electric cooking demonstrations at Winscome, Wedmore, and Cheddar. At each place there was a display of electrical domestic appliances, in addition to wireless apparatus.

In a recent address to the East Devon Branch of the Electrical Association for Women, Mr. F. Marsh said, in regard to the elimination of glare, the pearl and opal lamps on the market to-day were probably the last word in lamp manufacture.

Stoke-on-Trent Electricity Committee has authorised the Engineer to give Miss Williamson, organiser of domestic teaching, such assistance as he may consider desirable and to lend cookers and other domestic appliances for the purposes of instruction on the use of electricity in the schools in the city.

At the E.D.A. Conference, North East Area, on February 26th, Mr. S. Burns chose for his subject "Modern Days—Modern Ways." The next conference of the area will take place on March 26th when Mr. K. M. McKensie will give a paper entitled "Generation and Supply of Electricity."

At the meeting of the Overhead Lines Association to be held on March 19th, Dr. Alfred Ekstrom will deliver a paper entitled "Overhead or Underground Cables for Rural Transmission Lines." The paper will be illustrated by a film showing cable laying by a special machine, largely used on the continent.

At a dinner given by the Institution of the Rubber Industry last week to its new president, Mr. Eric Macfadyen, Sir Arnold Wilson outlined a scheme for the building of central headquarters near Westminster to house a number of learned and technical societies. The cost would be £350 000, towards which nearly £100 000 had been promised. The scheme had the approval of the Prince of Wales and was backed by the Department of Scientific and Industrial Research.

The second annual general meeting of the Television Society will be held on Tuesday, March 18th. The presidential address will be delivered by Prof. Sir Ambrose Fleming, F.R.S., in the Botanical Theatre, University College, Gower Street, London W.C.1, on "The Relation of Governments to Invention." The annual exhibition of apparatus will be held this year on Wednesday, April 9th, at University College, London, from 3 p.m. to 9 p.m. A silver challenge cup, presented to the Society by Capt. B. S. Tuke, will be awarded annually for the best exhibit in relation to television shown by a member of the Society at the annual exhibition, while offers of suitable exhibits from non-members of the Society, bearing on the, subjects of television, picture telegraphy, or talking films will be considered if particulars are sent as soon as possible to the Secretary, at 4, Duke Street, London, W.C.2.

BUSINESS ITEMS.

WILD-BARFIELD electric furnaces will be exhibited at the Leipzig Fair, and also at the Achema Exhibition at Frankfort-on-Main. Visitors to either of these will be able to witness demonstrations.

S. THOMAS PEMBERTON AND Co., 8, Church Street, Colmore Row, Birmingham, have recently been appointed to represent BRUCE PEEBLES AND Co., LTD., Edinburgh, in the midland counties of England. Mr. Pemberton, the principal, has for the last 28 years been the representative of Electromotors, Ltd., in the same district.

Our attention has been drawn to a mis-statement on page 269 of our last issue. The four photographs of gear manufactured by A. REYROLLE AND Co., LTD., reproduced on that page, are represented as having been exhibited at the British Industries Fair, whereas in fact they are various equipments now in service in the Argentine, Saskatoon, Jerusalem and Java, and were sent to us as illustrations of interesting export shipments in 1929.

An order has been secured by the SOCIETE ANONYME DES FOYERS AUTOMATIQUES of Paris for the Quaregnon power station, comprising three steam generators having an evaporation of 190 000 to 225 000 lbs. per hour at 950 lbs. pressure and 840 deg. F. final temperature. The boilers will normally be fired with pulverised coal, but provision will be made for using as fuel de-hydrogenated coke oven gas. Another order is for one steam generator of a similar design evaporating 80 000 to 90 000 lbs. per hour at a pressure of 400 lbs. per square inch and a final temperature of 800 deg. F. This unit will also be fired with pulverised fuel and is intended for the Hensies Pommeroeul Collieries.

As announced in our Tenders Accepted columns, an important contract has been placed with the General Electric Co., Ltd., London, by the Central Electricity Board for six 30 000 kVA three-phase transformers for the Mid-East England Electricity Scheme. These transformers, the windings of which will be suitable for pressure ratios of 132 000/11 000 and 132 000/6 600 V on a three-phase 50 cycle system, will be complete with G.E.C. on load tap changing gear and external automatically controlled forced air cooling equipment. They will be manufactured in Birmingham at the Witton works of the G.E.C. and installed in Yorkshire at Kirkstall, Bradford and Rotherham.

The Gamewell fire alarm system, installed by STANDARD TELEPHONES AND CABLES, LTD., for the Hendon U.D.C., was officially inaugurated at Mill Hill fire station last month. The system comprises 28 boxes, connected in two separate street circuits, and protects the Mill Hill district, the calls being recorded in the local fire stations and simultaneously in the Central Station at Hendon, where they are automatically timed and dated. Telephone facilities are provided over the same lines used for the fire alarm circuits, without interfering with or delaying the alarm bells. Portable hand-micro-telephones are supplied and a telephone call to the fire station can be put through from any box in the system by plugging the micro-telephone into the jack provided.

An interesting electric steam boiler installation, which shows the progress in poultry farming due to the effects of the "Marking Scheme," has just been completed in what is computed to be the world's largest poultry farm at Corstorphine, Edinburgh. Its size may be gauged from the fact that as many as 170 000 eggs (all White Leghorns) are hatched and the pullets reared up to six weeks of age in a mammoth incubator and brooder at one time. The chickens when hatched are placed in brooders and kept from that time to six weeks old in regulated temperature, which is decreased as the chickens grow up. The complete system of steam supply has been arranged by Comdr. Campbell Allen of Messrs. BASTIAN AND ALLEN, Slough, the whole installation being arranged to give automatic working under all conditions. Three "Mascarini" boilers working on a load of up to 900 kW on 400 V, three-phase supply, working in conjunction with a Ruths steam storage, supply the necessary steam to the brooders.

NEW G.E.C. SHOWROOMS AT BRISTOL.

The new showrooms and offices of the General Electric Co., Ltd., at Magnet House, 26, Victoria Street, Bristol, were officially opened on Wednesday. The proceedings were followed by a luncheon at the Grand Hotel. In the afternoon there were special demonstrations in the showrooms and the visitors were entertained to tea.

PERSONAL.

MR. T. Medcalf, transport manager at Swindon, has resigned after 27 years' service.

Sir George Sutton has retired from the directorate of the Enfield Cable Works, Ltd.

MR. BRIERLEY H. COLLINS (centre), who received last week a presentation on his retirement after nearly fifty years' service with the Liverpool Corporation Electricity Department. See note on this page.

Mr. J. Hanns, chief engineer of Colyton Electric Light Works, who has been seriously ill, is progressing favourably, and is now out of danger.

Mr. E. P. Barfield and Mr. J. P. Coleman, of Wild-Barfield Electric Furnaces, Ltd., have left England for an extended visit to the United States.

Mr. A. L. Keet has been appointed city electrical engineer at Exeter at a salary of £700 per annum, the position to be reviewed at the end of twelve months.

Burnley Corporation has appointed as manager of the tramways and transport department Mr. C. H. Stafford, deputy manager and assistant engineer to Reading Corporation tramways undertaking.

Estate of the gross value of £5 667, with net personalty £5 476 was left by the late Mr. C. A. Blashcheck, for 27 years chief electrical engineer to the Canterbury Corporation, who died on November 26th last, aged 55 years.

Mr. R. Borlase Matthews has been elected chairman of the Rural Reconstruction Association for the forthcoming year. He has for some time been a member of Council and Chairman of the Executive Committee, and has been responsible for the rural electrification policy of this Association.

Mr. Brierley H. Collins was the recipient on March 1st of a mains-driven wireless set from his colleagues in the Liverpool Corporation Electricity Department, on his retirement after forty-eight years' service, a record for the department. Mr. F. C. Wilson, chairman of the Tramways and Electric Power and Lighting Committee, in making the presentation, said Mr. Collins came to the undertaking in 1882, at the age of sixteen, and subsequently became secretary of the Liverpool Electric Supply Co., Ltd. Since the transfer of the company's undertaking to the Corporation, Mr. Collins had held the positions of chief clerk and latterly installation assistant. Mr. P. J. Robinson, the city electrical engineer, paid tribute to Mr. Collins's services, and two of the chief assistants, Mr. E. L. Morland and Mr. T. B. Drummond, supported.

Obituary.

SIR ALEXANDER GRACIE, on Sunday. He was a director of the English Electric Co., Ltd.

MR. HENRY WILLIAM BROOKMAN, on February 25th, aged 91 years, formerly superintendent of the Central Telegraph Office.

MR. H. L. THOMSON, on March 1st, aged 32 years. He was electrical engineer and manager of the Cannock electricity undertaking and was killed within five minutes of leaving his office on Saturday afternoon, when his motor-car burst into flames after a collision and overturned with him underneath it.

ELECTRICAL TRAVELLERS.

Scheme for Reducing Unemployment Amongst Association Members.

THE fifth annual dinner of the Electrical Trades Commercial Travellers' Association was held at the Connaught Rooms, London, W.C., on February 28th, with Mr. R. W. Whitley in the chair. The number present approached 300, and during the evening Miss Angela Maude and Mr. H. C. Leonard entertained the assembly.

Mr. R. W. WHITLEY, in proposing "The President," drew the attention of members to a scheme which had been evolved for the benefit of those who were faced, or likely to be faced, with unemployment. The scheme was dependent upon members furnishing the Association with particulars of their experience, and with this end in view special forms had been prepared. Every member was allotted a number, and the information given on the returned form was filed under that number, thereby ensuring that the identity of each member was lost to all save the person concerned and the chairman of the Association. These numbers, according to the qualifications of their holders, were then filed under different headings, so that in the event of an inquiry being received for the most suitable man to fill a vacancy, information was readily available. Mr. Whitley pointed out that the response of members to the scheme had been good, and records of 70% of the full membership had been collected. Forms had been sent to all members, and it was particularly important that the remaining 30% of the Association's strength should make their returns as early as possible. The forms were in the shape of questionnaires, and allowed for recording sales experience under thirty-three different heads. Particulars of apprenticeship, technical training, workshop experience, advertising, drawing office, show room, power station, buying and other qualifications were asked for, while information as to whether members would consider a position abroad was also recorded.

Mr. ROBERT HORNBY, the President of the Association, in reply, pointed out that schemes similar to that outlined by the last speaker were used with good effect elsewhere, and recalled that whilst in Canada in 1915, he had wanted meter testers, but had no knowledge of where such men could be found. On a suggestion that he should try the Eaton Stores he then discovered that this firm kept a detailed record of each of its employees, with the result that he found the men he wanted in the ironmongery, stocking and similar departments. Continuing, Mr. Hornby said that he believed the electrical traveller to be the most important link in the chain of success. The object of the Association was not only to give recognition to the importance of the selling and distributing side of the industry, but also to raise the status of the electrical traveller, and thereby raise the status of the whole industry.

During the course of the evening a collection was made on behalf of charities, and the sum of £12 15s. 6d. was raised.

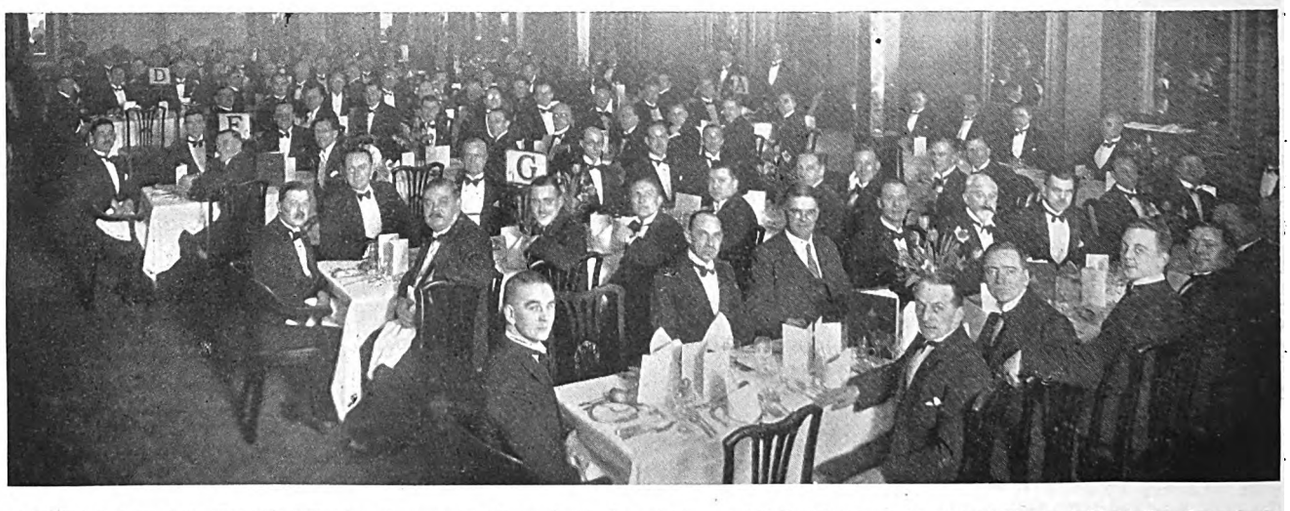
THE SOCIAL SIDE.

THE second staff dance of the season of Johnson and Phillips, Ltd., was held in Woolwich Town Hall on February 28th, and was attended by a more than usually large number of the staff, and their friends. Mr. J. Macgregor, chairman and managing director, and Mr. C. Stewart, director, were present, and prizes were presented for various competition items by Mrs. Macgregor and Mrs. Stewart.

A goodly proportion of the 1 020 employees who have served the Metropolitan Vickers Electric Co., Ltd., for twenty years or over, sat down to supper on February 24th, in one of the works' canteens, and afterwards enjoyed a lively entertainment provided for the most part by the M.V. Male Voice Choir and M.V. Orchestra. The Metropolitan-Vickers Electrical Company opened its works in Trafford Park less than 30 years ago, when it was known as the British Westinghouse Electric and Manufacturing Co., and it speaks well for the company's relations with its employees that more than a thousand of them have been with them almost from the start. Sir Felix Pole, chairman of Associated Electrical Industries, Ltd., was the guest of the evening and Sir Philip Nash, chairman of Metropolitan-Vickers Electrical Co., Ltd., occupied the chair as President of the Long Service Association. Mr. Philip Lang, who was managing director of the company in its early years, was also present, and the popularity of his regime with these old timers was evinced when they called vociferously for a speech from him, and would not be denied. Sir Felix Pole thanked the association for inviting him, though a newcomer, to attend their annual meeting and congratulated them all on their good fortune in having served a firm of such standing for so long.

LIVERPOOL ELECTRO-HARMONICS.

Over 70 members of the Manchester and Liverpool electrical trades foregathered at the Angel Hotel, Liverpool, on February 28th, when the Liverpool Electro-Harmonic Society gave a dinner and concert, at which they entertained as guests about 20 members of the Manchester Electro-Harmonic Society. In the speeches there was a good deal of banter anent "the Manchester man and the Liverpool gentleman." Mr. H. A. Pryor, the secretary of the Manchester Society, who responded to the toast to the Manchester visitors, submitted by the chairman Mr. Sutton, added to the amusement by proclaiming that when a Manchester man secured business in Liverpool it demonstrated two things: (1) He deserved it; and (2) he needed it. He could not let the opportunity go by, he said, without alluding to the inactivity of an electro-harmonic society in London, which was all the more noteworthy since the two Lancashire societies seemed to be thriving. Neither of them however received the support they deserved to get from the younger members of the electrical industry. Mr. E. G. Pulford, Junr., the secretary of the Liverpool Society, appealed to all to make "Members' Night" (March 28th) "a jolly good night."



MEMBERS of the Electrical Trades Commercial Travellers' Association and their friends at the annual dinner held at the Connaught Rooms, London, on February 28th. Details of a new employment scheme, for the benefit of members, are given above.

THE EVERLITE LAMP.

Further Developments of the Eight-hour Battery.

READERS will remember that we published in our issue of February 1st last year, details of an interview with Prof. A. Schmid, of Bale University, with regard to an invention of his which was to be put on the market by Everlite, Ltd., of Metropole House, Finsbury, London, E.C.2. It was pointed out at the time that the invention took the form of a wet battery having sufficient capacity to give a "straight-line" discharge curve over some hours, and so constructed that the charge could be renewed by refills.

An opportunity of inspecting the battery in process of manufacture was afforded our representative last week when a visit was made to the works of Everlite, Ltd., at Waltham Abbey. At the moment practical application of the invention is confined to the manufacture of lamps likely to interest the bicycle trade, though obviously the battery has possibilities in a number of other directions. The cell itself is contained within a "Metduro" casting, and resembles somewhat the Bunsen cell with its carbon and zinc electrodes. The electrolyte is made up in solid form, chromic and sulphuric acids being absorbed in a specially prepared block partly lead-covered. This block, which possesses the property of absorbing a volume of liquid equal to several times its own weight, also accommodates the zinc electrode, the carbon being permanently secured to the "Metduro" container and connected to one side of the lamp socket. The battery is made active by inserting the electrolyte and zinc block into the container, adding a small, but definite, quantity of water and screwing on the cap; this latter operation connecting the zinc electrode in circuit.

Turning the lamp causes the block to make chemical contact with the water, and thus converts the latter to the desired electrolytic solution. Turning the lamp again, to an upright position, lowers the electrolyte below the level of the zinc electrode, and so in effect disconnects the lamp by rendering the cell inactive.

It is claimed for this battery that, with the lamp used, eight hours continuous discharge at a constant rate is obtained, while the battery can be renewed for further use by renewing the electrolyte block and changing the water. The cells may, if desired, be connected in series or parallel and, it is stated, even though the cells be ready for immediate use, neither deterioration of the electrolyte nor erosion of the zinc electrode will occur until the container is turned into that position which causes the lamp to light.

INDUCTION FURNACES.

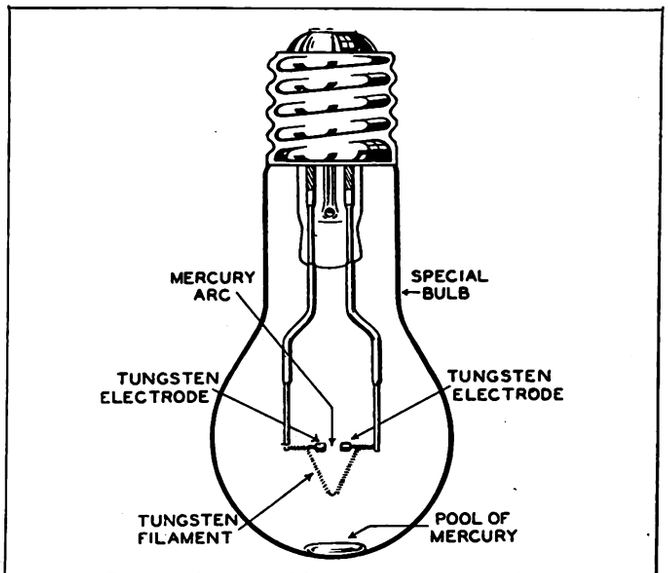
Electrical Penetration in the Steel Industry—Crucible Process Being Superseded.

THE UNITED STEEL COMPANIES, LTD., have placed with the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester, an order for an electric induction furnace for steel melting to be installed at the works of SAMUEL FOX AND CO., LTD., Stocksbridge. The furnace will be of ¼-ton capacity and of the Metropolitan-Vickers standard design, which aroused considerable interest when the first installation was made a little more than a year ago. Since that time furnaces of this type installed at a number of works in Sheffield and elsewhere, including the works of Vickers-Armstrongs, Ltd., and Hadfields, Ltd., have been in continuous commercial operation. The performance of these furnaces in service has been the subject of considerable attention in the steel industry, especially with regard to the reliability of the equipment, the quality of the product and the cost of operation. It is now known that the equipments installed have operated in such a way as to give satisfaction and the placing of the present order is significant.

The results obtained, apart from demonstrating reliability, have confirmed that the coreless induction furnace gives more accurate control over the composition of the product and therefore over the quality of steel produced. As regards cost of operation, actual records over six months operation in a large steel works show that steel of crucible quality has been melted at an overall cost, including labour, power, overhead and depreciation charges, of about £9 per ton, as compared with £16 per ton for the crucible process. The ¼-ton furnace melts its charge in about one hour and the records show that for an output of about 50 tons per month the average overall power consumption has been about 770 kWh per ton.

SIMULATING SUNLIGHT.

ACCORDING to the "General Electric Review" the General Electric Co. of New York and its foreign affiliations have achieved a combination of a filament and an arc in the same bulb. In this Type S-1 Sunlamp the filament and a mercury arc (in pure argon) operate together, the V-shaped filament



Diagrammatic sketch of the type S-1 Sunlamp developed by the General Electric Co. of New York.

hanging downward with its tip near a small pool of mercury in the bottom of the bulb. Above this filament and in parallel with it is a pair of tungsten electrodes. The bulb contains pure argon. No tilting is necessary to start the lamp. Practically as soon as the filament is lighted the arc strikes. The lamp can be operated throughout a wide range of angles. The lamp is a low-voltage source and the volt-ampere characteristic of the transformer is important. At present the lamp is approximately 400 W. The no-load volts of the secondary are approximately 35. When the switch is closed the filament takes about 9 A and the drop across it is approximately 33 V. Almost instantly the arc begins to operate without any further action on the part of the user. Now the mercury arc between the tungsten electrodes is operating in parallel with the tungsten filament. The volts drop to 11 and the total current passing through the filament and the arc is approximately 30 A.

This Type S-1 tungsten-mercury lamp when used in a proper reflector, produces the same degree of erythema (reddening of the skin) in the same or even less time in 30 in. from the source as is produced by midday midsummer sunlight. An average of many tests indicates that, as measured in foot-candles, it is at least 20 times more effective than good summer sunlight. The character of the tan produced by successive reddenings of the skin by means of natural sunlight or this new artificial sunlight is claimed to be the same.

TORONTO ELECTRICITY SUPPLY.

The report on the Toronto Hydro-Electric System for 1927 and 1928, respectively, recently presented by the Commissioners to the Corporation of Toronto, shows that the gross income for 1927 was $10 380 960 and for 1928 $11 083 883, surplus of income on operating account was $2 826 033 and $3 274 244, and net income carried to reserve for stabilisation of rates $39 273 and $311 688. At December 31st, 1928, the funded debt, less sinking funds in the City Treasurer's hands, amounted to $21 013 926, the fixed assets with respect to the distribution plant in the City of Toronto amounted to $35 065 221, and the total investment in the system, including the share of capital investment of the Hydro-Electric Commission of Ontario in respect of the Toronto Hydro-Electric System for generation and transmission equipment, amounted to $83 360 941. Electrical energy purchased from the Hydro-Electric Power Commission of Ontario in 1927 cost $4 877 569, and in 1928 $5 215 185. The quantities of electricity sold in 1927 and 1928, respectively, were 603 626 754 and 675 026 262 kWh, the connected load was 711 744 and 800 124 H.P., and the peak load 238 849 and 259 579 H.P.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

BECKERMET READING ROOMS, near WHITEHAVEN.—Electric light installation. Particulars from the Secretary.

ERITH URBAN DISTRICT COUNCIL, March 7th.—Twelve months' supply of h.t. and l.t. underground cable, joint boxes and other accessories. Forms of tender, etc., from the Electrical Engineer, Walnut Tree Road, Erith.

KETTERING URBAN DISTRICT COUNCIL, March 7th.—Supply of certain transformers. Specifications from Mr. W. A. Walker, Electricity Offices, Rockingham Road, Kettering; deposit £1.

Wiring and Fittings.

LEICESTER CORPORATION, March 7th.—Installation of electric light wiring and fittings at Belgrave pumping station. Specifications, etc., from the City Surveyor, Town Hall, Leicester; deposit £1.

GRAVESEND CORPORATION.—March 8th.—Wiring to three extra points at 96 houses on King's Farm estate. Particulars from the Electrical Engineer, 17, Harmer Street, Gravesend.

EDINBURGH CORPORATION, March 8th.—Supply and maintenance of telephones, in Edinburgh, Leith and Portobello districts. Forms of tender, etc., from the City Architect, City Chambers, Edinburgh.

WEST RIDING EDUCATION COMMITTEE, March 8th.—Electric light installation in Shepley Council School. Specification from Mr. W. Heeley, 4, Macaulay Street, Huddersfield.

ABERDEEN CORPORATION, March 10th.—Electrical work in connection with erection of new shelter and public conveniences at Sea Beach. Specifications, etc., from Mr. T. F. Henderson, burgh surveyor, Town House, Aberdeen.

BEDFORD CORPORATION, March 10th.—Supply during one year of e.h.t., h.t. and l.t. underground cables; and incandescent lamps. Specifications from the Borough Electrical Engineer, Prebend Street, Bedford. Tenders from British manufacturers in the United Kingdom only are invited.

BERWICK-ON-TWEED CORPORATION, March 10th.—Electrical work in connection with erection of 16 houses at Prince Edward Road, Tweedmouth. Specifications from Mr. G. Davidson, borough surveyor, Berwick-upon-Tweed.

BLACKBURN CORPORATION, March 10th.—Manufacture and supply of electrical requirements for 12 months, including paper insulated, lead sheathed cable, rubber insulated wire, consumers' meters and gasfilled and vacuum incandescent lamps. Specifications, etc., from the Engineer and Manager, Electricity Offices, Town Hall, Blackburn; deposit 10s.

CHEDDLESTON (LEEK) MENTAL HOSPITAL, March 10th.—Supply of electric lamps for six months. Tender forms from the clerk and steward, Mr. F. G. Eve.

OLDHAM GUARDIANS, March 10th.—Supply of electric lamps and fittings. Particulars from Mr. F. W. Fletcher, clerk to the Guardians.

PORTSMOUTH CORPORATION, March 10th.—Alteration, supply and erection of electric food and goods lifts at the Guildhall, Portsmouth. Specifications, etc., from Mr. R. J. Jenkins, City Engineer, Guildhall, Portsmouth.

PRESTWICH URBAN DISTRICT COUNCIL, March 10th.—Twelve months' supply of lamp standards, electric lamps, etc., Forms of tender, etc., from Mr. H. T. Ainsworth, surveyor, Town Hall, Prestwich, Lancs.

TORQUAY CORPORATION, March 10th.—Supply and erection of 7 500 kW m.c.r. turbo-alternator and condensing plant. Specifications, etc., from Mr. G. J. Hollyer, Electricity Offices, Torquay; deposit £3 3s.

WARRINGTON CORPORATION, March 10th.—Supply of (1) motors, and (2) transformers. Specifications from Mr. F. V. L. Mathias, Electricity Works, Warrington; deposit £1 1s. for each.

EAST RIDING HOSPITAL COMMITTEE, March 11th.—Supply and erection of electric generating and storage plant, and for underground distribution cables and wiring work at Driffield Isolation Hospital. Specifications, etc., from Mr. J. Edwin Storr, 14, Park Row, Leeds; deposit £3 3s.

LIVERPOOL CORPORATION, March 12th.—Supply of 5 000 kVA, 12 500 kVA and 33 000 V step-down transformers and 6 000 V and 33 000 V metal-clad switchgear for sub-stations. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

STOKE-ON-TRENT CORPORATION, March 12th.—Twelve months' supply of (1) e.h.t. truck type switchgear (contract No. 3 004); and (2) a.c. and d.c. meters (contract No. 3 005). Specifications from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 for each.

SHEFFIELD CORPORATION, March 14th.—Supply of tramway rails (section d) and copper bands (section e). Particulars from Mr. A. R. Fearnley, Tramways and Motors Department, Division Street, Sheffield.

HARROGATE CORPORATION, March 15th.—Supply of meter boards for one year. Forms of tender, etc., from Mr. N. McLean, borough electrical engineer, 33, Swan Road, Harrogate.

KEIGHLEY CORPORATION, March 15th.—Construction of l.t. overhead line. Specification, etc., from Mr. H. Webber, borough electrical engineer, Coney Lane, Keighley.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 17th.—Supply and laying of l.t. cables, etc. Specification, etc., from Mr. D. J. Keep, town clerk, Town Hall, Cambridge Road, Bethnal Green, E.2; deposit £2 2s.

MANCHESTER CORPORATION, March 17th.—Twelve months' supply of incandescent lamps. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

WEST LANCASHIRE RURAL DISTRICT COUNCIL, March 17th.—Electric lighting scheme for Hesketh, Rufford and Tarleton. Specifications from Mr. J. Scott, 358, Royal Liver Buildings, Liverpool; deposit £2 2s.

CARDIFF CORPORATION, March 19th.—Supply of e.h.t. and l.t. paper insulated cable during 12 months. Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only manufacturers on the King's National Roll are invited to tender.

METROPOLITAN ASYLUMS BOARD, March 19th.—(1) Installation of synchronised electric clocks at Joyce Green Hospital, Dartford; (2) installation of electric sewing machines at Southern Hospital, Dartford; (3) conversion of workshop power units to electricity at Darenth Training Colony. Specifications from the Office of the Board, Victoria Embankment, London, E.C.4; deposit £1 for each.

KENDAL CORPORATION, March 24th.—Supply and erection of electrically driven blower, electric lift for retort house and lathe with electric motor drive, at the gasworks. Specifications, etc., from the engineer and manager, Mr. T. Crowdy, Parkside Road, Kendal.

LONDON COUNTY COUNCIL, March 24th.—Supply and erection in Blackwall Tunnel of (1a) four electrically driven exhaust propeller fans, 8 ft. diameter, each with 15 B.H.P. motor; (1b) two centrifugal blowing-fan sets, each with 55 B.H.P. electric motor, and suction and delivery air ducts; and (2) girders, joists, platforms, etc. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £5 in each case.

MORTLACH PARISH CHURCH, March 24th.—Electrical work in connection with alterations and additions to church. Schedules, etc., from Messrs. A. Marshall Mackenzie and Son, architects, 173A, Union Street, Aberdeen.

CENTRAL ELECTRICITY BOARD, March 31st.—Supply and erection of metering equipment required in the area of the North West England and North Wales Electricity Scheme. Specification (N.W.E.-G.M. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

VICTORIAN ELECTRICITY COMMISSION, March 10th (extension of time).—Two 6 000 kVA, 50 cycle, 11 000/2 200 V, oil insulated, self-cooled, outdoor type, three-phase transformers, with spare coils and bushings (specification 30/8). (Reference B.X. 6 014.)

MOROCCO POSTS AND TELEPHONES (FRENCH ZONE), March 11th.—Supply of glass insulators, bronze and copper wire and galvanised ironwork. (Reference B.X. 6 410.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, March 11th.—Supply of three-conductor cords (P. and T. No. 151/2 145). (Reference B.X. 6 173.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 110 kV switchgear, for interconnecting auto-transformers, for Waitaki power scheme, section 76. (Reference B.X. 5 797.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Switchgear and controlling equipment. (Reference B.X. 5 798.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 11th.—Supply of 66 kV switchgear and protective system for Lyttleton, Lake Coleridge, power scheme, section 217. (Reference B.X. 5 796.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 11th.—Supply of bells and buzzers (schedule C. 552). (Reference B.X. 6 043.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 13th.—(extension of time).—Supply of electric tube butt welder. (Reference B. 6 116.)

ANTWERP MUNICIPALITY, March 20th.—Supply and erection of a signalling and lighting installation for a swingbridge at Antwerp Docks (No. 198). (Reference B.X. 6205.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 20th.—Steel water tank, on steel tower, with piping and fittings; and electric water level indicator. (Reference A.X. 9 073.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 20th.—Supply of two 150 kVA motor alternator sets, for Durban workshops (tender No. 1 615). (Reference B.X. 6 115.)

POSTMASTER-GENERAL'S DEPARTMENT, March 24th.—Supply of dial parts (schedule C. 555). (Reference B.X. 6 047.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

EGYPTIAN PORTS AND LIGHTHOUSES ADMINISTRATION, March 27th.—Supply and installation of electric cables in the Port of Alexandria. (Reference B.X. 6 199.)

JOHANNESBURG MUNICIPALITY, March 27th.—Supply of paper insulated, lead covered, double steel tape armoured and jute served cable (contract No. 348). (Reference B.X. 6 200.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Supply of lead-covered switchboard cable (schedule C. 574). (Reference B.X. 6 202.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, April 28th.—Supply and erection of electrically driven high lift and low lift pumping plants, etc., for South-West Tablelands Water Supply (tender No. 51, 1929/1930). (Reference A.X. 9219.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12.) (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

CHILEAN MINISTRY OF MARINE, May 15th.—Supply of 3 metric ton travelling electric crane and 4 metric ton stationary electric revolving crane. (Reference No. A.X. 9 186.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping control switchboard, etc. (Reference A.X. 9212.)

Tenders Accepted.

BLACKBURN CORPORATION.—J. Marsden, electric light installation at Free Library.

READING GUARDIANS.—J. H. Winter and Co., lighting new Casual Ward at Woodley, £425.

READING CORPORATION.—Forest City Electric Co., Ltd., five automatic point controllers, £63.

CHESTERFIELD CORPORATION.—Macintosh Cable Co., Ltd., £954 12s., supply of l.t. cables, £954 12s.

AYR EDUCATION COMMITTEE.—Darroch and Espie, electric light installation in eight blocks of 23 houses.

PLYMOUTH CORPORATION.—A. Reyrolle and Co., Ltd., twelve months' supply of switchgear. (Renewal.)

BRIGHTON CORPORATION.—W. A. Gooding and Sons, renewing electrical installation at open market, £420.

STOKE-ON-TRENT AND WOLSTANTON GUARDIANS.—Barnett and Soans, cables to proposed new nurses' home, £2 537.

LONDON, MIDLAND AND SCOTTISH RAILWAY CO.—Edison Swan Electric Co., Ltd., supply of electric lamps for 12 months ending December, 1930.

METROPOLITAN ASYLUMS BOARD.—Alpha Manufacturing and Electrical Co., Ltd., alterations to electric lighting at South-Western Hospital, £130.

CENTRAL ELECTRICITY BOARD.—General Electric Co., Ltd., six 30 000 kVA three-phase transformers, for Mid-East England Electricity Scheme.

Conversion of Street Lamps.

PITLOCHRY DISTRICT LIGHTING COMMITTEE.—J. Scott and Son, converting 57 lamps from gas to electricity and supply of 22 additional lamps, £309.

KETTERING URBAN DISTRICT COUNCIL.—Union Cable Co., Ltd., supply of e.h.t. cable, £6 020; Croydon Cable Works, Ltd., supply of l.t. cable, £8 505.

NATIONAL COMMITTEE FOR TRAINING OF TEACHERS.—J. Foggo and Son, electric light installation, etc., at Demonstration School, Edinburgh, £1 357.

BANGOR (CO. DOWN) CORPORATION.—Johnson and Phillips, Ltd., laying pilot circuit and telephone cable between Bingham Street station and the pumping station, £398.

GLASGOW CORPORATION.—General Electric Co., Ltd., e.h.t. switchgear for Pinkston power station, £32 080; Dorman Long and Co., Ltd., supply of tramway rails, £25 250.

STOKE NEWINGTON (LONDON) BOROUGH COUNCIL.—General Electric Co., Ltd., supply and erection of rotary converting plant and switchgear (revised tender), £7 173. (Recommended.)

BRADFORD CORPORATION.—Yorkshire Repetition Casting Co., Ltd., supply of 60 tons of tramway hand brake shoes, £517 10s., and 60 tons of brake blocks, £510; English Electric Co., Ltd., supply of 100 tramcar motors, £96 15s. 6d. each; F. Ashcroft, electric lighting installation at Thornton Baths, £234.

RUGBY RURAL DISTRICT COUNCIL.—W. G. M. Robinson, electric lighting in connection with the following housing schemes: Wolston, 26 houses, Brandon, 12 houses, erected; Dunchurch, 16 houses, Newton, eight houses, Churchover, 12 houses, in course of erection, from £4 4s. to £4 19s. 6d. per house.

STOKE-ON-TRENT CORPORATION.—D.P. Battery Co., Ltd., renewing plates of storage battery, £229; Callender's Cable and Construction Co., Ltd., supply of mains and cables for 12 months; Metropolitan-Vickers Electrical Co., Ltd., supply of static transformers for 12 months; General Vehicle Co., Ltd., supply of 15 cwt. electric mains van, £404 5s.

GENERAL POST OFFICE.—Cable: supply, delivery, drawing-in and jointing, Manchester-Chester, British Insulated Cables, Ltd.; Reading-Oxford, W. T. Henley's Telegraph Works Co., Ltd; Chester-Whitchurch, W. T. Glover and Co., Ltd.; Dundee-Aberdeen and Southampton-Basingstoke, Pirelli-General Cable Works, Ltd.; electric lift, Sunderland Telephone Exchange, W. Wadsworth and Sons, Ltd.

DEWSBURY CORPORATION.—Rotary conversion plant at electricity works: 500 kW rotary convertor (with Yorkshire transformer), Harland Engineering Co., £1 285; 1 500 kW motor convertor, Bruce, Peebles and Co., Ltd., £3 200; d.c. switchboard, Electric Construction Co., Ltd., £1 549; battery switchgear, Tudor Accumulator Co., Ltd., £195 16s.; cable, Power and Lighting Cables, Ltd. (for German cable), £2 439.

METROPOLITAN WATER BOARD.—Palatine Engineering Co., Ltd., provision of two water level transmitters and recorders for the Bishop's Wood reservoir, to record at Kempton Park and Fortis Green pumping stations respectively, £178. (Recommended.) Also tendered: Gent and Co., Ltd., £257; Isenthal and Co., Ltd., £267; Glenfield and Kennedy, Ltd., £372; Telechron Electric Transmitter Co., £375; G. Kent, Ltd., £423.

LOWESTOFT CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of equipment and erection of h.t. mains in connection with transmission to Kessingland, £9 399. (Recommended.) Also tendered: W. T. Henley's Telegraph Works Co., £9 824; Siemens Bros. and Co., Ltd., £9 809; Johnson and Phillips, Ltd., £9 782; British Insulated and Helsby Cable Co., Ltd., £9 788; Standard Telephones and Cables, Ltd., £9 715; W. T. Glover and Co., Ltd., £9 657; Pirelli and Co., Ltd., £9 564.

ELECTRICITY SUPPLY.

Crediton Undertaking to be Sold—The Pangani Falls Project—Burnley and the Wireless Listener—Supply on the North-East Coast—Hastings' Big Scheme—The London Joint Authority.

REIGATE T.C. is about to have 50 gas lamps in the borough converted to electricity.

Subject to a loan of £10 000 for mains extensions being sanctioned, Kingston-on-Thames T.C. will extend the mains to several additional thoroughfares.

Poplar (London) Housing Committee has arranged with the Borough Council's electricity department for the maintenance of lighting services in the Council's houses and flats at 3s. per tenement per annum.

Hammersmith (London) Electricity Committee recommends that sanction be sought from the L.C.C. to the raising of the supply pressure from 110 V, which operates in the major portion of the borough, to 230 V.

Battersea (London) Electricity Committee has authorised electricity services to 91 premises at a cost of £903; extensions of mains for private services at a cost of £1 936 and replacement with armoured cable of old vulcanised bitumen distributors at a cost of £2 134.

Crediton U.D.C. has decided, subject to the approval of the Commissioners, to dispose of the electricity undertaking to the Whitehall Securities Corporation for £15 000, which will give a profit of £4 000 on the price the Council paid for the works some three years ago.

One of the last remaining areas in the Wirral peninsula was connected with Birkenhead Corporation's electricity supply last Saturday when Mr. C. W. Constantine, chairman of Wirral R.D.C., switched on the supply to the Burton district, the ceremony being witnessed by members of the Corporation and the R.D.C.

Negotiations are proceeding satisfactorily between the Tanganyika Government and Power Securities, Ltd., represented by Major Conrad Walsh, in matters relating to the generation of electric light and power from the Pangani Falls and the electricity supply of Dar-es-Salaam and other towns on the Central Railway. An account of the Pangani Falls project appeared in our issue of January 3rd.

Bury (Lancs) T.C. has received sanction to a loan of £6 660 for plant and incidental works in connection with extensions to the central power station. The Central Electricity Board has approved of the renewal of a portion of the h.t. switchgear at an estimated cost of £27 000, including buildings.—Slot meters are to be installed in Corporation houses where the supply has been discontinued on account of the non-payment of charges.

In reference to the application of Barnes U.D.C. for consent to extend its generating station, the Electricity Commissioners have notified that they are not satisfied that the Council would be in a position to give a supply of electricity adequate in quantity and regularity to meet the present and prospective demands of their consumers at a cost not greater than that at which they could give a supply if they obtained it from the London and Home Counties Joint Electricity Authority. The Commissioners have accordingly decided to refuse the consent applied for.

Guildford Electricity Committee recommends central lighting for the High Street. The main in Epsom Road is to be replaced by a larger one, at an estimated cost of £656. The Electricity Committee has considered an application from Messrs. Messenger and Morgan to complete the laying of mains on the Farnham Road estate. The borough electrical engineer reported that the estimated cost would be £762. It was decided that, having regard to the fact that this estate is not being developed rapidly, the owners be requested to bear 75% of the cost of laying the mains.

Owners of wireless sets in Burnley affected by the change-over from d.c. to a.c. resent the policy of the Corporation in disclaiming any responsibility. Mr. J. E. Starkie, borough electrical engineer, states that there is no precedent for the compulsory changing of wireless apparatus by electricity authorities; the revenue obtained from electricity for wireless apparatus is practically negligible, and is entirely disproportionate to the expense involved in alterations. The cost to the department, if the Corporation compensated every wireless user, would be between £12 000 to £15 000, equivalent to a 6d. rate.

Mr. Chas. Turnbull, borough electrical engineer, has reported to Tynemouth Electricity Committee that it has been definitely arranged that the North-East Coast shall change over from 40 periods to 50 periods. The scheme involves the building of a new super power station on the North-East Coast, and when such station is completed two supplies will be available—a 40-period supply and a 50-period supply. Arrangements will be made for transferring gradually over from one to the other supply.—There has been an enormous increase in the Corporation's meter department, and it is proposed to extend and improve the arrangements for meter testing.

Taunton T.C. has approved a recommendation of its electricity committee to borrow £15 000 to meet the cost of replacing existing cables and transformer sub-stations which had been in use for 25 years and upwards, and to provide for further cables in anticipation of additional supplies of electricity being required. The Unemployment Grants Committee is to contribute 30% of the loan charges.—The Council has also adopted a scheme for the free wiring of small dwellings, prepayment meters to be fixed and set to provide for an additional charge of threepence per unit to cover maintenance. Not less than two adjoining houses will be wired at one time.

Hastings Corporation's scheme for the electrification of an area which covers 250 sq. miles and embraces the boroughs of Rye and Winchelsea, the urban district of Battle, and the villages of Broad Oak, Brede, Waites Farm and Fairlight Cove; Pett, Icklesham, Beckley, Northiam, Sedlescombe, Westfield will cost upwards of £100 000. At Winchelsea and in the villages, except Northiam, the transfer was made from oil and candles to electricity. Farms are using the supply for motive power, milking, chaff cutting, water pumping, etc., in addition to lighting and heating. The Corporation has recently adopted a further scheme for extensions to more remote districts.

Seaham Harbour Housing Committee has decided to invite the Electrical Engineer to submit a tender for the wiring of the 80 cottages now in course of erection on the Carr House estate.—The Electricity Committee has approved the scheme submitted by the Engineer for the provision of an alternative source of supply, at an approximate cost of £4 000, and provisional arrangements made for the submission of the scheme to the Electricity Commissioners and the Unemployments Grant Committee and for approaching the Power Supply Co. for assistance in connection therewith.—The Committee reports an increase of rather more than 50% in the consumption of energy, compared with the corresponding month of last year.

A return issued by the London and Home Counties Joint Electricity Authority gives particulars of the output and an analysis of the accounts of each of the undertakings authorised to supply electricity in the Authority's area. These include 93 undertakings with 62 generating stations, and the total quantity of electricity generated in such stations during the year ended March, 1929, was 2 175 491 000 kWh, and electricity purchased increased the total to 3 236 625 632 kWh. The quantity sold, exclusive of bulk supplies, was 1 758 752 078 kWh, against 1 493 880 881 kWh in the previous year. Total working costs were 0·71d. per kWh sold, against 0·82d., and the gross surplus on the year's working was £8 005 061. Electricity generated by railway and tramway undertakings and not included in the above figures, was 863 077 995 kWh.

Brighton Lighting Committee is to lay a new feeder from the Lewes Road station at a cost of £3 300. The committee has decided to establish a sub-station at Warren Farm and lay a ring main extension to Rottingdean, at a cost of £12 433.—Mr. W. M. Selvey, who has been called in to advise in connection with the grit and dust trouble from the chimneys at Southwick, advises that certain equipment be installed to enable him to carry out experiments. He recommends alterations to ducts in connection with pulveriser vent to furnace through the primary air fans, estimated cost, £200; construction of temporary wooden flue for carrying off effluent to the beach, £150; installation of circulating pump for spray washers, piping, etc., £375; and modern type sprays for precipitating finer particles of dust, £75. The Committee has authorised the Engineer to put the works in hand.

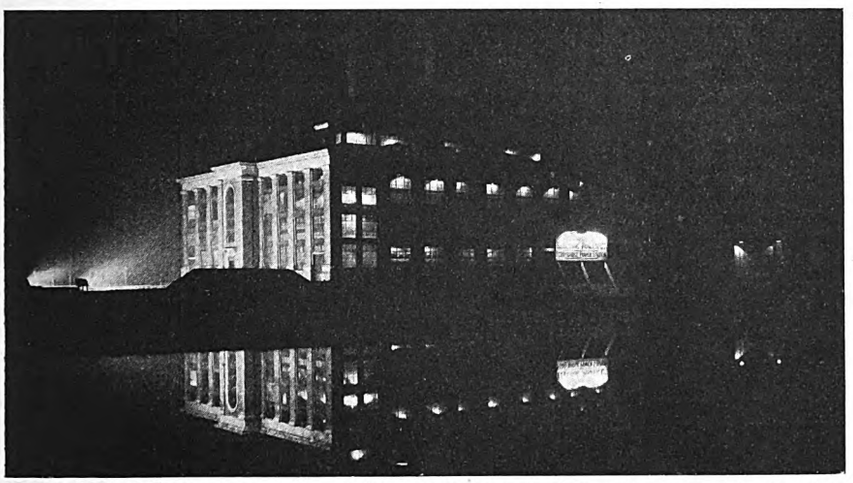
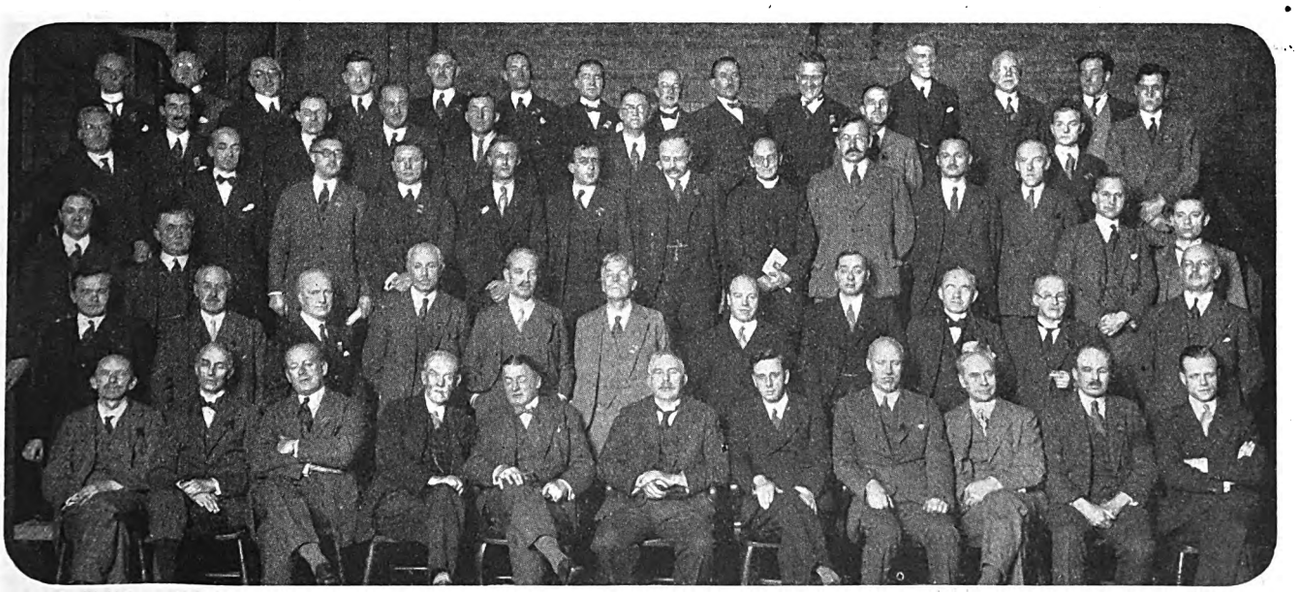
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

The Faraday House Old Students' Association and Faraday House Rugby Club gave a successful supper dance at the Hotel Russell, Russell Square, London, W.C., on February 26th. Over 200 old and present students and their friends attended, and some of the revellers may be recognised in this group taken during the early part of the evening.



An unusual and attractive view of the Ferrybridge station of the Yorkshire Electric Power Co. The floodlighting of power stations is a form of propaganda which could very usefully be developed, and if treated in the right way would do much towards popularising the idea of floodlighting public and other buildings.

Mr. Harold L. Thomson, chief engineer and general manager of the Cannock electricity department, whose death is referred to on page 309.



Some well-known faces in the electrical engineering world are seen in this group taken at the works of the Metropolitan-Vickers Electrical Co., Ltd., at Trafford Park, on the occasion of the official opening of the new high tension laboratory on February 28th. A description of the building, together with photographs taken during some of the tests, are given on pages 295-297.

COMPANY NEWS.

Decline of Cables and Wireless Ordinary Stocks—Southern Railway Main Line Electrification—Directors' Reports and Dividends—New Companies.

CABLES and Wireless issues continue to absorb attention. The definite confirmation by the Postmaster-General of the long-current rumours that the Post Office does not intend to make use of the Marconi beam stations for its overseas telephone service, has elicited a reply from Imperial and International Communications, Ltd., in a letter to the Prime Minister, which makes out a strong case for a full inquiry into the subject and reconsideration of the important issues at stake. The one undoubted fact that already emerges is that the sympathetic fall which has taken place in Cable and Wireless stocks far and away exceeds the amount of any rental which would have been received from the Post Office, and is entirely unjustified. Shareholders, however, have become unsettled, and continue to sell, with the result that the "A" stock is down to 56, and the "B" to 26.

American Telephone and Telegraph capital stock is 5 points higher at 245, and Radio Corporation of America shares are nearly 50. Hydros are quoted over 44⅛ without the dividend. Home manufacturing favourites have been weak, Electric Constructions falling from 15s. to 11s. 3d., Insulateds, Callender's and Consolidated Signals losing half-a-crown apiece, and Henley's and Enfields 1s. 3d.

At the annual meetings of the shareholders of the Underground Electric Railways Co. of London, Ltd., and the companies which it controls, including the London Electric, City and South London and Central London Railway Companies, the Metropolitan Electric and London United Tramways, the South Metropolitan Electric Tramways and Lighting Co., the London and Suburban Traction Co. and the London General Omnibus Co., Lord Ashfield said passengers carried showed some small advance upon 1928. The total number carried by railway, tramway, and omnibus amounted to 2 175 000 000. They had put before the Government a programme for raising and expending some £13 500 000 for the extension and completion of their railway system. The gross income of the Underground Co. amounted in 1929 to £1 182 533, increase £28 735. See also p. 318.

Directors' Reports, etc.

GENERAL ELECTRIC CO. OF NEW YORK.—Qrtrly div. of 40 cents on new stk. has been declared.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Qrtrly div. of 50 cents on common shs. is announced.

FARNHAM GAS AND ELECTRICITY CO.—Rev. £63 321, exes. £44 104. Fin. div. on ord. 3¾%, makg. 7½%. Fwd. £4 123.

GLOBE TELEGRAPH AND TRUST CO., LTD.—Qrtrly. div. of 3/ p. sh., less tax, on pref. and 5/ p. sh. net on ord. will be payable on March 31.

CENTRAL STATES POWER AND LIGHT CO.—The company has acquired ownership of Canada Electric Co. and Eastern Electric and Development Co.

TYNEMOUTH AND DISTRICT ELECTRIC TRACTION CO., LTD. Half-yearly div. on 5 % cum. pref. shs., due March 15, is postponed, as financial results of 1929 workg. does not justify paymt.

WASTE HEAT AND GAS ELECTRICAL GENERATING STATIONS, LTD.—Fin. div. of 5½%, makg. with intm. div. paid in Aug., 1929, total div. of 8% for year ended Jan. 31, 1930, has been declared.

SOUTH METROPOLITAN ELECTRIC TRAMWAYS AND LIGHTING CO., LTD.—Net blce. from workg. for 1929, £57 651, less provisn. for renewals and res. £30 000, div. of 5% proposed. Fwd. £11 790, agst. £11 139.

ELECTRICAL DISTRIBUTION OF YORKSHIRE, LTD.—Pft. for 1929, £98 482 ; brt. in £21 904. Div. on ord. cap., 9%, less tax, of wh. 4½% was paid in Aug., 1929, on shs. issued prior to 1929. To res. £17 500 ; fwd. £23 657.

BERLIN TELEPHONE FACTORY CO.—This company's loss for year 1928 was £174 500 ; and the board recommends acceptance of an offer by Standard Electricity Co., of America, to take over sh. cap. at the rate of 70%.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—Directors propose fin. div. of 4% actual, makg. 8% for year 1929, on "A" ord. shs. and div. of 7½% for year on "B" ord. shs., both less tax.

DAVIS AND TIMMINS, LTD.—Net pft. for 1929, £26 068, agst. £23 417. Blce. div. on ord., 12%, makg. 20% for year (same) ; to gen. res., £4 912, agst nil ; to income tax acct. £1 153, agst. nil ; fwd. £20 819, agst. £21 317.

NORTHAMPTON ELECTRIC LIGHT AND POWER CO., LTD.—Net rev. for past yr., £79 127. Fin. div. of 6% recommended, makg. 10% ; to depreciatn. £38 973 ; to obsolescence of plant and machinery £10 000 ; to gen. res. £7 000. Fwd. £9 770.

LAUNCESTON AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Rev. receipts for 1929, £5 212, agst. £5 217; gross pft., £2 798; net pft., £1 596, plus £1 653 brt. in. To res., £600 ; depreciatn., £1 000 ; ord. div. for year 8 %, tax free, £512 ; fwd., £1 136.

LIVERPOOL OVERHEAD RAILWAY CO.—Receipts for 1929, £95 339, working exes., £78 360 ; to contingency fund, £400 ; int. on deb. stk. £6 755, surplus £9 824, plus £3 730 brt. in. Div. for year on pref. shs. 5 % payable March 13. Fwd. £5 623.

ENFIELD CABLE WORKS, LTD.—Fin. div. on ord. shs. of 10%, with cash bonus of 5%, making 25% for year, compared with 30% (= 20% p.a.) for preceding 18 months. An issue of 50 000 £1 shs. was offered to ord. shhldrs at £2 p. sh. last week.

BARCELONA TRACTION, LIGHT AND POWER CO., LTD.—On March 20 shhldrs. will meet to consider a plan under which it is proposed to convert the ord. and pref. cap. into shs. of no par value and to take power to issue 400 000 new shs. of no par value.

DUBLIN UNITED TRAMWAYS CO. (1896), LTD.—Net rev. for 1929, £86 240, agst. £152 961 ; amt. available £62 638. Div. at rate of 6% p.a., less tax, to be paid on pref. stk. for half-year endg. Dec. 31, 1929 ; set aside towards renewal of track, £20 000. Fwd. £12 038.

AMERICAN COMMONWEALTH POWER CORPORATION.—Gross earngs. of corporation and affiliated companies for year to Jan. 31, 1930, $25 857 407, agst. $17 903 764 ; net earngs. $115 227 42, agst. $7 077 798. Blce. for reserves, taxes, common stk. divs. and surplus, $3 887 252, agst. $2 599 794.

INTERNATIONAL LIGHTING ASSOCIATION.—Net pft. for 1929, £1 405, agst. £1 270. After paying pref. div. for 1929 and directors' fees for 1928 and placg. £366 to special res. for pref. div., carry fwd. is £50. Holdg. of 6% pref. shs. of Para Electric Railways and Lighting Co. remains as before, but div. on same is 7 years in arrear.

ELECTROBEL CO.—This company is to be reorganised for the purpose of organising on a sound basis the production and distribution of electricity throughout Belgium. The company's activities will be placed under the control of the Société Générale, the Banque de Bruxelles, the Banque de Paris et des Pays Bas, the Mutuelle Solvay, and the Sofina Co.

NORTH AMERICAN CO.—Income statemt. of company and subsidiaries for 1929 shows $26 986 790 for common stk., after mtg. exes. and providg. for depreciatn., reserves and pref. divs. Earngs. equal to $5.03 p. sh. on average number of common shs. of parent company outstandg., agst. $4.68 p. sh. Output of subsidiaries 6 772 637 073 kWh, increase 10·97%.

RUSHDEN AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Net rev. for 1929, £7 696, agst. £6 864, after placing £5 027, agst. £3 007, to depreciatn. Deb. int., £1 663, agst. £1 434 ; loan int., £250, agst. £202 ; income tax, £324, agst. £25 ; to res. £500 (same), deb. exes., £500, agst. nil ; fin. div. 4½%, makg. 8% (same) ; fwd. £1 259, agst. £1 250. Output increased from 2 256 707 kWh to 3 056 654.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—Gross rev. for 1929, £1 019 502, agst. £901 753 ; carried to net rev. acct. £348 201, plus blce. brt. in and int. and divs. from investmts. and allied undertakgs., makg. total £494 736. Blce., after provn. for deb. stk. and loan int., sinkg. fund. pref. div., etc., £234 746. Div. on ord. shs. at rate of 14% p.a. recommended. makg. 10% for year. Fwd. £84 746.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Pft. on workg. for 1929, £171 833, plus £25 437 brt. in and int. from investments, etc., £46 939. Deductg. int. charges, £23 494, and provisn. for sinkg. funds £33 994, left blce., £186 721, agst. £181 206. Fin. divs. of 3% on pref. shs. and 5% on ord. shs. makg. 9% for year, are recommended. To special res. fund (ord. shhlders' benefit under sliding scale for year) £90 941. Blce. £46 832, allocated to co-partners. Electy. sold 248 144 007 kWh, agst. 203 711 271.

LANCASHIRE DYNAMO AND MOTOR CO., LTD.—Pft. for 1929, after charging £7 535 for depreciatn. and obsolescence, and £2 399 for deb. int., £18 157, agst. £21 003. Div. 5% (same), directors' fees £700 (same), res, £5 000 (same), fwd. £7 227, agst. £7 809. During year extnsns. have been made to works of Crypto Co., in view of which a further 12 250 of their ord. shs. have been taken up. Severe competitn. has continued, reducg. prices to an unremunerative level. Amt. of orders on hand is greater than has been the case for some considerable time.

OFFICIAL QUOTATIONS.—The Stock Exchange Committee has granted official quotations to £52 730 7½ % non-cum. "A" ord. stk., £27 412 "B" ord. stk. and £50 516 5½% cum. pref. stk. of Cables and Wireless, Ltd. ; 867 066 ord. shs. of no par value of the Brazilian Traction, Light and Power Co., Ltd. ; 600 000 5s. fully paid ord. shs. of Crampton Parkinson, Ltd. ; 200 000 £1 fully paid ord. shs. of James Keith and Blackman Co., Ltd. ; and 150 000 £1 fully paid 6% cum. pref. shs. of the Shropshire, Worcestershire and Staffordshire Electric Power Co.

CABLE, TELEPHONE AND GENERAL TRUST, LTD.—Net rev. for 1929 £35 909, agst. £26 202, plus £1 050 brt. in. Directors recommend div. on ord. shs. of 6%, agst. 4%. Fwd. £3 706. Authorised cap. was increased in July last from £550 000 to £710 000 by creatn. of 145 000 "A" preference shares of £1 each and 15 000 ord. shs. of £1 each, and a total of 160 217 shs. was issued. As a result of changes in investmts. during year a credit blce. has arisen, wh. has bn. applied in writg. off office furniture and fittings, and blce. has been deducted from figure of other investments in blce.-sheet.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Net pft. for 1929, £36 650, plus £10 663 brt. in. Directors propose blce. divs. on 1st pref. shs. in respect of 6 months to Dec. 31 at rate of 3%, accrued divs. on 2nd pref. shs. in respect of 3 months to Dec. 31 at rate of 1¼%, makg. 5% for year ; and blce. div. on ord. shs. at rate of 10·1811d. p.sh., makg., with intm. div. already paid, standard div. for year of 1s. 7·1811d. p. sh. To special res.—ord. shhldrs' benefit under sliding scale, £10 317 ; appropriation to co-partners, £3 998 ; fwd., £2 123. Electricity sold 19 448 096 kW, agst. 16 404 067, increase 18·56%.

Company Meetings.

ENGLISH ELECTRIC CO., LTD.—At the adjourned meeting of the 6% debenture stock holders last Friday, Mr. W. L. Hichens, chairman, announced that the number of votes polled for the resolution approving the proposed reorganisation of capital, which was discussed at the meeting on February 25th, was 769 401, and the number against was 9 100. He therefore declared the resolution carried by the requisite majority.

UTILITIES AND GENERAL TRUST, LTD.—Mr. Wm. Shearer, presiding at the meeting on February 27th, said one found in

Digitized by Google

reviewing the past year an inflation of prices to points where yields did not enter into calculation, followed by sensational declines, rapid changes in the price of money, and abnormal unsettlement of exchanges. Keeping in view all the happenings of the last six months, it is not surprising that they should have suffered depreciation, and this amounted to approximately 8% on the figure at which investments stood in the balance-sheet. The investments stood in the balance-sheet at £851 609. Income amounted to £52 065, against £38 173. There was a net profit of £25 448, to which had to be added the balance brought forward of £3 170, making a total available of £28 618. There had been paid dividend on 5% preference stock for the year, and interim dividend on ordinary stock of 3 per cent. It was proposed to pay a final dividend of 3% less tax on the ordinary stock, and carry forward £3 118 1s. 1d. The report and accounts were adopted.

Mersey Railway Co.—Mr. James Falconer, presiding at the meeting last Friday, said the net receipts from railway working for 1929 at £89 294, showed an increase of £5 942, and the Board recommended a dividend on the ordinary stock of ¾%, against ½% for last year. Some time ago the Rt. Hon. J. H. Thomas, Lord Privy Seal, intimated that he had approved an application by the London Midland and Scottish Co. for the electrification of the Wirral section of that railway. The electrification of the Wirral Railway was, of course, a matter primarily for the L.M. and S. Co., but it was a step which the Mersey Co. would cordially welcome. The Mersey Railway was in a position, at comparatively small expenditure of capital, and at short notice, to take part in a joint service, and. deal efficiently with all traffic to and from the Wirral area He need not dwell on the important development in that area which might be expected from an adequate service of electric trains between it and Liverpool. The Board assured the L.M. and S. Co. of their readiness to co-operate with them in affording to the public a frequent service of through trains.

Northampton Electric Light and Power Co., Ltd.—At the meeting last Friday, Mr. F. H. Thornton (chairman) said their net capital expenditure during the year was £122 255, making their total capital expenditure £1 385 513. Revenue from sale of current had risen from £158 487 to £190 917, and electricity sold from 26 500 000 to 33 000 000 kWh. During the past year approximately 40 miles of high and low tension mains had been laid in the area covered by the Brackley, Buckingham and Winslow Order. They had purchased the distributing plant and goodwill of the Buckingham Electric Light Co. Brackley and four villages in that neighbourhood had been connected. The use of cookers, the design of which had been much improved lately, had grown enormously. Many large country houses and even cottages used no other form of cooking stove, and automatically controlled electric water heaters were growing in popularity. They had also adopted assisted wiring schemes. It was proposed to pay a final dividend of 6% on the ordinary shares, making 10% for the year. The report and dividend were approved.

Mather and Platt, Ltd.—Mr. L. E. Mather, presiding at the meeting last Friday, said the directors were able to report an increase of profit on the previous year of £27 000, which, with the smaller amount brought forward, still gave a slightly larger sum available for distribution. This profit was arrived at after full depreciation had been made, as hitherto. They therefore recommended the same dividend and bonus as last year, leaving £109 855 to be carried forward. The results now shown had been produced by a larger turnover in all departments. He would like to say a few words with regard to Russia. The reopening of diplomatic relations between Great Britain and the U.S.S.R. gave them confidence that more business might now be possible. It was encouraging to find that British exports for the last three months of 1929 were nearly three times what they were for the same period of 1928. Unfortunately, these exports largely consisted of raw materials, but the need for manufactured goods was great. The demand for their own productions had not yet revived, but one of their representatives was again in Moscow, and they hoped more business would result. The report was adopted.

Electrical Distribution of Yorkshire, Ltd.—Mr. R. W. Wickham, presiding at the meeting on Tuesday, said for 1929 they had a profit of £96 481, which enabled them to pay nearly £20 000 more in dividends than last year, to put away £17 500 to reserve, and to slightly increase the carry-forward. The results put before the shareholders to-day had certainly exceeded his expectations. Trade in the company's area had been very difficult, and to have produced such figures as these reflected the greatest credit on Mr. Woodhouse and all his staff. This coming year they would feel the full burden of the dividend on the new capital, and to maintain their dividend would require another £24 000. On the other hand, they paid £11 000 odd in bank interest He was quite prepared to repeat his last year's prophecy that they would be able to pay their usual dividend for 1930. In 1921 the total units sold, excluding traction and large power, was 1 379 000. Their sales last year were 16 608 000. In 1921 the average price per unit sold was 4·6d. per unit; in 1929 it was 3·1d., a drop of 32%. At the end of 1923 the issued capital was £150 000. Since that date four issues had been made, bringing the total capital issued to £1 400 000. The shares issued last year were offered at 5s. premium, and after paying the costs of the issue the balance was added to the share premium account, bringing that account to £315 615, which was available with the reserve fund for depreciation and other purposes. The company had been authorised during the past year to supply electricity for all purposes under new Orders, which increased the company's area of supply to 1 197 square miles, with a population of 744 000. The report and accounts were adopted.

Southern Railway Co.—At the meeting on February 27th, Brig.-Gen. Everard Baring (chairman) announced that under the remission of the railway passenger duty the board had decided to proceed with the electrification of the London to Brighton and Worthing lines. This extension presented a different problem from the electrification of the suburban lines. They had not only to decide the type of motor and the type of carriage best suited to the requirements, but also whether the system should be worked on the higher or the lower of the voltages laid down in the Order about to be issued by the Ministry of Transport. This Order would prescribe a maximum voltage of 750 for trains worked under the third-rail system and a maximum of 1 500 for a system worked by means of overhead conductors. It might be desirable to recall that in 1923 the company decided to adopt the 660 V third-rail system as a standard, in preference to a higher voltage system. Nearly 800 miles of line had been electrified at 660 V, and any increased voltage which it would now be practicable to adopt for the present scheme would confer no benefit. They therefore decided that the extension to Brighton and Worthing should be worked on the same voltage. They had decided to adopt the multiple unit system rather than electric locomotives. It was proposed that south of Coulsdon electricity should be obtained from the "grid," and this would be supplied through sub-stations at Croydon, Three Bridges, and Southwick. Supply would be given at each point as three-phase energy at a pressure of 33 000 V between phases and a frequency of 50 cycles per second. North of Coulsdon electricity would be supplied from Deptford, with the exception of a small portion which would come from Durnsford Road. The steam train mileage that would be discontinued amounted to about 1 972 000 miles per annum. They proposed to substitute for this an electric train service with a mileage of about 4 921 000, thereby providing an increase in the train service of no less than 150%. The total cost of the whole scheme, including the resignalling of the line from Purley to Brighton, was estimated at £2 700 000.

Underground Railways.—Lord Ashfield presided on February 27th at the annual general meetings of the Underground Electric Railways Co. of London, Ltd., and the companies which it controls, including the London Electric, City and South London and Central London Railway Companies, the Metropolitan Electric and London United Tramways, the South Metropolitan Electric Tramways and Lighting Co., the London and Suburban Traction Co. and the London General Omnibus Co. The chairman said passengers carried showed some small advance upon 1928. The total number carried by railway, tramway, and omnibus amounted to 2 175 000 000. The tramways carried 9% of this total, the railways 18%, and the omnibuses 73%. During last year the passengers carried by the railways increased by 7%, those carried by the tramways increased by 4%, and those carried by the omnibuses by just over 1%. In 1929 the total car miles run by the companies in that group were 281 000 000, an increase of ¾%. Since 1918 they had spent £29 000 000 upon the provision of traffic facilities, but it was not enough. They had put before the Government a programme for raising and expending capital to the extent of some £13 500 000 for the extension and completion of their underground railway system. The common fund for 1929 amounted to £1 150 426. It was £22 761 less than in 1928. The total amount appropriated to reserves for contingencies and renewals by this group of companies was £813 357, and, including certain

Digitized by Google

miscellaneous provisions for the equalisation of expenditure and other purposes, the sums set aside in 1929 amounted altogether to £1 161 676, or £14 128 more than in 1928. In this last year the receipts of the three tramway companies from traffic amounted to £1 275 552, an increase of £48 007. Steps had been taken, in anticipation of assistance, for the construction of 46 new tramcars for working the Uxbridge Road. The gross income of the Underground Co. amounted in 1929 to £1 182 533, an increase of £28 735, due chiefly to the interest and dividends received from the increased holdings in the stocks and shares of the North Metropolitan Electric Power Supply Co. The expenses of the company, including the interest charges, required £587 786, a reduction of £16 372. The reports and accounts of the several companies were adopted, and the dividends, as set out in our issue of February 21st, were approved.

MIDLAND COUNTIES ELECTRIC SUPPLY CO., LTD.—Mr. George Balfour, M.P., presiding at the meeting on Monday, said he was glad to be able to report continuation of the progress of the business of the subsidiary companies owned by that company. With an expenditure of something like £400 000 per annum in recent years, largely for providing services in new territory each year, it was no small achievement to be able not only to maintain but to increase the dividend so as to provide a moderate return on the shareholders' capital. Compared with the movement of capital, the trading balances had grown from £48 391 in 1919 to £349 209 in 1929, of which £340 000 was from electricity supply. The balance of the transport earnings, amounting to £23 000, was left as depreciation in the subsidiary companies. With regard to the power and lighting properties, the electricity sold during the past year aggregated 165 602 000 kWh, an increase of 32 006 000, or 24 % over the output for 1928. The output for 1929 was more than three times that of 1924. An additional 5 604 consumers were connected during the year, bringing the total up to 26 181. In 1919 the number was 2 567. The total load connected was now 125 180 kW, an increase of 19 880 kW compared with the previous year. The maximum load on the generating plant was 50 400 kW, to which must be added 1 200 kW obtained from other sources, or a total of 51 600 kW, compared with less than 5 000 kW in 1919. Extensions in the transmission and distributing system involving the provision of 118 miles of e.h.t. lines and 135 miles of l.t. distributors, had been brought into operation during 1929. They now owned 746 route miles of extra high pressure line and 598 route miles of l.t. line. The accounts showed an available balance of £158 578, and it was proposed to pay a dividend at the rate of 7 % on the ordinary shares. If the Coal Mines Bill was passed in its present form, it was very probable that the cost of coal would be increased, and the additional cost would be passed on to the public. An advance of 1s. per ton would mean an increased burden upon the company's consumers of £8 000 per annum. Whatever legislation was sound and necessary they must accept, take the rough with the smooth, but he could hardly believe that this artificial attempt to readjust industry could be of any benefit to the country. A proposal to increase the authorised capital by £500 000 to £4 500 000 was approved.

New Companies.

COMMERCIAL RADIATORS, LTD.—Cap., £700. Electrical and general engineers. Reg. Office: 4, Vicarage Mews, Blackboy Lane, London, N.15.

RADIO IMPROVEMENT CO., LTD.—Cap., £500. Wireless, electrical, telephone and general engineers, wireless experts, etc. Solicitor: J. S. Crook, "Amalfi," Forest Road, Meols, Cheshire.

PORTHCAWL ELECTRICITY CO., LTD.—Cap., £20 000. To carry on the business of an electric light and power company. Reg. Office: Magnet House, Kingsway, London, W.C.2. (Public Co.).

SHOOLBRED ELECTRICAL CO., LTD.—Cap., £5 000. To carry on business of electrical and general engineer hitherto carried on by H. G. Shoolbred, as Shoolbred and Connell at Luton and elsewhere, etc.

DRONFIELD AND DISTRICT ELECTRIC SERVICE, LTD.—Cap., £500. —Electricians, electrical and mechanical engineers, manufacturers and workers of and dealers in electricity, etc. Reg. Office: Rose Hill, Dronfield.

C. W. OUTRAM AND CO., LTD.—Cap., £50 000. To acquire business of a manufacturer of electrical porcelain, etc., carried on by W. Hassall, at Boothorpe Works, Excelsior Works, Rawdon Works, and Little Thorn Pottery, Woodville, Derbyshire. Solicitor: A. H. Timms, Swadlincote.

BRITISH DOMINION FIRE ENGINEERING CO., LTD.—Cap., £2 000. To acquire the business of fire engineer carried on by W. D. Rees at Neath, Glam., as "South Wales Fire Appliance Co.," and to carry on same and business of contractors for fire prevention work, electrical engineers, etc. Solicitor: A. Jestyn Jeffreys, Neath.

KINETIC WIRELESS AND ELECTRIC SUPPLIES, LTD.—Cap., £2 500 —To acquire business of dealer in wireless and electric supplies now carried on by A. L. Chatfield at 5, Godstone Road, Caterham, and 82, Godstone Road, Whyteleafe, Surrey, as "Kinetic Wireless and Electric Supplies." Reg. Office: 5, Godstone Road, Caterham, Surrey.

LANCASHIRE ELECTRIC SIGN CONSTRUCTION CO., LTD.—Cap., £1 000. To acquire from W. Donegani, the inventor and patentee, his invention called the "Controlagraph," and to carry on business of advertising contractors, suppliers of electrical, luminous, and other signs, signalling apparatus, etc. Solicitors: Robert B. Batty and Co., 4, Clarence Street, Manchester.

UPAC PUBLICITY CO., LTD.—Cap., £500. To acquire business of advertising contractors and agents carried on by W. Coop and F. E. Milner at Blackpool as "Universal Publicity and Advertising Co."; to manufacture and deal in lamps, lanterns, electrical devices, and all kinds of materials used in connection with displayed advertisements, etc. Solicitors: Jacob Parkinson and Co., 17, Birley Street, Blackpool.

INTERNATIONAL MARINE RADIO CO., LTD.—Cap., £60 000. To carry on business connected with owning, operating, purchasing, selling, leasing, hiring, and maintaining telephonic or telegraphic apparatus, etc., for communicating by radio-electric means, between fixed points and mobile stations, and also between any two or more mobile stations. Solicitors: Johnson, Jecks and Colclough, 24, Austin Friars, London, E.C.2.

FERGUSON SHIERS AND CO. (FAILSWORTH), LTD.—Cap., £125 000. To acquire business carried on by F. A. Shiers as Ferguson, Shiers and Co., at Phœnix, Failsworth, Manchester; to carry on said business and that of manufacturers of, and dealers in, compositions and mouldings, articles and parts used in connection with accumulator and electrical trades., etc. Solicitors: Mayo Elder and Co., 10, Drapers Gardens, London, E.C. (Public Co.)

BRITISH RADIOSTAT CORPORATION, LTD.—Cap., 1 000 000 shs. without par value. To acquire, develop and turn to account trademarks, formulæ, secret processes, trade names and distinctive marks, all inventions, improvements and processes used in connection with, or secured under, patents or otherwise of Canada or elsewhere, etc. British address: 29, George Street, Hanover Square, London, W.1. (Company incorporated in Canada).

TITANIUM AND RARE METALS, LTD.—Cap., £7 500. To acquire from W. G. Moore all his existing patents and the benefit of all his patent rights and pending applications throughout the world in relation to the manufacture and use of electrodes of special metals and alloys, and in particular of alloys of Titanium and rare and other metals with tungsten for the purpose of rays for therapeutic and other purposes, etc. Reg. Office: Panton House, 25, Haymarket, London, S.W.1.

THE LEAD MARKET.

The market opened last week with an easier tone, but, according to James Forster and Co., on support from producing interests, prices were bid up to a higher level. In spite of this, Tuesday saw a bad break, the market finally closing 20s. per ton lower on the day. Wednesday's market was steady, but on Thursday an easier tone was seen once more and prices fell a further 10s. per ton. The American price was lowered on February 27th, from 6.25 to 6.10 cents per lb., in sympathy with values in London.

Closing prices on February 28th were £20 1s. 3d. for February and £20 for March, April and May, 22s. 6d. to 20s. per ton lower on the week.

Deeds of Arrangement.

HOLT William Percy, trading as W. P. HOLT AND CO., 14, Chester Street, Bradford, electrical contractor. Dated February 21st, filed February 22nd. Trustee, P. Hodgkinson, 48, Sunbridge Road, Bradford. Liabilities unsecured, £1 986; assets, less secured claims, £1 315.

KERSHAW, Selwyn, and ORMIAN, Harold, trading at Broad Lane, West Derby, and 4, Daulty Street, Liverpool, as S. KERSHAW AND CO., electrical and radio engineers. Dated February 19th, filed February 26th. Trustee, P. S. Booth, 2, Bixteth Street, Liverpool. Liabilities unsecured, £457; assets, less secured claims, £260.

WOODMAN, William, trading as T. WOODMAN AND CO., 44, Norton Street, Liverpool, electrical contractor. Dated February 24th, filed March 1st. Trustee, P. S. Booth, 2, Bixteth Street, Liverpool. Secured creditors, £901; liabilities unsecured, £1 039; assets, less secured claims, £627.

Receiverships.

CRANMER BROWN (R.), LTD.—H. L. Haller, estate agent, of 62, Whitefriargate, Hull, was appointed receiver on February 22, 1930, under powers contained in mortgage dated November 14th, 1920.

BOWYER-LOWE CO., LTD.—R. L. Marsh, of Ethelburga House, Bishopsgate, E.C., was appointed receiver on February 25th, 1930, under powers contained in debenture dated December 3rd, 1929.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

AEONIC RADIO, LTD., London, E.C.—Registered February 12th, £16 000 (not ex.), charge, to Bank; charged on Salfords, Horley, and 15, Cromer Street, King's Cross.

Satisfaction.

SIEMENS BROTHERS AND CO., LTD., London, S.W., telegraph engineers.—Satisfaction registered February 17th, £34 800, part of amount registered January 21st, 1918.

Private Meetings, etc.

[Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.]

EDISON ILLUMINATING, LTD., 55, Victoria Street, S.W., electrical and wireless factors. The statutory meeting of creditors was held on February 27th at the offices of Hacker, Rubens, Horner and Co., C.A., 23, Surrey Street, Strand, W.C., when Mr. Gotelee, who had been nominated the liquidator of the company, submitted a statement of affairs which disclosed liabilities of £1 817, of which £471 was due to creditors for goods; there were loan creditors amounting to £262; expense creditors amounted to £277; there was a bank overdraft of £517, and directors' fees amounted to £89. The assets totalled £142, thus disclosing a deficiency of £1 675. Mr. R. Alfred, the managing director of the company, presided. The liquidator said that the company was formed in August, 1927, with a capital of £400, all of which was issued for cash. The principal product of the company was the Sun-Glo Lamp which was obtained from America, and in many cases when the supplies arrived in this country many were broken, and consequently a number of the orders had to be cancelled. In November, 1928, it was arranged that the supplies should be obtained from this country, and the consignments from America cancelled. By that time, however, the working capital of the company had been expended, and although the directors obtained a further £200, it proved totally inadequate for the carrying on of the business. In October, 1929, the managing director of the company got into touch with people who were prepared to put up additional working capital, but unfortunately that proposition never matured. The managing director, however, was satisfied that the product was a good one, and several substantial contracts were practically completed, and he considered that if he were allowed to carry on the business it could be conducted successfully in the future. With that end in view, he was prepared to offer the creditors a royalty of 7½ % on all future sales until 10s. in the £ had been paid to the creditors. A creditor asked how long Mr. Alfred anticipated it would be before the creditors would receive their 10s. in the £ if the scheme were eventually formulated. Mr. Alfred replied that he considered that the full amount would be paid in less than two years. Answering a creditor, the liquidator said that for the year to November, 1928, the sales were £2 054; the purchases were £993; there was a gross profit of £1 100; and a net loss of £450. From November, 1928, to February 15th of this year the sales were £1 185; the purchases, 769; there was a gross profit of £368 and a net loss of £1 300. After discussion, it was decided that the liquidation should be continued, with Mr. Gotelee as liquidator, and a committee of inspection consisting of the representatives of two of the largest creditors, was also appointed.

BURGOYNE WIRELESS, LTD.—The statutory meeting of creditors in this voluntary liquidation was held on March 3rd at the offices of Baker, Sutton and Co., C.A., Eldon Street House, E.C., when a statement of affairs was presented which disclosed liabilities of £4 120, of which £4 003 was due to unsecured creditors, and net assets expected to realise £1 635, or a deficiency of £2 485. Mr. Milner Gray stated that the present company was formed on December 14th, 1928, with a nominal capital of £6 000 in £1 shares. The company took over the business of Burgoyne Manufacturing Co., Ltd., which was formed in May, 1928, and in which Fordhams, Ltd., had a debenture and appointed a receiver in October, 1928. Fordhams, Ltd., held 4 000 shares in Burgoyne Wireless, Ltd. The solicitor for the company said that Messrs. Fordhams could not make an offer because a receiver had been appointed of that company, and it had also gone into liquidation. The future of Messrs. Fordhams was a very problematical one. He, as the solicitor to the company, had been approached by a firm to know whether Burgoyne's would sell their assets and goodwill. The receiver for the debenture holder had sent out a price which would enable the creditors to have a fairly good dividend if the negotiations materialised. He was going to suggest that a strong committee of inspection should be formed to investigate the whole of the affairs of the company and, if necessary, to report to a further meeting. On the motion of the representative of Messrs. Mullards, seconded by the representative of the Fuller Accumulator Co., it was decided that Mr. Baker should be appointed as liquidator with a committee of inspection.

M'QUEEN (H. A.) AND CO., LTD., electrical engineers, 182, West George Street, Glasgow. A meeting of the creditors of the above was held on February 28th at the Accountants' Hall, St. Vincent Street, Glasgow. The statement of affairs submitted showed ranking liabilities of £3 773. The assets were estimated to realise £5 868, or an apparent surplus of £2 095 9s. 11d. It was reported that the company commenced trading on October 1st, 1928, there having taken place an amalgamation of two existing businesses. The idea was that the company should carry on a trading business, and also start the manufacture of switchboards. It was estimated that the profits from the trading would be sufficient to enable the company to carry on until such time as the manufacturing end paid its way. The vendors were allotted fully paid shares in payment of the assets transferred. The existing premises were unsuitable. Other premises were acquired, and were fitted up at a cost of approximately £1 200. Subsequently further alterations were carried out, bringing the total cost up to £2 100. The company found itself short of working capital owing to the fact that the turnover on the trading side of the business did not come up to expectations. A resolution was passed, confirming the appointment of Mr. Hutcheson as liquidator of the company, with a committee consisting of the representatives of the General Electric Co., the British Electric Co., Walter and W. B. Galbraith, and Mr. McMillan.

SYMPHONY GRAMOPHONE AND RADIO CO., LTD.—At a meeting of the creditors, held on February 28th, when a scheme was approved providing for the payment in cash of all creditors under £10 in two months from the date of the scheme becoming operative; payment in cash of all preferential or essential service creditors; payment in cash to the other unsecured creditors, other than Symphony (Foreign), Ltd., rateably 5s. in the £ within two months of the scheme being operative, and the issue to creditors of second debenture stock. The scheme also provided to pay in cash all debts and liabilities incurred on or after January 2nd last, working capital to be provided by creation of a series of first debentures to an aggregate amount not exceeding £50 000, carrying interest at the rate of 6%, and charged by the way of floating charge upon the whole of the company's undertaking and property. The outstanding debts and liabilities of the company were set out in the scheme, which showed trade creditors for approximately £44 664; Symphony (Foreign), Ltd., were put down as creditors for £13 578; royalties due, £10 464; a cash advance by Mr. D. M. Davies, £1 400; and contingent claims on contract, approximately £41 000. The issued and fully-paid up capital of the company was £189 958.

London Gazette, etc.

Winding-up Petition.

M. E. D. A. S., LTD. A creditor's petition for winding-up has been presented by Dualite, Ltd., 52-53, Fetter Lane, and is to be heard at the Royal Courts of Justice, Strand, London, on March 10th.

Companies Winding-up Voluntarily.

ARCTIC ELECTRIC SUPPLIES, LTD. Meeting of creditors, Anderton's Hotel, Fleet Street, London, E.C.4, on March 10th, at 3 p.m.

DUALITE, LTD. By special resolution, January 17th. W. E. Ogden, Audrey House, Ely Place, London, chartered accountant, appointed as liquidator.

EDISON ILLUMINATING, LTD. By reason of its liabilities, February 26th. B. C. Gotelee, chartered accountant, 23, Surrey Street, Strand, W.C.2, appointed as liquidator.

Bankruptcy Information.

CLEMENTS, Miss M. K., trading as K. RAYMOND, 27 and 28A, Lisle Street, Leicester Square, London, wireless apparatus dealer. Receiving order, February 27th. Creditor's petition. First meeting, March 13th, 11.30 a.m., and public examination, April 2nd, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

COLLER, Lawrence James, 63, Henton Road, Leicester, electrical engineer, trading as J. AND F. COLLER. Receiving order, February 25th. Debtor's petition. First meeting, March 11th, 3 p.m., Official Receiver's Office, 1, Berridge Street, Leicester. Public examination, April 4th, 11 a.m., The Castle, Leicester.

FRANKLIN, Victor, Newtown Garage, Malvern, Worcester, automobile engineer and electrician. Receiving order, February 24th. Debtor's petition.

Notices of Dividends.

BARNETT, Timothy, 934, Woodborough Road, Mapperley, Nottinghamshire, electrical contractor. First and finald dividend, 7d. per £, payable March 10th, 18, Low Pavement, Nottingham.

GATESHILL, Harry, 113, Witham, Kingston-upon-Hull, wireless engineer. First and final dividend, 8d. per £, payable, March 4th, Official Receiver's Office, 37, Scale Lane, Hull.

JONES, Thomas Ernest (trading as BERRINGTON JONES), 138, Northgate Street, Chester, electrical engineer. First and final dividend, 5s. 4d. per £, payable, March 7th, 5, Hunter Street, Chester.

MARSH, Basil, 17, Victoria Road, Brighton, Sussex, electrician. First dividend, 5s. per £, payable, March 7th, A. E. Orbell, 6 and 7, Old Steine, Brighton.

Application for Discharge.

COHEN, George, 49, Newman Street, Oxford Street, London, electrical engineer. Hearing, March 26th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Order Made on Application for Discharge.

COHEN, George, 49, Newman Street, Oxford Street, London, electrical engineer. Discharge suspended for five years, until February 5th, 1935.

Bankruptcy Proceedings.

Frank Walter Charles HOEY, late of 29, Sicilian Avenue, London, W.C., wireless and electrical dealer. A sitting for the public examination of the debtor was appointed in the London Bankruptcy Court on Friday before Mr. Registrar Mellor. The debtor who was adjudged a bankrupt on January 7th, has lodged a statement of affairs showing ranking liabilities £4 635 and estimated assets £2 409. The Official Receiver said that the debtor was a patient in hospital suffering from dysentery, having been admitted on February 3rd. He would probably be discharged six weeks from that date. He understood that the debtor was not in a fit state to be interviwed, and in these circumstances he applied for an adjournment of the public examination until May 1st. This application his Honour granted.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

293 705 M. BUCHHOLZ. Device for protecting transformers, switches, motors, generators, and similar electrical machines and apparatus. (8/7/27.)
321 438 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Electric discharge tubes. (9/7/28.)
321 439 G. D. POWELL. Method of supporting the armatures of electromagnetic devices such as loud-speakers. (10/7/28.)
321 441 J. L. BAIRD and TELEVISION, LTD. Television apparatus and the like. (11/7/28.)
321 391 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Processes for coating metallic or non-metallic bodies with vanadium. (27/7/28.)
321 409 J. A. CRABTREE. Electric couplings of the plug-and-socket type. (30/7/28.)
321 392 J. W. CAIRNS and F. A. THOMASSIN. Volume and tone control systems in electrical sound reproduction. (31/7/28.)
321 426 RELAY AUTOMATIC TELEPHONE CO., LTD., BRITISH POWER RAILWAY SIGNAL CO., LTD., and J. H. GRAHAM. Electric signalling or indicating apparatus. (1/8/28.)
321 427 R. GOLD and J. SCHMAUSS. Electric motors. (2/8/28.)
321 428 J. A. CRABTREE. Electric switch mechanism, and the mounting of such mechanism in boxes, cases, and the like. (3/8/28.)
321 393 LANCASHIRE DYNAMO AND MOTOR CO., LTD., and J. W. HOWARD. Alternating current electric motors. (4/8/28.)
321 412 H. F. HOWELLS and E. C. HOWELLS. Electric motors. (7/8/28.)
321 430 G. R. SEARLE. Loud-speakers for wireless apparatus or the like. (8/8/28.)
321 446 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.) Water-cooled vacuum tubes. (9/8/28.)
321 449 H. T. LOGAN. Electric switches. (9/8/28.)
295 397 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electrical circuit interrupters. (11/8/27.)
321 454 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and O. A. PEARCE. Telephone systems. (10/8/28.)
296 085 GENERAL CABLE CORPORATION. Method of heating the non-metallic covering of electric conductors, such as a single or stranded wire, cables, or the like. (26/8/27.)
300 192 L. GASTON. Mechanism for automatically controlling the lighting of electrically lighted vehicles. (22/8/28.)
321 490 GENERAL ELECTRIC CO., LTD., and E. P. L. WESTELL. Circuits comprising thermionic valves. (1/9/28.)
296 762 A. BLONDEL. Signalling systems for giving audible signals. (7/9/27.)
321 502 L. H. REID. Push-pull electric switches. (17/9/28.)
321 503 G. H. COLLINS and H. F. COLLINS. Electric heaters. (18/9/28.)
321 513 A. G. ELLIS, H. DIGGLE, and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Gas-treating devices for enclosed electrical apparatus. (27/9/28.)
321 522 P. A. SMITH, DR. O. FABER, and DRAKE AND GORHAM, LTD. Fittings for electric lighting and the like systems. (5/10/28.)
298 209 IGRANIC ELECTRIC CO., LTD. Reproducer units adapted to be actuated by a gramophone record for producing electrical impulses. ((5/10/27.)
321 523 W. SCHWEITZER. Electromagnetic switch. (8/10/28.)
298 987 BRITISH THOMSON-HOUSTON CO., LTD. X-ray tubes. (18/10/27.)
321 531 ELECTROLUX, LTD. (INVENTIA PATENT-VERWERTUNGS GES.). Machines for washing clothes. (23/10/28.)
321 533 W. V. BUTTERFIELD, A. W. BUTTERFIELD, and S. BUTTERFIELD (trading as MYCROMET MANUFACTURING CO.). Ceiling-roses and like electric fittings. (24/10/28.)
321 534 W. V. BUTTERFIELD, W. E. EVANS, A. W. BUTTERFIELD, and S. BUTTERFIELD (trading as MYCROMET MANUFACTURING CO.). Cord grips for electric lamp-holders, adapters, and the like. (24(10/28.)
312 335 SIEMENS AND HALSKE AKT.-GES. Telephone cables. 26/5/28.)
321 549 J. LUCAS, LTD., E. O. TURNER, and E. H. C. ROBINSON. Electric dynamos or motors. (8/11/28.)
321 553 MULLARD RADIO VALVE CO., LTD., and B. KROL. Electrode construction for electron-discharge tubes. (9/11/28.)
321 560 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Thermionic amplifier circuits. (12/11/28.)
321 562 G. A. COX. Apparatus for maintaing a constant speed of electric motors. (13/11/28.)
301 868 O. NEISS and H. BOLLMANN. Induction heating-apparatus. (7/12/27.)
321 571 LODGE-COTTRELL, LTD. (METALLGES. AKT.-GES.). Method of and means for cleaning the electrodes of electrical gas-cleaning apparatus. (27/11/28.)
307 012 SCINTILLA AKT.-GES. Electric reversing switches. (1/3/28.)
304 290 INTERNATIONAL GENERAL ELECTRIC CO., INC. Regulating transformers. (18/1/28.)
321 612 H. N. SKERRETT (H. FULD AND CO. TELEPHON-UND TELEGRAPHENWERKE AKT.-GES.). Micro-telephones. (29/1/29.)
305 632 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Direction-finding radio apparatus. (8/2/28.)
309 955 BRITISH THOMSON-HOUSTON CO., LTD. Electric transformers. (18/4/28.)
311 293 DR. P. MEYER AKT.-GES. Mercury electric switches. (8/5/28.)
321 415 RELAY AUTOMATIC TELEPHONE CO., LTD., BRITISH POWER RAILWAY SIGNAL CO., LTD., and J. H. GRAHAM. Electric signalling or indicating apparatus. (1/8/28.)
321 463 C. W. COX and C. E. C. SHAWFIELD. Switch-fuse. (9/6/28.)
321 416 J. A. CRABTREE. Electric switch mechanism, and the mounting of such mechanism in boxes, cases, and the like. (3/8/28.)
321 696 J. E. ALLAN and S. B. FREEMAN. Method of manufacturing insulated electric cables. (17/5/28.)
321 661 E. W. L. COWAN, W. E. KING, and MEASUREMENT, Ltd. Electric time switches. (9/6/28.)
292 086 AKT.-GES. BROWN, BOVERI, ET CIE. System of automatic control for the generation of energy in an electric power plant according to a prescribed table in dependence on the time. (11/6/27.)
294 200 RADIO FREQUENCY LABORATORIES, INC. Thermionic valve circuits. (20/7/27.)
321 663 E. R. AND F. TURNER, LTD., and F. H. JOHNSON. Eddy current brake. (13/7/28.)
321 671 J. NEALE. Delayed action electric relay service. (9/5/28.)
321 644 F. A. MITCHELL. Thermionic valve amplifiers.
321 673 CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., and J. URMSTON. Telephone repeater circuit arrangements. (15/5/28.)
321 678 BRITISH ELECTRIC TRANSFORMER CO., LTD., and J. L. THOMPSON. Means for dissipating the heat generated by electrical apparatus immersed in liquid within a casing. (11/8/28.)
295 689 DR. S. LOEWE. Method of mounting electric leads in thermionic valves. (17/8/27.)
321 664 A. ZAJDLER. Electrical advertising apparatus. (14/8/28.)
321 681 S. C. WHAITE. Electric storage batteries or electric accumulators. (15/8/28.)
321 682 STANDARD TELEPHONES AND CABLES, LTD., and A. H. REEVES. Electric signal systems. (15/8/28.)
321 686 NALDER BROS. AND THOMPSON, LTD., and C. L. LIPMAN. Electric relays of the time selective type. (15/8/28.)
321 688 P. WILSON. Mounting of vibrating reeds, more particularly for use in connection with electromagnetic gramophone picks-up, loud-speakers, an the like. (15/8/28.)
321 710 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.). Submarine cables. (16/8/28.)
321 711 GENERAL ELECTRIC CO., LTD., and W. H. PETERS. Inductance coils for wireless signalling apparatus. (16/8/28.)

33 856 G. Newton and C. P. Smith. Switching mechanisms for telephone systems.
33 776 N. Rimmer. Electric signalling apparatus.
33 755, 33 756 J. H. Runbaken. Electric bells.
33 757 J. H. Runbaken. Water heaters.

COMING EVENTS.

Friday, March 7th (To-day).

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Paper by Messrs. A. E. Moore and W. T. Slater on "An Investigation of the Frequency Variations in Induction Watt-hour Meters." 7 *p.m.*

North-East Coast Institution of Engineers and Shipbuilders.—Institution Rooms, Bolbec Hall, Newcastle-upon-Tyne. Informal meeting. Discussion on "The Effect of the Use of Electricity in Workshops on Efficiency and Costs." 7.15 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre, Students' Section).—Armstrong College, Newcastle-upon-Tyne. Paper by Mr. W. A. Cook on "Insulation Testing." 7.15 *p.m.*

Friday, March 7th—Saturday, March 15th.

Business Efficiency Exhibition.—White City, Shepherd's Bush, London, W

Saturday, March 8th.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Electrical Power Engineers' Association.—Café Royal, Regent Street, London. Annual dinner and dance. 6.45 for 7 *p.m.*

Monday, March 10th.

Electrical Contractors' Association (Hastings Branch).—Lewcock's Restaurant. Ordinary meeting.

Electrical Contractors' Association (Liverpool Branch).—Ordinary Meeting.

Institution of Electrical Engineers (Western Centre).—Merchant Venturers' Technical College, Bristol. Paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched Arc Switch" 6 *p.m.*

Institution of Heating and Ventilating Engineers (Associate Members' and Graduates' Section).—Borough Polytechnic, Borough Road, London, S.E. Paper by Mr. L. J. Fowler on "Some District Heating Systems." 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-upon-Tyne. Paper by Mr. H. H. Harrison on "Developments in Machine Telegraph Systems and Methods of Operation." 7 *p.m.*

Tuesday, March 11th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Ordinary meeting. Corridor Chambers. 2.30 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, Leeds. Annual dinner. 7 for 7.30 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. Paper on "Condensing Plant and Accessories." 7.15 *p.m.*

Institution of Electrical Engineers (North-Western Students' Section).—Engineers' Club, Albert Square, Manchester. Paper by Mr. A. M. Robertson on "Electrical Insulating Materials." 7.15 *p.m.*

Institution of Electrical Engineers (South Midland Students Section).—Birmingham University. Paper by Mr. F. J. Baldwin on "Overhead Line Work." 7.30 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Freemasons' Hall George Street, Edinburgh. Faraday lecture on "Broadcasting by Electric Waves," by Capt. P. P. Eckersley. 8 *p.m.*

Wednesday, March 12th.

Electrical Contractors' Association (Eastbourne Branch).—Ordinary meeting.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting.

Institute of Metals (Swansea Local Section).—Thomas's Café, High Street. Paper by Mr. A. Glynne Lobley on "Electric Heat-Treatment Furnaces." 7 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, George Street, Glasgow. Annual general meeting. 7.30 *p.m.*

Thursday, March 13th.

Electrical Contractors' Association (East Yorks. Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Institution, Victoria Embankment, London. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansall on "The Imperial Chemical Industries Limited's Steam and Electric Power Plant at Billingham." (To be illustrated by a cinematograph film.) 6 *p.m.*

Institute of Patentees.—Caxton Hall, Westminster, London. Lecture by Mr. P. Marshall on "The Inventor's Workshop." 8 *p.m.*

Friday, March 14th.

Birmingham Electric Club.—Grosvenor Room, Grand Hotel. Annual dinner.

Ex-British Westinghouse Association.—Hotel Cecil, Strand, London. Re-Union Dinner.

Institute of Metals (Sheffield Local Section).—Non-Ferrous Section of the Applied Science Department of the University, St. George's Square. Paper by Mr. A. Glynne Lobley on "Electric Heat-Treatment Furnaces." 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. W. A. Sallis on "An Outline of Siemens No. 50 Telephone Switching Equipment." 7.30 *p.m.*

Saturday, March 15th.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Patriotism and Publicity.

SIR FELIX POLE, at the end of the address which he gave to the Batti Wallahs Society last week, quoted the views of an anonymous friend on the subject of increased publicity for the electrical industry. These views, which are given in full on page 331 of this issue, are emphatic and clear. "A full dose of modern publicity and salesmanship" is all that is required, in his opinion, to bring the consumption of current into line with present output capacity. That highly desirable condition would not only bring prosperity to supply undertakings and installation contractors. It would also benefit manufacturers by "an unprecedented accretion of home orders." They, in turn, if they would "bring their publicity and business-getting machinery at home and abroad to the same fine pitch as their workshop machinery" would soon be handling outputs that would permit them "to pay bigger dividends and to reduce prices." This unknown mentor sums up the necessities of the industry in the slogan: "Patriotism and Publicity." He explains that the first word means "loyal support by each individual of the respective organisations representing the electrical industry at large and of his section of the industry." Both collective and individual effort are to be understood as implicit in "Publicity."

It is certainly the case that, taken as a whole, the expenditure of the electrical industry on publicity is much below that of most large undertakings which sell goods or services to the public. The recommended scale of contribution to the funds of the British Electrical Development Association is modest enough, and could be multiplied many times without placing the supply undertakings in any danger of being accused of extravagance. Yet in actual practice E.D.A.'s income amounts only to about half the annual income that would be available if all supply undertakings contributed on the recommended basis. As to the value of the work which is being accomplished by E.D.A. with its limited financial resources there is no question. We give a description on another page of the exhibit which the Lighting Service Bureau of E.L.M.A., in collaboration with E.D.A., has placed in the booking hall of Charing Cross Underground station—one of the most useful small display sites in London. This is a form of propaganda which could be greatly extended with advantage, given the necessary funds.

Hitherto electrical publicity has only touched the fringe of the field that is open to effort. Even such admirable productions as "The House You Want" must, in the nature of things, appeal mainly to the more comfortable classes. A somewhat less ambitious model of domestic electrification designed to meet the possibilities of the small wage earner's pocket is a logical further development. But, as Sir FELIX POLE pointed out, in addition to propaganda, educational publicity and personal canvass, "adequate facilities must be given to the consumer to provide himself with apparatus on easy payment terms." Coming into the industry from another sphere Sir FELIX POLE has clearly been much impressed with the insufficiency of the present expenditure and effort on selling electricity and electrical manufactures. It is not unusual for newcomers to see things that have not attracted the attention of those who have grown up within the fold, and thus have had less opportunity of making accurate comparisons. It is true that such expressions of opinion are sometimes based on an incomplete appreciation of all the relevant factors but in this case we do not think that Sir FELIX POLE can be charged with attempting diagnosis before he has had time to acquaint himself with the symptoms and constitutional inheritance of the patient—if we may use that word in connection with an industry which is endowed with such youthful vigour and enjoys such wonderful prospects of growth. Yet perhaps the word is not altogether inappropriate, for there are signs of asymmetrical development of the organism. If these tendencies are corrected in good time it will have a healthier future than might otherwise be the case, and the prescription recommended by Doctor POLE and his friend appears to be well suited to actual conditions.

Current Topics.

The Brighter Side of Unemployment.

UNEMPLOYMENT continues to be the principal topic in industrial and political discussion, and no one can deny the extreme gravity of the problem. At the same time, the facts of employment are apt to be obscured by the stress laid on unemployment, and there is in consequence a widespread lack of realisation of the brighter side of the picture. The importance of remembering this aspect of industry was emphasised by Sir JOSIAH STAMP, in a discussion with Mr. MAYNARD KEYNES broadcast from London some days ago. In the first place, the official figures do not give a true idea of the situation. It is not true that there is a solid mass of unemployment in which over a million men find themselves continuously without work. In Sir JOSIAH'S opinion, probably 50 per cent. of those unemployed at any particular moment will be in work again a month later. In the second place, it is estimated that the normal figure of unemployment due to seasonal fluctuation and other natural causes, would under the best conditions almost certainly be between 300 000 and 400 000. Out of an insured population of over 11 000 000 two-thirds have been hardly touched by the problem since the war. Recent tests over a period of two and a half years showed that 8 000 000 drew no unemployment pay at all.

Absorption of Labour.

BRITISH industry has shown a remarkable power of actual absorption since the war—there are over a million persons more in employment. When we consider the broken and unstable conditions of industry it is very much to the credit of this country that we have been able to achieve the task of employing 150 000 more annually. The slower rate of growth of the population should ease matters and in future there will not be so many people entering into industry in excess of those going out. The basic problem is mainly one of balance between specialised skill and specialised capital, and there is no doubt that the "dole" has affected the methods of economic adjustment, retarding the necessity for moving about or taking another kind of job that acted automatically before the war. In the distribution of unemployment there are thus geographical as well as industrial factors, the tendency being for expansion of business in the South and contraction in the North.

Wages Out of Equilibrium.

COMPARISONS with conditions abroad are often made to our detriment, but figures published in the International Labour Review show that the average wage in this country is 27 per cent. higher than in Germany, 43 per cent. higher than in France, and 53 per cent. above the figure for Italy. Since wages enter into production costs, our higher level adds to the difficulty of quoting a competitive price in neutral markets. The cost of the social services must also be taken into account. Sir JOSIAH STAMP gave the comparative figures of 1911 —a representative year before the war—and of 1928 as 14s. 6d. and 91s. 6d. per head respectively. At first sight it would appear that wages are too high, but the view of the economists was rather that the rates in various trades are out of relation. There is also an element of the vicious circle about the problem. The important conclusion, however, is that British industry bears highly favourable comparison with conditions in other countries, and that for ten years past we have steadily added to our employment roll at the rate of 3 000 a week.

Sir Hugo Hirst.

IT was a pleasant surprise for all who were present at the opening of the new Bristol showrooms and offices of the General Electric Company last week to see Sir HUGO HIRST about again and to hear from Lady HIRST that he is making good progress towards full recovery. Sir HUGO HIRST, who is convalescing in the West Country, motored over to Bristol in ignorance of the function which was taking place, but the short informal reception which he and Lady HIRST held in the new showrooms was regarded as an excellent augury for the first sub-branch of the G.E.C. to be established; it is this year celebrating its 21st birthday. By a happy coincidence Alderman SENNINGTON, who performed the opening ceremony by flashing an electric torch on a photo-cell which switched on the illumination, was elected to the Bristol Electricity Committee in 1909, the year in which the G.E.C.'s branch at Bristol was inaugurated.

Burden of Rates.

AT the general meeting of the Metropolitan Electric Supply Co. last week the chairman, Mr. GEORGE BALFOUR, M.P., drew attention to the relation between charges for electricity and local rates, and said that the constantly increasing amount payable in rates did much to stop the cheapening of the supply. In 1924 the Metropolitan and its subsidiary companies paid about £27 000 in local rates. Five years later, in 1929, the amount had risen to £58 000, but as the latter sum excludes about £20 000 which was included in the price of the bulk supply to cover local rates on the Willesden power station, the true comparison is between £27 000 and £78 000—an increase of nearly 189 per cent. in five years. Mr. BALFOUR also referred to the effect of the De-rating Act on supply undertakings, and complained that it was more difficult to induce customers to change over to electric power when they benefited from de-rating, so that the electricity supply industry was burdened with this "illogical surtax method" of determining their valuation for rating purposes.

New Rôle for Power Stations.

IF the forecast of Mr. E. H. SMYTHE and Mr. E. G. WEEKS proves accurate, power stations in the future will take their place with gas works as producers of motor spirit and heavy chemicals. In their paper on "The low-temperature carbonisation of fuel, with special reference to its production of electricity," which was read before the North-Western Centre of the I.E.E. last week, they suggested that the inauguration of the grid transmission system and the co-ordination of power production afforded favourable conditions for combining the latter with the distillation of coal. The electric-power plant of the future might take in coal as its raw material, but would deliver, in addition to electricity, motor spirit, fuel oil, creosote, pitch and other derivatives of coal tar. The authors claim that a new situation exists in which a practical process of coal distillation has been evolved in conjunction with the generation of electricity, and that as a result a definite step forward in the better utilisation of coal is now due.

AUTOMATIC SUB-STATIONS FOR JAPAN.

English Electric Equipment for the Ise Electric Railway—Demonstration at Stafford—1 000 kW 750 V Convertors and Ancillary Plant.

AT Stafford on Wednesday, the English Electric Co., Ltd., had on view one of three complete sub-stations which it is manufacturing for the Ise Electric Railway of Japan. A comprehensive series of tests was demonstrated.

The capacity of each sub-station is 4 000 kW and the d.c. voltage is 1 500 V. Each set of equipment consists of four 1 000 kW, 750 V rotary convertors working in series pairs for 1 500 V. The e.h.t. supply to the sub-station is 3-phase, 60 cycles, 11 000 V, and the equipment shown included one 11 000 V, 3-phase, 60 cycle truck type switchboard; two 2 100 kVA O.I.S.C. indoor type, step-down transformers, each with double wound secondary windings for supplying two convertors in series; four sets of l.t. a.c. starting and controlling relay equipments including cam shaft controllers; two common relay panels; four 1 000 kW shunt wound rotary convertors with direct coupled exciters and running at a speed of 900 r.p.m.; one set of 1 500 V d.c. switchgear including track feeder breakers; and one desk type control board.

The general scheme provides for the control of the incoming supply to the automatic and auxiliary equipments by one feeder supply oil circuit breaker which can be closed by the control switch on the desk control board, or by the manual hand operating gear if desired. After the supply has been made available the first unit, consisting of two machines, can receive its starting impulse either from a time switch or from a "start" push button on the control desk. The second unit can be brought into operation by a prolonged overload on the first unit by means of an overload relay or by the operation of the machine thermostat.

The rotary convertors are started by means of low-voltage tappings on the transformers and are provided with roller bearings. The English Electric Co. has specialised in the use of roller bearings on tap-started rotary convertors; the disadvantages of this method have now been overcome, so that the saving in first cost and in the space occupied due to the omission of the starting motor can be fully realised. Use of roller bearings obviates the need of a brush lifting device and the starting operations are as simple and straightforward as for a pony motor started machine. With roller bearings, the starting current taken from the h.t. mains compares favourably with that taken by a motor started convertor. Of well over 100 rotary convertors supplied by the company to Japan during recent years, not one has been started by means of a pony motor, and several repeat orders indicate that this system of tap-starting with roller bearings deserves the serious consideration of engineers dealing with this class of plant. All English Electric Co. rotary convertors fitted with roller bearings are now provided with a patented system of oil lubrication which is giving every satisfaction.

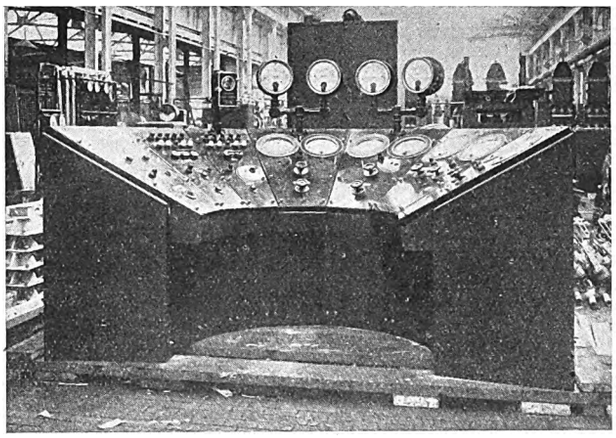

Fig. 1.—Desk type remote control board for automatic sub-station, Ise Electric Railway, Japan.

By the adoption of a new type of rotor, developed by the company, it is possible to use a pony motor of the same synchronous speed as the rotary convertor, and at the same time to retain a construction devoid of windings of any kind and, therefore, indestructible.

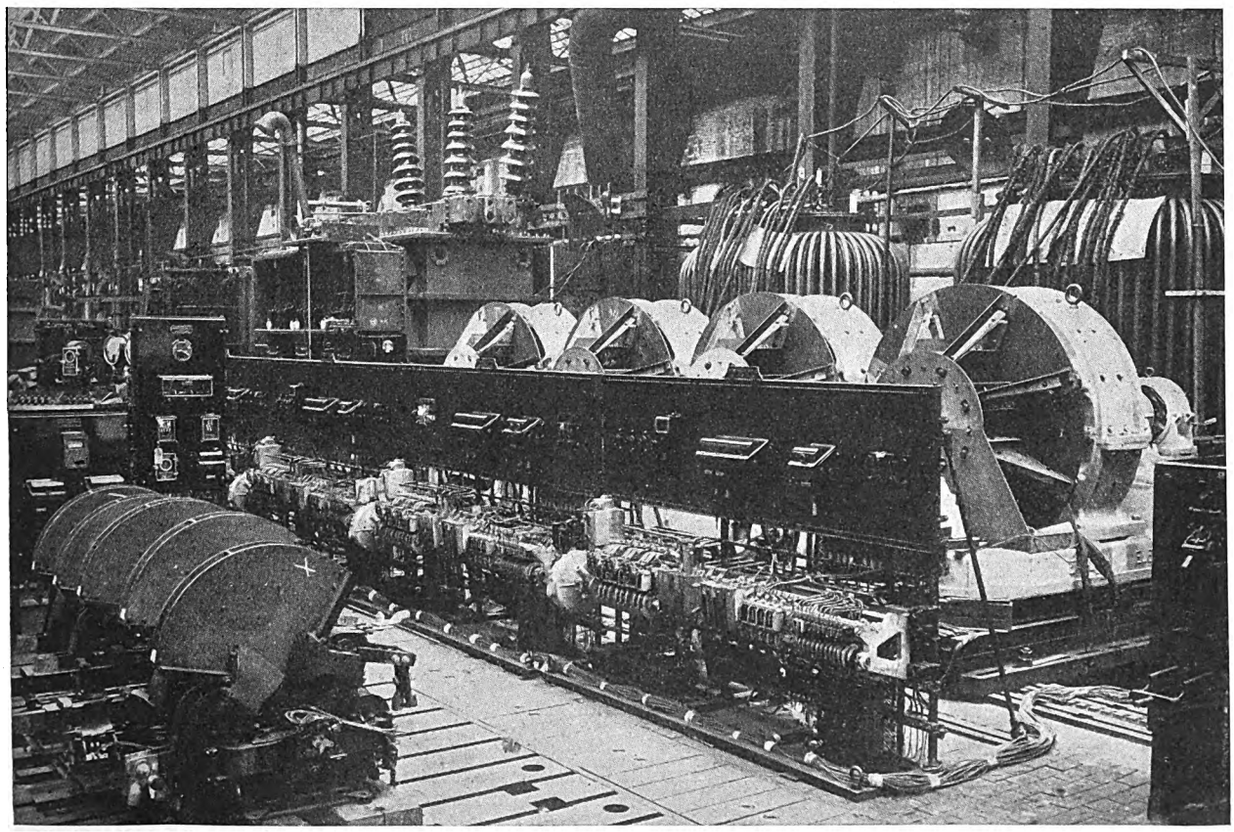

Fig. 2.—One of three sets of English Electric automatic sub-station equipment for the Ise Electric Railway, Japan, showing the special open type camshaft control equipment in front of the machines and the high-speed circuit breakers in the foreground. Normally the camshaft controller is housed in a sheet steel cubicle. The open type used in this instance was built to the specification of Japanese engineers.

MOULDED INSULATING COMPOSITIONS—II.*

Influence of Heat—Electrical Tests—Effect of Immersion—Mechanical Tests—Arc and Heat Resisting Materials—Hot, Moderate and Normal Temperature Materials.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

IN the earlier part of this article a brief review was made of the great variety of moulded insulating compositions used in the electrical industry, and some account was given of the different compositions available, indicating the various basis or bonding materials used, with a test by means of which they may be identified, and outlining the methods of manufacture. Since, as has been pointed out, a moulded composition almost invariably assumes the characteristics of its basis material, the particulars there given would serve to indicate approximately the service to be expected. For the safe use of materials under various conditions, however, precise information regarding the mechanical, electrical and physical properties is necessary.

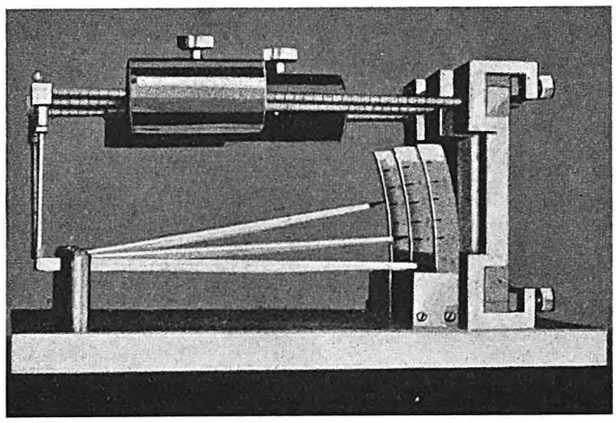

Fig. 8.—An improved "Martens" softening point tester.

As a means of ascertaining such information special tests have been adopted, many of which have been standardised by the E.R.A. The following notes describe some of the most important of these tests and indicate the results which may be expected from moulded compositions classified according to temperature conditions of service.

The effect of heat can best be ascertained by one or more of the following tests, which have been suggested by the E.R.A. :—

(1) Charring test by a carbon arc playing on the surface of the material under test. This test is usually applied to compositions with a hydraulic cement base.

(2) Ignition test by radiant heat uniformly increased at the rate of 300 deg. C. per hour, noting the temperature of ignition if this occurs, and also whether the material continues to burn in air when removed from the influence of the heat.

(3) Charring test by fuse-wire of copper ·036 in. diameter, in intimate contact with the moulding, repeatedly fused by the passage of a current of 100 amps. at 500 volts.

(4) Ignition test in the flame of an E.R.A. standard Meker burner, noting the time necessary to cause ignition and also the time taken for the material to cease burning when removed from the source of heat.

(5) Softening point test indicating the temperature at which the material yields under stress.

The first four tests of the above list are intended for arc-resisting and non-ignitable mouldings. These materials are easy to identify. It is proposed to deal more fully with the tests in a later article on arc-resisting and non-ignitable boards.

Test No. 5 is intended for materials of lower heat resistance, which may be taken as embracing about 80% of the moulding materials used. For this reason the method of test and some of the considerations involved in its application are dealt with more fully here.

The best method of carrying out the softening point test is one which was originally suggested by Prof. Martens, at one time director of the Material-Prüfungs-Amt. of Berlin. In this test a rectangular bar, made from the moulding material to be tested, is held in a vertical position and subjected to a constant and uniform bending stress throughout its length by means of a weighted lever. The stress applied is adjusted to 50 kg. per sq. cm. of cross section of the test specimen.

Fig. 8 shows an improved testing apparatus of this type developed by the Metropolitan-Vickers Electrical Company for use in its Research Department. In this apparatus three specimens can be tested simultaneously, the yield of the materials being shown by the movement of the pointers on the scales. The test is carried out in an electrically-heated oven in which the temperature is raised at the rate of 1 deg. C. per minute, starting from atmospheric temperature. The accepted softening point is regarded as the temperature reached when the drop at the end of the weighted cantilever is actually 6 mm. Typical results obtained on various mouldings tested by this method are shown in Fig. 9 .

Another method of testing the softening point consists of noting the penetration of a weighted standard needle into the specimen with gradually increasing temperature until the penetration increases rapidly without appreciable increase in temperature, this being taken as the point of collapse. This method of testing would be useful for small specimens, but further research work is required to calibrate the results for comparison with those of the Martens test.

The necessity for actually testing samples of materials for softening point is shown by the fact that it is not safe to assume that the use of certain base materials will result in the same softening point values. Considerable differences

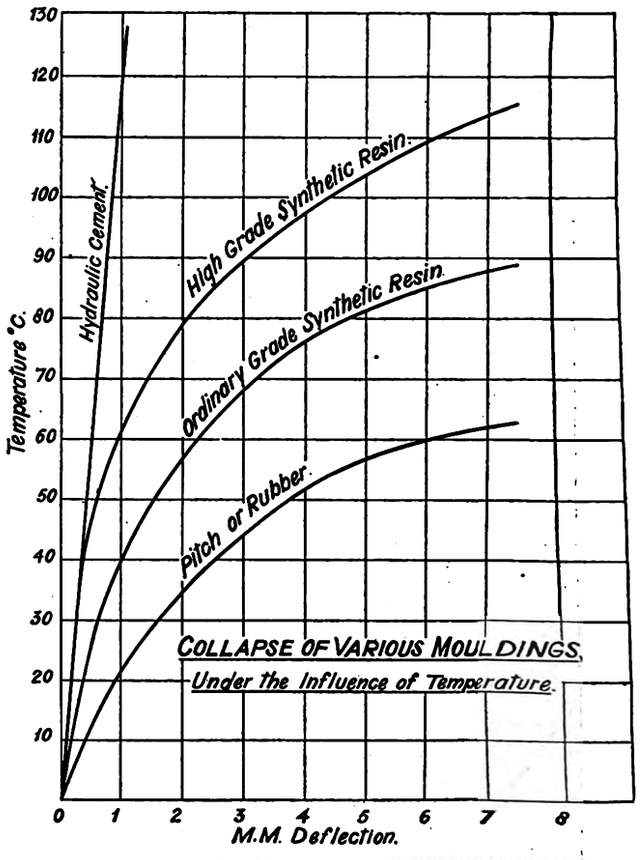

Fig. 9.—Typical results obtained with improved "Martens" tester.

can be obtained from identical mixtures by varying the curing period in manufacture. as is shown by the test results given in Fig. 10. The specimens used in this test were typical synthetic resin mouldings made from the same powder, and it will be noted that by varying the curing period from 5 to 10 minutes the softening point (6 mm. deflection) was varied, from 60 deg. C. to 95 deg. C. and 110 deg. C. The products of

* The first part of this article appeared in our issue of February 14th.

Digitized by Google

the longer curing period were also of a better quality in other respects.

It should always be borne in mind that the stated softening point does not mean that no deformation will take place at a lower temperature. The curves of Fig. 10 clearly show that collapse takes place quite gradually as the temperature increases and there is no sharp kink which would indicate a critical temperature. Further, where stresses are increased, deformation or "creep" will occur even at temperatures well below what is called the softening point. Fig. 11 shows

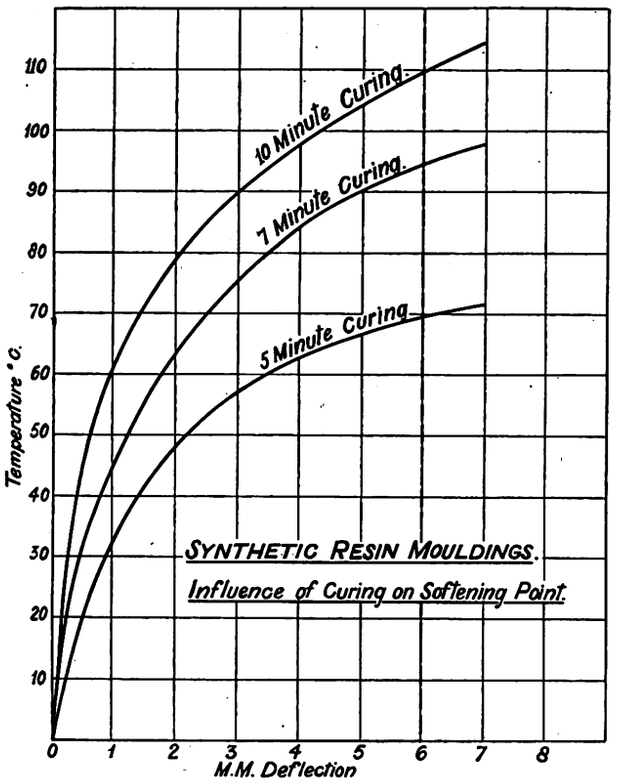

Fig. 10.—Gradual collapse with temperature increase.

a shellac moulding which has collapsed under the combined influence of the stress of clamped up contacts and temperature of about 80 deg. C. The stress and the temperature were both excessive, but either excess would produce a similar result. In view of these considerations it is important to examine the flowing properties of a material even at temperatures considerably below the test softening point, and to employ materials in service only for stresses and temperatures which are well below the test values.

The electrical properties of mouldings are generally obtained from specially moulded specimens so designed in shape and size as to give results which can be associated with those obtained from the various shaped articles used for electrical work, and therefore give some idea of the service to be expected. A group of such specimens for electrical and mechanical tests is shown in Fig. 12. The disc on the left is for electric strength test; the flat, square piece for shrinkage; the large cylinder for absorption of liquids; the small cylinder for compression; the notched bar for impact; the plain bar for softening (Martens); the special moulding on the right for surface-resistivity.

Electrical strength tests on mouldings are usually carried out under one of the following conditions:—

(1) Normal temperature and humidity.
(2) Highest temperature permissible.
(3) Before and after immersion in water for 24 hours.

Where surface-resistivity is of importance the special moulding shown in Fig. 12 is used. The details of the moulding now recommended as standard are shown in Fig. 13. The surface resistance is measured at the end of each minute over a period of 10 minutes under a potential difference of 500 V and a curve is plotted showing the relationship between surface-resistivity and time.

For practically all commercial work the most important test on mouldings, other than arc-resisting and non-ignitable, is the electric strength test. There is some divergence of opinion concerning the form of the test specimen to be recommended. In earlier recommendations the type of specimen shown in Fig. 14 was adopted. This is a 4-in. disc with a concave depression in the middle. It was soon found, however, that the values obtained with such specimens exceeded those obtained in service, and it is now generally accepted that tests carried out on a plain 4-in. disc approximately $\frac{1}{8}$ in. thick give values nearest to those obtained on commercial mouldings. The modern method is to test such a disc between the flat surface of cylindrical electrodes of $1\frac{1}{2}$ in. and 3 in. diameter respectively, usually under oil to prevent flash-over.

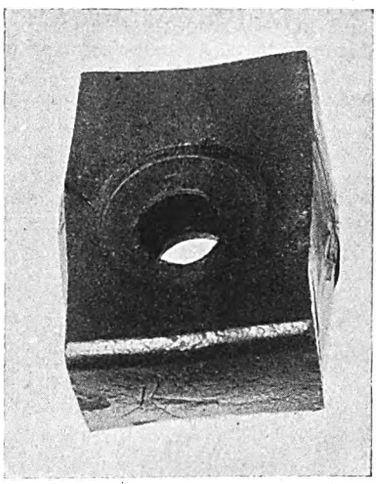

Fig. 11.—Collapsed shellac moulding.

Where the electric strength is of importance, it is always advisable to carry out the tests at the highest temperature expected in the service contemplated. The necessity for this is shown by the great variation in electric strength exhibited by most moulded materials when tested cold and hot. Typical examples of such variation are shown in Table I. The electric strength values here given should be regarded as typical only of ordinary products. Improved values are possible with synthetic resin products, for instance, when the powders are kept free from moisture or are vacuum dried before moulding. Superior results are also obtained where effective curing periods are allowed either during the moulding process or by the adoption of a lengthy baking period afterwards. By the exercise of special precautions remarkable test values have been reached, an example being the production of a tube only 12 in. in length which successfully withstood over 250 000 V when tested along its length in oil at 90 deg. C. Mouldings of this class are essential for such applications as tap-changing apparatus on high voltage transformers. Examples of materials for such work were on exhibition at the recent British Industries Fair.

In addition to the electric strength of materials, the surface flash-over values are generally of importance, especially if repeated flash-over is accompanied by a decrease in the voltage necessary to cause flash-over again. The test is usually made in air between cylindrical brass electrodes of $1\frac{1}{2}$ in. diameter standing on the test specimen with a distance of 1 in. between their nearest points.

Service conditions for many insulating mouldings involve immersion in various liquids, the most common of which are transformer oil, dilute acid, dilute alkali and water. For

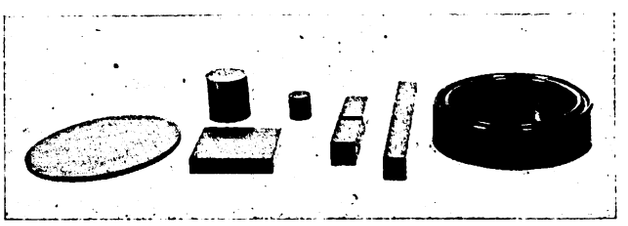

Fig. 12.—Moulded shapes for electrica and mechanical tests.

research purposes it is usual to study the effect of immersion for various periods, but fairly reliable results can be obtained after the periods of 24 hours and 6 days for water, 6 days for transformer oil, 24 hours for 20% soda solution, and 6 hours for sulphuric acid of Sp.g. 1·4. The effects produced vary considerably with different base mouldings, but a general conception can be obtained from the results indicated in Table VI.

The mechanical properties of most mouldings are usually compared from the results obtained on recognised specimens. There is, however, a variation in the dimensions suggested by various authorities, which therefore rather confuses the comparison of test results. The variation in the dimensions of the suggested test specimens are summarised in Table II.

Digitized by Google

The actual mechanical properties are very greatly influenced by the process of mixing the various components, but as a general rule practically all arc-resisting materials can be considered as brittle and poor mechanically. The mixtures embracing synthetic resins are generally strong and tough, and in this respect are superior to those with a pitch or bitumen base. The inclusion of long fibred fillers greatly adds to the mechanical properties, as in the case of asbestos wool when included in hydraulic cements and bitumen or pitch

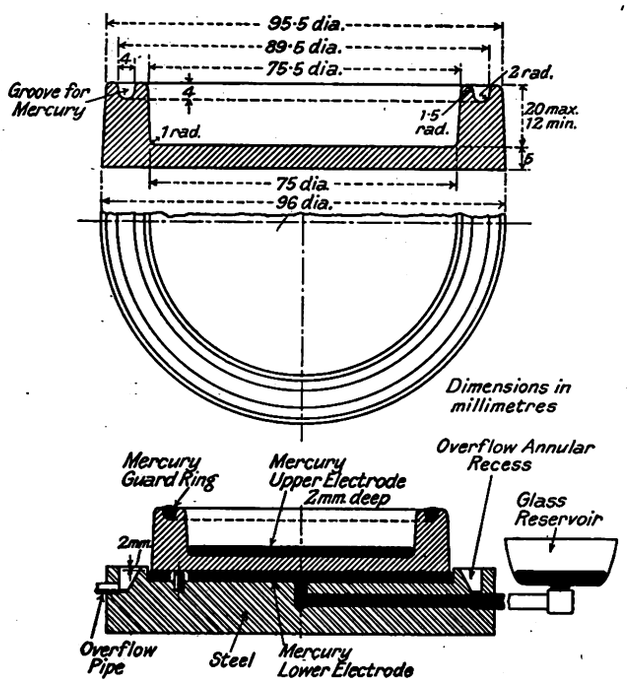

Fig. 13.

mouldings; flaked fabrics are also employed when very tough synthetic resin mouldings are required.

Good synthetic resin mouldings should give a compression strength of approximately 30 000 lb. per sq. in., and a transverse strength of 8 000 to 12 000 lb. per sq. in. Tensile strength tests are included in those called for by the American Society for Testing Materials, but are not covered by the recommendations of the V.D.E. or E.R.A. The average tensile strength for synthetic resin mouldings is approximately 4 500 lb. per sq. in.

The following notes, giving particulars of the properties of moulded insulating materials, are grouped according to temperature conditions of service, on the basis which has already been suggested for their classification.

Arc-resisting materials are usually made from an hydraulic cement base. Their principal use is for arc-shields on switchgear and control gear. The characteristics desired are similar to those associated with non-ignitable and self-extinguishing boards, practically all incorporating asbestos. The materials should show no deformation under stress at temperatures up to their fusion point and should be non-ignitable. The electric strength is usually low, and most of the materials are inclined to be brittle and lacking in mechanical strength. Because no carbonisation is permissible under arcing, no impregnation can be used, and it is thus practically impossible to protect the materials from their tendency to absorb moisture. The general characteristics of the class are indicated in Table III.

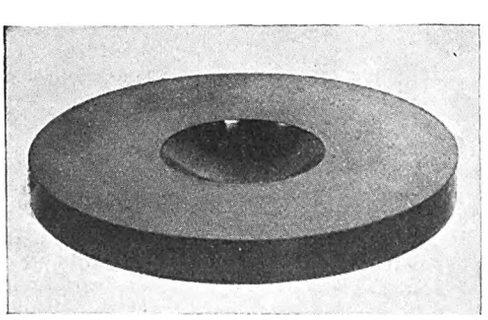

Fig. 14.

Many materials of the heat-resisting class are impregnated varieties of arc-resisting materials, and are therefore better electrically than the latter. Heat-resisting materials find a somewhat limited field of use in heating equipment, including domestic electric kettles, irons and heaters. The main characteristics of the group are summarised in Table IV.

Hot service materials should be immune from distortion under stress up to about 120 deg. C., the choice is limited to some of the higher grade synthetic resin base mouldings, where conditions permit of their use, or a combination of synthetic resin with various solidifying resins which cure only after a prolonged heating process. These latter materials have an advantage over ordinary synthetic resin mouldings in the fact that they do not carbonise so readily. This class of materials has found favour in connection with electric traction equipment, switchgear, and for service in which absolute alignment of contacts at elevated temperatures must be maintained. The main characteristics of the materials of this class may be taken as conforming with those shown in Table V.

Moderate temperature service materials should be capable of continuous service at 90 deg. C. without distortion. This class of material is also confined to the synthetic resins and specially cured preparations. The materials available are very limited and are only to be found among the products of manufacturers of repute. The characteristics of the class may be taken as similar to those given for hot-service materials in Table V, with, however, a lower plastic yield point.

Under the heading of Normal Temperature Service Materials come a vast number of mouldings, including products of synthetic resins, pitch, bitumen, rubber, shellac, cellulose acetate, cellulose nitrate, and caseins. The separation of these products into their spheres of effective use depends upon their ability to withstand different conditions of service. A guide to the characteristics of the materials in this class is given by the typical test results set out in Table VI. With regard to the last column of this table, it should be noted that the particulars and classification given are the result of observation and experiment, and are not based on manufacturers' descriptions.

TABLE I.—Typical Test Results Showing Influence of Temperature on Electric Strength.

Grade.	Type of Moulding.	Thickness (inch)	Elec. Str. (volts/mil). Normal	Hot
Arc-resisting	Hydraulic Cement	·20	10	15 at 180 deg. C.
Heat-resisting	Special Mixtures	·375	36	30 ,, 180 ,, ,,
Hot Service	Synthetic Resin	·110	390	100 ,, 90 ,, ,,
Moderate Temp.	Rubber ..	·130	350	200 ,, 75 ,, ,,
Normal Temp.	Cellulose Acetate	·09	600	400 ,, 60 ,, ,,
	Pitch ..	·125	200	100 ,, 60 ,, ,,

TABLE II.

Test Specimens Suggested by :

Test.	V.D.E.	E.R.A.	A.S.T.M.
Compression Strength ..	None.	A cylinder 15 mm. dia. × 15 mm. long	A cylinder 286 mm. dia. × 31·8 mm. long
Transverse Strength ..	10 mm. × 15 mm. × 120mm. Supports 100 mm. apart.	15 mm. × 15 mm. × 200 mm. Loaded at one end.	12·7 × 12·7 × 127 Supports 102 mm. apart.
Impact Strength ..	10 mm. × 15 mm. × 120. Plain specimen.	15 mm. × 15 mm. × 80. Notched specimen.	None.

TABLE III.—Characteristics of Typical Arc-Resisting Materials.

Spec. Gravity .. .. 1·8 to 1·9

Moisture Absorption (24 hours immersion), 17 to 20 per cent.

Surface Breakdown between electrodes, 1½ in. dia. spaced ½ in. apart.

	Normal.	*Dry.*
	Depends on humidity.	19 kV.

Fuse Wire Test .. .. No damage should occur after intimate contact with 10 explosions of 100 amps. at 500 V through fuse wire of ·036 in diam.

Elec. Str. in air at 20 deg. C. On specimen of approx. $\frac{3}{16}$ in. thickness puncture should not occur at less than 18 kV or approx. 96 V per mil.

Radiant Heat Test.. .. No ignition should take place.

Carbon Arc Penetration .. A specimen $\frac{3}{16}$ in. thick under a carbon arc of 10 amps. 45 V should not be penetrated at a greater rate than 1 mil per 2·5 secs. (Fig. 15).

NEW NICKEL-IRON ALLOY.

Remarkable Magnetic Properties of Permalloy "C"—Some Applications in Electrical Manufacturing.

(FROM A CORRESPONDENT.)

CONTINUOUS research work on magnetic materials has led to the development of a new alloy of the Permalloy series which has been designated Permalloy "C." This new material exhibits magnetic and manufacturing properties which are considerably better than those of the earlier alloy of the same group known as Permalloy "A," which it now replaces. With one exception (that of the maximum flux density obtainable) it is greatly superior in all respects to the earlier alloys. It is now, from the point of view of magnetic properties, the softest material available, and possesses, at the same time, the advantages of having the high resistivity of commercial grades of silicon steel and of requiring a simpler form of heat treatment than has been necessary with the earlier alloys. With these advantages Permalloy "C" should find a considerable application in the lighter branches of electrical engineering, such as the construction of telephone apparatus and electrical measuring instruments.

The data for Permalloy "C" and for silicon steel given in the accompanying table were obtained by a series of ballistic measurements on ring stampings of a thickness of 0·014 in., an outside diameter of $3\frac{1}{16}$ in. and an inside diameter of $1\frac{15}{16}$ in.

Comparison of D.C. Characteristics of Permalloy "C" and other Magnetic Materials.

Property	Permalloy "C"	Silicon Steel	Iron
Initial permeability μ o (at 200 p.p.s.)*	6 000	400	250
Maximum permeability μ max. ..	100 000	6 500	5 000
Magnetising force at μ max. (gauss)	0·035	0·75	1·2
Maximum flux density B max. (lines per sq. cm.)	9 000	16 000	20 000
Remanence from B max. (lines per sq. cm.)	4 500	9 000	9 000
Coercive force from B max. (gauss) ..	0·035	0·6	0·8
Hysteresis loss for B=5 000 (Ergs per c.c. per cycle)	50	550	1 000
Resistivity (microhms per cm. cube) ..	55	55	10

* The initial permeability at 200 p.p.s. is given, as this value is more reliable than that obtained by the usual d.c. methods.

With silicon steel the initial permeability remains substantially constant throughout the frequency range up to 1 800 p.p.s., but for magnetic materials having a very high initial permeability, such as Permalloy, this is not the case. The reason is that the eddy currents which are set up cause an irregular distribution of the flux, with a consequent diminution of the apparent or effective permeability. It follows that those materials with the highest initial permeability will have the steepest permeability-frequency curve, other factors being equal. Furthermore, the higher the resistivity of the material, the lower will be the rate of decrease of permeability with frequency.

Magnetic Sensitivity.

Comparison of the magnetic properties of the materials under consideration shows that Permalloy "C" is, magnetically, the softest material available for use in the construction of telephone and kindred apparatus. Also, its marked susceptibility to the influence of magnetising forces renders it superior to any other material at present employed where high sensitivity is of cardinal importance, or where a reduction in size for a given performance is desired. Simultaneously with these important advantages Permalloy "C" possesses a high value of resistivity, comparable with that of the commercial varieties of silicon steel. Furthermore, its use will enable considerable reductions to be made in the dimensions of apparatus, and consequently in manufacturing costs.

As the magnetic properties of nickel-iron alloys are somewhat sensitive to excessive strain the same care should be exercised in handling parts made of this material as is common in dealing with silicon steel laminations. For this reason it is desirable, in order to obtain the best results, to heat treat the material after the component has attained its final shape. Processes, such as drilling, riveting, etc., should not be carried out after heat treatment, although operations such as coil winding and assembling under ordinary workshop conditions may be carried out with impunity at this stage. Transformer stampings which have been badly buckled should not be taped up into cores, or the permeability will be impaired and the hysteresis loss increased. In this respect, however, Permalloy does not differ from silicon steel.

Hitherto the heat treatment of nickel-iron alloys has been a somewhat complicated process and, as the heat treatment has had to be carried out by the manufacturer of the material, the user has been involved in greater expense and delay. A feature of very considerable importance in connection with the manufacture and application of Permalloy "C" is that this new material requires only a single heat treatment—nothing more than a straightforward simple annealing process—which is actually simpler and more rapid than the process usually employed to anneal silicon steel stampings. Apart from the manufacturing advantages outlined the simplicity of the heat treatment is also of importance from the point of view of application of the material, since it greatly facilitates the attainment of uniform results in the finished product.

Method of Manufacture.

Permalloy "C" is made by melting the constituents in a high frequency electric tilting furnace. It is capable of being rolled easily to any desired shape, and can be supplied in sheet, rod or wire form of any thickness. Some of the directions in which it may be employed with advantage are :—

Instrument Transformers.—The advent of a magnetic material having such high permeability at low inductions and such low hysteresis loss is of considerable importance as regards the construction of instrument transformers used in connection with the measurement of high-tension currents and voltages. It will be possible to extend the use of the "straight-through" bushing type of transformer to the measurement of currents of much lower magnitude than has yet been possible, and considerably to increase the accuracy of this type of transformer, both as regards transformation ratio and phase angle error. The low cost and the convenience of this type of construction will enable transformers of the "wound-primary" type to be replaced to a considerable extent by the "straight-through" type. Further, the reduction in the size and number of ampere-turns, made possible by the use of a Permalloy core, will greatly simplify the precautions necessary to guard against the effect of short circuit currents in both types of transformer. The increased accuracy resulting from the application of Permalloy to bushing-type transformers also applies to wound-primary transformers. The high permeability and low hysteresis loss of Permalloy enable current transformers to be designed having less than one-third of the ratio and phase angle errors of similar transformers with silicon steel cores.

A striking instance of the utility of the high nickel content nickel-iron alloys in the design of heavy current resistors was noted by Messrs. Spilsbury and Arnold in a paper read before the Institution of Electrical Engineers on February 7th. The authors had at first considered it inadvisable to adopt air-cooled resistors for the measurement of alternating current by electrostatic methods above about 200 amperes on account of the extreme bulk entailed. While this matter was being considered, however, the remarkable properties of nickel-iron alloys of high nickel content became known, and it was at once seen that current transformers with cores of such materials might solve at one stroke all the difficulties in the design of heavy-current resistors.

High Quality Audio-Frequency Transformers.—The use of Permalloy for the cores of audio-frequency transformers has contributed very largely towards the high quality of the transmission now attainable. There were two principal reasons for its choice—to obtain the best available transmission characteristics, and to secure a reduction in size. The former reason has been the more influential, but instances have occurred where extreme compactness, such as could not have been obtained with a core of silicon steel, has been of primary importance. Where a transmission as nearly uniform as possible between the frequencies of 40 and 6 000 p.p.s. is required the use of Permalloy will produce the desired result. In the construction of output transformers a marked improvement in transmission at the lower frequencies, comparable to that obtainable for transformers, can be made, under most conditions, by the use of Permalloy cores. The use of a Permalloy core is not, of itself, an assurance of high quality

Digitized by Google

transmission at the lower frequencies; there are other conditions to be satisfied, such as a suitable type of core assembly and suitable circuit conditions. With these conditions fulfilled, however, the transformer with the Permalloy core would give the results indicated.

Electrical Measuring Instruments.—Owing to their cheapness in comparison with moving-coil instruments, it has long been desired to produce moving-iron ammeters and voltmeters which could be used with accuracy on both alternating current and direct current circuits. Up to the present it has been difficult to manufacture such instruments owing to the hysteresis errors introduced, and to the variations with frequency resulting from their high inductance. The low hysteresis loss and high permeability of Permalloy will enable these errors to be reduced to negligible proportions. Permalloy may also be employed, with advantage, in the construction of moving-coil milli-ammeters and voltmeters. In this type of instrument stray magnetic fields are a constant source of trouble, but their effects may now be eliminated by the use of covers made of Permalloy, which, owing to its high initial permeability, makes a very effective shielding material. Dynamometer-type watt-meters are also subject to interference from external fields, and the use of Permalloy shields will enable the accuracy of this type of instrument to be increased considerably.

A further application of Permalloy is in the magnetic circuit of ironclad dynamometer-type instruments, where its use would result in a considerable increase in the strength and concentration of the magnetic field, and in the elimination of errors due to hysteresis.

Sensitive Relays.—The fact that Permalloy is so very much softer, magnetically, than the softest annealed iron, together with its high permeability, will make it possible to design and manufacture relays of much greater speed and sensitivity than has hitherto been possible.

Permalloy, with the methods and processes for its manufacture and heat treatment, is protected by the International Standard Electric Corporation's patents in most countries.

BATTI WALLAHS ENTERTAIN SIR FELIX POLE.

Anomalies in the Electrical Industry—Disadvantages of the Small Undertaking—Need of More Publicity.

SIR FELIX POLE was the guest of the Batti Wallahs, at the Hotel Cecil, on March 6th. Mr. H. A. Howard, the president, before calling upon Sir Felix Pole to speak, mentioned that the annual dinner of the Batti Wallahs, on March 21st, would be the last to be held at the Hotel Cecil before the closing of the hotel and restaurant, and that future gatherings would take place at the Hotel Metropole.

The company stood in silence for a few moments as a tribute to the late Mr. A. A. Campbell-Swinton.

Sir Felix Pole, after a reference to the large number of luncheons and dinners given by the electrical industry, said that he gathered that the one object of the Batti Wallahs was to expand the electrical industry, and he imagined that it was due to the society that the P. & O. Co. had become pioneers in adopting electric propulsion for their newest liners. They were right in pushing this new and highly successful development.

Unremunerative Prices.

He was surprised at the anomalies in the electrical industry. On the one side, he found the very highest engineering skill in design and manufacture; and on the other, the selling of these products at prices which could only be regarded as far too low. Again, there were factories which were so full of work that Sir John Brooke was reported to have said, at a recent luncheon at the British Industries Fair, at Birmingham, that the orders in hand represented a much greater horse-power than at any previous time in its history. He believed that the same issue of "The Times" recorded a financial reconstruction of one of the largest electrical manufacturing companies. The industry deserved to be so prosperous that the writing down of capital ought to be as remote from our thoughts as a capital levy should be from the financial schemes of the Chancellor of the Exchequer. Electric supply undertakings had no competitors at their end of the industry. He wondered what they would say if he suggested that no new firm should be allowed to start the manufacture of electric appliances without Parliamentary sanction. A new political party was needed to carry this reform. (Laughter.)

We should soon have one enormous main transmission area inter-connected over all its extent, and controlled by one organisation—the Electricity Board. It was one thing to carry 132 000 V high tension mains over the country, but what had to be done was to bring the current into every house in the country. There were undoubtedly many ways in which the convenience of electric lighting and adaptability of electric power would assist the farmer in his efforts to make a living. Looking at the matter on broad lines, the future development in rural areas would depend, just as it did in the town, on the energy and ability with which the distributing undertakings of the country set out to sell their goods. The distribution of electricity in rural areas was not going to be an easy matter, as the revenue in certain areas of small population would not be very great at first, and the utmost economy in capital expenditure would have to be exercised to ensure an adequate return. An active selling organisation must be developed in every distributing undertaking, and every effort made to explain to the community, by propaganda, educational publicity and by personal canvass, how electricity could be used. Adequate facilities must be given to the consumer to provide himself with apparatus on easy payment terms, either by hire, hire purchase or deferred payments.

The small undertaking was at a very great disadvantage, and undertakings of less than a certain size could not provide the facilities required, give the service that the consumers had a right to expect, or provide an adequate selling organisation. Each undertaking should at least be large enough to employ a staff in which the selling organisation was separate from the engineering organisation, as engineering talent did not always go with the commercial mind, and vice versa. The Bedford demonstration area was linked up with the Bedford supply undertaking, being, in fact, part of that supply undertaking's area, so that in the administration and commercial development of the demonstration area the expert staff of the Bedford municipal undertaking would be available.

As regards electrification as a whole in this country, he was told that he was taking a generous figure if he suggested that of the maximum possible field at home we had conquered 15 per cent. In the domestic field, at any rate, not more than 18 per cent. of the houses were wired, and of these not one in fifty was completely electrified. That showed the scope; and what we needed was to avail ourselves more and more of the science of publicity and salesmanship. All sections of the industry should combine in a much greater collective publicity campaign, and by intensive collective effort we could enormously increase the use of electricity.

Patriotism and Publicity.

He had asked a friend to give him his views on the subject generally, and quoted his reply:—

"In my view, all that the electrical industry needs to absorb its output capacity, which at present exceeds the demand, is a full dose of modern publicity and salesmanship. If the electric supply undertakings and installation contractors spent four times as much as they do to-day on attracting new business, that would bring them not only a huge additional turnover with consequent prosperity, but the manufacturers would also benefit by an unprecedented accretion of home orders. And if the manufacturers would, at the same time, bring their publicity and business-getting machinery at home and abroad to the same fine pitch as their workshop machinery, they would soon find themselves handling such outputs that they could afford to pay bigger dividends and to reduce prices, thus strengthening their power in foreign markets.

"To sum up, in two words, what you need is Patriotism and Publicity. By patriotism I mean electrical patriotism, loyal support by each individual of the respective organisations representing the electrical industry at large, and of his section of industry. And by publicity I mean collective as well as individual publicity, the whole art of persuading possible customers to buy."

Mr. A. W. Blake sounded a note of caution in regard to expenditure on rural electrification, and suggested that the money being devoted to standardisation of frequency in districts where things were now working quite smoothly might be better devoted to other purposes.

STANDARDISATION—TRUE AND FALSE.

A Danger to be Avoided.

By Charles C. GARRARD.

THE benefits which the engineering industry owe to the self-sacrificing labours of the members of the many committees and panels whose work during recent years as embodied in the published specifications of the British Engineering Standards Association are gratefully acknowledged by all members of the industry who are familiar with the facts.

One branch of electrical standardisation deserving of special mention is that of switchgear. In a paper read before the Institution of Electrical Engineers in 1918—see " Journal I.E.E.," Volume 56, p. 213—the present writer called attention to the unsatisfactory state of affairs, which then existed, as regards switchgear standardisation. Since that time, however, great changes have taken place and to-day the established British Standards in this branch of engineering surpass in comprehensiveness those of any other industrial country. Indeed, so far has this developed that there is a danger of the enthusiasm of the engineers engaged in this work carrying them into fields where standardisation is not only superfluous but positively harmful.

It is not necessary to repeat the well-known arguments in favour of standardisation ; they are accepted by all. But it is necessary to point out that standardisation should not be allowed to prevent the expression of the personality of the engineer or the embodiment of beautiful shapes and arrangements in his work. Great engineering work is generally beautiful. The bridges of Brunel and the lines of the " Mauretania " demonstrate this. Conversely, it is very often true that an ugly looking engineering product is a bad job. And it is to be expected that this should be so. For sound engineering is only possible by men or women who are enamoured of their work, and those who design and construct under these conditions naturally make their productions as good looking as possible.

Now, of course, it is absurd to desire to express one's individuality over the study of an electric switch or the rupturing capacity rating of an oil circuit breaker. But it is altogether different when one comes to deal with the shape of the containing case of a starter or the layout of a control switchboard. To standardise such things as these merely produces a drab uniformity with no counterbalancing advantage. It is related of the late Dr. Ferranti that when he designed the columns of his engines he used a shape which was not capable of being drawn by any known geometrical construction or combination of conic sections, and the draughtsman was obliged to resort to freehand drawing.

Engineers' Duty to Society.

The result was at least something distinctive to look at. Some engineers there are, of course, who despise this idea of bringing beauty into their work. Such men would standardise the appearance of all houses and put most of our architects out of work. Unfortunately, the fringes of many of our large towns bear devastating witness to the influences of men of such ideas, or rather lack of ideas, in recent years. The work of the engineer endures after him, sometimes even after his death ; therefore, it is a duty he owes to society and to posterity that it should be nice to look at, besides, of course, performing its engineering function. The standardisation of appearance offends against this principle. No motor car manufacturer in his senses would propose that all motor cars should look alike. On the contrary each manufacturer strives to attain a distinctive appearance. This, of course, in no way affects the question of standardisation in the motor industry as applied to materials and component parts. Similarly in electrical engineering we have standard wires, standard ratings, standard terminals, cable box fittings, and the like. But if we were to try to make the shape of all ironclad switches the same, or to build all control boards to look alike we should be applying standardisation where it was not wanted and stifling the artistic proclivities of the designer ; and, after all, the designer who has nothing of the artist in him is not likely to go very far.

As Sylvanus Thompson used to say at the beginning of his lectures on that subject : " Electric design is first an art and secondly a science." That was a very true saying.

OVERHEAD LINES.

Exhibits at the Association's Conversazione.

AT the Conversazione of the Overhead Lines' Association on February 26th the Central Electricity Board showed models of towers, posts and conductors. The British Insulated Cables Ltd. had aerial cable unions, one for copper and for steel-cored aluminium conductors, a pothead insulator and various conductor samples and accessories. Bullers, Ltd., had a part of an insulator chain with an oval saddle-shaped arc ring at the lower clamp end. The Electrical Transmission, Ltd., showed one pole of a remote-controlled 11 kV isolating link, and also an 11 kV fuse, with a photo showing a h.t. fuse breaking a short circuit of 30 000 kVA at the same voltage. The Croydon Cable Co. had a set of Pernax bird guards, P.B.J. overhead cables, sheets, tubes and suspenders. Le Bois Bakelisé (of 66, Victoria Street) showed how bakelised wood was being used for electrical purposes ; a cross arm with wood pins, standard wood pins for 20, 30 and 65 kV, an operating pole and linesmen's and switchboard safety devices. The Standard Switchgear had a bracketed and an underhung fuse, the latter with lock-in clips ; a surge limiter with a self-regulating variable resistance designed to extinguish the arc at the zero point of the alternating current ware ; also a horn gap arrestor with a dry, large capacity earthing resistance ; the above-mentioned apparatus being for 11 kV. A low tension arrestor and a low tension hand grip fuse were also of interest. Messrs. Estler Bros. had a most interesting exhibit, showing in operation the way in which glass in general and h.t. insulators in particular could be tested for internal strains with the aid of the Adam Hilger polarised light apparatus.

The demonstration showed the way in which annealed glass h.t. insulators could be examined for internal stresses.

Another exhibit of the same firm was a system of strip-on-edge steel gridwork and steps for the galleries of outdoor transformer stations, and for sub-station and boilerhouse work.

Mr. F. J. Down had a number of things used for overhead lines, such as screw stay anchors, for normal ground and for swamps ; various clamps and slack pullers and earth augurs.

Neon Potential Indicator.

The Edison-Swan Co. showed a new patent neon tube potential indicator for h.t. transmission lines ; it is designed with a spark gap on the h.t. side in series with the tube, which increases the sensitiveness ; a metal portion which may serve as a hood is connected to the earth side, thus increasing the capacity and the luminosity. It can be arranged to give an adjustable audible signal in lieu of luminosity. The insulated pole used contains no earth wire, so the device is safe in use. The same company had a telephone line protector made up of three or more electrodes of refractory conducting material enclosed in a gas-filled bulb. A heavy discharge raises the electrodes to incandescense, emitting sufficient electrons to form an arc with a negative volt-ampere characteristic, thus having a great ampere-carrying capacity. These tubes impose no load on the line and singing and speech are in no way affected.

The British Aluminium Co. had two sets of samples of aluminium conductors and accessories. Thos. Bolton showed sections of ante-corona copper cables with some tubular conductors to increase diameter without increasing weight.

The Steatite and Porcelain Co. had some suspension insulators for 132 kV circuits. Messrs. Johnson and Phillips showed, among other items, one of their expulsion type h.t. fuses ; and also a type of inclined bracket for shackle insulators for l.t. circuits, the suspension of the conductor being dependent on the binding.

Messrs. Venner showed a series of time switches for various purposes. In rural areas one must look to night storage heating circuits and such like with time switches to operate them to carry a material proportion of the burden of the high standing charges, which are inevitable where customers are scattered and the load density is low. Messrs. Griffith Bros. showed a series of illuminated micro-photographs of their special paints for outdoor steelwork.

Major Rich had a table showing some propaganda scrap pictures for children and a game of lotto which is being distributed by power companies in France to accustom children in schools to recognise electrical apparatus used in the home, the office and the farm ; also photos of bats-wing swinging arm towers used on some German grid lines.

H.V. TESTING LABORATORY.

New Equipment at Ferguson, Pailin, Limited's Factory—Details of 500 000 V Testing Transformer—Artificial Rain Apparatus—Tanks for Insulator Tests.

FERGUSON, Pailin, Ltd., have added a 500 000 V Laboratory, designed for research and routine testing, to their plant. The two 150 000 V transformers, which have hitherto served for testing up to 300 000 V, will be retained for separate testing up to 150 000 V.

The laboratory covers a floor space of 90 feet by 55 feet and the height to the lowest member of the roof trusses is 33 feet.

The testing transformer is rated at 300 kVA 500 000/840 V 50 cycles and is of the conservator type with oil filled terminal bushing. A bakelite busbar, with internal tinfoil cylinder, is permanently connected to the transformer through a horizontal spiral choke coil situated immediately above the conservator tank at the top of the terminal bushing. A flexible testing lead can be connected to any of the three spheres, which interconnect the busbar sections.

The transformer is fed by a motor generator comprising a special 300 kVA sine wave alternator, induction motor and exciter. The alternator voltage is controlled by field regulation of the exciter, which is directly coupled to the end of the alternator shaft. The control desk is located on a control and observation gallery the platform of which is 18 feet above the floor of the laboratory.

The primary winding of the testing transformer consists of two windings which can be connected in series or parallel to give two ranges of voltage, i.e., 0/250 000 V and 0/500 000 V respectively. This arrangement enables the half range of voltage, i.e., 0 to 250 000 V, to be obtained over the same range of generator field excitation and incidentally gives half the value of voltage increment per step of the coarse regulator that obtains when testing on the full range of 0/500 000 V. The motor generator is placed underground

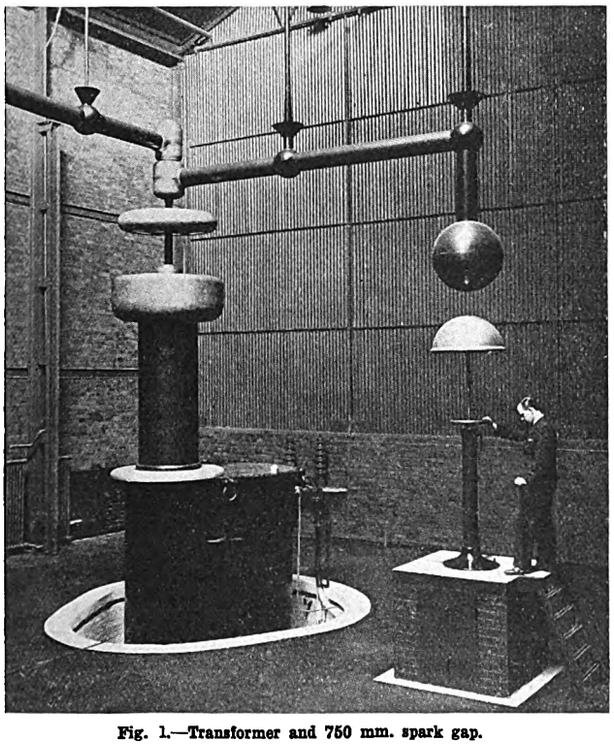

Fig. 1.—Transformer and 750 mm. spark gap.

away from the laboratory in order that it may not be heard during testing.

Four methods of measuring the test voltage are provided as follows :—

(1) Non-continuous indication by spark over of the 750 mm. sphere spark gap.

(2) Continuous indication by the 750 mm. sphere spark gap connected as an air condenser, in conjunction with a two-valve rectifier and moving coil permanent magnet d.c. instrument. This method gives crest voltage indication. The lower half of the sphere spark gap is in two portions which are insulated from each other. The upper portion of the hemisphere together with the upper 750 m.m. sphere forms an air condenser, the lower portion of the hemisphere being earthed and functioning as a "guard" ring. When

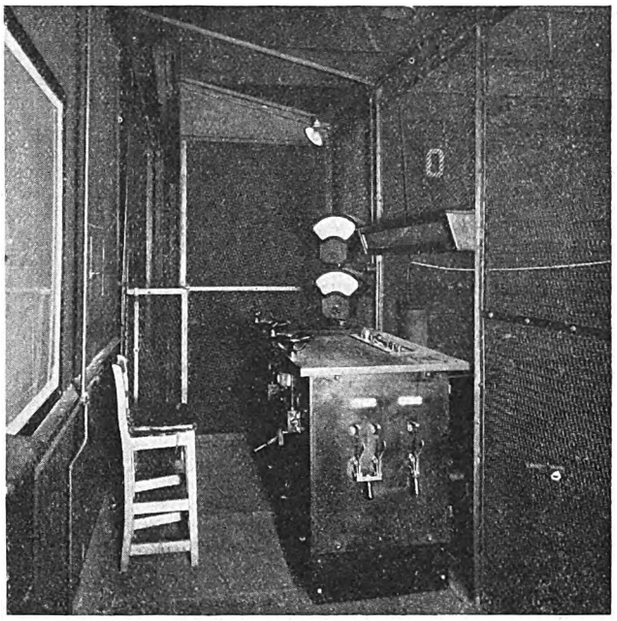

Fig. 2.—The control desk.

the gap is used for spark overs, the upper and lower portions of the hemisphere are connected together and earthed.

(3) Continuous indication by an illuminated dial voltmeter fed from a special voltmeter coil in the testing transformer.

(4) Continuous indication by a standard voltmeter connected across the primary terminals of the transformer.

A test tank, 9 ft. 6 in. diameter by 12 ft. deep has been installed for the testing of large high voltage bushings. The oil in the test tank can be heated by immersion heaters which are controlled automatically by a thermostat capable of being set to maintain the temperature constant at any value up to 100 deg. C. This tank stands in a pit eight feet deep.

A compressed air apparatus has been installed for the production of artificial rain. The spray tower is portable and adjustments can be made without interruption of the water spray of the height of jets and angle of spray. The spray can be rotated in a horizontal plane, for the purpose of measuring the rate of precipitation, and the distance between the tower and the apparatus under spray can be varied.

Temperature cycle tests on porcelain insulators are carried out in two portable tanks one of which is fitted with immersion heaters. A two-ton travelling electric block is used for handling bushings and porcelain insulators.

The main entrance to the laboratory is fitted with two sliding doors. A bogie track enables apparatus to be run into the laboratory from the erection bays. Alternatively, high voltage switchgear can be tested whilst in the erection bays by running out a test line through the main entrance. Direct access to the control gallery staircase is obtained by a small door. This door, along with the main doors and electric lifting block are interlocked with the control circuits so that the testing transformer cannot be energised unless all doors are closed and the block is at the end of the girder alongside the control gallery. The testing equipment can be operated in total darkness for corona tests. Two-way switches are provided in the immersion heater and lifting block circuits enabling these circuits to be connected to earth during testing.

The British Thomson-Houston Co., Ltd., supplied the transformer, motor generator, control desk and sphere spark gap; the latter was manufactured by Emile Haefely and Co., S.A. The testing busbar was supplied and erected by the Micanite and Insulators Co., Ltd.

E.L.M.A. AND E.D.A. AT CHARING CROSS.

Good Lighting Exhibit Attracts Thousands Daily.

LAST week the Lighting Service Bureau of the E.L.M.A., in collaboration with the British Electrical Development Association, opened an attractive lighting exhibit in the form of a pavilion in the booking hall of Charing Cross Underground station—a very valuable site for small displays which draws the attention of about two thousand people daily. The lighting exhibit will remain on view until the end of March.

The pavilion itself is divided into three interiors with the addition of two built-in windows, and a good deal of exterior lighting is provided by various luminous features in the form of flashing opal cubes, lamp pylons, and other devices. The lounge has been designed entirely on architectural lighting lines and will be a revelation to the many thousands who will see this exhibit.

On the opposite side to the lounge, the demonstration room should exert considerable influence on the public mind to the benefit of the electrical industry. The three-colour cornice lighting, controlled by three photo-electric cells which can be operated by members of the public placing their hands over apertures in a front pedestal, is a very popular combination. Each beam of light interrupted in this manner brings on one colour of lighting in the cornice, and the combinations of colours obtained in this manner by the use of red, green and blue lamps produces remarkably pleasing effects. This section of the pavilion bears the legend : " Controlling Light with Light—The Electric Eye." In this room most of the lighting effects are novel. They include a system of indirect ceiling lighting, two colour lighting recesses, a mirror lighting demonstration, and one of the familiar Lighting Service Bureau lamp cabinets. The pedestal topped by a brightly illuminated bowl of goldfish is particularly effective.

The " House You Want Sign " recessed into one of the walls of the stand is good propaganda, designed by E.D.A.

The model all-electric kitchen, complete with washing machine, cooker, floor polisher, and other apparatus, flashes from good to bad lighting in conjunction with a telling electric sign, and the two window displays built into the pavilion are instructive. One of these windows shows the E.L.M.A. " Lady of Light " display in a new and improved form ; the other indicates the progress in light sources from the crude oil lamp to the latest electric bulb, and shows the improvement in efficiency on a basis of candle power per heat unit consumed.

Two external lighting features in the form of stainless steel pylons some 13 ft. 6 in. in height (lent by Messrs. Thomas Firth and Sons, Ltd.), serve to emphasise the modern tone which is noticeable throughout the whole exhibit.

(A view of one side of the pavilion will be found on page 343.)

PUSH BUTTON CONTROL.

AT the informal meeting of the Institution of Electrical Engineers, held on March 3rd (Mr. H. T. Young in the chair), Mr. J. J. Fisher opened a discussion on " Push-button Control." Mr. Fisher said that push button or automatic control could be applied to almost anything from opening garage doors by shining the headlights on to a photo-electric cell to the complete automatic control of a rotary sub-station.

Mr. J. R. Bedford said that British manufacturers always seemed to make control gear that required current flowing continuously to maintain contacts. It was, of course, quite a small current but there were conditions where it was quite unsuitable.

Mr. A. Morgan said that the gear indicated by Mr. Bedford was obtainable but the keynote of button control was not economy but convenience. Ease of control was a point which electrical engineers should stress persistently.

Mr. J. Eck pointed out that push button control eliminated many sources of trouble with motors—it prevented misuse of the starter and, by mounting the controller adjacent to the motor, it confined the circuit leads to short lengths, pilot leads being run only to the control points.

Mr. J. F. Shipley said that one of the defects of contactor gear as now designed was the great space it required—he thought the double-wound rotor would simplify the control gear considerably.

NEW G.E.C. SHOWROOMS AT BRISTOL.

Official Opening—Sir Hugo Hirst's Informal Visit.

IN our last issue we briefly recorded the opening, on March 5th, of the new showrooms and offices of the Bristol branch of the General Electric Company. The ceremony was performed by Alderman A. A. Sennington, who flashed an electric torch on a photo-cell, thereby actuating a master switch which controlled the illumination of the building.

The company then adjourned to the Grand Hotel for luncheon. Alderman Sennington proposed the toast of the General Electric Company, and spoke of the remarkable growth that had taken place since the inauguration of the G.E.C. in 1887. He recalled that Wine Street, Bristol, was first electrically lighted about 1882-84, and that Taunton was the first city in the country to have electric light in its streets. He said that few of the authorities in this country were anxious to place orders abroad, but they wanted some assurance that they were not dealing with a ring. He referred appreciatively to Sir Hugo Hirst's work in the development of the electrical industry.

Coming of Age of the Branch.

Mr. F. Winstanley, of the G.E.C. directorate, replying, said that it was a joy to every G.E.C. man to hear the name of Sir Hugo Hirst quoted, for he was one of those men who had visualised just what the possibilities of electricity meant to this country. The Bristol offices were the first sub-branch of the G.E.C. to be opened. That opening took place in 1909, so they were signalising their coming of age by the move into the new premises. The company now had 24 branches in the towns of this country and more than 24 in the Dominions. Its hundreds of acres of works gave regular employment to 24 000 British workers. He mentioned some of the large contracts recently obtained by the company, including erection of 132 000 V transmission lines for the Mid-East England section of the grid, the Manchester South-Altrincham Junction railway electrification, including the first standard (1 500 V) voltage train motors to be built in this country, and the installation of automatic telephone exchanges. The Thames Embankment lighting was carried out by the G.E.C., and Bristol was going to adopt a similar system.

Mr. W. E. Hobbs, the manager of the Cardiff branch, proposed the toast of " Our Guests, supported by Mr. W. L. Richards, manager of the Bristol branch. The toast was acknowledged by Mr. H. R. Beasant, of the City Tramways Department, and by Mr. W. B. Williams, the chairman of the Bristol area of the Electrical Contractors' Association.

In the afternoon a series of demonstrations was given in the new showrooms, interesting features being a comparison between rows of carbon filament, metal filament, gas filled, outside coated and the latest Pearl Osram lamps, with examples of good and bad lighting. The visitors were entertained to tea in the building. Sir Hugo and Lady Hirst, who are staying at Bath, arrived at the new premises quite unexpectedly, while the luncheon was in progress, and remained long enough to shake hands with some of the guests, who were delighted to see Sir Hugo Hirst about again after his severe illness.

The new offices at 26, Victoria Street, consist of four main floors, with a back extension on the ground floor and a large basement. The present building is expected to meet the needs of the branch for several years to come. It includes, on the ground floor, the wireless, light electrical machinery and illumination showrooms ; on the first floor there are the lighting fittings showroom, a model electric kitchen and the manager's office. The upper part of the building and the basement are required for stocks. (Pictures on page 343.)

PAISLEY ASSOCIATION OF ELECTRICAL ENGINEERS.

A meeting of the Paisley Association of Electrical Engineers was held in the Y.M.C.A. Board Room on February 25th, Mr. R. W. Dodson presiding. Mr. Alex. Thomson of the Paisley Post Office Engineering Department delivered a lecture on " Automatic Telephony." At the conclusion of the paper members visited the Paisley Automatic Exchange, when the lecturer and his staff demonstrated the equipment in actual operation.

BOOK REVIEWS.

The Practical Electricians' Pocket Book, 1930. Edited by F. H. ROBINSON. (Odhams Press.) Pp. lxx+554. 2s. 6d. net.

This is the 32nd annual edition of a publication which has proved its utility by the length of its existence. New sections include "Testing and Fault Localisation" "Induction Motors—Synchronous and Asynchronous" and "Law of Contracts." Other sections have been revised where necessary and the central station data have been considerably expanded.

Telegraphy. by T. E. HERBERT, A.M.I.E.E. (Sir Isaac Pitman and Sons, Ltd., The Specialist's Series.) Pp. 1199. 20s. net.

The fifth edition of Mr. Herbert's well-known exposition of the telegraph system of the British Post Office, of which he is Assistant Superintending Engineer, includes in addition to its decriptive matter, a good deal of material not to be found in any one elementary textbook. The new lease of life given to the Wheatstone system by the Creed additions has been covered by detailed descriptions of the Creed receiver and column printer and Mr. R. P. Smith, of the Telegraph Section of the Engineer-in-Chief's Office, contributes a valuable chapter on the Baudot apparatus and its derivatives. "Start Stop" telegraphs voice frequency systems and simultaneous telegraphy and telephony are adequately covered, but we do not find any reference to the picture-telegraphy apparatus which is now being operated between Great Britain, Germany, Austria and Scandinavia.

Schaltanlage fur Drehstrom-Kraftwerke. By J. WALTJENZ. (Berlin: Julius Springer.) Pp. xvi+267. 39 marks.

The title of this work would lead one to expect it to deal with a somewhat restricted field, but the range of information covered is surprising.

The book is well bound and printed in clear type; the illustrations, both photographic and diagrammatic, are generally excellent, except that, though clearly drawn and printed, the latter are often too small, particularly some of the more complex ones. This is a fault frequently found in Continental technical books, as is also the lack of an index. On the credit side, however, we have tables of the algebraic and graphical symbols used in the book. The latter are particularly good (standard graphical symbols are used and they will cause the English reader no trouble, though in certain details they differ slightly from the usual British style).

The earlier sections deal with calculations of short circuit currents which are set out on the percentage basis. The whole section is clear and the tables of short cirucit factors and formulæ are very useful for reference. Perhaps the explanation of the "doubling effect" might have been expanded with advantage. Diagram 27, which illustrates this point, should certainly be larger or the information split up into two or three separate sketches—incidentally it appears that the draughtsman himself has tripped up at one point due to the very small scale.

The section on "reduction" of networks is quite good and throughout the book many handy formulæ and curves are given, but the limits of space render some of the theoretical portions a little bit dangerous, e.g., section 19 dealing with mechanical stresses is certainly inadequate.

Leaving the theoretical part of the book which fills roughly the first fifty pages, we find the next fifty pages or so given up to the discussion of principles and operation of protective systems, relays, etc. One cannot help remarking on the high state of development of what may be called graded and special purpose "relay" protection and the lack of use of pilot wires, which still do not seem to penetrate far beyond the "British sphere of influence."

The final two hundred pages deal chiefly with the construction and selection of equipment and are mostly descriptive. To review this would in effect be to review modern German practice, though English (Reyrolle) metal-clad gear is illustrated.

The book will probably be of more direct interest to purchasers than to makers of switchgear. The theoretical part is very valuable for reference, but should be supplemented by a sound knowledge of the physical phenomena concerned; the descriptive part is a useful summary of modern practice, particularly on the continent of Europe, and considering the limitations of space the whole work is to be commended.

W. F. C.

Future of the B.I. Fair.

[TO THE EDITOR.]

SIR,—With reference to the leading article in your issue of February 28th, it is our experience, as exhibitors at Birmingham and London, that London is by far the more attractive to buyers, both home and overseas. In spite of the special visits of associations, advertising, etc., diverting electrical people to Birmingham (and rightly so) we are more than satisfied with the results of our London stand.

There are not sufficient hotel accommodation and attractions at Birmingham to hold the overseas visitors. They pay a flying visit for a few hours, as if it were an irksome duty. The result is merely a hurried glance at stands and a rush for the London trains. At the London Fair they can spend comfortably several days without fatigue, and give individual stands maybe an hour or two—one needs this time to deal properly with customers' inquiries and orders. Overseas people have made repeated visits to our stand, and finally placed orders. What chance has a stand attendant to hold the interest of a man who has a train to catch?

February, in our opinion, as heating apparatus makers, is a perfectly good month, especially if there be a cold snap, to help buyers make decisions.—We are, etc.,

High Power Arc Rectifiers.

[TO THE EDITOR.]

SIR,—Mr. J. C. Read in his paper on the above subject, recently read before the Rugby Engineering Society and abstracted in your issue of February 7th, lays proper stress on the striking technical progress made during the last few years with the steel cylinder arc rectifier. But he states that this type of converting plant "is not at present able to invade seriously the field of power and lighting plant at 400 to 500 V." In our opinion this hardly does justice to the position, for as far as Brown Boveri rectifiers are concerned, the last return we have (September, 1929) gives the following figures to the nearest 1 000 kW:—

Total output of steel cylinder rectifiers for 500 V or less	422 000 kW
Ditto between 500 and 1 000 V	378 000 kW
Ditto above 1 000 V	200 000 kW

Incidentally, the first rectifier equipment to be ordered from the Bruce Peebles Co. (licensees in Great Britain for our rectifiers) is a 1 500 kW unit at 550 V.

BRITISH BROWN-BOVERI, LTD.,
C. D. WALE, Secretary.

March 10th.

Ship to Shore Telephone Charges.

[TO THE EDITOR.]

SIR,—In your editorial comment on ship-to-shore telephony in THE ELECTRICIAN, February 28th, referring to rates established for telephone connections with the s.s. "Majestic," you state that the minimum charge established by the Post Office is £4 10s., while the corresponding American fee for service inaugurated with the s.s. "Leviathan" is from £7 to £11, according to the telephonic zone occupied by the subscriber on land. These figures for the American charges are in error. The minimum American charge is $21, which is slightly less than the minimum English charge quoted above.

The American ship-to-shore charge varies from $7 to $11 per minute, according to the zone concerned, in place of varying from £7 to £11 for three minutes as he states.—I am, etc.,

H. E. SHREEVE,
Technical Representative in Europe,
American Telephone and Telegraph Co.
and Bell Telephone Laboratories, Inc.

London.
March 8th.

[*We regret that a misunderstanding on the part of a contributor should have caused us to make an inaccurate comparison of British and American "Ship to Shore" telephone charges.*—ED.]

NEWS IN BRIEF.

The Manchester Radio Exhibition—Cheakamus Hydro-Electric Scheme—Conference of Electrical Women to be Held in London—Telephone Progress.

AT a meeting of the Institute of Fuel on Wednesday, Professor W. E. Gibbs read a paper entitled "Some Factors Affecting the Problem of Smoke Prevention." Dr. E. H. Lander was in the chair.

In order to celebrate the Royal Charter recently granted to it, the British Engineering Standards Association held a dinner at the Grocers' Hall, London, on March 6th, when the Duke of York was the guest of honour.

The twenty-second annual general meeting of the Institute of Metals was held in London on March 12th and 13th, when the retiring president, Dr. W. Rosenhain, F.R.S., inducted the incoming president, Dr. R. Seligman, into the chair.

Direct telephonic communication has been established between Bordeaux and Kovno (Lithuania).

Hull Electricity Committee is to erect workshops at Sculcoates power station, at a cost of £1 200.

The seventh annual radio show at the City Hall, Manchester, will be held from October 16th to 26th.

Vancouver City Council is proceeding with a proposal for the erection of a hydro-electric power plant on the Cheakamus River.

Walsall Corporation Electricity Committee has decided to appoint a showroom superintendent at a salary of £300 per annum.

An electric lighting installation is to be provided in Holy Trinity Church, Hawley, as a memorial to the late Mr. Lewis Kelsey.

Windsor Board of Guardians has postponed consideration of the question of the installation of electricity generating plant until after April 1st.

Plymouth Corporation Hospital Committee seeks sanction to borrow £2 200 for a new battery house and plant at the mental hospital.

LOOKING BACKWARD.

FIFTY years ago, THE ELECTRICIAN *of March 13th, 1880, contained a paper by Dr. C. W. Siemens, F.R.S., on the influence of electric light on vegetation, which foreshadowed the development of electro-horticulture, as the result of a series of experiments which he had carried out.*

Use of the telephone to measure the time of flight of small arm projectiles was successfully achieved by the U.S. Ordnance Department, two Blake transmitters, one placed near the rifle and the other in front of and close to the target, being employed.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of March 10th, 1905, the provision of a tube to the north-eastern suburbs of London was described as "urgently needed." A deputation was received by Mr. Gerald Balfour, then President of the Board of Trade, from local authorities whose districts would have been traversed by a proposed line from the City to Walthamstow and Cheshunt.*

Transmission at 57 600 V between Moutiérs and Lyon was recorded.

An electrically operated derrick with a jib 60 ft. long standing on a gantry 75 ft. high was used in building operations at Dundee. A 15 H.P. motor was used and the cost was given as five lifts for a penny.

A new cotton mill with 84 000 spindles, belonging to the Acme Spinning Co., at Pendlebury, was reported to be the first spinning mill in England to be entirely lighted and driven by electricity.

The application of electricity to the home was dealt with by Mr. W. F. T. Pinkney in a lecture, under the auspices of the E.D.A., to domestic science teachers from Northumberland and Durham at Carliol House, Newcastle, on March 8th.

A meeting of the Physical Society will be held to-day (March 14th) at the Imperial College of Science, South Kensington, at 5 p.m. The papers to be read are: "A Harmonic Analyser," by Mr. J. Harvey; "A Method of Comparing Small Magnetic Susceptibilities," by Mr. R. A. Fereday; and "The Masses of the Proton and Electron," by Mr. H. T. Flint.

A description of the British Thomson-Houston Co.'s apprentice training scheme appears in "Industrial Welfare and Personnel Management." No premiums are required, but new boys are subjected to trial periods of 12 months as office or utility boys, and six months in the apprentice department, after which their apprenticeship commences in the engineering shops or drawing office.

The annual conference of the Electrical Association for Women will this year be held in London, on May 15th and 16th. Preliminary arrangements include a luncheon on May 15th at the Park Lane Hotel, over which the president, Mrs. Wilfrid Ashley, will preside, and at which the Minister of Transport will be the principal speaker. A ball will be held on May 16th at the same hotel.

St. Pancras (London) Electricity Committee reports that the Council has approved the principle of utilising public street lamp standards for advertising purposes, subject to certain conditions. In view, however, of a suggestion that steps should be taken which would enable the borough councils to take uniform action with regard to such signs, the Committee has deferred consideration of the matter.

At the conference of the Federation of Engineering and Shipbuilding Trades at York, it was decided to recommend the executive committees of the affiliated unions to give notice to terminate the agreement with the employers regarding procedure for settling differences without stoppage of work. The conference is of opinion that the threatened lock-out of shipyard joiners at Belfast last autumn was an infringement of the agreement.

Hull Corporation Telephones Committee has asked the City Architect to prepare working drawings and invite tenders for the erection of the telephone exchange at Hedon.

The Post Office announced that telephone facilities would again be available between this country and the liner "Majestic" during her voyage which commenced on March 6th.

Barking Electricity Committee has decided that a scheme be prepared on the question of the supply of cookers and hire-purchase wiring terms for the consideration of a sub-committee.

It is stated that negotiations with the Power Securities Corporation for the supply of electricity to Dar-es-Salaam, the Central Railway and the Tanga District (Tanganyika Territory) have been practically completed.

Radio By-wire, Ltd., has applied to Leeds Corporation for permission to establish a wireless relay exchange in the city. A representative of the company is to discuss the proposal with the Highways Committee.

The number of telephones in use in Canada at the end of 1928 was 1 334 534, an increase of 6 per cent. during the year Canada's average of 13·82 is only exceeded by that of the U.S.A., which was 15·8 in 1927.

A proposal that school children should be taught the use of the telephone and the police telephone box has been adopted by Bradford Education Committee.

The number of telephones working in connection with the public telephone service in Great Britain and Northern Ireland at the end of 1929 was 1 848 468, an increase of 125 885 during the year. Of this total, London had 661 977, an increase of 67 726.

Mining students attended the Technical School, Mexborough, March 8th, to hear Mr. W. Maurice speak on "Modern Mine Lighting and Gas Detection." Mr. Maurice said coal mining was the worst lighted industry in the world. In Great Britain every modern mine was equipped with electric hand lamps of a type which experienced mine-lighting engineers regarded as obsolete. The average lighting value of the pre-war class of lamp was about half a candle power.

At a recent meeting of the Leeds and District Section of the Institute of Transport, Mr. R. H. Wilkinson, manager of Bradford tramways department, stated, in a paper, that the chief thing in favour of the tramcar to-day was tradition, although for the handling of heavy traffic and making frequent stops the bus could not compare with either the tramcar or trolley vehicle. The trolley bus had nearly all the advantages of a tramcar, and others in addition. It was the most silent vehicle in public service, and could be stopped as often as desired, on all kinds of gradients.

PERSONAL.

MR. H. Jackson has been appointed electrical engineer and manager to Cardiff R.D.C.

Miss N. M. Pedler has been appointed temporary lady demonstrator and showroom assistant in the Fulham electricity department.

Leeds Electricity Committee has appointed Mr. S. F. Luckly as mechanical superintendent and Mr. R. J. Ure as electrical superintendent.

Mr. D. S. Richards, installation engineer of Newport electricity department, has been presented with a gold watch on the occasion of his leaving for York.

Estate of the gross value of £303 512, with net personalty £294 982, was left by the late Sir Robert Ashton Lister, chairman and founder of R. A. Lister and Co., Ltd., who died on December 6th last, aged 84 years.

Estate of the gross value of £63 335, with net personalty £24 623, was left by the late Lt.-Col. Montagu Cradock, a director of the Metropolitan-Vickers Electrical Co., Ltd., who died at the age of 70 years.

Mr. H. Mason Lloyd of Holywell has been offered the position of superintendent of the Chester electricity showrooms. Mr. G. P. Pierpoint of Scarborough, who had been previously recommended for the position, declined the appointment.

Mr. R. W. Steel, southern district mains assistant, Stoke-on-Trent, has resigned his position on appointment as assistant mains engineer to the Newcastle and District Electric Lighting Co., Ltd. The Electricity Committee has appointed Mr. F. R. Ward at present mains assistant, south eastern district, to succeed Mr. Steel.

Mr. J. M. Fay has been appointed a whole time member of the Irish Free State Electricity Supply Board. The remaining whole time members are Mr. A. F. Browne, chairman, and Dr. T. A. M'Laughlin, managing director. The part time membership is made up of Mr. J. J. Murphy, Dr. H. Kennedy, Mr. J. C. Foley, and Mr. P. J. Egan.

Lt.-Col. C. G. G. Crawley has been appointed Inspector of Wireless Telegraphy to the General Post Office in succession to Comdr. F. G. Loring, who recently retired after 20 years' service. Comdr. Loring has taken up a position with the International Marine Radio Co., Ltd., the subsidiary formed in Great Britain by the International Telephone and Telegraph Corporation of New York.

Mr. S. A. Russell, resident engineer at Barton (Manchester) power station, has been appointed to succeed the late Mr. T. Baxendale as power station engineer. Mr. Russell's place has been taken by Mr. W. E. Plowman, resident engineer of the Stuart Street station, and Mr. A. Williams, assistant engineer of the Barton power station, has been appointed resident engineer of Stuart Street station.

For the meeting of the British Association, to be held this year in Bristol from September 3rd to September 10th, under the presidency of Professor F. O. Bower, Glasgow, the following sectional presidents have been appointed :—Section A (Mathematical and Physical Sciences) : Dr. F. E. Smith, Director of Scientific Research, Admiralty. Section G (Engineering) Sir Ernest Moir, partner in S. Pearson and Son.

OVERSEAS TRADE.

Electrical Exports during February over £1 500 000 in Excess of Imports.

ACCORDING to the Board of Trade returns issued on Wednesday, United Kingdom exports of electrical goods, apparatus and machinery during February were valued at £1 655 364, as compared with £1 462 365 for the same month last year. For the two months of this year electrical exports were valued at £3 400 415, the total for the corresponding period of 1929 being £3 076 666. Electrical imports for the month were valued at £795 928, as compared with £508 816 for February of 1929, while for the two months, imports were £1 718 156, as against £1 106 911 for the same months of last year.

These figures show for the month an improvement in exports of £192 999 when compared with February, 1929, and for the two months the same comparison shows an advance of £323 749. On the import side February, 1929, showed an increase of £287 112 over February last year, while for the two months of this year the advance was £611 245 over the total for the corresponding period of last year.

Electrical exports during February last were, however, £859 436 in advance of similar imports, while two months, export trading showed a balance over imports of £1 682 259.

BUSINESS ITEMS.

THE HORSTMANN GEAR CO., LTD., Newbridge Works, Bath, announces the appointment of Mr. E. Glover Clark as north of England representative.

Mr. W. Kirtley, of 8, Beverley Terrace, Cullercoats, Northumberland has been appointed by WM. SAUNDERS AND CO., Falcon Electrical Works, Wednesbury, as representative for the North East Coast.

We have received an inquiry for the name of the makers of, or the agents for, a 2 kW fire sold under the name of "Furnace." The co-operation of any reader able to assist will be much appreciated.

The BENJAMIN ELECTRIC, LTD., announce that Mr. Towers, who represents them in Northumberland, Durham, Cumberland and Westmorland, has now changed his address to 5, Grosvenor Drive, Whitley Bay, Northumberland.

As manufacturers of petrol buses and electric trolley buses respectively, the ASSOCIATED EQUIPMENT CO., LTD., and the ENGLISH ELECTRIC CO., LTD., have arranged to collaborate in putting on the market a line of single-motor low-loading trolley omnibuses. These vehicles, which will shortly be put on test, will have as their basis the A.E.C. "Regal," "Regent" (four-wheel) and "Renown" (six-wheel) chassis. The line of vehicles will include single and double-deck types with the following wheelbases and seating capacities :—Model "661T," 50–52 seat double-decker (four-wheeled), wheelbase, 15 ft. 6½ in.; model "662T," 30–34 seat single-decker (four-wheeled), wheelbase 17 ft.; model "663T," 60 seat double-decker (six-wheeled), wheelbase, 16 ft. 6 in. The last-mentioned model can be supplied with a wheelbase of 18 ft. 7 in. In these new vehicles the Associated Equipment Co. will manufacture the chassis and components. The electrical equipment and the bus bodies will be manufactured by the English Electric Co.

THE CASE FOR INDIVIDUALISM.

Thirty-Second Luncheon of the Individualist Movement.

SIR ERNEST BENN was the speaker, and Sir Hugh Bell the chairman, at the thirty-second luncheon of the Individualist Movement, held on Wednesday at the Hotel Cecil, London.

The Chairman reminded the gathering that the original meeting of the Movement took place four years ago, when his rôle and that of the speaker were reversed, Sir Ernest on that occasion being in the chair and he (Sir Hugh Bell) deputed to launch their effort, which had so far been a flourishing enterprise. Unless a man helped himself, continued Sir Hugh, nobody else would help him to any good purpose. Nowadays, whenever there was any trouble, we ran to the Government. When he was a young man, that was the very last resort for help. The best they could say for government was that it was a necessary evil; let us have as little of it as we could.

Sir Ernest Benn claimed at the outset of his speech that the Individualist Movement had an effect for good upon thinking people better than that of any other movement within recent history.

The present position, as he saw it, was that we as a people had recently got hold of this new toy, government. Thirty millions of us were now fascinated by it and playing with it, and our only interest seemed to be to find out how much governing we could do.

The social reformers would never understand how much levelling down was done by legislative attempts to level up. While we were building motor cars to circumvent taxation, foreign manufacturers were building them to climb hills. Wherever one went in the world to-day, everybody seemed to think that we were down and out, and that doles and tariffs had done their deadly work on our character for independence and initiative.

In the meantime, he discerned a large element of hope in the position. The political education of our people advanced apace. We were getting over the politics that might be labelled "9d. for 4d.," and we should, largely as a result of the four years' work of the Individualists, in the near future be in a position to return to principles in politics—opposing principles, but principles about which we could argue. Nobody denied the basic soundness of the Individualist position, and their function was to keep the lamp of truth burning brightly above the clouds and fogs of political ignorance, content to know that now and again a few bright beams would break through for the benefit of the sufferers below.

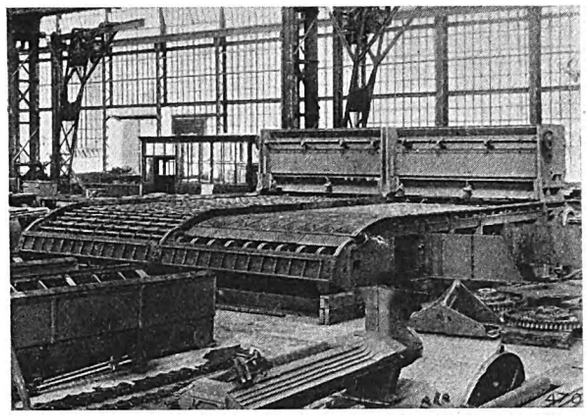
MECHANICAL STOKING.

Large Travelling Grate Units for the London Power Company.

THERE are now being completed at the Derby works of the UNDERFEED STOKER CO., LTD., two " Type L " stokers for the London Power Co., Ltd., which are to be installed at the Deptford East power station. Each of these stokers is



"Type L" stokers being constructed at the works of the Underfeed Stoker Co. at Derby, for the London Power Co.

31 ft. wide, corresponding to 700 sq. ft. of grate area for boilers of 200 000 lb. normal evaporation per hour, to operate also in conjunction with " Usco " multiple plate air heaters with an air supply of about 250 deg. F., the steam pressure being 525 lb. gauge with 700 deg. F. superheated steam temperature, constituting what are claimed to be the largest travelling grate stokers in the world. There are many new features of the " Underfeed Type L " stoker, including twin grates, for widths over 15 ft., but one of the most important claims is the solution of the problem of uniform distribution of the air supply to every point because of the width of the stoker. The forced draught fan discharges the air by way of the two main compartments, one at each side, direct into one very large simple windbox of ample height and capacity, while underneath the chain the active grate area is divided into a series of transverse compartments all opening at the bottom to the windbox, and each serving with air its own section of the grate surface above. Inside these compartments are a number of small shutters or dampers arranged in a row, and controlled in one section of the compartments by a common shaft projecting from the side of the setting and provided with a wheel control or handle.

In the above photograph, taken during construction in the shops, is seen in the foreground an " Underfeed Class B " stoker as used for " Lancashire " and other internally fired cylindrical boilers. This is of the " Underfeed " or " retort " type with a central trough, and a gear driven screw feed for the coal which " floods " over down each side of the sloping grate, made on the " louvre " principle with overlapping fire-bars and mechanical forced draught.

G.P.O. TELEPHONE CONTRACTS.

In the report of the Comptroller and Auditor-General on the appropriation accounts of the Government's revenue departments, it is stated that with regard to the supply of the equipment and plant of new telephone exchanges, the Post Office has mainly depended on five firms, with whom an agreement has been in force as to price since 1923. It was recognised at the outset that the manufacturing firms would incur abnormal initial expenses, which would be reflected in the prices charged, and substantial reductions were expected when these preliminary expenses should have been exhausted, or written off. In the opinion of the Postmaster-General, the reductions made in recent years have not been so great as should have been possible. A new scheme has been evolved in which the prices represent at the outset a reduction of 12½% for automatic and 10½% for manual equipment, compared with the former current schedule prices, and further reductions operate in succeeding years. The orders covered by the agreement are estimated to amount to at least £2 000 000 yearly, and it is anticipated that the value to the Post Office of the reductions secured will amount to not less than £1 750 000 during the period of the contract.

IN PARLIAMENT.

Derby Corporation's Trolley Vehicle Proposals Approved by Committee.

A SELECT Committee of the House of Commons had under consideration, last week, the Derby Corporation Bill, the provisions of which include authority to run railless trolley vehicles along any authorised tramway route in the borough and along routes in certain districts outside the borough. Mr. J. W. Horton, surveyor to Derbyshire County Council, said it was considered that the existing omnibus services were adequate. The poles for trolley vehicles would be dangerous to traffic on country roads. The Committee decided to grant the powers asked for within the borough and on six of the outside routes.

Newport Trolley Vehicles.

A Select Committee of the House of Commons, on Friday last, dealt with Newport Corporation's Bill, which includes powers to provide a railless trolley vehicle service. Mr. Wrottesley, K.C., for the Corporation, said that in order to facilitate traffic on the arterial road, for which they were also seeking powers, and which for part of its length would be constructed by widening an existing thoroughfare, the Corporation desired to remove the present tramway and run trolley vehicles. It was proposed to run those vehicles for a short distance outside the borough, and the Corporation asked for power to apply to the Ministry of Transport for a Provisional Order permitting them to run other trolley vehicle services outside the borough when they became necessary. The Committee decided to give powers to run trolley vehicles on the proposed route, but refused to permit the Corporation to seek extensions of the route by Provisional Order. The preamble of the Bill was found proved.

Replies to Questions in House of Commons.

An experiment with automatic traffic signals is to be made in Oxford Street, London.

The second part of the investigation of the Severn tidal power project has been put in hand, and the whole cost of this part of the inquiries is estimated at £17 000.

The sanction given in respect of one-third of the London Power Co.'s Battersea power station is proceeding. The question in dispute is whether any further sections of the station will be allowed to be erected.

As at present advised, the Minister of Transport is not satisfied that it would be desirable to compel electric tramway undertakers to equip cars with electric danger signs at the rear, to indicate when the brakes are applied.

The Electricity Commissioners are engaged in preparing a regional electricity supply scheme for East England, covering Norfolk and Suffolk, and expect to be in a position to transmit the scheme to the Central Board in a few weeks.

The estimated cost of lighting the National Gallery is £12 000, and of lighting the Tate Gallery £5 000. Experimental work will be necessary for the type of lighting to be adopted, and provision in next year's estimates has consequently been limited to work on one or two rooms.

The electrified lines on the amalgamated railways at December 31st, 1928, were: Southern Railway, 678 miles, equivalent to 16·3% of the total; London, Midland and Scottish Railway, 219 miles, equivalent to 1·6%; and London and North Eastern Railway, 120 miles, equivalent to 1%.

The Minister of Transport has received the report of his inspector upon the inquiry held on July 19th last on the Special Order promoted by the Dorking Electricity Supply Co., Ltd., relating to supplies of electricity in Dorking urban and Dorking and Reigate rural districts. He is not fully satisfied that the proposals of the Order as it stands are in the best interests of the development of the electricity supply in Dorking and neighbouring areas, and he has asked the Electricity Commissioners to discuss the position with the promoters and other parties concerned with a view to making further proposals.

The two directors of Imperial and International Communications whose appointments are subject to the approval of the Government are Sir Basil Blackett (chairman) and the Earl of Clarendon (who is resigning). Imperial and International Communications has made the following payments in respect of cables owned by or in which the Government has an interest: Imperial cables, £450 000, with interest from 1st April, 1929; Pacific cable, £466 486, with interest from 1st April, 1928 (part of the purchase consideration of £516 406); West Indian undertaking, £270 000, with interest from 1st April, 1929 (part of purchase consideration of £300 000).

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

DUNDEE CORPORATION.—Electric lighting installations in 84 houses. Further particulars from Mr. G. Baxter, director of housing, 91, Commercial Street, Dundee.

SHEFFIELD CORPORATION, March 14th.—Supply of tramway rails (section d) and copper bands (section e). Particulars from Mr. A. R. Fearnley, Tramways and Motors Department, Division Street, Sheffield.

HARROGATE CORPORATION, March 15th.—Supply of meter boards for one year. Forms of tender, etc., from Mr. N. McLean, borough electrical engineer, 33, Swan Road, Harrogate.

HARROGATE CORPORATION, March 15th.—Twelve months' supply of cables, joint boxes, joint-box compound, service meters and service cut-outs. Specifications, etc., from Mr. Neil McLean, borough electrical engineer, 33, Swan Road, Harrogate.

KEIGHLEY CORPORATION, March 15th.—Construction of l.t. overhead line. Specification, etc., from Mr. H. Webber, borough electrical engineer, Coney Lane, Keighley.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 17th.—Supply and laying of l.t. cables, etc. Specification, etc., from Mr. D. J. Keep, town clerk, Town Hall, Cambridge Road, Bethnal Green, E.2; deposit £2 2s.

BRADFORD CORPORATION, March 17th.—Supply of six double-deck, six-wheel, electric trolley vehicles. Specification from Mr. R. H. Wilkinson, general manager, Tramways Department, 11, Foster Square, Bradford.

COLCHESTER CORPORATION, March 17th.—Supply of about 11 miles of e.h.t. and one mile of l.t. underground cable of British manufacture. Specifications, etc., from the Borough Electrical Engineer.

LONDON COUNTY COUNCIL, March 17th.—Electric light wiring and fitting of block of dwellings known as Broxholme House, on Harwood Road site, Fulham, comprising about 425 wiring points. Specification, etc., from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £1.

MANCHESTER CORPORATION, March 17th.—Twelve months' supply of incandescent lamps. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

WEST LANCASHIRE RURAL DISTRICT COUNCIL, March 17th.—Electric lighting scheme for Hesketh, Rufford and Tarleton. Specifications from Mr. J. Scott, 358, Royal Liver Buildings, Liverpool; deposit £2 2s.

BELFAST CORPORATION, March 18th.—Supply of (1) 50 complete double deck top covered tramcars; or (2) 50 tramcar bodies; (3) 50 tramcar trucks, with wheels and axles; (4) 50 tramcar electrical equipments. Forms of tender, etc., from the General Manager, Tramways Department, Sandy Row, Belfast; deposit £2 2s.

INSCH (ABERDEENSHIRE), March 18th.—Electrical work in connection with alterations and additions to Benmohr, Insch. Schedules from Messrs. G. B. Mitchell and Son, 1, West Craibstone Street, Aberdeen.

LIVERPOOL CORPORATION, March 18th.—Installation of electric lifts, etc., at new abattoir, Stanley, Liverpool. Specification, etc., from the Land Steward and Surveyor, Municipal Buildings, Liverpool; deposit £3 3s.

CARDIFF CORPORATION, March 19th.—Supply of e.h.t. and l.t. paper insulated cable during 12 months. Specifications, etc., from the City Electrical Engineer, The Hayes, Cardiff. Only manufacturers on the King's National Roll are invited to tender.

METROPOLITAN ASYLUMS BOARD, March 19th.—(1) Installation of synchronised electric clocks at Joyce Green Hospital, Dartford; (2) installation of electric sewing machines at Southern Hospital, Dartford; (3) conversion of workshop power units to electricity at Darenth Training Colony. Specifications from the Office of the Board, Victoria Embankment, London, E.C.4; deposit £1 for each.

METROPOLITAN ASYLUMS BOARD, March 19th.—Installation of automatic telephones at Grove Fever Hospital, Tooting Graveney, London, S.W.17. Specifications from the Office of the Board, Victoria Embankment, E.C.4; deposit £1.

WEST MIDLANDS JOINT ELECTRICITY AUTHORITY, March 19th.—Coal-handling plant at Ironbridge generating station. Specification (No. 8), etc., from Mr. E. F. Hetherington, Phœnix Buildings, Dudley Road, Wolverhampton.

NEATH RURAL DISTRICT COUNCIL, March 20th.—Supply of sundries in connection with Dulais Valley electricity scheme, etc. Tender form from Mr. D. M. Davies, Council Offices, Orchard Street, Neath.

SALFORD GUARDIANS, March 20th.—(1) Electric light installation, and (2) electric lifts, in infirmary and adjacent buildings.

THE floodlighting of Olympia, London, during the period of the British Industries Fair, carried out with specially designed G.E.C. floods and Osram lamps.

Specifications from Mr. W. Martin, 33, Arran Road, Catford, London, S.E.6, or from the Poor Law Offices, Eccles New Road, Salford; deposit £2 2s. in each case.

MANCHESTER CORPORATION, March 21st.—Six months' supply of electric cooking ranges. Specification (No. 267) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

BRADFORD CORPORATION, March 22nd.—Electric light installation at Semon House, Ilkley. Specifications, etc., from the City Architect, Town Hall, Bradford.

DALKEITH CORPORATION, March 22nd.—Electrical work in connection with erection of about 28 houses at Gibraltar Gardens. Schedules, etc., from Mr. Jas. L. M. Dougal, burgh surveyor, Dalkeith.

KENDAL CORPORATION, March 24th.—Supply and erection of electrically driven blower, electric lift for retort house and lathe with electric motor drive, at the gasworks. Specifications, etc., from the engineer and manager, Mr. T. Crowdy, Parkside Road, Kendal.

LONDON COUNTY COUNCIL, March 24th.—Supply and erection in Blackwall Tunnel of (1a) four electrically driven exhaust propeller fans, 8 ft. diameter, each with 15 B.H.P. motor; (1b) two centrifugal blowing-fan sets, each with 55 B.H.P. electric motor, and suction and delivery air ducts; and (2) girders, joists, platforms, etc. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £5 in each case.

MORTLACH PARISH CHURCH, March 24th.—Electrical work in connection with alterations and additions to church. Schedules, etc., from Messrs. A. Marshall Mackenzie and Son, architects, 173A, Union Street, Aberdeen.

WEST HAM GUARDIANS, March 27th.—Laying of main and sub-main cables, and wiring work in various blocks at Central Home, Union Road, Leytonstone, London, E.11.

LIVERPOOL CORPORATION, March 28th.—Supply of 12 step down transformers. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, March 29th.—Six months' supply of electrical fittings, etc.

D

Digitized by Google

Forms of tender from Mr. C. L. Addison-Smith, 19, Heriot Row, Edinburgh.

CENTRAL ELECTRICITY BOARD, March 31st.—Supply and erection of metering equipment required in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-G.M. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CONGLETON CORPORATION, April 1st.—High tension and low tension switchgear, transformers, kiosks, h.t. cables, l.t. cables and l.t. overhead distribution. Specifications from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £3 3s.

CENTRAL ELECTRICITY BOARD, April 7th.—Supply and erection of 66 kV and lower voltage transformers, in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-G.T.1), from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

NEW ZEALAND POSTS AND TELEGRAPHS, March 18th.—Supply of ebonite mouthpieces (P. and T. 151/2 191.) (Reference B.X. 6 201.)

ANTWERP MUNICIPALITY, March 20th.—Supply and erection of a signalling and lighting installation for a swingbridge at Antwerp Docks (No. 198). (Reference B.X. 6 205.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 20th.—Steel water tank, on steel tower, with piping and fittings; and electric water level indicator. (Reference A.X. 9 073.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 20th.—Supply of two 150 kVA motor alternator sets, for Durban workshops (tender No. 1 615). (Reference B.X. 6 115.)

IXELLES MUNICIPALITY, March 21st.—Supply of 845 V, 440 V and 220 V d.c. electricity meters. Cahier des Charges (fr. 6¾), from Service de l'Electricité, 20, Rue d'Alsace Lorraine, Ixelles, Belgium.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of dial parts (schedule C. 555). (Ref. B.X. 6 047.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

EGYPTIAN PORTS AND LIGHTHOUSES ADMINISTRATION, March 27th.—Supply and installation of electric cables in the Port of Alexandria. (Reference B.X. 6 199.)

JOHANNESBURG MUNICIPALITY, March 27th.—Supply of paper insulated, lead covered, double steel tape armoured and jute served cable (contract No. 348). (Reference B.X. 6 200.)

SOUTH INDIAN RAILWAY CO., LTD., March 28th.—Transformers for power, lighting and signalling in connection with Madras Improvements—Electrification. Specifications (10s.), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays, for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

NEW ZEALAND POSTS AND TELEGRAPHS, March 31st.—Supply of spare parts for B.P.O. dial No. 10. (Reference B.X. 6 097.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30th.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

VICTORIAN ELECTRICITY COMMISSION, May 5th.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19.) (Reference B.X. 6 226.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year, 1930-31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13th.—Supply of terminal strips (P. and T. 151/2 200.) (Reference B.X. 6 209.)

CHILEAN MINISTRY OF MARINE, May 15th.—Supply of 3 metric ton travelling electric crane and 4 metric ton stationary electric revolving crane. (Reference No. A.X. 9 186.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of cable clamps, for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators; for Waitaki power scheme—section 53. (Reference B.X. 6 216).

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14th.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

Tenders Accepted.

YORK CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £6 695. (Recommended.)

EASTBOURNE CORPORATION.—A. E. Perry and Son, wiring at East Dean and Friston, £1 1s. per point.

ESSEX COUNTY COUNCIL.—Marconiphone Co., Ltd., wireless installation at Black Notley Sanatorium, £475 5s.

CHELTENHAM CORPORATION.—Sharpe and Fisher, Ltd., and Siemens Electric Lamps and Supplies, Ltd., supply of electric light fittings for 12 months.

SALFORD CORPORATION.—Supply of cables for 12 months; Derby Cables, Ltd., £2 072 2s., and N. V. Nederlandsche Kabelfabrick, £9 327 15s. (Both recommended.)

METROPOLITAN ASYLUMS BOARD.—Alpha Manufacturing and Electrical Co., Ltd., electric lighting at Woolwich casual ward, £175, and at Lambeth casual ward, £162 10s. (Recommended.)

HULL CORPORATION.—G. Baigent and Co., two generator sets, £450; Equipment and Engineering Co., Ltd., insulators, £91; F. Smith and Co., bronze wire, £440 14s.; British Insulated Cables, Ltd., lead-in cable, £116 0s. 6d.

EASTBOURNE CORPORATION.—General Electric Co., Ltd., switchboard, £1 150, l.t. board, £280, six 1 000 kVA transformers, indoor type, £2 940, four 1 000 kVA transformers, outdoor type, £2 160; two 250 kVA, £520; two 500 kVA £750, and cable connections, £500. (Recommended.)

SHEFFIELD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., 18 pairs of tramcar traction motors, £355 per pair; A. G. Wild and Co., Ltd., 18 car sets of upholstered seating, £146 12s. per set; Maley and Taunton, Ltd., 18 car sets of control and braking equipment, £207 10s. per set; Cravens Railway Carriage and Wagon Co., Ltd., 18 tramcar trucks, £208 each.

MANCHESTER CORPORATION.—John Thompson Water-tube Boilers, Ltd., water tube boiler and accessories; Howden-Ljungstrom Preheaters, Ltd., air heater; Davidson and Co., Ltd., fans; Underfeed Stokers Co., Ltd., mechanical stokers; Lancashire Dynamo and Motor Co., electric motors; Brookhirst Switchgear, Ltd., starters; Ferguson, Pailin, Ltd., transformer neutral earthing resistance and switchgear; English Electric Co., Ltd., outdoor type sub-station kiosk. Ruston and Hornsby, Ltd., supply of oil engines and generators; and J. M. Henderson and Co., Ltd., supply of travelling cableways with electrical equipment at Haweswater works; A. London, electric lighting at Mansfield Street school; Seddon and Sons, electric lighting at New Moston school; John Adams, Ltd., electrical installations at extensions of Old Moat and Green End Municipal Schools.

THE SOCIAL SIDE.

THE newly formed G.E.C. Rowing Club has distinguished itself in winning a number of river events recently. A rowing eight was turned out for the first time in the history of the G.E.C. on the Thames on February 15th, and competed successfully with St. Bride's Rowing Club, while on March 1st two fours proved equally successful.

Some 550 members of the staff of W. T. Henley's Telegraph Works Co., Ltd., and Henley's Tyre and Rubber Co., Ltd., and guests of the companies were present at the annual dinner and dance at the Wharncliffe Rooms, last Saturday. The company thoroughly enjoyed themselves. Numbers on the menu cards and on the toy balloons, for which a scramble took place later in the evening, entitled the fortunate possessors to prizes ranging from a tennis racket to a large Mickey Mouse doll. Mr. H. Savage, works manager at North Woolwich, who is retiring, after 40 years' service, in June, occupied the chair, and replied to the toast of "The Companies," proposed by Mr. A. H. M. Jacob. Mr. Jacob referred to the fact that the parent company had now been in existence for 50 years, and said that if the tyre company, which was only 12 years old, continued to progress as it had done so far, it would, when it reached the present age of the parent company, require a building larger than the Hotel Cecil.

The annual fancy dress carnival of the Igranic Electric Co., Ltd., was held on February 28th, at the Corn Exchange, Bedford, when a party of about 450 employees and guests, including a large contingent from the London office of the company attended. The costumes presented a riot of colour, and the judging, which was carried out by ballot, proved a difficult matter. Thanks to the generosity of the directors and the senior officials of the company, a large number of valuable prizes were awarded and one of the most striking events of the evening was the parade. The first three prizes for ladies were awarded to Miss L. Hettinger, whose costume represented Igranic wander-plugs; Miss C. L. Church, as an Eastern lady; and Miss F. McKillop, representing an Arcadian shepherdess. The three first prizes for gentlemen were awarded to Mr. H. Woods, as Sairy Gamp; Mr. F. Harrison, as the hunchback of Notre Dame; and Mr. Joe Taylor, as a Jack-in-the-Box. Mrs. A. H. Curtis, wife of the general manager, presented the prizes, and brief speeches were made by Mr. Curtis and Mr. A. H. Mackley.

CALLENDER'S HOSPITAL FUND.

The accounts of Callender's Hospital and Distress Fund for 1929 show receipts £1 418 2s., including £64 4s. 10d. balance at bank and cash in hand. The receipts included members' subscriptions, £860 11s. 4d.; death levies, £347 11s. 4d.; and £132 in donations by the company (£100) and directors and others. Gratuities to members amounted to £180 3s. 10d., death levy payments to 14 applicants £347 11s. 6d., and grants to hospitals, nursing associations, etc., £819 12s., and the total remaining in hand and at bank is £61 8s. 8d. Letters issued to members and their dependents for treatment at hospitals numbered 634, and letters for special nursing at home 25, while optical treatment was received by 122 members and their dependents, and 63 surgical appliances were supplied.

ELECTRICITY IN VICTORIA.

Satisfactory Report on the Development of the Yallourn Brown Coal Deposits.

IN the report of the State Electricity Commission of Victoria for the year ended June last the supply of electricity now available is compared with the conditions preceding the development of the Yallourn brown coal resources. The work at Yallourn began in February, 1921, and the first unit of generating plant there started working in June, 1924. The scheme had begun to pay its way after four years of operation, the figures for 1927-28 showing a small profit over all operations, on a total capital expenditure of over £11 000 000. Although the scheme may have been suggested and rendered possible by the immediate needs of the metropolis, rural supplies at once engaged the attention of the Commission. The first town to receive a supply of transmitted energy was Morwell, over the first section of the high-tension line which was to serve many towns in Gippsland concurrently with the availability of current from the main power station at the open cut. Supply to Colac and other western district towns was instituted in June, 1923, by means of the 44 000 V line which obtains its energy from the Geelong power station of the Melbourne Electric Supply Co. The outer suburban areas, the Yarra Valley and the Mornington Peninsula, were also in readiness to be served by Yallourn at this time, and plans were in course of preparation for the construction of the main north-eastern line, which was commenced in August, 1924, completed in January, 1926, and, pending the completion of the Sugarloaf-Rubicon hydro-electric scheme, received its energy from Yallourn, about 300 miles distant from the border towns which were served.

During the year the maximum load on the Commission's system rose from 84 000 kW to 91 000 kW, and the load factor from 49·05 to 50·3. The net energy sent out from the metropolitan terminal stations during the year increased from 325 000 000 units to approximately 356 000 000 kWh, and increases also took place in the cases of the various rural terminal and district supply stations. In the metropolitan area during the year, 555 500 000 kWh were generated. Total expenditure was £1 697 639, and the revenue £1 702 253. On electricity supply there was a profit for the year of £45 577, and on briquetting a loss of £25 705. The profit on both electricity supply and briquetting, however, is subject to annual adjustments, so that in the general profit and loss account the surplus is £4 614 over all operations.

At the Yallourn open-cut 1 660 698 tons of coal were excavated during the year. All of the coal won was excavated by the Ruston power shovel. Shortly after the close of the year a deep coal dredge commenced work on the south face of the open-cut. In 1931, when the extended briquetting factory and the first unit of 25 000 kW of new generating plant to be installed at Yallourn are in operation, 10 000 tons of coal a day will be required, rising to about 13 000 tons a day in 1934, when the full installation of 75 000 kW of new generating plant at Yallourn is due for completion. The maximum load on the Yallourn power station during the year was 62 500 kW, the station supplying 304 652 390 kWh of the total required by the system.

GROUP taken at the annual fancy dress carnival of the Igranic Electric Co., Ltd., on February 28th. Some 450 employees and friends attended, and a number of valuable prizes were awarded. See note on this page.

ELECTRICITY SUPPLY.

Proposed Extensions at Birmingham and Manchester—Electrification in the Isle of Man—Derby and A.C. Supply—An Electrical Offensive in North Wales—The Lister Drive Station.

SHIPLEY Electricity Committee is seeking sanction to borrow £10 000 for new mains.

North Bedburn P.C. is to borrow £600 for the provision of electric street lighting in the village of Howden-le-Wear.

AN innovation at the Prescot works of British Insulated Cables Ltd. is a large showroom containing examples of the range of articles manufactured by the company. A lantern and cinema projector equipment are fitted so that slides or films may be shown. The windows on one side of the room have been filled in with large, hand-coloured photographic enlargements of the overhead line work of the Central Scotland Electricity Scheme and the Great Indian Peninsula Railway electrification contract.

St. Pancras (London) Electricity Committee is to lay an additional low tension feeder main at Highgate, at a cost of £2 680.

Barking Electricity Committee seeks sanction to borrow £18 527 in connection with the electricity supply to the Becontree Estate.

Birmingham Electricity Committee has obtained sanction to borrow £740 000 for sub-station buildings, equipment, mains and plant.

Derby Electricity Committee is to apply to the Electricity Commissioners for permission to change from d.c. to a.c., and to borrow £21 000.

Manchester Electricity Committee has obtained sanction to borrow £5 000 for buildings; £100 000 for mains, and £45 000 for sub-station equipment.

Bootle (Cumberland) R.D.C. has decided to assent to an application by the Cumberland Waste Heat Co. for a Special Order to supply electricity in the rural area.

Walsall Electricity Committee has decided to extend mains at Rushall at an estimated cost of £300 to supply 20 houses, to be erected by the Walsall R.D.C. in Winterley Lane.

A Bill is to be introduced in the Tynwald (Isle of Man) to authorise the laying of mains to supply electricity throughout the island. Douglas Corporation will supply the power in bulk.

Sleaford Housing Committee has decided to ask the Electrical Engineer to prepare a specification and estimate for electric light installations in houses, to be erected on the Grantham Road housing site.

Oxford Corporation has received a letter from the Oxford Electric Co. with respect to the proposed electric line to Wolvercote, stating that it has been decided to carry out the extension underground.

The Electricity Commissioners have sanctioned the borrowing by Croydon Corporation of £4 082 for switchgear. Mains extensions are to be carried out at a cost of £687; and street lighting is to be improved at a cost of £705.

Liverpool Corporation has received loan sanctions from the Electricity Commissioners in respect of £46 306 for new buildings, plant and cooling towers, and £4 000 for ash-handling plant and builders' work at the Lister Drive power station.

It has been reported to South Shields Electricity Committee that the Central Electricity Board holds out every prospect of being able to link up the South Shields and Sunderland undertakings under the Board's scheme by October, 1931. —The Electricity Committee seeks sanction for a further loan of £5 000 for the assisted wiring scheme.

The increased supply required in the Longton sewage works will necessitate the installation of transformers of larger capacity at the Hanford Bridge sub-station and at the sewage works, and it has been decided by the Stoke-on-Trent Electricity Committee that the necessary new transformers and switchgear be provided at an estimated cost of £400.

Ripon Electricity Committee has asked the Chairman, Town Clerk, Consulting Engineer and City Engineer to confer as to the possibility of adopting scales of charges, based on rateable value of domestic premises, plus a unit rate.—The Committee has asked the Electrical Engineer to prepare a scheme for the electrification of Ure Bank area with a view to extension to Wath and Melmerby at a later date if desired.

The Cornwall Power Co. has applied to Plymouth electricity department for terms for supplying electricity to the company. Consideration of the company's application has been deferred pending the decision of the Commissioners with respect to Plymouth Corporation's application for sanction to a loan for additional plant.—The chairman of the Electricity Committee and the Town Clerk are to negotiate *re* supply of current in the Tavistock district.

The Irish Free State Electricity Supply Board has concluded arrangements whereby it has secured the monopoly rights in electricity supply for Cork City and environs, including Cobh; agreed to buy the interests of the Galway Electric Co. for supply in that city and to supply the complete requirements of electricity by the Dublin United Tramway Co., and of Messrs. Henry Ford & Sons, Cork. These demands will secure an immediate market for approximately 43 000 000 kWh per annum.

Mr. J. N. Waite, city electrical engineer, has reported to Hull Electricity Committee that as a result of the extension of the assisted wiring scheme, there is an increasing demand for the use of prepayment meters, but that, in consequence of the heavy additional expense of such meters, together with the difficulties caused by their use, it is not desirable to extend their use, except in especial cases. The Committee has decided that where prepayment meters are in use, the additional charge of ½d. per kWh be continued, and that the supply of such meters shall be restricted as far as possible.

Invitations have been issued by the North Wales and South Cheshire Joint Electricity Authority to the mayors and chairmen of other local authorities, electrical engineers and others to attend a conference at Llandudno on March 21st to discuss the present and future position of the electricity supply in the area controlled by the authority. The authority controls an area of 4 400 square miles, from Holyhead in the west to Crewe in the east. The invitation to the conference is the result of an offer by the North Wales Power Co. of a reduced charge for current, conditional on the reduction being passed on to the consumer, and the object of the conference is to start a "big push" in the consumption of current. In connection with the conference, makers of electrical appliances have been invited to join in an exhibition, which will be open for two days.

On February 21st members of Harrogate Corporation and a number of guests, including Sir Harry Haward, deputy chairman of the Electricity Commission, inspected the Corporation's electrical plant, which has been extended and reorganised under the powers granted by the Harrogate Electricity (Extension) Order, 1929. The additions to the plant include a 10 000 kW, 11 000 V, three-phase steam turbo-alternator and two 50 000 lb. per hour water tube boilers. The extension Order authorised the purchase of the Knaresborough, Summerbridge and Pateley Bridge undertakings, and the change over of the Corporation's system from single phase to three phase. Amongst other new outlets for current is the bulk supply to Ripon, which was commenced last year. The total output has increased steadily from 1 000 000 kWh in 1904 to over 8 000 000 kWh in the last financial year.

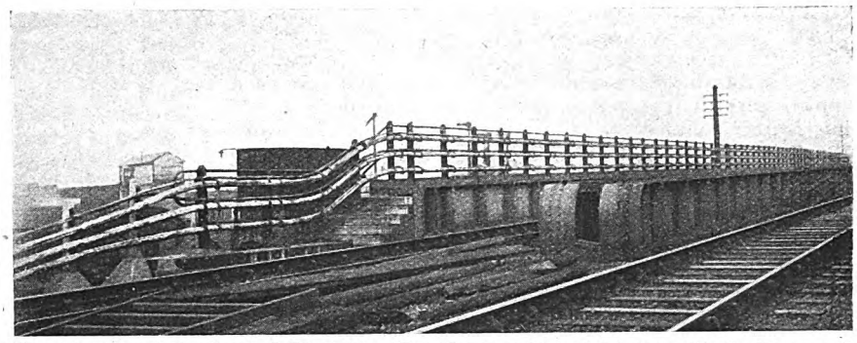
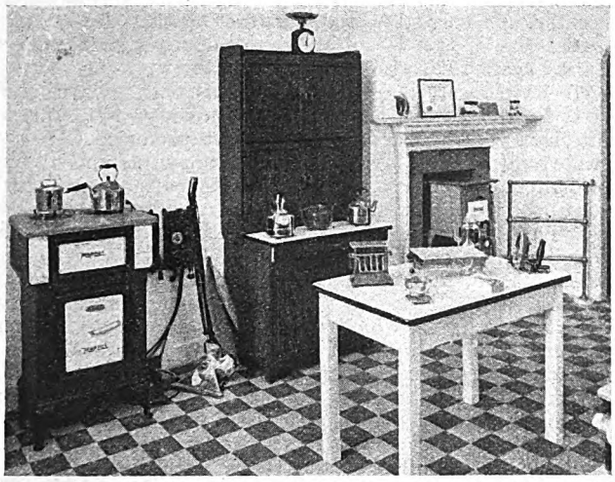
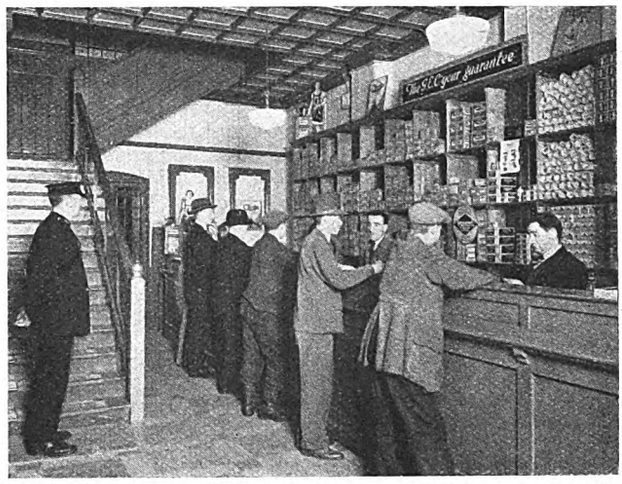
ELECTRICAL PICTURES OF THE WEEK.

Among the exhibits shown at the Nursing Exhibition, held at the Horticultural Hall, London, last week, was this novel electrical appliance which may be used as a cooker or radiator.

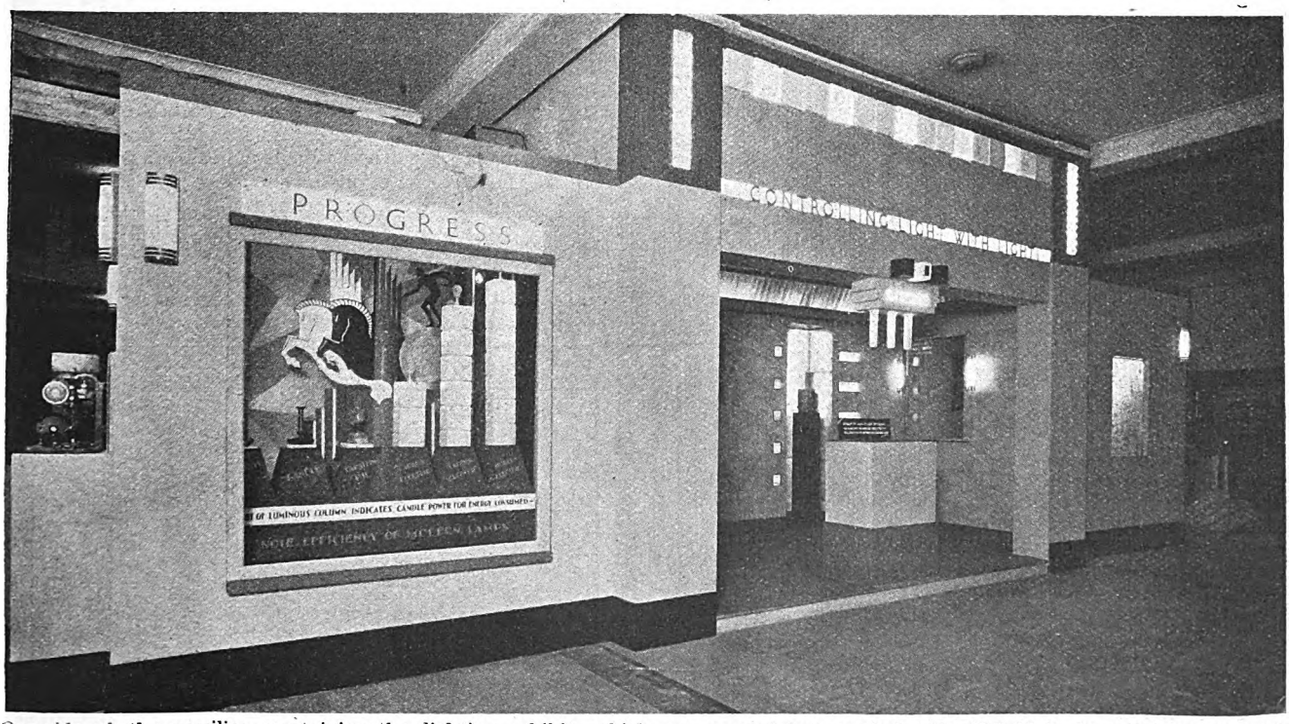


The schemes of the Central Electricity Board are quickly taking practical shape, and this picture of work recently carried out by British Insulated Cables Ltd. shows the method adopted for supporting cables across a railway bridge for linking up Willesden power stations of the London Power Co. and the North Metropolitan Electric Power Supply Co. The cables are 25 sq. in. three-core, 33 000 V.





Two views of the new showrooms of the Bristol branch of the General Electric Co., Ltd., which were opened last week. The electric kitchen, in the left-hand picture, is so arranged that demonstrations are possible under working conditions, while the trade counter at the new premises is provided with easily accessible bins containing items of stock most in current demand. See page 334.



One side of the pavilion, containing the lighting exhibit, which was opened last week by the E.L.M.A., in collaboration with the E.D.A., at the Charing Cross station of the London "Underground" Railway. The exhibit includes an all-electric kitchen and a new and improved form of the display entitled "Lady of Light." Other details of the pavilion are given on page 334.

DIESEL ELECTRIC LOCOS.

Two New Equipments for the North-Western Indian Railway.

THE General Electric Co., Ltd., has recently completed the electrical equipment for two Diesel-electric locomotives for the North-Western Indian Railway.

Each locomotive weighs approximately 50 tons in working order and both are of the double bogie type. They are each equipped with a 350 B.H.P. Beardmore high-speed Diesel engine, direct-coupled to a single-bearing generator with overhung exciter. The generator supplies current to four traction motors mounted upon the bogie axles, control being effected by master controllers located in the driver's cabs at either end of the locomotive. The locomotives are designed to haul loads up to 100 tons at a maximum speed on the level of approximately 47 m.p.h., and at correspondingly less speeds on gradients up to 1 in 50. The engine is started by motoring the generator from a storage battery which floats across the exciter circuit and serves to provide a low tension supply for the lighting and the control circuits. The primary control of the locomotive speed is by remote control of the engine throttle, this being effected from the master controller at either end of the locomotive. The Diesel-electric power unit has self-regulating properties, the main generator being provided with a differential series field winding in addition to a shunt field winding, so arranged that the locomotive characteristics ensure that corresponding to the particular throttle position the locomotive accelerates automatically up to its balancing speed. The controls are very simply arranged, push buttons being provided both to start and to stop the engine, speed control being obtained as stated previously by the movement of an electrical controller which gives 5 running positions. The locomotives are designed for the Indian track gauge of 5 ft. 6 in., but the bogies of one locomotive are being modified to the standard British gauge of 4 ft. 8½ in. to enable a number of tests to be conducted on the locomotive before shipment. Illustrations of the locomotives are reproduced below.

FINSBURY OLD STUDENTS' ASSOCIATION

Annual General Meeting—Election of Officers for Coming Year.

THE annual general meeting of the Finsbury Technical College Old Students' Association was held in the Engineers' Club on February 24th, when it was decided to utilise the interest on the money of the Finsbury Defence Fund and the Thompson Memorial Fund for a prize to be given by the Physical and Optical Society to Apprentices to commemorate the name of S. P. Thompson and Finsbury. The annual dinner of the Association will be held at the Trocadero on March 29th. Any old students who have not received a notice are asked to communicate with the Hon. Secretary, F. R. C. Rouse, 15, Clifton Gardens, Golders Green, N.W. The following officers have been elected for the coming year :—PRESIDENT Mr. W. B. Esson ; VICE-PRESIDENTS : Messrs. E. W. Moss, H. F. Knight, H. D. Symons and E. G. Walker ; MEMBERS OF COUNCIL : Messrs. W. J. Jeffrey, W. G. Head (mechanical), H. P. Guy, H. W. Gregory (electrical), L. M. Clark, J. V. Eyre (chemical) ; HON. SECRETARY : Mr. F. R. C. Rouse. HON. TREASURER : Mr. W. B. Thompson ; HON. AUDITORS : F. B. Preston, A. J. Chapman.

TRADE PUBLICATIONS.

THE subject of water heating by means of "Inventum" appliances is the subject of new issue by Mr. ALAN WRIGHT, 117, Victoria Street, London, S.W.1.

Publication No. P.F. 65 describing "Helsby" wireless Condensers and replacing No. H. 115 has been issued by BRITISH INSULATED CABLES, LTD., Prescot, Lancs.

Pamphlet No. 255/1 dealing with horizontal oil immersed flameproof controllers has been published by MAVOR AND COULSON, LTD., 47, Broad Street, Glasgow, S.E.

A list of revised prices and terms for the "Sunco" general catalogue, list No. 600 has been published by the SUN ELECTRICAL CO., LTD., 118, Charing Cross Road, London, W.C. The new list, No. 516, brings the main catalogue up-to-date but does not contain details of new lines or alterations to existing lines.

G. A. HARVEY AND CO., LTD., Greenwich Metal Works, Woolwich, London, S.E.7, has recently produced a booklet which describes and illustrates a few of the many diverse types of rivetted and electrically welded work carried out by the company's steel plate constructional department. The reference is No. 472.

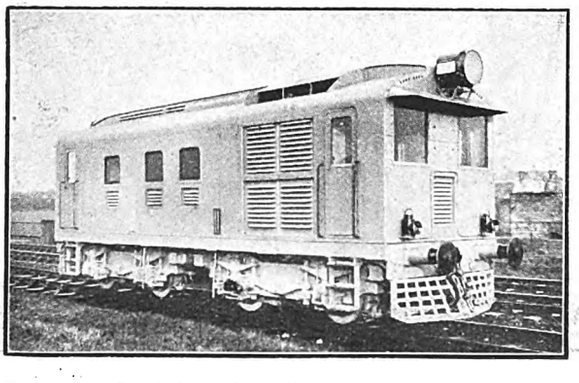
We have received from the WARDLE ENGINEERING CO., LTD., Elsinore Road, Old Trafford, Manchester, a copy of a new folder describing the "Maxheat" tubular electric radiator specially designed for the heating of offices, etc. Leaflet No. H 252 describing the company's tubular electric heating system has also been received.

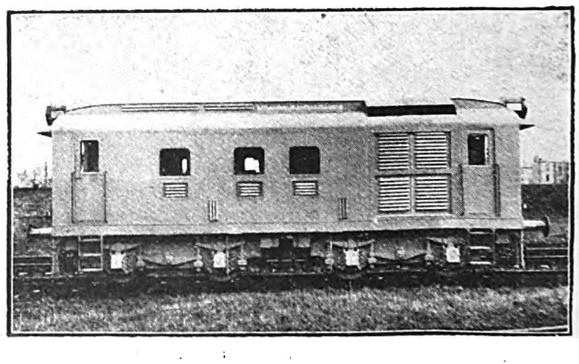
We have received from the NICKELOID ELECTROTYPE CO., LTD., Printer Street, London, E.C.4, a copy of the improved tint chart which this company has just produced. It shows a wide range of tints, is well protected from wear, and is arranged for hanging for quick reference whenever required. Such a chart should prove useful to advertisers and others who desire to arrive at some conclusion with respect to blocks most likely to suit their needs.

The MARCONIPHONE CO., LTD., 210, Tottenham Court Road, London, W.1, announces that the company's series of valve advertisements, in which attention is drawn to the many national services in which "Marconi" valves are used, has caused a considerable amount of favourable comment in the advertising world, and it is felt that their scheme of usefulness should be widened by bringing them to the attention of the local public. The result is a series of valve window bills, available to members of the trade, with the promise that fresh examples will be added from time to time.

"QUIPS."

Those who attend the many social functions attaching to the electrical industry will welcome the latest publication of Mr. H. Cecil Hunt, the author of "Howlers," for the many new business stories which it contains. The book, bearing the title of "Quips," claims to provide a suitable joke for every occasion and for every trade, and besides affording considerable amusement from the reader's point of view, will be found useful to those called upon to tell a joke new to the industry. The dinners, luncheons, and other social affairs of the electrical calling are probably greater in number than in any other industry. For this reason a new story quickly becomes a "chestnut," and a collection such as "Quips" should prove a valuable investment, for many of the stories are new, even to us who go to every gathering of note.





The two new Diesel electric locomotives which have been built for service on the North-Western Indian Railway. The electrical equipment was made by the General Electric Co., Ltd., and a description of the gear is given above.

ELECTRIC TRACTION.

Single-Phase Locomotives for Rack and Adhesive Operation.

THE adoption of the single-phase system for the electrification of the rack railway from Viège to Zermatt in Switzerland constitutes a new development in the application of this traction system, as single-phase current had never been resorted to before for the operation of rack locomotives. At the outset, direct current at 2 000 or 3 000 V was favoured for the line in question, but, after further consideration, single-phase current at 10 500 V was decided upon, and an order was placed with the Oerlikon Company, as main contractors, for five locomotives. These locomotives, which are fully described in the Bulletin 102 just issued by Messrs. Oerlikon, Ltd., of 28/31, Essex Street, Strand, W.C.2, are for rack and adhesion operation; they are for a metre gauge track with maximum gradients of 1 : 50 on the adhesion sections and 1 : 8 on the rack sections, while the minimum radii of curves on these sections are 262 ft. and 368 ft. respectively. The locomotives are equipped with four motors, mounted on two bogies; the motors are arranged, as in the case of tramcars, with bracket bearings resting on the axles and casing supported by the end frames of bogies through the intermediary of springs. The equipment is further arranged for short-circuit breaking. The normal tractive effort is 19 000 lb. and the maximum tractive effort 30 800 lb. The locomotives weigh 48 tons and are capable of dealing with a total train load of 108 tons.

A new type of tramcar, designed by the manager, Mr. R. Horsfield, and built at the Leeds Corporation Kirkstall Road tramway depot, embodies many new features affording increased comfort to passengers. New mechanical features are air wheel and track brakes. It is proposed to build 150 cars of the new pattern.

London County Council Improvements Committee recommends that the Council's Charing Cross Bridge Bill shall include provisions authorising the execution of certain works at Waterloo, Charing Cross (Embankment), and Strand stations that have been proposed by the Underground Electric Railways Co.

METAL AND CHEMICAL PRICES.

TUESDAY, March 11th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£75 15 0	—	£1 0 0

Rubber—Para fine, 8¾d.; plantation, 1st latex, 7 ⅛d.

∴ **The metal prices are supplied by British Insulated Cables Ltd.**, and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

THE LEAD MARKET.

In spite of support given by producing interests at the end of last week, the market, according to James Forster and Co., again opened easier by 5s. per ton. Tuesday's market was steady and active, but on Wednesday prices threatened to fall again. Thursday's market opened flat and, with no official support, the price fell away rapidly a further 11s. 3d. per ton, followed by an average drop of 10s. Declarations of a considerable quantity of Mexican and American lead for early arrival created a Contango of 5s. per ton. The official American price was lowered on March 3rd to 6 cents, and again on the 6th to 5·85 cents per lb.

Closing prices on March 7th were £18 10s. for March, and £18 15s. for June, 30s. to 25s. per ton lower on the week.

WIRELESS NOTES.

Swiss "Regional" Broadcasting Plan—British Equipment Ordered.

SWITZERLAND is to have a "regional" broadcasting system, somewhat similar to that which is being instituted by the British Broadcasting Corporation, with three high-power stations—in the German, French, and Italian speaking sections of the country, respectively—and smaller relay stations where required in the principal towns. The most powerful of the new stations, a Marconi type "P.B." 60 kW broadcasting transmitter, has already been ordered from Marconi's Wireless Telegraph Co., Ltd., and is to be erected at Munster, about twelve miles to the north-west of Lucerne. This station will constitute the main "regional" station for German-speaking Switzerland, which is the largest of the three lingual sections of the country. While it is similar in design to the transmitters at the London "regional" broadcasting station at Brookman's Park, the Munster station will employ greater power, with 60 kW in the aerial, compared with London's 30-50 kW. It will thus be one of the most powerful stations in Europe, a condition rendered necessary, in spite of the comparatively limited area served, by the fact that Switzerland, with its valleys, high mountains, and curious screening effects, is one of the most difficult countries in the world for broadcasting. Studios in Berne, Zurich, and Basle will provide the programme for the Munster station, which will be allotted the wavelength of 459 metres. To provide for "crystal listeners" in the towns, Marconi broadcasting stations of ½ kW aerial power are to be erected at Berne and Basle. These stations are of special design, with crystal-controlled drive to ensure constancy of frequency. The new station at Berne will replace the present Marconi 1 kW "Q" broadcasting station, which was erected in 1925, and which will later be modernised and re-erected elsewhere to play a part in the "regional" plan. At Basle the new station will be the frontier town's first full-time broadcasting station, the broadcasting service having previously been carried out by the Marconi transmitter at the Basle aerodrome, which is primarily employed for wireless telephony with aircraft. The re-organisation of the Swiss broadcasting service on the "regional" basis is expected to be completed in 1931.

This is the second recent Continental broadcasting re-organisation in which assistance has been sought from the experience of the British Marconi Company, in September last year the company having received an order from Poland for high-power and relay stations designed to give crystal reception throughout the industrial and thickly-populated districts of that country.

APPROVAL OF SAFETY LAMPS.

Secretary of Mines Makes Further Order Respecting Electric Lamps.

THE Secretary for Mines announces that, on February 10th, he made an Order approving for use in all mines to which the 1911 Coal Mines Act applies the following types of safety lamps:—Electric lamps for general use: Davis-Derby cap, Derby 4 V, Davis-Derby portable floodlight, 8 V, Edison cap (model G), Aldwarke and Wolf alkaline 18 Ah and 22Ah. Electric lamps for use by officials or for special purposes only: Ceag gas detecting, No. 1 and No. 2, Derby officials', and "Wefco" hand torch (for auxiliary purposes). The Order also amends the schedules to previous safety lamp orders by substituting revised specifications, or amending the specifications, of certain types of safety lamps already approved. The Secretary for Mines announces that on February 11th he made an Order approving the Wolf alkaline 18 Ah miners' lamp with Gulliford firedamp indicator attachment for use in all mines to which the 1911 Act applies, subject to the conditions specified in the schedule to the Order. This lamp is the same as the Wolf alkaline 18 Ah miners' lamp except that it is fitted with a firedamp indicator. The indicator is designed so that a heated platinum wire may be connected in series with the lamp bulb by means of a switch; the presence of approximately 2½ % or more of firedamp in the air causes the platinum wire to fuse and the light to be extinguished.

Torquay Electricity Committee has received sanction to borrow £60 000 in respect of boiler extensions at the generating station.

COMPANY NEWS.

Recovery of Cables and Wireless Stock—Ericsson's Increased Profit—Shropshire, Worcestershire and Staffordshire Co.'s Expansion—Reports and Dividends.

THE slump in Cables and Wireless issues has stopped, and the price of the "A" stock has recovered to about 60. American Telephone and Telegraph Stock has moved up a further five points to 250. Radio Corporation of America shares are over 53 and Hydro Electric Securities over 46. Marconi's International Marine Communication shares have eased from 45s. to 43s. 9d.

S. Alexander Roger, presiding at the meeting on March 4th of the Cable, Telephone and General Trust, Ltd., said the Trust's position showed steady and satisfactory improvement. Investments amounted to £1 172 784, an increase of £434 882. A valuation of the trust's investments for which a market quotation was available showed the current market value of these investments to be in excess of the figure shown in the balance-sheet, and in the case of investments where no market quotation was available the directors were of opinion that these investments were worth as much as, or more than, the figure appearing in the balance sheet. In association with the Automatic Telephone Manufacturing Co. and the International Automatic Telephone Co., and other important British interests, they had arrangements and agreements with the Associated Telephone and Telegraph Co. of U.S.A., whereby investments were made in telephone operating companies, long term credits arranged and manufacturing sales facilitated for the purpose of creating tied house investment, and financial and manufacturing business to be divided among appropriate associated companies. It would at once be grasped therefore that the company was an important link in an important chain of companies, covering the U.S.A., Great Britain and elsewhere.

Home manufacturing shares have again shown a little weakness, Associateds falling 1s. 6d. to 25s., while British Insulateds, Callender's and Enfields have all shed 1s. 3d. London Electric Railway stock has fallen a couple of points, and Underground Electric Railways ordinary shares are a shilling down at 22s. 6d.

Directors' Reports, etc.

TELEPHONE RENTALS, LTD.—Intm. div. of 2½%, less tax, will be paid on March 31.

HURST, NELSON AND CO., LTD.—Intm. div. of 5%, less tax (agst. 7½% last year) is announced.

WARD AND GOLDSTONE, LTD.—Intm. div. of 3½% actual on ord. shs. (same as last year) is announced.

PENNSYLVANIA WATER AND POWER CO., LTD.—Qrtrly. div. of $\$\frac{3}{4}$ p. sh. on common stk., will be payable on Apl. 1.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Fin. div. at rate of 11·2d. p. sh. is recommended; to sinkg. funds, £17 000; fwd. £21 800.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—Div. of 7½%, tax free, is recommended, makg. 10% for year (same as last year).

WAYGOOD-OTIS, LTD.—Div. of 7½%, makg. 10% (same) for year is proposed. To res. for contingencies, £25 000, against £30 000; to pensions £6 000 (same); fwd. £17 631, against £15 570.

INTERNATIONAL AUTOMATIC TELEPHONE CO., LTD.—Pft. for 1929, £135 849, agst. £130 823. Fin. div. 6¼%, less tax, on ord., makg. 10%, plus bonus 2½% (same). To res., £10 000. Fwd. £82 578, agst. £69 735.

AMERICAN AND FOREIGN POWER CO.—An offer of $50 000 000 100-year 5% debs. was made in New York last week at 90%, to yield 5·55%. A portion of the issue was withdrawn for offering in Europe.

CLYDE VALLEY ELECTRICAL POWER CO.—Fin. divs. of 5%, less tax, on ord. shs. issued prior to 1929, makg. 8%, less tax, for year 1929, and 8·9293d. p. sh., less tax, on new ord. shs. (at rate of 8% from due date of calls) are recommended.

BRITISH INSULATED CABLES LTD.—Fin. div. 10%, makg. 15% (same); to res. and depreciatn., £298 333; fwd. £280 000, agst. £250 089. A div. equalisatn. fund of £300 000 has been created out of specific provisns. previously made but no longer required.

AUTOMATIC TELEPHONE MFG. CO., LTD.—Pft. for 1929, after again charging £50 000 for depreciatn., £122 702, agst. £123 670. Fin. div. 6¼%, makg. 10% for year (same), with bonus of 2½% (same). To res. £19 500, agst. £35 000. Fwd. £118 285, agst. £93 482.

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.—Directors recommend divs. of 7·2d. p. sh. on 6% cum. pref. shs., makg. 6% for year, 9·6d. p. sh. on 8% cum. 2nd pref. shs., makg. 8% for year, and 1s. p. sh. on ord. shs., makg. 10% (standard div.) for year, all less tax.

ISLE OF THANET ELECTRIC SUPPLY CO., LTD.—Rev. for 1929, £179 036, agst. £171 863; pft. £73 909, agst. £73 416. To deb. stk. int. and sinkg. fund £15 000 (same); income tax, £4 000 (same); gen. res. and depreciatn., £30 000 (same); div. on ord. 4% (same); fwd., £8 357, agst. £6 204.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD.—Pfts. for 1929, £203 111, plus £36 689 brt. in. Intm. div. of 5% paid on Oct. 28, 1929, absorbed £59 636, directors, additional remuneratn. for 1928, £1 500. Fin. div. of 10% on ord. sh. cap. recommended for year 1929, makg. 15% for year. To gen. res., £41 986. Fwd. £17 405.

TELEVISION COMPANIES' AMALGAMATION.—The directors of Baird International Television, Ltd., and the Baird Television Development Co., Ltd., state that they have agreed upon a scheme for amalgamatn., full particulars of which will be sent to the shhldrs., with an explanatory circular, as soon as the necessary legal formalities have been completed.

TORQUAY TRAMWAYS CO., LTD.—Pft. for 1929, £80 380 agst. £34 521, includg. £50 500 net surplus on sale of 50% of hldg. of ord. shs. in Devon General Omnibus and Touring Co. Deductg. deb. int. and £6 600 transferred to sinkg. fund for debs., blce. is £73 780. To res. and renewals acct. £10 748, agst. £9 712, income-tax £4 000, agst. £4 400, depreciatn. £105, agst. £117, and sick pay and pensions, £185, agst. £192. Fin. div. of 5%, tax free, again makes 9%; fwd., £2 026, agst. £1 786.

ERICSSON TELEPHONES, LTD.—Net pft. for 1929, £64 087, agst. £31 011; plus £18 235 brt. in. To depreciatn., income tax, int. on debs. and directors' fees and sh. of pfts., £45 300, agst. £28 302. Div. 8%, tax free, agst. 5% less tax, on ord. shs.; to special res., £5 000, agst. nil; to gen. res. £20 000, agst. £5 000; fwd. £19 322, agst. £18 235. Rpt. states that an efficient and automatic totalisator equipmt. for use on racecourses has been evolved and substantl. contracts received from Racecourse Betting Control Board.

PINCHIN, JOHNSON AND CO., LTD.—Sales and pfts. for 1929 show satisfactory expansn. A majority interest in another important Australian undertakg. has been acquired, and arrangemts. were completed early in last year for consolidatn. of certain Continental interests. An extensn. of interest in the Italian undertakg. has also been acquired, which gives company effective control. Net pft. £462 349, plus £80 103 brt. in, after providg. for directors' fees. Carried to cap. res. during year £48 310. Further allocatn. to res. from pft. and loss, £20 000. Provisn. for income tax £80 816; pref. div. £26 000; fin. div. on ord. shares, 20%, less tax, makg. 30% (same); fwd. £84 446. No loss has been incurred by any of subsidiary companies.

AMERICAN TELEPHONE AND TELEGRAPH CO.—Report for 1929 shows increase of $260 000 000 in company's own assets, and $400 000 000 in assets of associated Bell Telephone system. Total assets of the two organisatns. now exceed $4 228 000 000. There was an increase of 9·8% in operatg. rev. of Bell system, and the hldg. company's net income increased by $23 000 000 to $166 189 757, making earngs. equal $12.67 on average number of shs. outstandg., agst. $12.11. The Western Electric Co., a subsidiary which mftrs. telephone equipmt. and through another subsidiary, talkg. pictures, shows 67% increase in rev. Sales, $411 000 000, were largest in history of company. The telephone system as a whole will spend $700 000 000 this year for additns. and improvemts.

HASLAM AND NEWTON, LTD.—First rpt. covering period from Oct. 22, 1928, to Sept. 30, 1929, states that with exceptn. of Haslam works, all branches have exceeded estimated figures of prospectus. Owing to acute depressn. in ship-building and rayon industries and general depression in heavy general engineering trades, this departmnt., after makg. full provisn. for depreciatn., was unable to contribute to the pfts. Directors have developmts. in hand which are expected to provide the works with remunerative employmt. Accts. show pft. on tradg., includg. income from investmts., etc., £30 175. After charging interest on purchase money £1 472, depreciatn. £10 730, and £2 761 earned prior to incorporatn., net blce. is £13 289, plus £5 439 brt. fwd. Pref. div. absorbs £16 592 and intm. on ord. at 2½% p.a. £2 136.

SHROPSHIRE, WORCESTERSHIRE, AND STAFFORDSHIRE ELECTRIC POWER CO.—Net receipts for 1929, £369 109, agst. £303 950, administration and gen. exes., £33 368; rates, £33 368; directors' fees, £3 250; deb. and other int., £86 805; blce. on year's workg. £180 520, agst. £142 993. Directors recommend div. for year on 6% cum. pref. shs., div. of 8% for year on "A" ord. shs. (on acct. of which 4% has already been paid), and div. of 7½% for year on "B" ord. shs.; to res. appropriation acct., £57 895. Written off development expenditure, £4 047; to res., £60 000; fwd., £80 249. There are included in net rev. for 1929 some divs. payable by subsidiary companies on acct. of 1928, in additn. to those for 1929. Cap. expenditure during year, upon plant, machinery, trunk and distributg. mains, new sub-statns., etc., and acquisition of Hereford electricity undertakg., amtd. to £816 757. Approximately 120 miles of overhead and underground cables have been brt. into service during 1929, makg. total length at end of year about 640 miles, not includg. cables of Hereford undertakg. Total number of consumers supplied by company and subsidiary companies at Dec. 31, 1929, shows increase of 45%, and electricity sold increased by 17%.

Company Meetings.

LISBON ELECTRIC SUPPLY CO., LTD.—At the second general meeting, last week, Mr. J. Johnston (chairman) said they had completed their first trading period of 13 months to December 31st, 1929, and the directors were satisfied with the progress made. They hoped next year would put them on a dividend basis, and, in the meantime, were developing the area as fast as possible. The problem of generating electric power and its distribution at high voltage to various points was very simple, if looked upon as a single whole, and it was only in this way any progress could be made. He, speaking as the chairman of the company, thought the Government of Northern Ireland would be wise to ensure that the generation and distribution of electricity in that province developed along the lines adopted by England, Scotland and the Free State.

CABLE, TELEPHONE AND GENERAL TRUST, LTD.—Sir Alexander Roger, presiding at the meeting on March 4th, said the authorised capital was increased in July last from £550 000 to £710 000 by the creation of an additional 145 000 "A" preference and 15 000 ordinary shares. The whole of these were issued and also 217 6% cumulative preference shares, and they had issued since the close of the year a further 70 000 6% cumulative preference shares, with 20 000 ordinary

Digitized by Google

shares, so that the subscribed capital was now £698 737. Income for the past year was £74 840, against £36 040. Net profit amounted to £35 909, compared with £26 202. After provision for preference and "A" preference dividends a dividend of 6%, less tax, was recommended on the ordinary shares, leaving £3 707 to carry forward, against £1 050 brought in.

CHISWICK ELECTRICITY SUPPLY CORPORATION, LTD.—Mr Harry Kahn, presiding at meeting last week, said the undertaking had made further progress during 1929. The number of consumers had increased by 364, and the total revenue by £7 197. He had reason to believe that the undertaking would continue to show expansion during the current year. Sale of current has increased by £6 857 and rental of meters and sundry receipts by £340. The balance carried to net revenue account was £46 951, which was £302 less than last year. The net result was that, with the balance brought forward, there was £25 578 available for distribution after deducting the interim dividend of 7½% actual paid on July 23rd, and this sum the directors recommended being appropriated as follows: Final dividend of 8½% actual (less tax), £12 750; refund to consumers for 1929, £9 000; forward, £3 828. The report and accounts were adopted.

Manufactnrer's Progress.

HASLAM AND NEWTON, LTD.—Mr. C. A. Newton, presiding at the meeting on Monday, said during the period under review the electrical side of the business had made a profit beyond the figures mentioned in the prospectus. During this period Derby Cables had been started. The factory was fully employed day and night, and he believed would be a source of considerable profit to the company. This came into full operation in January of this year only, so that the money invested, namely, £26 000, reflected adversely in the figures before the shareholders, but he was confident that it would help them in next year's results. During the year they had carried out some notable contracts, of which he might mention the complete electrication of the "R101," including the wireless generating equipment. They also carried out a contract in Berlin for the German Post Office long-distance wireless service.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—At the meeting on March 5th, the Earl of Bessborough (chairman) said they reduced their prices as from January 1st, 1929, but the revenue from the sale of current had increased to £729 053 for 1929, compared with £692 506 for 1928. Net profits were £186 721, against £181 206. The amount to be allocated to the special reserve fund for the ordinary shareholders for 1929 was £35 000. The board recommended payment of 6% for the year on the preference shares and a final dividend of 5% on the ordinary shares, making a total of 9% for the year. Sales of current amounted to 248 144 007 kWh, compared with 203 711 271. The load connected last year was 11 300 H.P., making a total connected load of approximately 75 000 H.P. The reduction in their charges had had the effect of bringing down the average price received for each kWh sold to 0·705d., compared with 0·816d. for 1928. This was the lowest average price received by any of the London companies. The all-in domestic tariff had been most successful and had resulted in their domestic consumers making a more extended use of electricity. The amount to be credited to the co-partners for 1929 was £4 145. This reduced the balance to £42 687. The report and accounts were adopted.

LONDON AND NORTH-EASTERN RAILWAY CO.—Mr. William Whitelaw, presiding at the meeting last Friday, said the board had given the closest consideration to the question of the electrication of their suburban lines in the old Great Eastern and Great Northern areas. As to the first, they had satisfied themselves that no scheme of electrication, which had at present come before them, would provide an adequate solution of the congestion which now undoubtedly existed. They had invited Messrs. Mott, Hay and Anderson to prepare a report as to the possibility and cost of providing a tube between Liverpool Street Station and Ilford. As regards the Great Northern suburban district, although the congestion was less severe, there are peculiar difficulties to be overcome. Any plan which was to solve the problem must provide satisfactory terminal accommodation in or near the City of London. In considering expenditure of the extent which would be involved in the electrification of their suburban lines, they were bound to take account of the scheme which had been adumbrated by the Minister of Transport in reference to the future organisation of London transport generally. The Minister had recognised this and ad intimated that at an appropriate moment he would invite the main line railway companies to enter into a discussion with him on the subject.

METROPOLITAN ELECTRIC SUPPLY CO., LTD.—At the meeting on March 5th, Mr. George Balfour, M.P. (chairman), said he thought the progress they had made justified their policy of rapid extension and absorption in the western area. They could measure the growth in the western area when he mentioned that in 1924 they sold 27 600 000 kWh, against 117 300 000 last year, and their receipts for the same years were £193 017 and £488 794 respectively. The constantly increasing amount payable in rates did much to stop the cheapening of the supply. For the Metropolitan and subsidiary companies they paid in 1924 about £27 000 in local rates. Last year they paid over £58 000, in addition to a sum included in the price of their bulk supply in respect of rates in the Willesden power station, making in all something like £78 000 for 1929. Their average price for electricity was exactly one-half the average price in 1924. The total output from sub-stations was 167 000 000 kWh, compared with 126 000 000 in the previous year. Additional connections amounting to 21 071 kW were made, the total connections were 172 640 kW and the maximum load was 64 370 kW. The number of consumers supplied by the Metropolitan Co. was 36 785 and by its subsidiary companies 19 083. The gross receipts from the sale of electricity amounted to £974 591, an increase of £113 363 over the previous year. Adding sundry receipts, the total was £1 019 502, or an increase of £117 749. The balance on revenue account of £348 201, with the balance from the previous year and interest on dividends from shares in subsidiary companies and other investments, brought out a total available of £494 736. Deducting from this sinking fund appropriations, interest and dividends on preference shares and other charges, including the allocation to depreciation and addition to the staff pension account, there remained a balance of £234 746, out of which an interim dividend on the ordinary shares amounting to £45 000 had already been paid. The directors recommended a further dividend be paid on the ordinary share capital at the rate of 14% per annum, making, with the interim dividend, a dividend of 10% for the year. The report was adopted and dividend approved.

The 1929 Frost.

CHARING CROSS ELECTRICITY SUPPLY CO., LTD.—Mr. W. F. Fladgate, presiding at the meeting on March 5th, said in addressing the shareholders last year he commented on the satisfactory result of the year's trading and pointed out that the company had made satisfactory progress in almost every direction, but he particularly called attention to the fact that that satisfactory result was to a considerable extent due to the very moderate price at which the London Power Co., consequent upon the reduction in cost, had been able to give them a supply to their stations. In speaking of this reduction he asked them to remember that they must not expect it to continue always at the same rate. He was glad that he took the precaution of giving this warning, because the one blot upon their working for 1929 was the increased price which they had had to pay for their supply. This increase had been caused by no fault of the Power Co. but simply was made up of a fixed charge for every kilowatt of maximum demand and a flat rate per unit for the energy supplied. In the early part of 1929 there was a period of very severe, cold weather and many fogs. The effect of this was to increase their maximum demand to a figure greatly in excess of that of the previous year, with the consequence that their proportion of fixed charges was far higher than in 1928, and hence the increase in cost to which he had referred. In the West End the units sold had increased by over 4 000 000, and in the City by over 6 000 000. The net revenue had, however, decreased in both areas, the decrease being caused by the increase in price for power and also to the decrease in charges to customers. During the past 10 years the kilowatts connected in the West End had increased by some 53%, and in the City some 56%, while the corresponding increase in units sold was 124% in the West End and 111% in the City. These figures showed a yearly increase of a little more than 10%. The amount of their dividend being fixed under the sliding scale, there was no necessity to trouble them with any details as to how this was arrived at beyond stating that they had sufficient income to pay their standard dividend at the fixed rate, and in the West End to transfer to reserve account No. 8 the shareholders' proportion of the consumers' benefit, amounting to £19 134, and in the City similarly to transfer £31 931. The report and accounts were adopted and the dividends approved.

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1928–9 of the 224 undertakings included in the following table and in the tables which appeared in our issues of August 9th, September 13th, and November 1st, 1929, was £54 245 755. The gross profit on the year's working of the undertakings was £14 912 514, and the aggregate sales of electricity amounted to 5 034 074 989 kWh, while 73 undertakings out of the total number have contributed out of the year's profits or from reserve an aggregate of £452 302 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current. As it is desired to make these tables as complete as possible, the Editor will be pleased to receive similar particulars of other municipal electricity undertakings.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

APPLE, Mr., 87, Tottenham Court Road, W., electrical factor. £16 13s. 4d. January 29th.

BROWN, G. E., Boot Stores, Little Sudden, Birkenhead, wireless dealer. £13 0s. 11d. January 17th.

Satisfactions.

BRITTAIN (J. V.) AND CO., LTD., Stoke-on-Trent, electricians.—Satisfaction registered February 21st, £300, registered October 18th, 1927.

LANGHAM RADIO, LTD., London, W.C.—Satisfaction registered February 21st, all moneys, etc., registered November 27th, 1929.

SHOREHAM AND DISTRICT ELECTRIC LIGHTING AND POWER CO., LTD.—Satisfaction registered February 28th, £700, part of amount registered June 30th, 1927.

Private Meetings, etc.

[Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.]

NORTH SURREY ELECTRICAL FACTORS, LTD., George Street, Croydon, Surrey. The statutory meeting of the creditors in this voluntary liquidation was held recently at the Greyhound Hotel, 19, High Street, Croydon, Surrey. Mr. C. F. Turner, one of the directors of the company, occupied the chair, and reported that the liabilities were £2 480, all due to the trade. The assets consisted of book debts £1 320, valued at £900; and stock £450, expected to produce £350; making a total of £1 250. It was reported that the company was registered in August, 1928, and the issued capital was £600, all of which was fully paid. For a time the company was able to trade successfully, but then difficulty was experienced in the collection of accounts. Finally creditors began to press, and a writ was issued. It was then decided that liquidation should take place. A resolution was passed in favour of the voluntary liquidation being continued with Mr. W. A. J. Osborne, of Corfield and Cripwell, accountants and auditors, Balfour House, Finsbury Pavement, E.C., as liquidator, together with a committee consisting of the chairman and the representatives of the Hackbridge Cable Co., Ltd., the Weinbau Electric Co., and Poppleton Appleby and Hawkins. It was stated that the business premises had been closed, and that the liquidator would consult with the committee as to the realisation of the stock and the collection of the book debts. The following are creditors:—Acme Electric Wire Co., Shardlow, £55; Bellina and Co., Enfield, £57; Bernard and Co., London, £30; Berrys Electric (1928), Ltd., London, £25; Falk Stadelman and Co., London, £30; General Accessories Co., Ltd., London, £194; Grothe and Co., Ltd., Cologne, £38; Hackbridge Cable Co., Hackbridge, £220; Kersono Manufacturing Co., Birmingham, £75; Metallic Seamless Tube Co., Birmingham, £22; Morley, T. B., and Co., Ltd., Hull, £25; Nico Light Co., London, £42; Parsons, C. H., Ltd., Birmingham, £35; Perfecta Seamless Steel Co., Birmingham, £77; Phillips Lamps, Ltd., London, £89; Randon, Ltd., A., London, £356; Sanders, W., and Co., Wednesbury, £115; Steam Electrical Co., London, £72; Turfity, C. G. F., London, £74; Vandam and Co., Ltd., London, £53; Weinbaum Incandescent and Electric Co., London, £110; Wootton, H. A., and Co., Ltd., London, £35.

London Gazette, etc.

Companies Winding-up Voluntarily.

ALMONDSBURY AND DISTRICT ELECTRIC SUPPLY CO., LTD, Meeting of creditors at the offices of F. J. Ackland and Co., Sun Buildings, Clare Street, Bristol, on Thursday, March 20th, at. 5.30 p.m. All trade creditors have been, or will be, paid in full, the liquidation being in consequence of the sale of the company's assets and undertaking.

BURGOYNE WIRELESS CO., LTD. By reason of its liabilities, March 3rd. J. J. Baker, chartered accountant, Eldon Street House, Eldon Street, E.C.2, appointed as liquidator.

ELECTRIC SWEEPERS, LTD. By special resolution March 4th. Sir J. D. A. A. Makgill, Baronet, of 53, Seymour Street, London, appointed as liquidator.

Partnerships Dissolved.

DEVONSHIRE RADIO SERVICE (Leonard Victor COOK and Percy Edward LEWIS-NORTH), 47, Mount Pleasant, London, W.C.1, radio manufacturers, by mutual consent as from January 7th, 1930.

PREMIER ELECTRICAL SUPPLIES CO. (Harold TAYLOR, Kenneth Bradford JOIST, and Nixon ROBINSON), electrical factors, 6, Millergate, Bradford, by mutual consent as from January 31st, 1930.

UNION ELECTRIC CO. (Harry Neville KAYE and Hans Christian SHOT), electrical engineers and contractors, Falcon House, 61, Eagle Street, High Holborn, London, W.C.1, by mutual consent as from February 20th, 1930. Debts received and paid by H. N. Kaye who continues the business.

ASSOCIATED GAS AND ELECTRIC SYSTEM.—Gross earngs. and other income for 1929, $91 480 596, increase $49 317 046. Net earngs. $45 755 674, increase $26 585 037. Pfd. divs. and int. $10 271 235; blce. $35 484 439. After provisn. for other int. charges, replacemt. renewals and depreciatn., blce. for divs. and surplus is $16 645 984, increase $10 150 392.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

321 759 L. E. Ryall. Thermionic amplifiers. (11/9/28.)
321 766 S. S. Stolp. Electrically operated track switches. (21/9/28.)
321 771 C. E. G. Bailey and Gramophone Co., Ltd. High-frequency amplifiers. (27/9/28.)
321 776 Siemens Bros. and Co., Ltd., and F. J.'Gee. Thermostatically controlled protective devices for electrical apparatus. (1/10/28.)
321 781 English Electric Co., Ltd., and F. D. H. Bremner. Electric traction control systems. (3/10/28.)
301 418 Maschinenfabrik Oerlikon. Electric signalling systems. (29/11/27.)
299 707 Dr. S. Loewe and Dr. E. Roemhild. Multiple thermionic valves. (29/10/27.)
307 738 Conduit Electrical Manufacturing Corporation. High tension switchgear installations in switch houses. (12/3/28.)
321 830 J. McCallum. Insulation of electric cables and conductors. (17/11/28.)
321 831 P. L. Harlow and Associated Electrical Industries, Ltd. Starting apparatus for induction electrical motors. (20/11/28.)
321 845 Benjamin Electric, Ltd., and G. Campbell. Shade or globe holders and galleries. (28/11/28.)
309 532 G. Hezez and Soc. L'Appareillage Electrique de la Seine. Electric switches. (12/4/28.)
321 853 J. A. Kuyser and Associated Electrical Industries, Ltd. Ventilation of dynamo electric machines. (6/12/28.)
302 320 British Thomson-Houston Co., Ltd. Toasters. (14/12/27.)
302 584 Telefunken Ges. fur Drahtlose Telegraphie. Piezo-electric devices. (17/12/27.)
321 862 J. S. Ericsson. Electric lighting systems for the headlights of motor vehicles. (17/12/28.)
321 869 Lodge-Cottrell, Ltd. (Metallges. Akt.-Ges.) Collecting electrodes for use in the electrical precipitation of suspended particles from gaseous fluids. (27/12/28.)
321 874 Macintosh Cable Co., Ltd., and J. A. Smith. Means for holding electric conductors, cables, and the like in position. (1/1/29.)
303 908 W. Fantl. Illuminating devices. (12/1/28.)
321 888 Curtis Manufacturing Co., Ltd., and F. C. Curtis. Electric resistances, rheostats, and dimmers. (30/1/29.)
305 583 Forges et Ateliers de Constructions Electriques de Jeumont. Electrical braking systems for vehicles equipped with more than two electric motors. (7/2/28.)
306 100 Elektrizitats-Akt.-Ges. Hydrawerk. Electric condensers. (15/2/28.)
307 294 Accumulatoren-Fabrik Akt.-Ges. Sealing cover for the cells of lead accumulators. (2/3/28.)
309 573 Naamlooze Vennootschap Philips' Gloeilampenfabrieken. Process of manufacturing incandescent bodies. (13/4/28.)
308 277 British Thomson-Houston Co., Ltd. Electrical transmission of pictures. (20/3/28.)
310 523 Naamlooze Vennootschap Philips' Gloeilampenafbrieken. Electric incandescent lamps. (27/4/28.)
321 665 Standard Telephones and Cables, Ltd. (Western Electric Co. Inc.). Thermionic cathodes. (13/6/28.)
321 666 A. Zajdler. Electrical advertising apparatus. (14/8/28.)
321 466 A. H. Marks and P. Russell [legal representatives of E. C. R. Marks (deceased)]. (Automatische Fernsprech-Anlagen-Bau-Ges.). Apparatus for effecting graphic recording accompanying electrical impulse transmission. (18/9/28.)
321 947 Standard Telephones and Cables, Ltd., E. Kaempf and D. P. Dalzell. Electric communication cables. (22/5/28.)
321 963 H. Hibbert. Electrically-circuited direction-indicators of the illuminated type for motor vehicles and the like. (23/5/28.)
321 914 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Coating metallic or non-metallic bodies with chromium. (9/7/28.)
321 915 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (13/7/28.)
321 949 Ceag, Ltd., G. L. Harris and T. Knoyle. Electric safety lamps, particularly miners' hand-lamps. (14/7/28.)
321 935 D. N. Sharma. Systems and apparatus relating to television picture transmission, telekinematography, and the like. (9/8/28.)
310 458 S. Westberg. Baking a highly-refractory lining in metallurgical furnaces, especially induction furnaces, crucibles, and the like. (26/4/28.)
296 003 J. L. Matabon and C. M. Foucault. Apparatus for starting synchronous dynamo-electric machines. (22/8/27.)
296 091 Akt.-Ges Brown, Boveri, et Cie. Electromagnets with rotary armatures. (25/8/27.)
321 956 Standard Telephones and Cables, Ltd. (G. Deakin). Metering arrangement for telephone systems. (22/8/28.)
321 957 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Methods of producing magnetic materials. (22/8/28.)
296 304 Associated Telephone and Telegraph Co. Telephone systems. (27/8/27.)
321 979 A. Compare. Combined portable wireless-set and gramophone. (23/8/28.)
321 983 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic and semi-automatic telephone exchange systems. (23/8/28.)
321 984 W. Loffler. Driving electromotor for talking machines. (23/8/28.)
321 985 Automatic Telephone Manufacturing Co., Ltd., S. R. Smith and J. E. Ostline. Automatic switches for use in telephone or like systems. (23/8/28.)
321 990 W. E. Beatty (Bell Telephone Laboratories, Inc.). Telegraph receiving systems. (24/8/28.)
321 996 E. Y. Walsh. Rheostats of the grid type. (28/8/28.)
312 660 Frigidaire Corporation. Refrigerating systems and methods of manufacturing and transporting the same. (30/5/28.)
296 446 British Thomson-Houston Co., Ltd. Electric transformers. (2/9/27.)
322 010 Igranic Electric Co., Ltd. (Pacent Electric Co., Inc.). Electrical connecting-devices. (4/9/28.)
322 011 British Thomson-Houston Co., Ltd. (Compagnie Francaise pour l'Exploitation des Procédés Thomson-Houston). System for regulating the speed of asynchronous motors. (5/9/28.)
322 015 H. V. Higgitt and Eastern Telegraph Co., Ltd. Electrical relays. (7/9/28.)
301 724 M. Paul and Dr. P. Wangemann. Apparatus for reproducing mechanical movements by electrical means. (3/12/27.)
322 018 A. J. Thompson. Shock-absorbers for use with electric lamps. (11/9/28.)
322 019 British Thomson-Houston Co., Ltd., and H. C. Heath. Electric circuit-breakers. (13/9/28.)
312 032 Ateliers de Constructions Electriques de Charleroi. Cascade-connected electrical groups. (12/5/28.)
322 025 Graham Amplion, Ltd., and W. J. Rickets. Systems for the electrical transmission of photographs and the like and for television. (17/9/28.)
297 390 Telefonaktiebolaget L. M. Ericsson. Microtelephones. (20/9/27.)
297 467 International General Electric Co., Inc. Means for cooling of dynamo-electric machines. (23/9/27.)
322 033 S. G. Brown. Recording and reproduction of sound. (21/9/28.)
317 458 Western Union Telegraph Co. Multiplex type-printing telegraphs. (18/8/28.)
298 231 Naamlooze Vennootschap Machinerieen en Apparaten Fabrieken. Electrical resistances. (7/10/27.)
322 041 J. Fowler and Co. (Leeds), Ltd., and C. H. Fowler. Ploughing-engines for use in the cable system of land cultivation. (2/10/28.)
298 239 International General Electric Co., Inc. Electric realys. (6/10/27.)
322 048 G. Redmayne. Galvanic batteries and the like. (13/10/28.)
322 050 Relay Automatic Telephone Co., Ltd., and T. M. Inman. Fire-alarm systems in conjunction with telephone-exchange systems. (16/10/28.)
322 055 Santon, Ltd., and H. C. Sanders. Tanks wherein water is heated electrically. (23/10/28.)
299 475 Electroacustic Ges. Directive transmission or reception of sound or other wave energy. (27/10/27.)
299 725 Metallges, Akt.-Ges. Obtaining smooth and dense electrolytic metallic deposits. (27/10/27.)
300 276 Associated Electrical Industries, Ltd. Protective devices for electrical apparatus. (10/11/27.)
322 081 Gramophone Co., Ltd., and C. O. Browne. Circuits embodying iron-cored transformers. (16/11/28.)
305 015 Soc. Anon des Etablissments Ducellier. Brush-holders for dynamo-electric machines. (28/1/28.)
322 089 E. M. Payne, A. H. Johnson and Gramophone Co., Ltd. Induction disc motors. (24/11/28.)
304 304 Soc. Anon. Le Carbone. Connections for electric resistances. (20/1/28.)
322 094 G. E. Whitehead. Coupling-up or isolating switchgear. (28/11/28.)
322 095 H. K. Ramsden and Associated Electrical Industries, Ltd. Electric circuit-interrupters. (28/11/28.)
301 473 Associated Electrical Industries, Ltd. Control systems for elevators, hoists, and the like. (30/11/27.)
322 107 British Thomson-Houston Co., Ltd., and J. C. Read. Electric transformers. (4/12/28.)
318 216 Marion Steam Shovel Co. Electric motor field control. (31/8/28.)
301 929 Dr. A. Esau and C. Lorenz Akt.-Ges. Apparatus for influencing substances by means of high-frequency electric energy. (8/12/27.)
301 930 Dr. A. Esau and C. Lorenz Akt.-Ges. Apparatus for influencing substances by means of high-frequency electric energy. (8/12/27.)
304 309 Hazeltine Corporation. Wheatstone-bridge filter for suppressing disturbances in thermionic-valve current-supply circuits. (20/1/28.)
303 476 British Thomson-Houston Co., Ltd. Photo-electric cells. (4/1/28.)
303 118 Schiele and Bruchsaler Industriewerke Akt.-Ges. Electrothermal release device for electric switches. (28/12/27.)
303 872 A. Tasquin and R. Delfosse [née Foy]. System of electric signalling for automatically insuring safety in railroad traffic. (11/1/28.)
304 609 Telephones Le Las. Mine lamps. (20/1/28.)
322 129 General Electric Co., Ltd., and E. L. Randall. Lantern or lamp for use on trains and vehicles. (22/1/29.)
305 135 G. Somajni. Control systems for electric motors. (31/1/28.)
307 014 Landis et Gyr Soc. Anon. Time switch. (1/3/28.)
307 879 Siemens-Elektro-Osmose Ges. Apparatus for the electro-osmotic separation from solutions of anodic or cathodic travelling particles. (15/3/28.)
307 794 E. Reisz. Processes for the manufacture of membranes for electrostatic loud-speakers. (13/3/28.)
321 994 Siemens Bros. and Co., Ltd., and G. F. Dutton. Transmitters for telephone systems and the like. (24/8/28.)
321 930 J. L. Baird and Television, Ltd. Electric discharge lamps for television receivers. (20/6/28.)
321 961 J. L. Baird and Television, Ltd. Television apparatus and the like. (20/6/28.)
312 273 General Electric Co., Ltd. Electric lamps. (23/5/28.)
322 156 R. O. Kapp and C. G. Carrothers. Protective arrangements for electric power lines or the like. (9/11/28.)

Applications for Patents.

November 6th.

33 832 Siemens-Schuckertwerke Akt. Ges. Electric protective devices. (7/11/28, Germany.)
33 843 Siemens-Schuckertwerke Akt. Ges. Plug and socket coupling. (8/4/29, Germany.)
33 872 Siemens-Schuckertwerke Akt. Ges. Electric distribution systems. (7/11/28, Germany.)
33 856 Standard Telephones and Cables, Ltd. Switching mechanisms for telephone systems.
33 853 Standard Telephones and Cables, Ltd. (N. C. Tournier). Thermostats for piezo-electric devices.
33 635 Standard Telephones and Cables, Ltd. (Western Electric Co.). Voltage regulation in intermittently closed circuit.
33 852 Standard Telephones and Cables, Ltd. (L. J. J. Schreiber). Keyboards for telephone systems, etc.
33 706 A. L. Taylor. Apparatus for charging h.t. batteries, etc.
33 870 Telefunken Ges. fur Drahtlose Telegraphie. Heating filaments of thermionic valves. (8/11/28, Germany.)
33 871 Telefunken Ges. fur Drahtlose Telegraphie. Frequency multipliers, etc. (10/11/28, Germany.)
33 826 Westinghouse Electric and Manufacturing Co. Light sensitive devices. (6/11/28, U.S.)

November 7th.

34 010 C. S. Agate and W. H. Connell. Electric condensers.
33 995 Associated Electrical Industries, Ltd. Electric switches. (12/11/28, U.S.)
34 039 Automatic Telephone Manufacturing Co., Ltd., and L. M. Simpson. Electric totalisators.
34 003 J. B. Baker. Electric time switches.
33 986 D. A. Christian and D. P. Long. Automatic telephone systems.
33 974 A. M. Codd. Alternating current apparatus.
33 997 Electrical Research Products, Inc. Acoustic horns. (24/11/28, U.S.)
33 950 General Electric Co., Ltd. Luminous electric discharge tubes. (21/1/29, Germany.)
33 951 General Electric Co., Ltd. Luminous electric discharge tubes. (17/6/29, Germany.)
33 952 General Electric Co., Ltd. Luminous electric discharge tubes. (11/7/29. Germany.)
33 953 General Electric Co., Ltd. Luminous electric discharge tubes. (12/7/29, Germany.)
33 955 General Electric Co., Ltd., and C. W. Stopford. Cord grips for electric coupli ngs.
34 025 H. C. Holmes, J. A. A. Taylor and A. Warwick. Line distributing systems for electrical signals.
34 016 A. Imhof. Lead-in insulators. (15/11/28, Germany.)
33 884 J. Lawn. Electric switches.
33 940 I. E. McCabe. Electric mercury tube switches.
33 920 L. Rottenburg. Tuning scales for wireless apparatus.
34 041 W. L. W. Schallrenter. Electro gas-discharge vessels.
34 042 Siemens-Schuckertwerke Akt. Ges. Arrangement for release of a.c. switches. (9/11/28, Germany.)
34 044 Siemens-Schuckertwerke Akt. Ges. Fastening device for overhead wires. (8/11/28, Germany.)
33 929, 33 930 Standard Telephones and Cables, Ltd. W. Hatton, C. de Vriendt and E. J. Rousseau. Automatic telephone systems. (18/3/29.)
34 021 Telefonaktiebolaget L. M. Ericsson. Elimination of distortion in telephone lines. (9/11/28, Sweden.)

November 8th.

34 204 A. Berger. Electromagnetic apparatus.
34 122 British Thomson-Houston Co., Ltd. Electric regulating systems. (10/11/28, U.S.)
34 200 R. T. Clarke and S. A. Smith. Driving electrical machinery.

34 259 British Thomson-Houston Co., Ltd., and F. P. Whitaker. Mercury arc rectifiers.
34 221 H. B. Jackson. Electric heating elements.
34 285 A. Kupeczek and Measurement, Ltd. Electricity meters, etc.
34 278 J. H. W. Lewis. Electric switches.
34 296 Siemens and Halske Akt. Ges. Telephone systems. (10/11/28, Germany.)

November 11th.

34 391 Allgemeine Elektricitats-Ges. Alternating current meters. (13/11/28, Germany.)
34 435 Automatic Telephone Manufacturing Co., Ltd., and R. N. Saxby. Ticket issuing machines for electric totalisators.
34 413 Corning Glass Works. Electric insulators. (24/11/28, U.S.)
34 345 E. M. Eden and General Electric Co., Ltd. Electrostatic telephone transmitters.
34 415 Electroacoustic Ges. Determining direction of wave energy in space. (6/12/28, Germany.)
34 401 Elin Akt.-Ges. fur Elektrische Industrie.—Regulating poles for electric machines. (16/11/28, Austria.)
34 344 General Electric Co., Ltd. Loud speakers, etc.
34 346 General Electric Co., Ltd. Incandescent lamps. (13/11/28, Germany.)
34 369 A. C. Johnson. Control apparatus for electrical installations.
34 313 T. Johnson. Electrodeposition of metals.
44 431 N. V. Philips Gloeilampenfabrieken. Magnet systems for converting electrical into mechanical energy. (13/11/28, Holland.)
34 345 D. A. Oliver. Electrostatic telephone transmitters.
34 428 Siemens-Schuckertwerke A.G. Regulating voltage over long lines. (12/11/28, Germany.)
34 375 C. de Witt. Poles for electric power transmission lines, etc.

November 12th.

34 491 Akt.-Ges. Brown, Boveri et Cie. Choking coils. (24/12/28, Germany.)
34 533 V. Bansch. Production of insulating paper.
34 450 N. M. Bell and A. Bell and Co., Ltd. Electric fires.
34 558 R. Bosch Akt.-Ges. Switch control means for vehicle lamps. (12/11/28, Germany.)
34 572, 34 573 W. F. Boyd and London Electric Wire Co. and Smiths, Ltd. Wave traps for wireless receiving apparatus.
34 559 E. J. Buckingham. Electrical ignition devices.
34 566 A. Gozzano and Soc. Anon. Accumulatori Dr. Scaini. Electric rectifiers (13/11/28, Italy.)
34 508 S. Hector. Radio receiving sets.
34 511 T. J. Juby and E. Rowe. Rotary switch.
34 575 L. Koros. Arrangement for keeping constant terminal voltage of current sources. (12/11/28, Hungary.)
34 560 Laudis et Gyr Soc. Anon. Induction electricity meters. (9/1/29, Switzerland.)
34 462 S. Larris. Burglar and fire alarm.
34 479 M. Loridau. Electric massage instrument.
34 455 L. McMichael, Ltd., and E. J. Pound. Tuning systems for wireless apparatus, etc.
34 519 Maschinenfabrik Oerlikon. Electric motor vehicles. (24/11/28, Switzerland.)
34 462 V. E. Newman. Burglar and fire alarm.
34 567 P. J. Packman and Plessey Co., Ltd. Totalisators, etc. (29/10/28.)
34 439 F. J. Pearce, G. H. Scholes and G. H. Scholes and Co., Ltd. Plug and socket couplings, etc.
34 508 Phonoradio, Ltd. Radio receiving sets.
34 540, 34 541 J. E. Pollak (Ganz Fele Villamossagi Reszvenytarsasag). Apparatus for regulating voltage in a.c. distribution systems (1/6/28.)
34 545 W. W. Smith. Loud speaking telephones.
34 528 T. R. Scott and Standard Telephones and Cables, Ltd. Method of insulating h.t. cables.
34 436 A. M. Taylor. Transformers.
34 471 R. Wenning. Electrically-heated boilers.

November 13th.

34 722 Allgemeine Elektricitats Ges. Light sensitive cells. (17/11/28, Germany.)
34 636 C. P. Allinson. Electromechanical sound reproducing devices.
34 700, 34 702 Automatic Telephone Manufacturing Co., Ltd., and J. Smith. Telephone transmission systems.

COMING EVENTS.

Friday, March 14th (To-day).

Birmingham Electric Club.—Grosvenor Room, Grand Hotel. Annual dinner. 7 *p.m.*

Ex-British Westinghouse Association.—Hotel Cecil, Strand, London. Re-Union Dinner.

Institute of Metals (Sheffield Local Section).—Non-Ferrous Section of the Applied Science Department of the University, St. George's Square. Paper by Mr. A. Glynne Lobley on "Electric Heat-Treatment Furnaces." 7.30 *p.m.*

Junior Institution of Engineers.—39, Victoria Street, London, S.W. Paper by Mr. W. A. Sallis on "An Outline of Siemens No. 50 Telephone Switching Equipment." 7.30 *p.m.*

Saturday, March 15th.

Incorporated Society of British Advertisers (Engineering Section).—Hotel Cecil, Strand, London. Luncheon meeting. Address by Mr. G. E. Rowland on "Optimism—An Asset in National Salesmanship." 12.40 for 1 *p.m.*

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Monday, March 17th.

Electrical Association for Women (Bristol and District Branch).—Annual general meeting, followed by a lecture on "Electricity in Architectural, Furnishing and Lighting Design," by Mr. G. S. Francis.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "High-Tension Substation Control Gear." (Opened by Captain P. P. Eckersley.) 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales-Liverpool Centre).—University, Brownlow Street. Paper by Mr. H. H. Harrison on "Machine Telegraph Systems." 7 *p.m.*

Sheffield Illumination Society.—Paper by Mr. E. Selwood on "Surveying." 8.15 *p.m.*

Tuesday, March 18th.

Institution of Electrical Engineers (North-Western Centre).—17, Albert Square, Manchester. Paper by Mr. H. W. Taylor on "Voltage Control of Large Alternators." 7 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Lecture by Mr. A. M. Browne on "Mercury Arc Rectifiers." 7.15 *p.m.*

Institution of Electrical Engineers (Students' Section).—Heriot-Watt College, Chambers Street, Edinburgh. Paper by Mr. L. B. Torond on "Cooling of Oil-Immersed Power Transformers." 7.15 *p.m.*

Electrical Association for Women (Bristol and District Branch).—Fortt's Restaurant, Queen's Road. Dance. 8 *p.m.*—1 *a.m.*

Wednesday, March 19th.

Overhead Lines Association.—Institution of Electrical Engineers, Savoy Place. Victoria Embankment, London. Paper by Dr. A. Ekstrom on "Comparative Cost of Overhead and Underground Transmission Lines." 5.30 *p.m.*

Electrical Development Association (N.W. Area).—Demonstration Bureau 4, Fountain Street, Manchester. Short talk, followed by display of E.D.A. films. 6.30 *p.m.*

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London. Paper by Mr. W. M. Crook on "Modern Reproducers for Record and Radio." 7.30 *p.m.*

Thursday, March 20th.

Association of Ex-Siemens' Men.—Gatti's Restaurant, King William Street, Strand, London. Annual dinner.

Institution of Electrical Engineers.—Institution, Victoria Embankment, London. Ordinary meeting. Paper by Dr. Bernard Leggett on "The Medical and Surgical Applications of Electricity." 6 *p.m.*

Institution of Electrical Engineers (Hampshire Sub-Centre).—University College, Southampton. Short paper to be read and discussed. 7.30 *p.m.*

Institution of Electrical Engineers (Irish Centre).—Physical Laboratory, Trinity College, Dublin. Paper by Mr. W. J. Girvan on "The Practical Application of the Principles Underlying the Equitable and Profitable Sale of Electrical Energy." 7.45 *p.m.*

Friday, March 21st.

British Electrical Development Association.—Savoy Hotel, Strand, London. Luncheon, 1 *p.m.*; followed by annual general meeting. 3 *p.m.*

Batti-Wallahs' Society.—Hotel Cecil, Strand, London. Annual dinner and dance. 7 *p.m.* for 7.30 *p.m.*

Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. J. Bennet and O. A. Chrisp on "A Survey of Switch and Control Arrangements with Examples of Modern Practice." 7.15 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference. 7.30 *p.m.*

Saturday, March 22nd.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Visit to the Post Office (London) Railway, Mount Pleasant. 4 *p.m.*

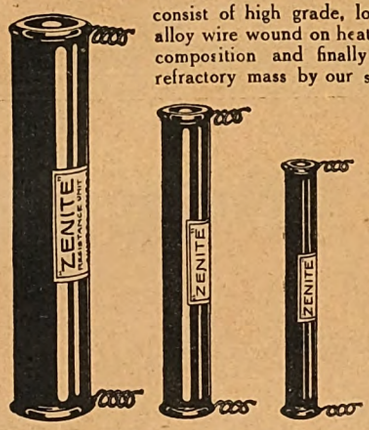
REGISTERED **"ZENITE"** TRADE MARK

VITREOUS ENAMELLED, EMBEDDED

RESISTANCE UNITS



consist of high grade, low temperature co-efficient alloy wire wound on heat-resisting tubes of special composition and finally embedded in a vitreous refractory mass by our special process.

For use in Motor Starters, Speed Regulators, Dimmers and for Protective purposes.

They can be supplied in seven sizes, 2" × ⅝" up to 8½" × 1⅛", and 130 standard windings between the limits of 0·1 ohm and 44 amperes and 150,000 ohms and 0·02 ampere; and can now be fitted with brass caps like cartridge fuses, a feature which makes for increased convenience.

WIRELESS WORK

"ZENITE" Units on account of their permanence are particularly suitable for "leaks" in connection with Medium Power Thermionic Valves as well as in the construction of Resistance Capacity Amplifiers.

Thousands in constant use for many years in all parts of the world.

COMPETITIVE PRICES and PROMPT DELIVERIES

Catalogue of Resistances and Units post free

The ZENITH ELECTRIC CO., Ltd.

Sole Makers of the well-known "Zenith" Electrical Products.

Contractors to the Admiralty, War Office, Air Ministry, Post Office, L.C.C., etc.

The Economic Crisis.

TAKING a wide survey of existing economic conditions, it is difficult to be optimistic as to the prospects of an early and general return of activity in world trade. The sharp fall in commodity prices which has taken place since the collapse of the American boom last October has affected all countries producing foodstuffs and raw materials and must lead to a considerable curtailment of their purchasing power for some time. Among the countries most severely hit by the slump in the values of their principal exports are many of Great Britain's most valuable Oversea markets. Australia, which, after India, takes more British manufactured goods than any other country, is particularly badly hit. The discount of 3½% on Australian cable transfers is, in effect, an additional import duty of 3½% over and above the already high and recently much stiffened Commonwealth tariff. In the case of New Zealand the discount is 2½%. The Argentine exchange is showing great weakness and the harvesting of a record maize crop in South Africa cannot, in present circumstances, be regarded with unqualified satisfaction in view of the effect it has had on the price.

How far will the decline in purchasing power in our Oversea markets react on exports of electrical manufactures? So far the effect has hardly been felt, but, as Mr. QUIGLEY pointed out in the thoughtful survey of prospects contributed by him to our issue of February 28th, it is difficult to be optimistic about the immediate future of any branch of the export trade. It can be said perhaps that the electrical manufacturing industry will suffer less than most other branches of engineering because, in the endeavour to reduce production and transport costs, there will be a tendency to instal the most up-to-date equipment wherever capital is available for the purpose. Unfortunately in many directions the severity of the depression will prevent such expenditure. Competition from other manufacturing countries must also become more severe. Since prices in most export markets are already cut to or below the lowest level at which they return any profit, the proportion of total production which any electrical manufacturing country can afford to export without seriously disturbing its financial equilibrium is likely to dwindle rather than increase. Last year British electrical manufacturers exported about 25% of their total output. It may be difficult under the conditions that seem likely to prevail for some time to come, to maintain both this percentage and the present far from excessive net overall remuneration of the industry. One satisfactory feature at the moment is the success with which British electrical manufacturers are competing for business in Europe, at prices which are said to allow of reasonable profits being made.

Meanwhile imports of foreign electrical manufactures by Great Britain are, as Sir HUGO HIRST has pointed out in a recent letter to "The Times," showing a marked rise. Sir HUGO regards this as a sign that foreign manufacturers are capturing much of the new business in the domestic market which has been stimulated by the national electrification programme. He suggests that the policy followed by the Central Electricity Board of placing its contracts with British firms requires supplementing in order to secure the home market for British manufacturers of electrical appliances presumably by a duty on foreign-made goods. Whatever opinion may be held as to the merits or drawbacks of a protective tariff it would seem to be unwise for British manufacturers to look for salvation in that direction. At the last general election some 14 000 000 votes were cast for the parties which stood for free trade against 8 500 000 for a party which is by no means solidly in favour of safeguarding or protection. Even if a gradual change in sentiment is taking place such movements in this country are very slow and are apt to be checked by a trade revival before they have time to effect a change of national policy. It would therefore be taking grave risks to count on a change of fiscal policy, and, in the hope of such an event, to neglect any possible means of reducing production and marketing costs.

Current Topics.

Broadcasting and Ship Wavelengths.

CAPTAIN ECKERSLEY in the course of a Faraday lecture under the auspices of the Scottish Centre of the I.E.E. at Edinburgh, and also at the annual dinner of the Birmingham Electric Club—an institution which again lived up to its position as the pioneer electric club of the country—referred to the unsuitability of the wave band allotted to broadcasting. If ships are using the wavelengths that would best suit broadcasting, and vice versa, the sensible plan would, at first sight, seem to be to arrange for an exchange at the Madrid Conference in 1932. But the number of transmitters ashore and afloat is so great that any proposal of the kind would inevitably meet with much opposition from both interests. Use of the 600–900 m. wave band by ship stations may cramp broadcasting activities to some extent, but the authorities will take a lot of convincing that the advantages of such an exchange would justify the disturbance that would be caused. At the same time it is important to take a long view in such matters and not to shackle ourselves irrevocably to present policy if by courageous action now we may secure substantial future gains in flexibility.

Supply Voltage Variations.

USERS and prospective users of mains radio sets in certain districts complain that the variations of voltage in their house supply are much in excess of the statutory limit of $2\frac{1}{2}\%$ on either side of the nominal supply voltage. Many of these complaints probably originate from new districts where houses are connected to a dead end cable, those at the far end having to take what the intermediate consumers have left in the way of pressure. Even where the main in a road is linked up at both ends with the distribution network there is, in some areas, a notable brightening of the lamps about 10.30 p.m., and it is probable that where this is noticeable the increase in pressure concerned is well in excess of 10%. Apart from any grievance which the consumer may have in respect of defective illumination in the earlier part of the evening, the matter is of considerable importance to manufacturers of mains wireless receiving sets, because although these are tolerant of voltage variations up to about 5%, larger fluctuations cause trouble. This means complaints from actual purchasers and also deters prospective buyers who may have noted palpable changes in the brilliance of their electric lamps, and fear the possible effects on the performance of a mains radio set. Persistent complaint, accompanied if necessary by a threat to instal a voltmeter, will in time lead to action on the part of supply undertakings, but this hardly meets the needs of the case from the manufacturers' standpoint.

Prevention of Casualties.

IT is satisfactory to learn that about 300 000 copies of "The House You Want" have been bought from E.D.A. for distribution to supply authorities and electrical contractors, and that a further 200 000 are to be available for this purpose. This is all to the good. At the same time we feel, and we note that the "Electrical Contractor and Retailer" for March holds a similar opinion, that, in addition to pressing the advantages of electricity upon the householder, the time has come for a much more comprehensive programme of electrical education which will begin in the proper place—the primary schools. It is impossible to make domestic electrical apparatus absolutely foolproof under all conceivable circumstances. Unless people are taught young that certain forms of ignorance and stupidity may entail most unpleasant results to them personally, we shall have much more bad publicity of the kind provided by the man who recently probed about with a pair of scissors amongst the wires of a lead to an earthed electric iron without troubling to switch off the current, and the child who held an earthed table toaster in one hand and poked a fork into the heating element with the other. We referred to this need of simple electrical education some weeks ago apropos of an American boy who electrocuted himself by allowing his metal kite string to touch an overhead h.t. conductor. "The Electrical Contractor and Retailer" appears to think that the electrical industry should undertake an educational campaign of this kind. It could certainly do so with advantage in the case of adults by seeing that each purchaser of electrical apparatus received adequate warning as to certain things that he or she would be well advised to refrain from doing, but we feel that the State should see to it that such action by the industry will be superfluous when the present generation of children reaches the status of users of electrical apparatus.

Two Special Features.

THIS week we print the first part of another challenging article by Mr. T. C. GILBERT on the vexed question of earthing of electrical apparatus. Previous communications from Mr. GILBERT have aroused a good deal of discussion, and his return to the lists in full vigour will doubtless cause those who hold different views to look to their pliers. Our contributor makes out a strong case for his contention that earthing is incapable of giving reasonable security in a great many cases. We shall, of course, be willing to give publicity to the opposite view, but we would ask any advocates of earthing who may wish to reply to await the publication of the concluding portion of Mr. GILBERT'S article (which will appear in next week's issue) before doing so. Another feature in this week's issue which will, we believe, prove useful to contractors, is Mr. BOND'S first article on the "Electrical Equipment of Cinema Theatres." This is an important and developing branch, and Mr. BOND'S experience qualifies him to give valuable advice as to procedure and layouts.

"Nine Till Six."

IT is so very seldom that a true picture of business life is to be seen upon the stage that we feel it almost a duty to make a reference to "Nine Till Six," now being played at the Apollo Theatre, London. Theatrical notices are not part of the regular function of the trade and commercial journalist, but if any responsible business man or woman wants to enjoy from the stalls, or the gallery, a couple of hours of life as it really is, they will see it in "Nine Till Six." Miss LOUISE HAMPTON'S representation of the daily life of one engaged in the practical affairs of the world is so true as to be something exceptional. The authors, AIMEE and PHILIP STUART, must surely have enjoyed an insight into the atmosphere of business which is given to all too few of our successful dramatists.

BILLINGHAM STEAM AND POWER PLANT.

Description of the Generating Station of Synthetic Ammonia and Nitrates, Ltd.—Largest High Pressure Pulverised Fuel Boiler Plant in the World—Unique High Pressure Turbines—Automatic Frequency Control.

AT the Institution of Electrical Engineers on March 13th, a paper by Mr. H. A. Humphrey, M.I.E.E., Mr. D. M. Buist, M.I.E.E. and Mr. J. W. Bansall, A.M.I.E.E., was read describing the Steam and Electric Power Plant of Imperial Chemical Industries, Ltd., at Billingham-on-Tees. This is a large pulverised fuel, high pressure, high temperature, industrial power plant erected to supply steam and electricity to the factory of Synthetic Ammonia and Nitrates, Ltd. at Billingham. The following special features are described in the paper from which this abstract is taken:—

(1) A maximum pressure of 800 lb. per sq. in. gauge and a maximum temperature of 856 deg. F.
(2) The world's largest high pressure pulverised fuel boiler plant, containing special constructional features for the high pressure and temperature.
(3) An unusually large distillation plant.
(4) A 7-stage feed heating system, with feed pumps specially designed for high pressure and temperature
(5) High pressure pass out turbines of unique design.
(6) The first system of its kind of automatic frequency control, automatic steam pressure control, and automatic feed pump regulation, together with automatic synchronising.
(7) Unusual layout features for the accommodation of pipework and cables.

The conditions differ essentially from those relating to a public electricity supply station. The extension programme of Synthetic Ammonia and Nitrates, Ltd., at Billingham, called for 6 930 tonnes* of steam per day delivered for process purposes, and 37 500 kW distributed as electrical energy to the works. The quantity of steam in the first item is approximately double the amount of steam required to generate the electrical energy of the second item, and so the boiler plant capacity is three times that of a purely electric power station.

Then again, the load factor of a chemical works approaches closely to 100 per cent. and continuity of supply is of the utmost importance. The power plant, therefore, must have sufficient stand-by plant and means of bringing such plant rapidly into operation, whilst, further, the layout, methods of control, size of units, etc., must all be considered on the lines of "safety first."

In designing a plant for an annual output as great as that of the largest electricity station in the country, great attention must be paid to all possibilities for securing economy in generating costs. The balance has to be struck between simplicity and reliability on the one side, and maximum attainable economy on the other. Unproved designs involving apparatus of an experimental nature had to be avoided, and the consulting engineer had to steer his way through some rather conflicting considerations in order to obtain the best commercial results.

Another matter influencing design was the existence of a large powdered fuel fired boiler plant and also the fact that a contract for a bulk supply at 11 000 V 40 periods, from the adjacent North Tees power station continues until 1941.

(*a*) *Boiler Plant.*—The existing boiler plant provides the steam used in the factory at 290 lb. absolute† and 653 deg. F., and the necessity of paralleling with these conditions made their adoption for the new plant almost imperative. The first problem, therefore, was how best to raise steam at some higher pressure, so that after some of its energy had been converted to electrical energy it could be passed on as steam to process. Calculations showed that if steam were raised at such a pressure that it entered the primary turbines at 645 lb. per sq. in. and 833 deg. F. its expansion down to 290 lb. would provide steam at 653 deg. F., these being the steam conditions of the existing boiler plant. To gain the economy due to high velocity of flow in the superheater tubes, a large resistance pressure drop had to be faced, and the normal working pressure at the boilers therefore became 715 lb. and was finally fixed at 815 lb. as a maximum.

In view of the fact that 856 deg. F. was considered to be the highest safe temperature for ordinary steel superheaters, and that such high temperatures have a greater influence on economy than super-high pressures, any temptation to adopt still higher pressures was readily rejected. Especially was such a decision made easy because a pressure of 1 200 lb. per sq. in., for example, would have entailed reheating the steam after expansion, in order to reach existing boiler plant conditions, and the small additional economy was not worth the added complication and expense thus involved. Further, we have yet to learn a great deal about creep stresses at 856 deg. F., and such stresses are proportional to pressure.

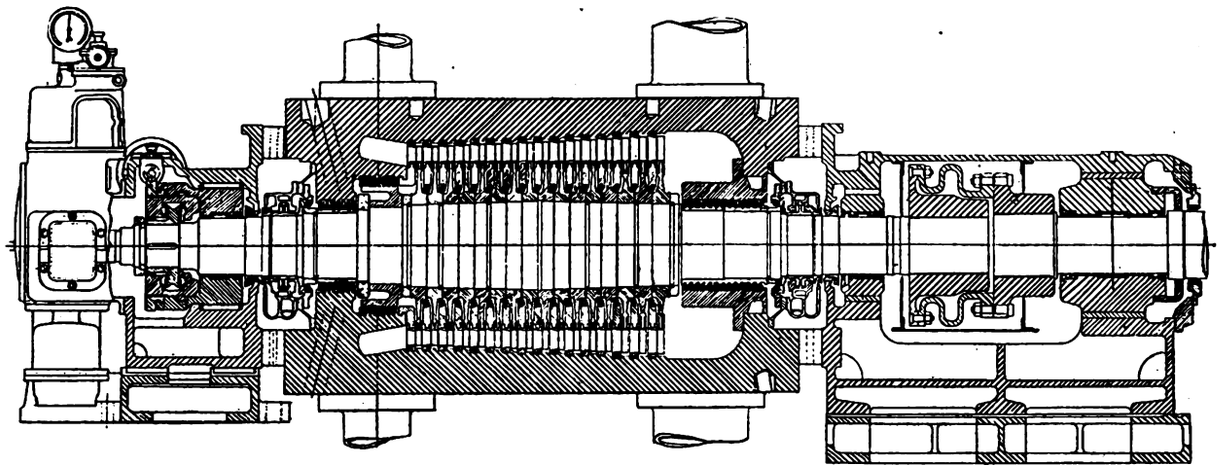

Fig. 1.—Sectional arrangement of high-pressure turbine.

Only 60% of the steam would be condensed and returned from process, and so 2 512 tonnes per day of raw water, obtained from Billingham Beck, had to be distilled and the distillate added to the "make-up" feed. This involved the erection of an unusually large distillation plant, with its attendant de-aerators.

(*b*) *Turbo-Alternators.*—Careful consideration of the possible degree of economy to be obtained by progressive feed heating led to the adoption of separate feed heating turbines from which the steam is bled to heat the feed water. Here, again, a commercial maximum economy, rather than a theoretical maximum, was aimed at, and no attempt was made to bleed the primary turbines. These unusual pieces of apparatus were advisedly kept simple and comparatively small, and the consulting engineer insisted, in the interests of flexibility, on their being mechanically independent of other units.

By passing all the steam required as such, plus that required for conversion to electrical energy, through two primary turbines, 23 800 kW would be obtained, so that two units of 12 500 kW each would provide the working units and one was to be added as a spare. A correspond-

* One tonne = 1 000 kg = 2 204 lb.

† Except where otherwise stated, all subsequent pressures mentioned in this paper are absolute pressures.

Digitized by Google

ing set of feed heating turbines would give 9 500 kW output for two units working, and these were fixed at 6 000 kW each on the generator side.

Lastly, condensing sets had to be provided because the proportion of steam energy to electrical energy distributed to the works was liable to vary, and condensing sets were necessary to meet such variation within the required limits and to make up the balance of the electrical output. One working condensing set to produce 10 200 kW would meet the then known conditions, another machine being kept as spare. These were made capable of 12 500 kW each in view of unknown requirements, and provision was made for a third set, should this be required in the future. The steam to be raised by the new boilers was found to be 11 700 tonnes per day, and the electrical energy required was augmented to 43 500 kW in order to cover all the internal requirements of the plant plus the outside load.

(*c*) *Costs.*—The directors of Imperial Chemical Industries, Ltd. have reserved from publication all questions of cost; the estimated cost of electric energy at the busbars of the station

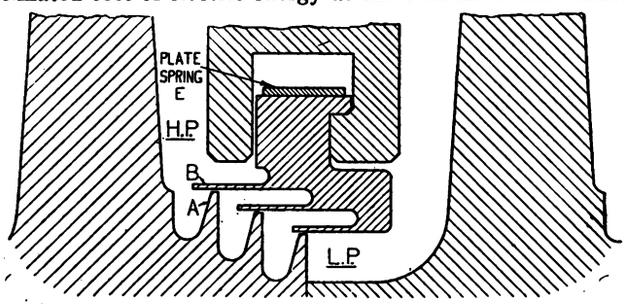

Fig. 2.—Labyrinth packing.

is well below the unit cost of any electric generating station in the world depending on coal as fuel. This is due to the use of high pressure and high temperature steam, to the use of primary turbines passing a greater quantity of steam than would be available in an ordinary central station, to the low cost of coal in the locality, to the high load factor, to the abundant supply of cooling water, and to the many economies which have been introduced into the designs.

(*d*) *Erection.*—The station was erected in record time. Tenders were invited in December 1927, contracts were placed in February 1928, excavations were commenced in May 1928, and by February 1929 the station was erected with sufficient plant to commence operation and give an external supply to the factory.

(*e*) *Layout.*—The general layout of the power plant was the subject of quick decisions, made even before contracts were placed and adhered to during the subsequent settlement of details with the main contractors. In reviewing the layout now that the plant is built, no radical improvement therein can be suggested. The governing decisions were:—

(1) To dispose the plant so that the flow from boilers to high pressure turbines, thence to the feed heating and the distillation plants and finally back to the boilers, constituted a simple ring with a tee-off to the condensing sets and one to the factory for process purposes.

(2) To make the distillation and feed heating bays duplicates in height, width and design of the turbine and switch bays respectively.

(3) To keep all large sets in one bay under a 40 ton crane.

(4) To place the feed heating sets with all heaters and pumps in one bay, under a 20 ton crane, this bay to adjoin the distillation bay and both bays to be next to the boiler plant.

(5) To place the condensing sets at that end of the plant where the 48 in. circulating water inlet and outlet pipes could most conveniently and cheaply be brought into the building.

(6) To include a separate bay for the accommodation of high-pressure steam receivers, de-superheaters, reducing valves, all interconnecting pipework and valves (in short a control centre, analogous to an electrical control room) for all high pressure and low pressure steam distribution.

(7) To provide on the electrical side, as on the steam side, a separate bay in the switch house for all cables, consisting of a vertical gallery fed from the basement and feeding two horizontal steel floored races under the main switchgear and under the control room respectively.

(8) To place the majority of the generating plant next to the switch house for convenience and economy of heavy cable runs.

(9) To place the switch house external to the main buildings to facilitate exit of the large number of feeders; and, for the same reason, to place the main switchgear on a level with the cable bridges.

The thermal efficiency and the effect of feed heating and increased pressure and temperature upon thermal efficiency are shown in Tables I and II.

The high pressure turbines are of single cylinder type and have 16 stages. A sectional view of one of them is given in Fig. 1. The cylinder and the two steam chests are of forged steel and their manufacture required the exercise of extreme care on the part of the makers. Fig. 2 illustrates the labyrinth packing between the diaphragms. The latter consists of a number of projections "A" cut on the boss of the diaphragms. These projections almost touch a number of projections, "B," on the packing piece "C," which fits into a slot. The clearance space behind "C" is taken up by the spring "E." This device is also one for regulating the clearance and this is accomplished by virtue of the shape taken by the projections during expansion, the diaphragm projections lengthening while the packing-piece projections assume the shape shown in Fig. 2. The clearance is thus always preserved. One of these packings is placed between each diaphragm, and eight are placed together at the exhaust end of the turbine.

The use of increased steam pressure, particularly in the case of large units, has resulted in radical changes in gland design. The disadvantage of some earlier types of labyrinth glands was that, in the event of rubbing of the faces, the resultant heating, with distortion of the faces, caused wear and decreased the gland efficiency.

The glands employed at both high pressure and low pressure ends of the turbines are so designed that, if rubbing should occur, the resulting distortion of the parts in contact causes the clearance to be increased automatically.

The glands at the high pressure ends are of a special axial clearance type, illustrated in Fig. 3. The projections "A" were made solid with the sleeve keyed to the main shaft, similar projections being cut on the packing piece "B" fitted into the turbine casing. A clearance is thus always maintained, since the projections on expanding tend to curve outwards from the clearance space, which tends therefore to become larger instead of smaller. This design enables a very large number of throttling joints to be provided in a given gland length, while the fitting of an adjustable thrust block of the Michell type permits the gland clearance to be most accurately adjusted to a working minimum while the set is in operation.

The control apparatus is the first installation of its kind applied to power station control.

The pressure control impulses are obtained by the rotation of a drum which is divided circumferentially into four segments, each of which generates impulses at a constant rate depending upon which of the four segments is in operation. The selection of drum segments is effected by means of a device responsive to steam pressure, provided with contact making segments corresponding to those on the drum. The result of this interaction is that impulses are generated with a frequency which increases, the further the steam pressure deviates from its normal value.

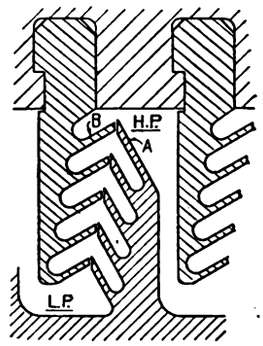

Fig. 3.—High-pressure gland.

Discrimination between pressures above and pressures below normal is obtained by means of a contact making pressure regulator of a standard type. The function of this regulator is duplicated on the pressure responsive device operating in conjunction with the drum, so that, if either apparatus becomes faulty, control is immediately cut off before misoperation can result. The adjustment of the actual length of the impulses themselves is carried out by means of two time-lag relays which are so connected that the failure of one of them can at the worst only effect cessation of control and so enable the operator to put a stand-by set of apparatus into commission. The automatic frequency control scheme marks an important stage in the development of this type of control in this country, and the paper gives a brief description of it as an interesting comparison with the recently evolved American schemes, some of which have now been applied to the control of power stations.* The most

TABLE I.—Thermal Efficiency.

	Boiler plant		Power plant	
Power supplied	Heat power in coal	409 500 kW	Steam power to turbo-alternators	59 150 kW
Power available	Power in steam to plants and turbo-alternators	141 700 kW	Electrical power at station busbars	41 300 kW
Efficiency of conversion	Boiler plant efficiency $\left(=\frac{141\,700}{409\,500}\right)$	34·6 per cent.	Power plant efficiency $\left(=\frac{41\,300}{59\,150}\right)$	70 per cent.
Overall efficiency	Overall thermal efficiency of power station $=\frac{34{\cdot}6\times 70}{100}=24{\cdot}2$ per cent.			

TABLE II.—Effect of Feed Heating and Increased Pressure and Temperature upon Thermal Efficiency.

Steam conditions at turbine inlet		Theoretical steam power available	Heat in coal converted into available steam energy	Heat in coal converted into electrical power with an efficiency of conversion from steam to electricity of 70 per cent.	Remarks	Gain in efficiency over steam generation at 290 lb./sq. in. abs. and 653° F. with no feed heating.
lb./sq. in. abs. (kg/cm.)	°F. (°C.)	kW	per cent.	per cent.		Per cent.
290 (20·4)	653 (345)	113 600	27·7	19·39	No feed heating	—
290 (20·4)	653 (345)	118 400	29·0	20·30	Single-stage feed heating to 176° F. (80° C.)	4·7
645 (45·3)	833 (446)	128 100	31·3	21·91	No feed heating	13·0
645 (45·3)	833 (446)	141 700	34·6	24·22	Seven-stage feed heating to 401° F. (205° C.)	24·9

important consideration from the point of view of continuity of supply of both steam and electricity from the power station is that of reliability of the electrical supply for driving the auxiliaries. Various methods of obtaining a duplicate supply were considered and it was ultimately decided to utilize the existing 11 000 V supply from the adjacent North Tees power station. The chief difficulty arising in the utilisation of this source lay in running the two supply systems in parallel, this being essential in order to avoid even a momentary interruption of supply to the auxiliaries in case of failure of the normal supply. Bearing in mind this consideration and having regard to the fact that nearly all the essential boiler house auxiliaries require speed variation, the situation has been met by permanently connecting one 2 000 kW motor convertor to a third or "transfer" busbar on the auxiliary

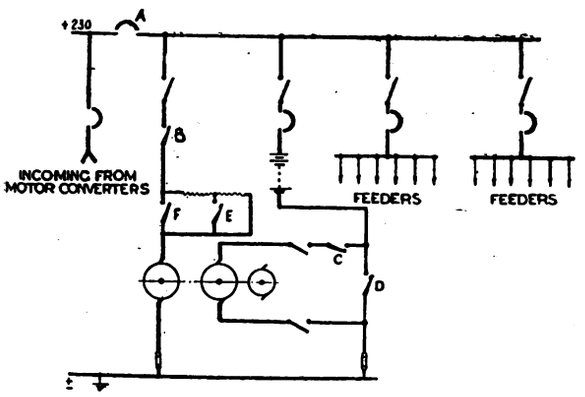

Fig. 4.—Battery booster control scheme.

A=reverse-current circuit-breaker. B=booster motor contactor. C=booster contactor. D=booster short-circuiting contactor. E=first motor-starting contactor. F=second motor-starting contactor.

e.h.t. switchgear which is supplied from a 11 000/6 600 V transformer. The transformer is situated in one of the substations of the existing 11 000 V network and is connected to the "transfer" busbar by a suitably protected 2 000 kVA interconnector. This motor convertor is paralleled on the d.c. side with the remaining convertor fed from the "normal" auxiliary e.h.t. busbar and remains "floating" on the Newcastle Electricity Supply Co.'s mains, i.e., its field is adjusted so that it is running light. In the event of a failure of the power station supply the normally loaded convertor automatically shuts down and the one running from the public supply immediately takes over the load.

The control of the battery and booster represents a divergence from normal practice in certain respects. In the first place it was found to be possible to dispense altogether with the usual buffer resistance by suitably designing the various control circuits. In order to appreciate how this could be done it is sufficient to remember that no danger exists in momentarily short-circuiting the booster during the running-up period before the field circuit is energised. On the other hand, there is no disadvantage in open-circuiting the battery circuit altogether while the booster bars are in parallel with the main d.c. supply or, in other words, when the line contactor is closed. By adopting such a procedure the heavy current which would otherwise circulate through the booster armature when short-circuited, with a residual field current still flowing, would cause damage and necessitate the provision of the buffer resistance, the use of which this scheme avoids. (Fig. 4).

A further interesting feature relates to the automatic change-over from the hand control of the booster excitation to the automatic control if trouble develops on the main d.c. system while the battery is being charged. The system has given every satisfaction since it was installed.

Discussion.

Mr. C. H. Merz suggested that it would have been economically more advantageous to have designed the plant required for steam process work as a separate plant—obtaining from it as much or as little electricity as might be—and to have taken the electricity required from the grid.

Mr. W. M. Selvey said that the outstanding feature of the steam plant was the superheater. In Detroit there was an experimental superheater working at 1 000 lb., and they were prepared in America to go to higher superheat temperatures without increasing pressures. Mr. Humphrey, however, had decided to go half-way, and the ingenuity shown in the construction of his superheater was to be very strongly commended. Another advance was that in the steam economiser it had been made possible to do away with the baffles, and with pulverised fuel, that was a great point.

Mr. T. R. Warren said that the adoption of automatic frequency control enabled governing to be coarsened without fear of incurring frequency fluctuations during times of changing load, and its application to the control of large systems offered material advantages.

Mr. H. W. Clothier said that it was significant that complete automatic control had been chosen. The crux of these automatic systems was the use of simple reliable relays making infallible contact-making connections which gave a clean reproduction of the corresponding manual operation. Hand control involved a great amount of human responsibility and worry particularly at times of emergency, and the schemes tried by the authors, with the addition of necessary pilot wires, contained all the elements for centro-visory, load sharing and automatic frequency control, for example, in a distribution system such as the British Grid where all the generating plant would be kept in step within narrow limits.

Mr. H. Risset said that removal of dust from boiler flue gases by water spray or water film had been adopted at Billingham; it was the first installation here and was the most promising. It gave a dust efficiency of 90 % easily, but it had the disadvantage of requiring a considerable quantity of water.

The main contractors for the boiler and power plants at Billingham were:—Boilers: International Combustion, Ltd.; pumps and motors, Mather and Platt, Ltd.; generating plant, Metropolitan-Vickers Electrical Co.; switchgear, A. Reyrolle and Co.; distillation plant, Vickers, Armstrong, Ltd.

ELECTRICAL EQUIPMENT OF CINEMA THEATRES.

How Trouble, Time and Expense can be Saved—Value of Early Consultation with Electrical Contractors—Load and Decorative Requirements—Subdivision of Installation Work.

By CLEMENT D. BOND.

(Mr. C. D. Bond is the amusement engineering specialist for Messrs. W. J. Furse and Co., Ltd., Nottingham, the well-known firm of electrical engineers and lift manufacturers, who specialise in electrical equipment and lifts for theatres, cinemas, race tracks, skating rinks and dance halls.)

THE remarkable growth of the electrical industry has taken place practically within a lifetime, and no section has developed more rapidly or extensively than that appertaining to the amusement world. The reason for this is that "entertainment" to be entertainment, must be new. The old British idea of "What was good enough for father is good enough for me," falls to the ground. Every installation in the amusement world must be "different"; it is useless to put forward a standard scheme to every customer. Each theatre or cinema owner wants something better than his competitor. The result has been one improvement after another, until today we get the super cinema, with its wonderful lighting effects, taking anything up to 500 A for lighting and 400 A for power, as compared with a tenth of this load twenty years ago.

Before dealing with the electrical equipment itself, I would like to say a few words, on behalf of the engineering contractor, to the architect, consulting engineer, owner, or whoever is responsible for this section of the construction of a new cinema. I feel sure that if notice is taken, considerable trouble, time and expense can be saved. The easiest way of doing this is to confine my remarks to a few golden rules.

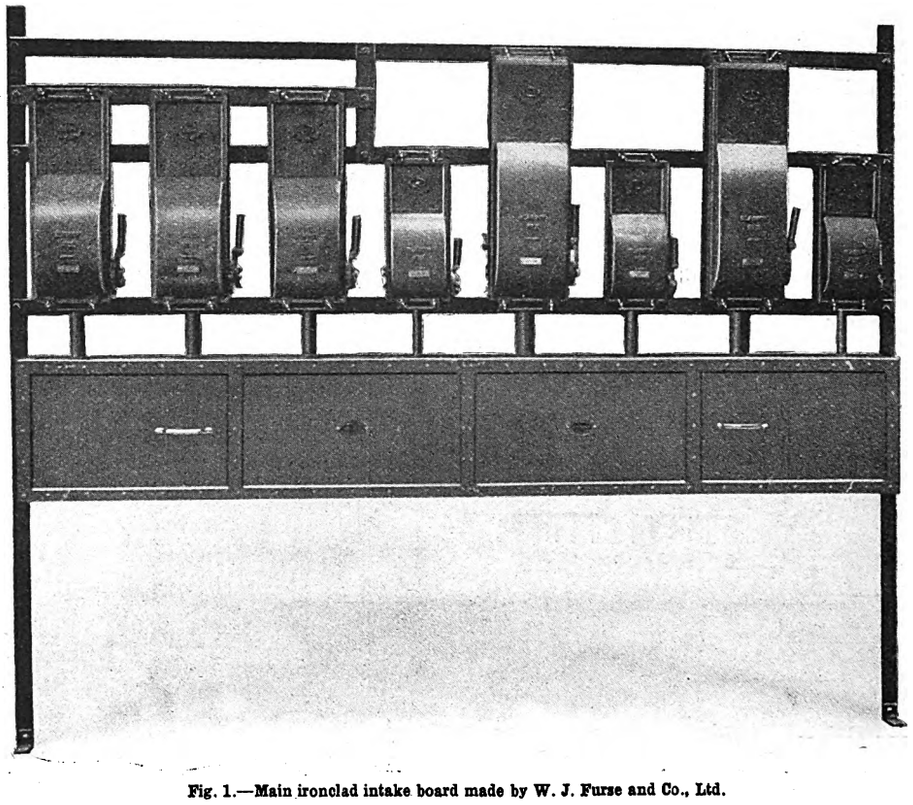

Fig. 1.—Main ironclad intake board made by W. J. Furse and Co., Ltd.

(1) Give your work to firms who have had the necessary experience.

(2) Consult, if possible, the electrical contractor for the work when the scheme is in the sketch plan stage. If you do this, modifications can frequently be made in the building to suit the engineers' requirements before they are submitted to the Council. This will save the re-making of plans and getting them approved at a later date.

(3) Allow the engineer plenty of space for his gear, especially in the intake, battery, motor generator, biograph, non-synchronous dimmer and switch rooms. If you are providing a stage, be sure that the roof is at least six feet above the proscenium bridge to allow for the accommodation and staying of battens.

(4) Just as you place the whole of the building with your building contractor, so in the same manner place the whole of the ordering of the electrical equipment with your electrical contractor. In this way, if you have chosen the right firm, you will be sure of obtaining the right material for the work required, and will have placed the responsibility for its satisfactory working under one head.

(5) Place your order for the electrical installation before the steelwork is completed. The electrical contractor has a great deal of organising to do before he begins his work. It does not cost anything to place your order early, but it makes it much easier for your contractor.

(6) Design your electrical layout and scheme before you start your building, and, with the exception of slight modifications, adhere to it. Alterations cost money, and greatly upset the smooth working of the job.

Now for the electrical equipment itself. Before beginning to get out an electrical scheme for a cinema, be sure to consult the supply authorities, watch committee, and fire chief, as on their requirements generally depends the whole layout. The following information is essential:

(1) Type of supply for both lighting and power.

(2) Regulation with regard to balancing.

(3) Position of intake.

(4) Alternative supply instead of using gas or stand-by battery.

(5) Regulations *re* motors, both from the point of view of electrical supply and fire requirements.

(6) Regulations with regard to dimmers and bio room, more with regard to fire than anything else.

(7) The question of tariff should be cleared up.

When the above points are agreed, the scheme should be prepared. In order to illustrate the way in which this should be done, I think the easiest method will be to describe the designing of the layout of one of the largest cinemas in the country with which I am dealing at the present moment.

It has been arranged for the Corporation to bring into the building at the intake room a three-wire 460/230 V d.c. supply, which has as far as possible to be balanced. This supply will be split up by the Corporation into 460 V and 230 V power, and two 230 V feeders for lighting. From the outlet side of the meters the electrical contractor will commence his work.

The question of tariff was discussed and an arrangement has been made for the Corporation to charge the cinema proprietors a fixed low figure per kW of maximum demand, plus a standard charge of varying with the price of coal at the time being. Some such arrangement can generally be arrived at when a load of 750 to 1 600 A is being considered.

Another difficulty which has arisen is that about six cafés and garages in the cinema have been sub-let to an outside firm who will pay for the electricity consumed by them. In order to take advantage of the maximum bulk rate, arrangements are being made to sub-meter all such supplies,

Digitized by Google

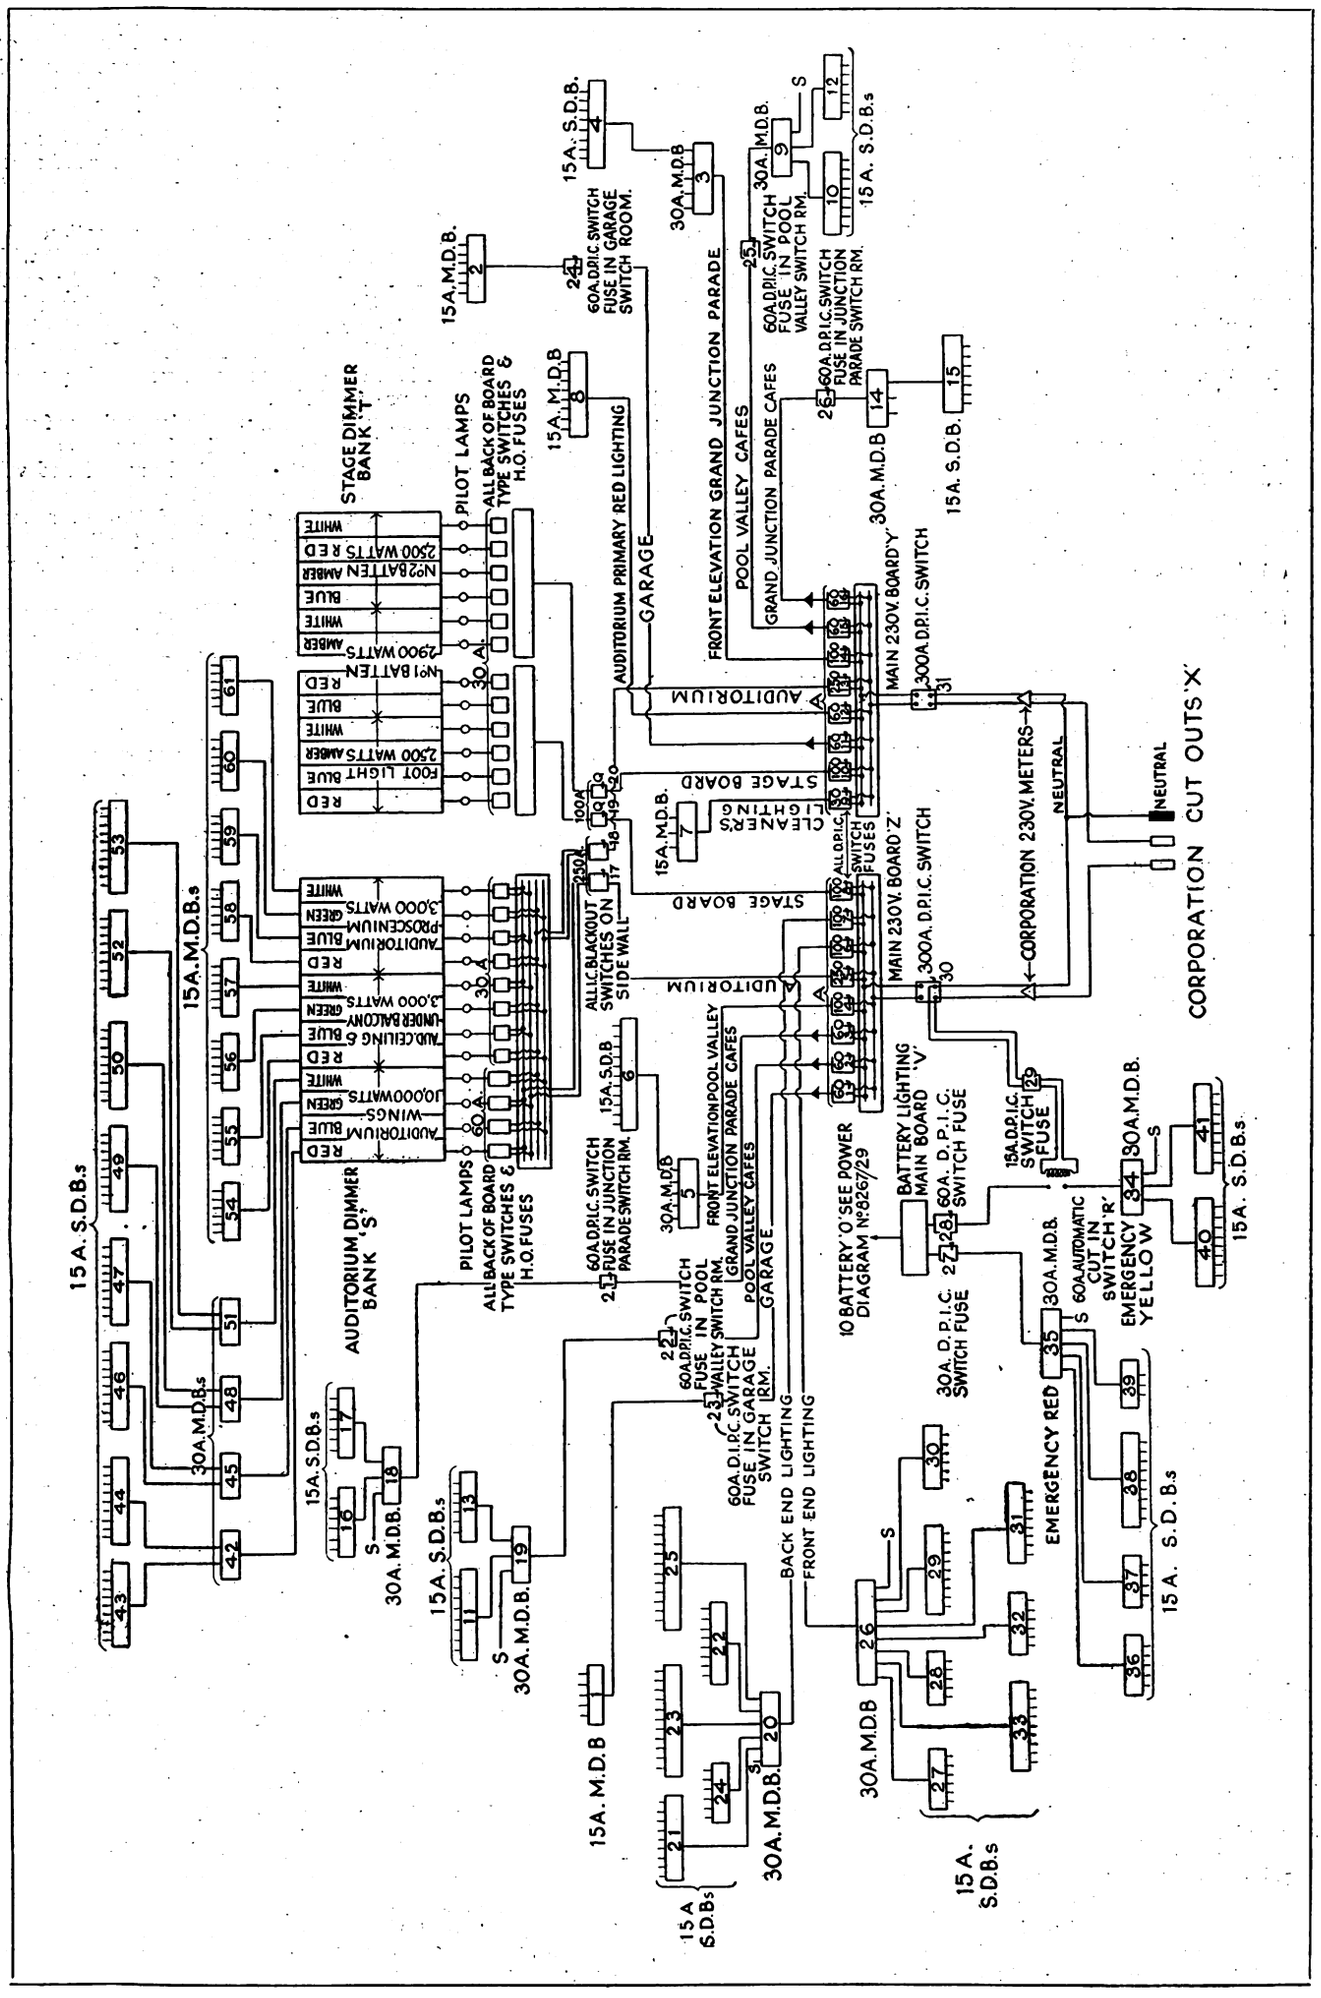

Fig. 2.—ARRANGEMENT OF MAIN LIGHTING DISTRIBUTION CIRCUITS.

Digitized by Google

both for power and lighting, and the café owners will pay an agreed sum per unit to the cinema owners. The installation will be so laid out that if the Corporation wish at any future time to make the sub-tenants direct consumers, it can easily be done by using existing circuits as Corporation mains.

Having definitely arranged for the supply, the next question was to decide the various points throughout, both for power and lighting. Consultations were held with the architect to obtain schedule of load for the various power plant such as plenum, lifts, and so on throughout the house, and with both the architect and the decorative artist as to effect required with regard to lighting. When this information was obtained the various points were marked on the plan, and a schedule got out giving point numbers, number of switches, watts per fitting, total watts and type of fitting. This having been done, the various sub-circuits could be designed right back to the main distribution boards. These were then grouped together and the various circuits decided on for the main switch loads. Reference to the single line diagrams will explain this more fully.

All local authorities require a secondary supply lighting to be used in every cinema. There are three alternatives to obtain this end, namely :—

(1) A separate electrical supply from a different generating station.
(2) Gas.
(3) Battery.

The first is seldom obtainable outside the metropolis, but is by far the most economical and satisfactory. The second is crude, antiquated and dirty. The third is the best alternative to number one, and is usually employed.

Emergency Circuit.

In the cinema being described, it has been decided to instal a battery charged through battery charging board by its own separate motor generator. This battery will be of 300 Ah capacity, the total load on the secondary police lighting being about 25 A. Provision is, however, being made to wire all the passages, entrances, etc., on what is termed a secondary emergency circuit. Under normal conditions, none of these lights will be on, but, in the event of failure of the Corporation, an automatic cut-in switch will come into action, bringing them all on at once and again switching them off when the Corporation comes on again. Of course, this circuit will be master controlled by main switch and fuse. The total load on this circuit will be about 50 A, so the battery will be amply capable of dealing with this increased load for an hour, in which time, if the Corporation breakdown is severe, the audience can be got out without panic.

It has been arranged to split up the electrical work of the cinema into five sections, namely :—

(1) Lighting, which will be sub-divided into general and primary from the Corporation supply, and secondary and emergency from the battery.
(2) Power.
(3) Motor generator.
(4) Projectors.
(5) Telephones.

The lighting is split up as stated above, and will again be sub-divided into the auditorium lighting, stage end lighting, front of house lighting, front elevation lighting, cleaners' lighting and special sub-let lighting through private meters.

The general contracting work will be carried out to the following specification : The whole installation will be made to comply not only with the I.E.E. regulations, but also those of all competent authorities and fire insurance companies concerned, with special reference to places of amusement.

The system of wiring will be on the draw-in system, in screwed barrel, and will be suitable in all respects for the stated voltages. The conduit will be welded heavy-gauge black-enamelled steel barrel ; vertical and incline runs will be drained at the lowest points. Conduits will be concealed below the surface of the walls and ceilings and under floors as far as possible. All conduits will be run in symmetrical lines parallel to each other and to the lines of the building where exposed to view, and will generally follow the lines capable of being readily located.

No conduit less than $\frac{3}{4}$ in. external diameter will be used on the installation. Where conduit is run outside, this will be galvanized and painted with bitumastic paint. No conductor will be drawn into the conduit until the conduit system is complete, and great care will be taken to prevent plaster or any other foreign substance getting into it. The conduit system will be fitted with draw-in boxes not less than $2\frac{1}{2}$ in. diameter, placed in such a position that they are accessible to enable the wires to be drawn in and out at any time. Not more than two sets will be made in a conduit run without a box. All right-angle bends, however, will be made with a box. The boxes behind surface switches will be of the semi-recessed pattern, and boxes behind sunk switches will be of the adjustable grid pattern.

The continuity of each light and power section of the conduits will be such that the resistance of any circuit will not exceed 2 Ω, and the whole will be efficiently earthed. Where the wires leave the conduit at sharp edge, brass bushes will be fitted. Special attention will be given to the importance of rigid fixing of all conduits and boxes. Where they are not buried or run in the roof space and voids, they must be firmly secured by clips or saddles.

All conduits, boxes, cables, etc., will be kept clear of gas and other pipes. The sectional area of all cables and conductors throughout the installation not particularly mentioned will be of such a size that the current density in no instance exceeds 1 000 A per sq. in. All cables will be of C.M.A. manufacture, 600 megohm grade. The polarity of all conductors will be distinguished by different colouring. No joints will be used throughout the system.

All distribution boards will be of Home Office pattern, in cast iron cases. The front of the boards will be fitted with doors on substantial hinges and secured by wing-nut fastenings, suitably drilled to take both incoming and outgoing conduits. All wall sockets will be of the iron-cased pattern, and the plugs metal sheathed and fitted with cab-tyre glands.

All branch local switches will be of the semi-recessed pattern mounted on $\frac{3}{4}$ in. conduit metal outlet boxes with dollies earthed. Where sub-switches are grouped for loading greater than 500 W, these will be of the rotary pattern.

The whole of the main switch gear will be ironclad and situated in one central position in the intake room. The main switches will be circuit breakers, and will form part of the main switchboard controls. (Fig. 1.)

The main switchboards themselves will be six in number, namely :—

One 460 V power board.
Two 230 V power boards.
Two 230 V lighting boards.
One 100 V battery lighting board.

Each will have its own main switch, referred to above, and its own busbar chamber. They will be prepared for screwed tube, prepared for both incoming and outgoing conduits. Reference to the single-line diagrams will show how the various parts of the house will be split up. From the various switches on these boards the various circuits will be run to the main distribution boards, sub-distribution boards and the various lighting and power points. Of course, certain modifications may have to be made to the single-line diagrams, but these will be kept to a minimum.

All the switchgear has been designed to carry considerably more than the stated loads, with the exception of the main circuit breakers. The approximate loads will be 500 A for lighting and 350 A for power.

(*The second article in this series will appear in our issue dated April 18th.*)

PORT OF BEIRA POWER STATION.

THERE has recently been completed a Diesel-driven power station to supply current for the lighting of the port area and the working of electric cranes and capstans on the wharves at Beira, Portuguese East Africa. The installation consists of two 6-cylinder 4-stroke Diesel engines developing 330 H.P. at 250 r.p.m., and capable of 10 per cent. overload for two hours, direct coupled to 220 kW 500 V compound wound multiple pole generators with static balancer. The generators were made by the British Thomson-Houston Company, Rugby, who also supplied the switchboards and balancer. The Lancashire Dynamo and Motor Company supplied a reversible booster, and the Tudor Accumulator Company supplied a battery of 900 Ah capacity at 450 V. The contractors for the supply and erection of the power station were Mirrlees, Bickerton and Day, of Stockport, and the specifications were drawn up by Messrs. C. S. Meik and Halcrow. Mr. A. Goodwin, who was for 14 years in the service of the Salisbury (Southern Rhodesia) Municipality, has been appointed engineer in charge of the station, which is being operated by the Rhodesia Railways, Ltd., on behalf of Beira Works, Ltd.

GROWTH OF ELECTRIC COOKING—I.

Pioneer Efforts—Electrically Cooked Banquet of 1895—Heating by Lamps—Early Types of Ovens—Great Progress since 1920.

By HILDA L. DOVER, B.Sc.(London).

BETWEEN 30 and 40 years ago, the late Prof. W. E. Ayrton, F.R.S., frizzled a little piece of fat by the aid of an electric current during a lecture given at the Royal Institution of Great Britain, and so became one of the pioneers of electric cooking. At the Crystal Palace Exhibition in 1891, a demonstration in electric cooking was given, and in 1895, a banquet was served to the Lord Mayor of London at the Cannon Street Hotel, which had been cooked by electricity. It is interesting to note in passing that in 1890, the Carpenter Electric Heating Corporation began to manufacture appliances for domestic purposes.

In the early days, the ordinary carbon filament lamp—which supplied more heat than light—was used as a source of heat. The lamp was fixed to a stand so that a vessel of water with a recess in the bottom could be placed above the lamp. It was not until the beginning of the present century that coils of resistance wire, packed in powders of various compositions, were used to any great extent. A further advance of some importance was made by fixing the wire in close proximity to the heating suface by means of asbestos powder mixed with silicate of soda. This arrangement had to be abandoned because of the low insulation resistance.

By 1905 the most important types of ovens employed either hot plates of special design or metallo-ceramic bars or wires wound on porcelain tubes to dissipate the heat. One of the most experienced women demonstrators of to-day recalls the use of a black metallic box fitted over a hotplate with a second inverted hot plate on the top. Up to 1908, most of the cooking appliances were made for pressures of 200 to 230 V, but about this time, Mr. John Roberts, of Durban, advocated the return to low pressures for cooking purposes, both for reasons of safety and convenience. The ever present problem of rapid boiling has stimulated the manufacture of utensils with flexible cords. Several of these in a kitchen were impracticable. As vessels must be heated by placing them in contact with hot plates, the latter must be designed to heat as rapidly as possible and to prevent radiation of heat in any direction other than where the heat is required. In view of the recent production of the Revo Super Speed Boiling Plate, a stove described by Mr. John Roberts ("Journ. I.E.E.," Vol. 42, p. 367) may be of interest. This stove was made of sheet iron, and the top was fitted with 4 hotplates, 2 large and 2 small. The body is taken up on the right hand side by the oven, and a compartment on the left holds the reducing transformer. The transformer is fed by distribution mains (800 V). It is so arranged that 7, 12½, or 20 V can be applied to the heating elements. The elements are securely fixed to the under side of the hot plates and to the lining of the oven. From 1909 to the beginning of the War—with the almost universal adoption of the metallic filament lamp and the consequent drop in the revenue per consumer, whilst the cost of the service and meter remained the same—the electrical industry began to take electric cooking more seriously. Investigations were carried out, and food cooked electrically was found to be much more palatable, but it was difficult to persuade the consumer that electric cooking was not more expensive than the other methods of cooking when taking into account the resulting food values and the saving of nervous energy. To-day, 50 per cent. of the population of Great Britain can have electrical energy at 1d. or less per unit, so without the consideration of any other advantages, this should prove attractive to the consumer.

Twenty Years Ago.

To show the marvellous advance in the construction of modern electric cookers, a brief description of a lagged, or black, cooker used 20 years ago may be given. The oven was fitted with open resistance coils loaded to 1 600 W. The coils soon failed, but while they lasted it seemed impossible to eradicate the smell of burnt fat which had accidentally been dropped on them. There was also no provision for top heat. Embedded in the top of the cooker were two hotplates, each loaded to 600 W—too much for simmering purposes, and too little for quick boiling. A quart kettle of water required 23 min. to boil. At Olympia, in 1911, a marked advance in the design of cookers was shown by Mr. A. F. Berry. Within two months of these cookers coming on to the market, the Derby mains had 30 satisfied consumers instead of two. These consumers had realised (1) the absolute cleanliness; (2) the reliability of the result due to constant pressure of the supply—relief from worry; (3) the saving due to non-shrinkage and the increase in the food value. These are the best money saving arguments. In the long run "Health is Wealth."

The rentals charged for electric cookers at Derby in 1913 were:—

For outfit including "duplex" cooker, extension heater, and oven, 4s. per quarter. Including griller and grease pan, 4s. 3d. per quarter. Additional extension heater, 1s. 4d. per quarter.

The small utensils used in conjunction with the hotplates were sold outright at prices approximately 10 per cent. above net cost.

To meet the drawback of slow boiling, Mr. Berry devised a specially shaped kettle into which a cartridge element was inserted. The loading was 1 200 W, and this could be assisted by standing the kettle on a hot plate. With an initial temperature of 40° F., 3 pints of water could be boiled in 6 min. with 2 000 W at an efficiency of over 98 per cent. Mr. Berry had already realised the necessity of lectures and demonstrations on electric cooking. These were arranged to be given in an interesting manner.

Table Cooking Before the War

About this time a cooking outfit was supplied by Mr. Berry's company to a boys' school at Eastbourne. The results for a term gave a consumption of just under 0·5 of a unit per head per day. There were, in all, 100 people to cater for, and besides the ordinary daily meals for boys and staff, the adults were served with a full course dinner in the evening. By 1913, table cooking with small appliances was being very successfully carried out, and a really reliable electric cooker was on the market, but the need for the reduction in the cost of electrical cooking outfits was fully realised.

Then about 6 years elapsed when research on electric cookers had to be abandoned. These years must be remembered in the development of the electric cooker, for the development of such things as motor transport was rather encouraged than delayed during this period.

By 1921, two main differences in the mode of heat transfer, corresponding to the two main types of hotplate, namely, the plain or enclosed type, and the open or radiant, type, were recognised. In the former a heating unit is clamped to the under side of an iron disc, the top of which is machined smooth, while in the latter the heater is generally a bare resistance wire, coiled and laid in a grooved disc of fireclay, which is covered with a bright grid to support the cooking utensil. It was also realised that the best results from enclosed boiling plates were obtained when using utensils with machined bottoms, whilst with open boiling plates bright utensils reflected the heat. The position of the heating element in the oven was still open to controversy, but the lagged oven showed distinct advantages.

Whilst the manufacturers in Great Britain were investigating the open and the closed hotplate with the view to rapid boiling, a thermal storage cooker was developed in Sweden. The hot plate is formed of a well-insulated mass of iron with heating elements fitted into it. This gives a very efficient boiling plate without undue high load demands on the power stations.

The year 1930 finds the enclosed hotplate more extensively used than the open type for boiling purposes, although the open type is used in the grill. The oven heating elements are arranged to supply either top and bottom heat, or side and bottom heat. From 1920 to the present day the history of the development of the electric cooker is too full of detail to record, but it is this development and the demand for this development that is most satisfying. Although the masses appear to be conservative the results are good, and it is up to the manufacturers and the supply companies to provide cookers on an attractive hire system and to demonstrate their use in the home if the progress is to be more satisfactory.

(The second article of this series will appear in our issue of April 18th.)

SAFETY IN DOMESTIC ELECTRIFICATION.

Varying Views—Inadequate Earthing of Small Appliances—Dangers of Discontinuity in Wiring Systems—Disintegration of Sheathings—Bad Effect of Plasters on Metals.

By T. C. GILBERT.

NO apology is needed in connection with this return to a subject that has been so much to the fore recently; the question is still so far from settlement that apparently much more consideration will be necessary before the various divergent views are crystallised into anything like agreement, if this can ever be done. The official precis of the proceedings at the recent I.E.E. informal debate "To Earth or not to Earth" states that "the question, despite the official stipulation, is as moot as ever," and as the whole point of this and similar debates seems to have been completely misunderstood even by those most affected, perhaps a rather more detailed examination may not be without its reward.

Even technical writers in the trade publications appear to deprecate any attempt to bring this vexed question of domestic safety in any degree nearer a solution. The writer has been vehemently told that these earthing debates are "so unsettling to the industry," and that in the existing I.E.E. regulations finality has been reached: that these regulations represent the pooled wisdom of the various eminent compilers, and that any attempt to go beyond them is rank heresy. He is of opinion, however, that a really serious succession of accidents would prove to be far more unsettling to the industry, and that a consideration of all the factors making for safety cannot, under any circumstances, be construed into an attack upon the regulations, which he hopes to make quite clear in subsequent paragraphs.

Search for Something Better.

Many writers of the older school appear to think that any criticism of the earthing clauses of the regulations are prompted by the desire to avoid the taking of a small amount of trouble, and that opponents of earthing consider the regulations too stringent in this direction. This, I think, may be due to the title usually given to the controversy—To Earth or not to Earth—indicating a defence of earthing in face of an attack upon it: a far better title would be—"To Earth or Something Better?" which is clearly what is being sought, within practical limits. I am bold enough to state that probably the opponents of earthing are those who most conscientiously carry it out, as by this means they recognise its limits and menace: they have recognised the existence of a danger, and while applying safety measures that have received official sanction, seek and strive after something better, if such can be discovered.

With the ever-increasing use that is being made of electricity in the household, with supplies rapidly becoming changed over to a.c.—mostly at a decidedly lethal pressure—it is being increasingly borne in upon the practical installation engineer that it is time that our ideas of the steps necessary to ensure public safety were very seriously overhauled. The purpose of this short article will be to examine, calmly and without any undue bias, the present position regarding earthing as a means of securing safety from shock and to consider whether we are to remain satisfied with this position, or, if not, in what other direction we can work. I cannot agree that finality, or anything like it, has been reached in installation methods: it may well be that there is no finality in matters electrical. This being the case, any suggestions or criticisms, even if they are "disturbing to the industry," must be argued out to their logical conclusions in our efforts to achieve progress. If disturbing only, and without any practical value, they are soon disposed of, and will leave no permanent mark.

One of the greatest steps forward in this irresistible progress will be when a means of ensuring a higher degree of safety for the public has been found and, what is equally important, put into operation. It cannot be denied that the earthing idea has had an excellent innings, yet it is far from being universal practice to-day: for many years, at least a quarter of a century, earthing has been advocated as a safety measure in our text-books, fire office regulations, and, of course, in our own Institute regulations. Yet after this long period it is now seriously advocated in some quarters that legislation should be introduced with the object of making the earthing clauses in the regulations compulsory, the assumption being that many contractors do not earth portable gear, and that manufacturers do not encourage them to do so, because of apathy, expense or want of knowledge. Might not this position be due to the fact that after due consideration, both contractors and manufacturers—and we might even include some supply authorities—have come to the conclusion that the obvious drawbacks outweigh the problematical advantages? That protection is so uncertain by this means that it were better to avoid it altogether? Even, possibly, that greater and more subtle risks are introduced by its adoption?

Before considering the problem from the point of view of the person intimately concerned—the householder—let us examine the position of the above-mentioned supply engineer, manufacturer and contractor. What is their attitude, professed or not, regarding earthing? Do all, or any, of them conscientiously consider their clients' safety, or is their only object to squeeze the last penny of profit out of their jobs? Doubtless there are some in the latter category, but that there are many more in the former will, I hope, be made clear. Fairly obviously, the man vitally concerned, and on whom the final blame will fall, is the contractor.

Firstly, however, let us take the supply engineer: the only point of contact between him and the householder will be the service cable, fusebox and meter. In many districts service fuseboxes are bonded and earthed to the lead cable sheathing, but in other districts earthing is avoided. The reasons for not earthing main fuseboxes are various, depending upon the particular ideas prevailing in the supply engineer's mind, but there is, of course, one very sound reason. When a fuse blows, an arc is sometimes carried by the volatilised metal over on to the earthed iron box, resulting in the destruction of the cut-out. This naturally renders the fuse completely ineffective as such, and sets up a risk of fire. With the iron fusebox unearthed, however, there exists a risk of shock to individuals who may have to frequent its vicinity. All these troubles have now been eliminated by the introduction and rapid adoption of an all-insulated house service fusebox, possessing a much higher factor of safety than the older iron box, earthed or unearthed.

Very few supply authorities will earth metal meter casings, and many meters have no provision whatever made for this to be easily done. Various reasons, again, are stated, one being the possibility of the meter having to be adjusted on circuit, another the possibility of breaking the meter down to earth in some situations. I cannot repress a shudder at the sight of an unearthed meter snugly esconced between a well-earthed service fusebox and an equally well-earthed main switch. The solution of the domestic safety problem would seem to demand the abolition of the metal case for meters and the substitution of a moulded insulated case. There would appear to be no practical difficulty in the way of this, not even that of cost, and I believe there is at least one manufacturer of meters who is adopting this idea.

Supply Authorities' Inconsistency.

The position regarding the supply engineer, therefore, seems to be that while he will often insist upon the contractor rigidly earthing everything, and sometimes even test to ascertain as to how far his dictum has been carried out, yet for himself he will generally reserve the right to earth or not, according to how it may happen to suit his gear or apparatus, other considerations being secondary. In at least one district that I know, the supply authority discourages earthing anywhere, and will always object to any earth wires being clamped to the lead sheathing of their service cable. Needless to say, their own cut-outs are not earthed, and they will not under any circumstances fix meters to iron switch boards without the provision of wooden battens or some other insulating medium. The contractor does not really grumble at this attitude, he realises that the reasons for it are sound; but he does resent these same people insisting that all his gear and apparatus must be earthed, irrespective of *his* views.

Regarding manufacturers, it is extremely difficult to obtain appliances, especially of the lighter type, with really efficient earthing devices actually incorporated in the appliance itself.

Digitized by Google

Earthing facilities, if provided, are apparently an afterthought, an attempt to please the contractor who demands, under force of circumstances, earthed equipment. It is fairly obvious that such equipment is supplied, if not actually under protest, yet with the idea that after all it is only a fad on the buyer's part ; that some attempt, however poor, must be made to meet it, but really it is a great nuisance, taking the manufacturer as it does away from his standard pattern. If manufacturers' catalogues are examined it will be found that in many cases no mention whatever is made of earthed appliances, even in lists published by really first class manufacturers. Some of these tell us that the demand is small, but growing ; yet I am informed by one of the largest of our appliance manufacturers that even if earthing facilities are provided it is the exception rather than the rule to find that an earth wire has been connected, and that in his opinion not one per cent. of appliances supplied and fitted to-day *are* earthed. There *must* be a reason for this extraordinary position, and we will try to discover it later on.

Even if earthed equipment is mentioned in the lists referred to, it is generally in rather small type at the bottom of the page, probably in the hope that it will not be noticed ; or else it is stated that an extra charge will be made for providing earthing facilities, which no doubt deters the undecided buyer.

Manufacturers and Earthing.

Again, there are some appliances to which certain manufacturers will not fit earthing arrangements : the large manufacturer previously referred to considers it is carrying things just a bit too far to provide earthing facilities on such articles as hair-dryers, and will refuse to do it except at my own risk. One cannot blame him for this attitude ; it is perfectly reasonable. It is obvious that an appliance such as a hair-dryer must be speedily broken down to earth by this means. A few strands of carbonised hair extending from the heater element on to the earthed case (and how often we find this little charred mass), the damage is done and the article probably rendered beyond repair. Yet this is the very type of appliance for which protection is required perhaps more than any other, considering the situations in which these useful articles are used. I occasionally watch my barber fiddling around with his hair-dryer amongst his water and gas taps ; I know it is unearthed, and yet I cannot advise him to earth it ! I must try and sell him one of the hairdryers completely constructed of insulating material, similar to the one I exhibited at the recent I.E.E. debate, which excited immediate interest. Once again insulation will solve the problem.

The criticisms that I have made concerning the earthing arrangements of the lighter appliances apply with equal force to those provided on the heavier equipment, such as radiators and cookers. Considering that these earthing arrangements will have to stand up to fault currents to anything from 30 to 100 A, the earthing pins or terminals, far from being larger or heavier than the regular current carrying pins, etc., are usually much more flimsy and nearly always smaller. These earthing " facilities " range—I am speaking now of first-class equipment—from a spring contact of practically equal size and current carrying capacity as an ordinary lamp-holder spring contact, to an ordinary telephone terminal mounted alongside the two-pin main contact. In the former case, the first really good earth fault will destroy the contact, which will in all probability never be replaced, and in the latter case, the earth wire has to leave the three-core flex outside the two-pin connector and go on by itself to the aforesaid telephone terminal. Every time the connector is taken off the earth wire must be unscrewed and disconnected, a perfectly hopeless arrangement, and in any case the terminal screw will probably be safely lost within a week, which will be all to the good.

Instances of this sort of thing can be produced *ad nauseam*, but I must just record another case I have noted recently. A vacuum cleaner, by a well-known firm, was supplied complete with three-core flex and earth clip to a buyer's special order. (I think he had been reading a book on wiring !) The earth clip was attached to the motor casing and the earth wire was as soundly connected as the job would permit ; unfortunately, the handle was of wood, and no attempt had been made to bond together the various metal portions on this handle, including the switch-plate which was a part of the metal hand-grip, and surely the most dangerous point of the whole machine. Yet the owner was very proud of it and used it, so I was informed, in places where he would not dare to use an unearthed machine.

The position regarding the supply of good earthed equipment is decidedly unsatisfactory ; manufacturers as a class do not encourage earthing, do not favour their appliances being subjected to it, and do all they can in as gentlemanly a way as possible to avoid having to supply earthed equipment. As I have said before, this attitude is perfectly reasonable, and one with which the contractor will sympathise.

I come now to the man of the three mentioned the most concerned—the unfortunate contractor. Here we have a man actually in intimate contact with the public, and who is in possession of first-hand knowledge as to how these various " protective " devices work out in practice. As a contractor myself, I know full well the difficulties with which the conscientious contractor has to contend as soon as he really seriously begins to consider his clients' safety. He is so very rarely a free agent and so often a buffer between the supply authority, with its various little fads, and the domestic consumer ; he also has often to model his work to the liking of a consultant to whom the letter of the regulations is the only unalterable thing in life. Neither of these superior beings, the supply engineer or the consultant, will take the contractor's experience as any guide as to what really *does* constitute a safety measure, or as to how far existing ideas fall short of the ideal ; yet our contractor is really the one man who *knows*. Let us assume that our consultant in his specification has called for completely earthed equipment throughout a building, and trace the contractor's difficulties step by step, if he is really going to study the safety problem and not merely blindly follow his regulations.

In the first place, with what wiring system in ordinary use to-day can the contractor absolutely guarantee earth continuity ? I do not mean immediately after the job is finished, which is usually the only time that such continuity is tested, if ever, but a few years later. With the possible exception of screwed conduit, I venture to state that earthing continuity cannot be guaranteed to be of any lasting nature whatever with ordinary wiring systems. Even with screwed conduit whole lengths have been known to disappear when buried in some forms of concrete—although I am willing to believe that this occurrence is not common—leaving a rust-lined tunnel through which the cables pass. This may isolate a whole bunch of points from earth, and the fact that it has been known just introduces that small element of doubt into one's mind which precludes the statement that we can guarantee earthing continuity by means of this system.

When we come to consider the many lead-covered systems, and grip or pin continuity devices, perhaps the less said the better : the practical and experienced man regards the value of their " continuity " qualities with wholesome suspicion. Tests on the sheathings or conduits of these systems should be made with a comparatively heavy current, certainly not less than 5 A, and, if this were done, many engineers' eyes would be opened regarding the continuity claims made by various makers for their systems. The inaccessible screw that is never tightened, the screw that gets lost or stripped, may provide a good enough contact to ring the consultant's bell but the heavy current will find it out.

Unsound Systems.

Possibly the condemnation of lead-covered wiring systems in connection with the recent Smethwick disaster was altogether too sweeping, and, as pointed out in the published opinion of the I.E.E. Council with reference to this condemnation by the expert witness, " there is every indication that the electrical installation did not comply with the I.E.E. wiring regulations " ; but be all this as it may, reliance cannot be placed upon these systems where human life is at stake. The conscientious contractor knows that most of these systems are mechanically and electrically unsound, the great number of joints in the earth circuit, made either by tiny screw clamps or simply by twisting together a slender bare wire, militates against reliability and invites disaster. if we are going to depend upon the continuity of this circuit. Luckily, in many installations where these systems are employed, earthing continuity is no great matter, the outer sheathing never being called upon to protect human life by exercising its earthing function, and the fact that this continuity does not exist is not discovered. Lead-covered wiring systems are neat and convenient, easy to instal, and enjoy a large measure of popularity amongst architects and consultants, but I do not think that the practical engineer will ever regard many of them as a 100 per cent. earthing job. Without exception, in every installation of these systems that I have recently tested for earthing continuity (all having been erected from four to ten years ago), one or more points were isolated from earth. In one case eight points were

Digitized by Google

without continuity, and in another a whole floor was isolated owing to a sub-main clamp having become detached. In no case, not even the youngest installation, was continuity complete throughout.

Other objections to the use of these numerous systems, from the earthing point of view, will readily occur to many engineers. In certain situations, the outer sheathing disintegrates and completely disappears in sections for some reason, probably chemical, this being especially noticeable in the vicinity of oak and some patent plasters. Heavy earth faults will also destroy the sheathing. Then there is the vitally important question of workmanship, which must be conscientious in the extreme if anything like continuity is to be ensured even in a new installation. Most installations will test out quite satisfactorily as regards earthing continuity when newly made with these systems, even if clamps are not tight, the bright metal casings of the wires being in touch contact only, but after a few months or years of traffic or domestic vibrations, and the sagging of cables to which these systems are so liable, complete earthing continuity is extremely problematical, and in many cases non-existent.

That existing wiring systems, without exception, are unreliable from an earthing point of view is recognised by the foremost advocates of earthing as a safety measure ; in fact, so great is this unreliability that revolutionary wiring systems, some of them a reversion to earlier practice, are advocated in order to overcome this evil. In his paper on " Earthing as a Public Safeguard," read at the Cheltenham E.C.A. Conference, one of the most masterly treatments of the subject that it has been my pleasure to read, Mr. W. R. Rawlings, A.M.I.E.E.,

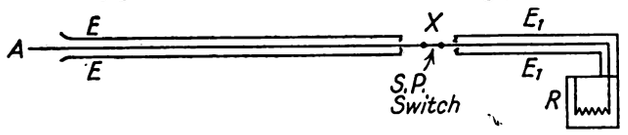

Fig. 1.—A, insulated conductor ; EE, earthed outer conductor, broken at X.
Result.—The outer casing of the appliance R, and all the outer conductor E1, E1, is at full line voltage above earth.

emphasised this unreliability of existing systems and advocated the general use of the earthed-concentric wiring system as the only one that could ensure safety. This view was also put forward by several other well-known engineers at the recent I.E.E. debate already referred to, and this claim would, on the face of it, appear to be well founded. The idea of an insulated conductor completely surrounded by a continuous bare earthed conductor, used with suitable junctions and fitments so that complete concentricity is maintained, seems sound until examined in its details, when doubts at once arise in one's mind.

Discontinuous Sheathing.

In the writer's opinion, such a system cannot become general, nor will it fulfil all expectations, for the following reasons. Very few supply authorities, probably not more than a dozen throughout the country, will at present approve the use of this system, nor are likely to do so. A great defect, to my mind, is that the outer earthed sheathing, far from being continuous, is made up of innumerable clamped or soldered joints, so that the system at once becomes subject to the same objections as have already been levelled against other wiring systems. Regarding a possible electrolysis trouble, it has been stated by those who advocate the system that as all supplies are likely shortly to be a.c., corrosion of the outer sheathing due to this cause will automatically disappear ; but it must not be forgotten that there are many other wandering earth currents, due to bell, telephone and other circuits, and these may safely be relied upon to exercise a corrosive effect upon the outer conductor. Also nearly all plasters and cements used in modern buildings appear to have a decidedly bad effect upon most metals, and this factor, aided by slight wandering earth currents, will be almost certain to cause trouble in actual practice.

With this multitude of joints in the outer, and with the other possibilities mentioned, there is a probability of a break in this earth circuit : this will be indicated at once, say the advocates of the system, by the failure of a lamp to light or a sweeper to function. This is so, but until the fault is traced and repaired there is in existence a certain amount of this bare exposed outer at line potential, should the aforesaid lamp or sweeper have been left switched on, not an unlikely proceeding under the circumstances. (Fig. 1.)

The difficulty of making extensions or alterations, and the trouble experienced to obtain concentric wiring supplies in connection with this system, are also against the possibility of it coming into general use, whatever measure of popularity it may have enjoyed in the past. The advocates of concentric systems, recognising these serious objections, have made alternative proposals to use heavy conduits, enclosing one insulated line wire and one bare earth return wire. This, again, is open to serious objection, as, while a true concentric system would give definite indication of an interruption in the earth circuit, such an alternative " concentric " system as proposed would give no such warning, and the consequences might be very objectionable.

Even with all these objections and shortcomings, however, in connection with the concentric system, Mr. Rawlings is right when he states that it ensures earthing safety better than any other system ; and if it should ever be our misfortune to have to face compulsory earthing regulations, I think the compulsory use of this system will have to follow, if only for the reason that a break in the earth conductor is made apparent as soon as it occurs.

(To be concluded next week.)

CANADIAN PROGRESS IN USE OF ELECTRICITY.

Industry 70 Per Cent. Electrified—Some New Applications.

(FROM A CANADIAN CORRESPONDENT.)

DURING the past year a number of interesting developments have taken place in the utilisation of electricity in Canada, quite apart from the immense strides in hydro-electric power development. In British Columbia, there has been brought into commission apparatus for converting alternating to direct current at high efficiency by the mercury arc rectifier. This rectifier, rated at 6 500 kW, is the largest single tank rectifier in the world. It will be used by the Consolidated Mining and Smelting Company of Canada, Limited, for the electrolytic decomposition of water into oxygen and hydrogen. The hydrogen will be used in the manufacture of synthetic ammonia, which in turn will be used in the new superphosphate fertiliser plant.

Canadian industry is now over 70 per cent. electrified, and during the past year electrical operation has been adopted for such special applications as the bridges over the new Welland Ship Canal, the new Cherry Street (Toronto) Bridge of the Toronto Harbour Commission, an electrically-operated dredge owned by the Dredging Contractors, Montreal, etc. The success of the electric dredge and the advent of huge dredging undertakings at the Beauharnois development, indicate a much more extensive use for dredging apparatus of this type.

There has been a remarkable advance in electric street lighting. Ornamental street lighting installations were made at Montreal, Calgary, Vancouver, Sault Ste. Marie, Welland, Sudbury, and Port Colborne. Flood-lighting, as an integral part of architectural design, was exemplified at the new Royal York Hotel, Toronto, the Edmonton Parliament Buildings, and the buildings at the Canadian National Exhibition, Toronto.

The increase of traffic in the streets has necessitated further study of electric traffic control. There are in Canada now 300 electrically controlled street crossings. Last year, Toronto added 25 new intersections, while Sarnia, Kitchener, Owen Sound, Woodstock, New Toronto, Mimico, York Township, Peterborough and Kingston also adopted electrical traffic control.

With the advent of night flying in air mail service, an entirely new field for lighting was opened up. During 1929 there were installed revolving beacons for the Western Canada and Western Ontario Air Mail routes and lighting equipment for airports at Edmonton, Medicine Hat, Winnipeg, Calgary and St. Hubert.

A paper by Lt.-Col. J. Hartley, of Chile, on engineering in Chile, was read before the Junior Institution of Engineers on March 7th. In the course of the paper, it was stated that a tube railway, 2¾ miles in length, under the Avenida Delicias, Santiago, was projected. A new steel works which had been commenced at the port of Corrall would cost 1½ millions sterling and employ electric blast furnaces of 50 000 tons capacity each, the electricity being obtained from the falls at Huilo-huilo.

ROUND THE JOBS.

Incubus of a Tradition—Economy of Complete Domestic Electrification—Wrong View of Discounts—Incidental Publicity.

By "CONTRACTOR."

BECAUSE electricity was first introduced to the public as a medium for lighting, the tradition has continued to exist that electricity is mainly a medium for lighting. Electrical contractors do not need to be told that this is a stupid tradition and that electricity is just as much a medium for doing domestic work as it is for lighting. On the other hand, customers do need to be told this; they need to be told on every possible occasion that there is no household or domestic duty which cannot be more effectively performed by electricity. An example of the view which is in general taken of the possibilities of electricity for domestic service is given by the lamentable paucity of plug outlets in the average household. Every room should certainly have one for a vacuum cleaner alone; many rooms, such as a nursery or a kitchen, need more than one such plug, although it must be remembered that domestic appliances with a low loading require a special fuse which certain manufacturers now make in the form of an intermediate plug between the installed plug socket and the plug attached to the apparatus when such a plug is on the power circuit.

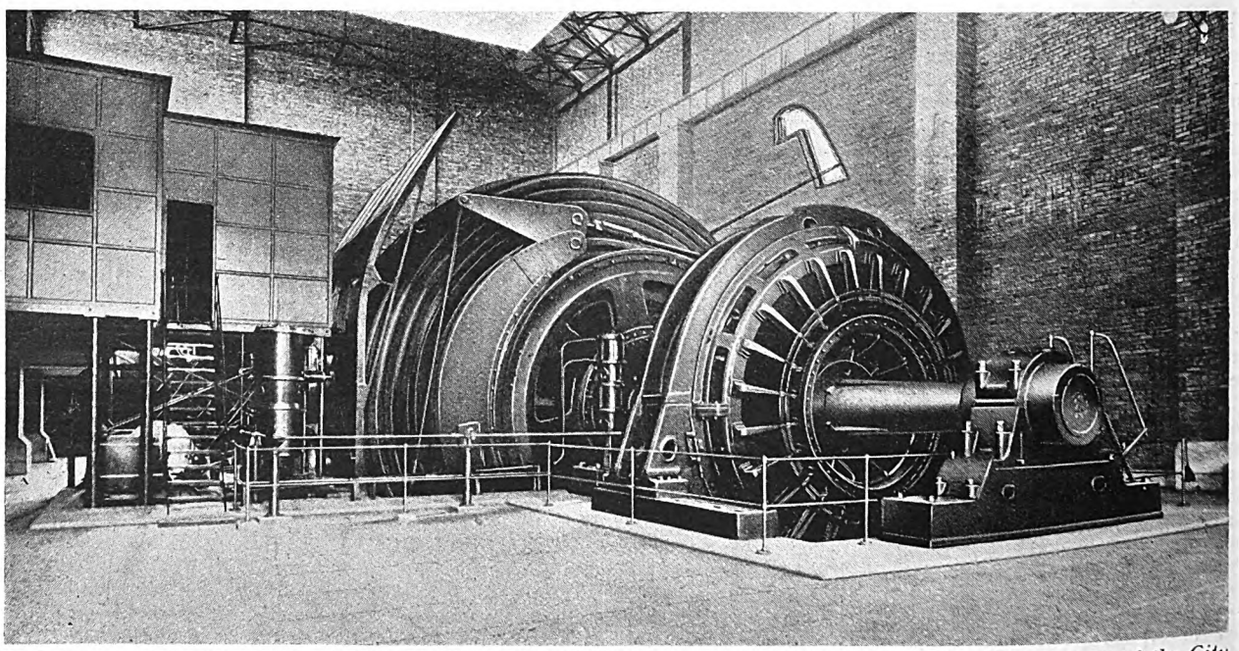
Another survival from the days of pioneering is the idea that electricity is expensive. Because it was once expensive—and it certainly was—the idea has stuck that electricity was, is and always will be expensive. Tariffs vary, of course, but generally speaking the impression that electricity is expensive is pure rubbish. I use electricity throughout my house for every purpose, not because I have made my bed and must lie on it, but because I thereby save myself many pounds yearly. The half-hearted use of electricity in the home is sometimes apt to be expensive, but a completely electrified home is beyond a doubt the most economical home that it is possible to have to-day.

It is interesting to reflect upon the exact function of discount as applied to articles which are listed in manufacturers' catalogues at a certain retail price and which are subject to a discount to the retailer or contractor. Many contractors and retailers regard this discount as profit and it is this view of discount which is doing such a great deal of damage to the retailing trade as a whole. From regarding such discounts as pure profit to regarding them as a bargaining margin is only a short step. Too many retailers and contractors to-day do in fact regard their discounts on, let us say, electric light fittings as bargaining margins. If I want to sell a motor car, and if the price I have decided in my own mind is £200, I shall probably start by asking £250 for that motor car, knowing that I am likely to be beaten down, and, after retreating to my second line of defence—£200—I am still getting what, in my own mind, I had hoped for.

Thus it is that many contractors are apt to regard their discounts. If, on the other hand, we apply a little bit of accountancy to the question of discounts it will very soon become apparent that out of, let us say, the 25% discount on an article, only a comparatively small amount can be regarded as profit; the cost of handling these articles is again, as in the case of electrical installation work, represented by a percentage, and that percentage is inexorably fixed by the ratio of the overhead charges of the business to the turnover. If discounts are to be used at all as a bargaining margin and there is really not the slightest justification for this—then the cost of selling the article should be accurately worked out, and the actual margin available for bargaining should be considered to be only that part of the percentage of discount over and above the percentage which is eaten up by establishment charges.

Probably all contractors indulge in a certain amount of publicity each year; the nature and amount of this publicity of course varies and many contractors would, offhand, say that they do no publicity or advertising, whereas they are doing it daily. Their delivery vans, their tricycles, their notepaper, their invoices, their shop-windows, their entry in the telephone directory and in the Buff Book—all these are advertising, and one is a little too prone to think that, because money is not being specifically allotted for publicity or advertising, no care need be exercised in the manner in which the name of a firm is brought before the public. I once made the same sort of mistake myself when talking to the managing director of a large store. I expressed surprise to him that he did no advertising whatsoever, for I had noticed that in the daily papers, where all his competitors seemed to advertise, he took no space. His answer was that he had a very large number of advertisements moving about London every day and being read by thousands of people. He was referring to

THE LARGEST MINE SHAFT WINDER IN THE WORLD.



5 000/12 500 h.p. Metropolitan-Vicker's winder recently put into commission at the head of No. 4 shaft of the City Deep Mine, Johannesburg. This winder lifts the gold ore 4 500 feet (from the head of No. 4A shaft, which descends a farther 2 500 feet) to the surface. The daily lift of ore is 3 000 tons handled in 12 hours.

Digitized by Google

his delivery vans, and, correctly, he considered the appearance of these vans and the lettering upon them as every bit as much advertising as taking space in the press.

Now the taking of space in newspapers and periodicals needs no justification from me; the amount of money that is spent each year on this form of advertising alone is so vast that its value is automatically justified. Yet it must not be forgotten that every firm is doing a certain amount of publicity work, whether or not they do take space, and it is this incidental publicity which can make or mar a business very easily. Most prominent, to my mind, in this incidental publicity is the question of window lighting by electrical contractors and retailers. The shop window of an electrical retailer should be the best lighted in the street. It should be a perpetual reminder to all his potential customers of the comparative poorness of their own window lighting. If he lags behind in this, his own subject, he will find it difficult to persuade his customers to a proper view of the matter.

A correspondent of mine in Sweden has just written me a letter in the course of which he makes it clear that the problem of shoddy installations is not one which is confined to Great Britain. He is interested to know how we deal with the problem in this country and gives me some idea of how they are dealing with it in Sweden. They seem to suffer as we do from a lack of legislation, for he condemns their laws on the subject as being very poor, old-fashioned and incoherent. Therefore, the Association of Electricity Works have issued standard specifications and no installations are connected to the mains which do not, when inspected by the electricity works engineer, come up to these specifications.

At first sight this would appear to be similar to our own method, but it appears to have one outstanding advantage in that the standard specifications are issued by the association of all the electricity works, and it is not left to individual undertakings to arrive at their own specifications and regulations. These specifications again are adopted by the owner of a property even where he may be generating his own electricity.

Again, there has recently been organised a testing bureau under the auspices of the Association of Electricity Works and the fire insurance firms for the purpose of testing installation details. It is intended that any material accepted by this testing bureau shall be entitled to carry a special sign consisting of an " S " in a ring. All the more important Swedish electricity works have issued special orders that only such types of installation as carry this mark are to be allowed.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—V.

Writing Off Bad Debts—Creating a Reserve Against Doubtful Debts—Method of Keeping Contract Accounts.

By S. HOWARD WITHEY, F.C.I.

BY comparing the items enumerated in the list of sales ledger balances with the amounts shown to be owing at the end of the previous month, it will be possible to keep the number of bad debts under control; but in the case of the electrical contractor transacting business in a variety of products and accessories, there are bound to be some debts that prove to be impossible of collection.

Debts which are, without question, irrecoverable for any reason should be written off against the periodical profits. To write off a bad debt, an entry should be made on the credit side of the personal account, giving the date and the words " By Bad Debt," or " By Amount Written Off," the amount being posted direct to the debit side of the Bad Debts Account opened in the impersonal ledger. At the end of the year or other accounting period, the balance of the Bad Debts Account will have to be transferred to the debit side of the Profit and Loss Account prepared for the purpose of ascertaining the amount of net profit realised, or the extent of the loss sustained. When debts are placed in the hands of a solicitor or agency for collection, the amounts should be transferred from the accounts of the debtors to the debit side of an account opened in the name of the collecting agency, any cash received in connection with these items being recorded on the debit side of the cash book in the usual way and posted direct to the credit of the agency account.

It is a good practice to create a reserve against future bad debts, and there are two ways of determining the amount to be reserved. Some electrical contractors make out a complete list of outstanding debts, as shown in the sales or customers' ledger at stocktaking time, and then calculate a certain percentage of the total balances. If the percentage of bad debts is fairly constant, this method is the better of the two, the total sum to be reserved being recorded on the debit side of the Bad Debts Account during the period under review, and thereby included in the amount transferred to profit and loss. Generally speaking, however, it would be more satisfactory to examine very carefully all the figures shown in the list of balances, making a sufficient allowance, at the same time, for all amounts which are known to be bad or which are uncertain of collection. These allowances should be set down on the list in an inner money column, the total being the amount to be reserved. Whichever method is adopted, special attention should be given to large debts of a doubtful nature, or which have been accumulating for a considerable time. As soon as the balance of the Bad Debts Account has been transferred, the reserve should be brought down on the credit side of the account, and this amount will have to be deducted from the total of the book debts, as shown on the assets side of the balance sheet.

The contractor who is frequently called upon to instal electric fires, lighting equipment, fittings, or who has contracts in connection with the illumination of schools, libraries, cinemas, hotels, offices, shops, etc., should be able to ascertain the profit made or the loss sustained as a consequence of executing work or rendering services at a stipulated figure. To arrive at reliable results, separate job or contract accounts should be opened in the impersonal ledger, each account being debited with the cost of the instruments, gear, accessories, materials and stores purchased in connection with the work or used on the job, the carriage and cartage expenses involved, the wages paid to men engaged in the various operations, and an adequate sum for the use of motors, plant, tools, dynamos, drills, machines, etc. If any meters, measuring instruments, standards, or machinery employed in the fulfilment of any contract have to be disposed of at a price lower than the book value, the difference should be debited to the particular contract account. On the credit side of the account may be recorded the amounts of cash received during the currency of the contract, although if the work has not been completed by the time the periodical profit and loss account and the balance sheet is drawn up, the balance of the account should be treated as an asset or a liability according to whether it is a debit or a credit balance. When the work has been finished in accordance with the agreement, the balance of the contract price should be recorded on the credit side of the account from where it will be posted to the debit side of the personal account, after which the balance of the contract account will represent a profit or a loss according to whether it is a credit or a debit balance. At stocktaking time this balance should be transferred to the profit and loss account.

The fact that a contract has been entered into does not, in itself, necessitate any entry being made in the contractor's books of account. But directly any goods, articles, materials, etc., are taken from stock or purchased in order to proceed with the work, the contract account should be opened in the ledger and debited with the cost or invoiced prices. Accessories taken from the contractor's stock should be passed through the day book, but if bought on credit for use on the job, the cost should be credited to the personal account of the suppliers kept in the purchases or bought ledger.

There is an alternative method of keeping account of contracts. This consists of recording on the credit side of the personal account all amounts of cash received on account of the work and debiting this personal account with the full contract price upon the completion of the job, the contract price being also inserted on the credit side of the particular contract account, against which should be shown the cost and expenses, depreciation, etc., involved. When these entries have been made, the balance of the contract account will represent the profit realised or the loss sustained, to be transferred to the profit and loss account at balancing time.

In those cases where two or more electricians agree to buy certain electrical products to be sold at a profit to be shared between them on an agreed basis, the cost of the purchases on joint account should be debited to a separate joint account

BIRMINGHAM ELECTRIC CLUB.

The Annual Dinner—Why Brookman's Park Uses 261 m.

THERE was a record attendance at the annual dinner of the Birmingham Electric Club—the pioneer electric club in the country—which was held at the Grand Hotel on March 14th. Mr. D. G. Brooks presided over a gathering of over 250 members and guests who, in addition to the speakers to the toasts, were provided with good musical and humorous entertainment. Mr. Percy Owens as Richard Cœur de Lion's batman and as a tub orator was the hit of the evening.

Mr. A. P. Young proposed the toast of "The City of Birmingham" and referred to the resiliency and complacency which had carried Birmingham through bad times in the past. He mentioned the local quickness to seize upon new industries to replace those which were declining for various reasons, and instanced the manufacture of electrical accessories. It was the vision of the electrical engineer to see all activity electrified. Among coming improvements in that direction he suggested the illumination of our highways at night and very much better lighting of railway stations than at present. (Hear, hear!)

The Lord Mayor, Alderman F. Samuelson, replying, said that the weekly output of electricity in Birmingham last year was equal to the total production for the whole of 1906.

Capt. P. P. Eckersley proposed "The Birmingham Electric Club" in a speech which caused as much laughter as Mr. Percy Owen's best efforts. He sounded a loud trumpet blast in favour of better financial treatment of technical men, himself not excluded. Mr. Brooks replied and asked Capt. Eckersley if he could explain why the B.B.C. adopted 261 m. as the wavelength for the second Brookman's Park transmission. Capt. Eckersley said that the band from 200–545 m. was allotted for broadcasting because it was wholly unsuitable for the purpose. The wavelengths from 600 m. upwards allotted to ships were also quite unsuitable for them but very suitable for broadcasting. The matter was decided at an international conference which cost £50 000. There would be another conference on the subject at Madrid in 1932.

Mr. F. W. Martin proposed "The Guests," and Mr. H. Foulds, in his response, threw a little further light on the B.B.C.'s reasons for adopting 261 m. He said that the B.B.C. being a thoroughly puritanical institution was naturally anxious to prevent British listeners from reaching out after Paris or feeling Toulouse—two stations which had very similar wavelengths.

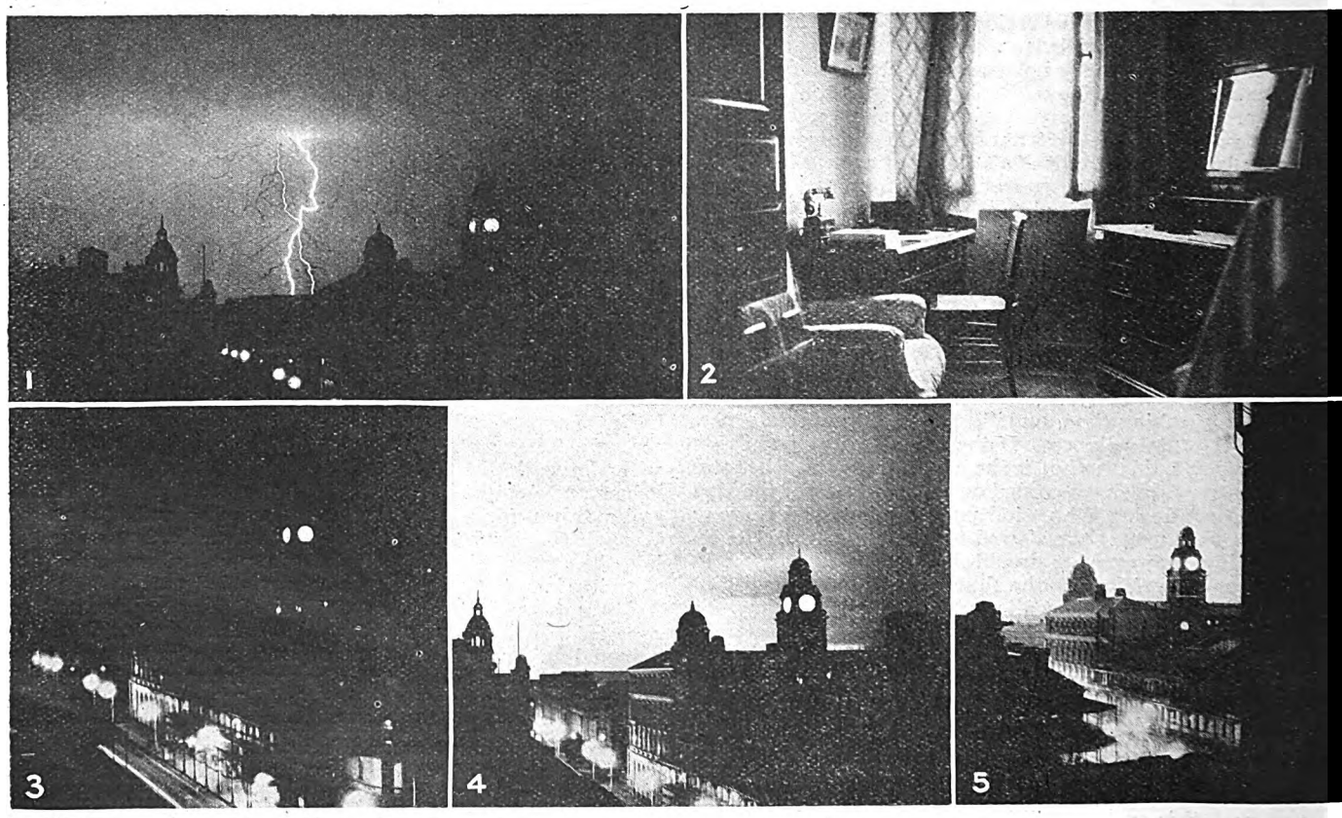
BOOK-KEEPING FOR ELECTRICAL CONTRACTORS.

(*Continued from page* 367.)

and credited to the manufacturer or supplier. The expenses and charges incurred in connection with the purchases should be posted from the payments side of the cash book to the debit side of the joint account, while the selling prices of the products bought on joint account should be credited to the account and posted direct to the debit side of the customers' accounts. If any cash has been received from one of the parties in the venture, the amount should be recorded on the debit side of the cash book and posted to the credit of the sender's personal account. As soon as all the products have been sold, each contractor should be credited with his proper share of the profit as shown by the joint account, or debited with the share of loss, as the case may be, the remaining balance of the account being transferred to the profit and loss account.

It is most important that adequate supplies of all materials and stores likely to be required in the execution of contracts should be available when needed, and consequently the stock on hand under any given heading should not be allowed to reach the minimum which past experience has proved necessary or advisable to carry, without a note being made of the fact. Moreover, all goods arriving on the contractor's premises should be subjected to an effective internal check and control, and in our next instalment the outline of a suitable method of organisation and stock reconcilation will be given, together with the most appropriate rulings for the books suggested.

(*To be continued in our issue dated April* 18*th.*)



A TRANSVAAL THUNDERSTORM.

PHOTOGRAPHS taken at Johannesburg on the night of October 24th/25th, 1929, by Mr. A. N. C. Horne—(1) Lightning flash at 10.30 p.m. local time; (2) interior taken by a flash at 1.30 a.m.; (3) Market Street lights between flashes, midnight (exposure 30 secs.); (4) the storm approaching from the south-west; (5) storm overhead, 2 a.m. The dark streaks on (1) probably represent red flashes of low actinic power.

WOMEN'S WANTS.

Their Views on Domestic Appliances—Requirements that Must be Studied.

By HARRY MOSS, A.M.I.E.E.

THE opening of the twenty-first branch of the Electrical Association for Women, a few weeks ago, prompts one to ask the above question. The growing interest that women are taking in electrical matters, and the ever growing numbers who are enrolling in the Association is a distinct sign that the woman of the future is going to have a say in matters electrical that concern home life.

It is through such an organisation that the women will be able to ventilate their ideas as to what they require and expect in connection with domestic household equipment, and all other matters that directly or indirectly concern household consumers of electricity, and it will be good policy on the part of manufacturers, suppliers and contractors, to keep in close touch with the views they may express and do their best to supply the desired appliances.

Need of a Dish Washer.

Take the instance which occurred at the inaugural meeting of the latest branch in Bradford, when a well-known lady alderman said she wanted something electrical that would wash dirty, greasy dishes and dry them, as this was one of the most unpleasant tasks in a house, and one which had to be carried out several times a day. She said she wanted something like a "whizzer," electrically driven, of course, that would "whizz" or "swish" the water about the dirty pots and thoroughly cleanse them, and then dry them. Furthermore, this article must be cheap, and within the reach of all electricity users.

Can our manufacturers produce such an article, either separately or as an added equipment to an electric washer, which of course would save the cost of an additional motor? It certainly gives food for consideration. Anyway, if the opinion or "want" of that particular lady is anything to go by and if it represents the feelings of thousands of others, then there is a demand opening up, which will no doubt be satisfied by some manufacturer at an early date. It does seem a pity that a motor, say of one-fifth horse power, on a washing machine, is only used for about two hours a week, and is lying idle for the rest of the time, when by some simple adaptation, the same driving power might be used for dish-washing, knife polishing, boot cleaning, etc., all operations of a tiresome kind which have to be carried out many times per week in every household.

Another expression of opinion was that electric washing machines are too expensive, and are not within the reach of thousands of householders. Probably the solution to this problem will be found in mass production, with the simplest machine that can be designed.

There is further evidence that women are also interested in tariffs, and the present multiplicity and complexity of these are most bewildering to the female mind. Is a low flat rate with sliding discounts for quantity going to solve this knotty problem? The question of tariffs is now engaging the attention of various supply authorities, and it will be very interesting to watch which way the wind blows in this matter, and what is going to be the final solution.

Work of the E.A.W.

There is no doubt the supply authorities are keenly and deeply interested in the work of the E.A.W. and are supporting the organisation in a splendid manner. This is all to the good, because the E.A.W. is an educational organisation, and the more confidence that can be created in the woman's mind regarding electrical matters in the home, and the more electrical apparatus is used in an intelligent manner, the less trouble we shall all have with domestic installations, which will, in its turn, reduce maintenance costs and make electricity more popular than ever.

The womenfolk, and the woman's point of view will make itself felt very considerably in the future, both in design of apparatus and cost, and their views must be considered by all parties concerned. Many unpracticable ideas may be suggested, but no idea must be turned down haphazard if there is any germ of usefulness at all in it. Therefore it follows that whatever is done by the engineer in the future in connection with domestic electrical equipment, it will be advisable to keep the thought in view "What a bout the Women and their Wants?"

ELECTRICITY FOR WOMEN.

Mr. Borlase Matthews on "Outlets" and Electricity on Farms.

MR. R. BORLASE MATTHEWS, addressing the annual meeting of the Electrical Association for Women (Birmingham and Midlands Branch) last week on "Electricity in the Service of Women," said he imagined that he was addressing a gathering of women practically all of whom made electricity play a very large part in their lives, and whose cooking, heating, lighting, washing and cleaning were probably all done by the aid of electric power. He would like to dwell for a few moments upon a less widely accepted aspect of the question, and deal with the ways in which electricity could be of the greatest possible service to the country women. But, before doing so, he would like to refer to a stay which he made a short time ago at a hotel de luxe in Switzerland. In his bedroom, cupboards, passage and bathroom there were 27 lamps. They were not, of course, intended to be all turned on at once, but were ready in every position where it could possibly be anticipated that a local light would be advantageous. It pointed to a moral, and that was, always provide more than sufficient lighting points and outlets. He congratulated the Association upon the part it had played in the outlet campaign. If the decoration and arrangement of a room permitted of it, he liked to run a chair-rail all the way round with a pair of electric wires concealed within it. The outlets were placed on this chair-rail, and further outlets could easily be added at a future time. The same lay-out could be arranged around the skirting board, and he had also employed picture rails in the same way.

In support of electricity in the service of women, a Birmingham works turned out over 5 000 electric flat irons and over 2 000 electric kettles per week, with the original design of which he was proud to have been associated. These figures indicated what women thought of electric servants, and it must be borne in mind that there were other factories making similar articles. At his home they had an electric cooker, which had no electric switches on it. The hot-plate would boil two pints of water in 2¾ minutes—a thing that no gas, coal or other electric stove would do. Under the hot plate was an oven which was always kept at 200 deg. F. This served as a vastly improved hay box cooker.

He was now asking a Birmingham firm, and other firms, to make 3 000 of these cookers for use by the housewives of Lincolnshire, where a big rural scheme of electrical development, in which he was interested, was under way. A second oven for roasting and baking is also to be incorporated in the stove, with automatic control of the oven temperature—so that it would not need watching—and a grill in the upper part of the oven.

In the town the coming of electricity had been a boon to women; in the country it was going to revolutionise the social and economic aspects of the lives of the women. It was going to give them and their husbands a living as good as that to be obtained in any other walk of life. An electricity supply would bring the revival of many rural industries and the institution of village factories. The uses to which electricity could be put on the farm numbered nearly 300.

Mr. Matthews concluded his address by referring to the beneficial effects of electric light upon laying hens, and upon the output of eggs, which was increased by 15% to 20% by the use of electric light when eggs were dearest.

THE A.E.A. AND REGISTER OF THE MOTOR TRADE.

Arrangements have been made for the names of members of the Automobile Electrical Association to be entered in the new edition of the register of the motor trade which is now in process of revision by the Society of Motor Manufacturers and Traders, Ltd. The entries will be distinctive in that they will emphasise the fact that the concern named specialises in automobile electrical service. As the revision is now proceeding early application for membership of the Association is advisable. A neat badge of membership has been designed and blocks are available for use in notepaper headings. The accompanying illustration is a reproduction of the design.

The membership badge of the Automobile Electrical Association.

NEWS IN BRIEF.

Scottish School Lighting—Police Telephone Boxes—Irvine's All-Electric Houses—Electrically Welded Cargo Vessel—Dunoon Electric Ferry.

KINROSS Education Authority has decided to replace gas lighting in its schools by electricity.

The police telephone boxes in Richmond and Wood Green have proved so successful that similar boxes are to be erected in other parts of London.

In connection with the Physical and Chemical Survey of the National Coal Resources, which is one of the important aspects of the fuel research work of the Department of Scientific and Industrial Research, the department has recently appointed a committee to deal with the West Yorkshire coal area.

Mr. G. H. Watson, district manager of telephones at Edinburgh, stated in a recent address at the Scottish Liberal Club, Edinburgh, that the number of telephones in this country had increased from 914 000 in 1920 to 1 850 000 at the present time. People in this country, however, had not yet got the telephone habit, especially in residences.

The Housing Committee of Irvine T.C. has decided to equip the next 148 of its houses with electricity throughout.

Shipley U.D.C. has instructed the Electrical Engineer to prepare a scheme for the lighting of the market stalls.

The next meeting of the Institution of Civil Engineers will be held on March 25th, when Mr. David Anderson and Mr. Geoffrey Lancaster Groves will read papers. A meeting of the Students' Section will be held on March 26th.

A meeting of the British Institute of Radiology was held on Thursday at the Institution of Electrical Engineers, when Mr. B. J. Leggatt read a paper entitled "The Medical and Surgical Applications of Electricity."

On March 11th the Birmingham and Midlands Branch of the Electrical Association for Women held its annual general meeting and a luncheon. Over 300 were present, and among the speakers were:—Sir John Brooke, Mrs. H. K. Beale (president), Coun. Beale, Mrs. M. L. Matthews, Mr. F. Forrest, and Mr. Borlase Matthews.

The 23rd annual dinner of the London Students' Section of the I.E.E. was held on March 6th, with Mr. P. V. Hunter, vice-president, in the chair. Mr. Crutch, hon. secretary, said he thought the alterations of the regulations governing the Associate membership would result in fewer students dropping out of the Institution when they reached the age limit for students.

A meeting of the North Midland Students' Section of the I.E.E. was held on Tuesday, when Mr. H. Copping read a paper entitled "The Control of Low Tension Induction Motors" and Mr. W. E. Park gave an address on "Chemistry as Applied to Steam Power Plant." Members of the Section are due to visit the Yorkshire Copper Works, at Stourton, Leeds, to-morrow, Saturday.

In the course of a paper read before the Liverpool and Manchester Section of the Institute of Transport recently, Mr. R. S. Pilcher, manager of the Manchester Corporation tramways, said tramcars might lose their advantage in seating capacity at any time, and if the design of the tram did not keep pace with that of the bus and railless vehicle the latter would supersede the tramways.

The B.E.A.M.A. index of production figure (per cent. of 1924) for the electrical engineering industry for January, 1930, was 112·5, against 104·1 for January, 1929. The monthly average for October to December, 1929, was 111·1 against 98·1 for October to December, 1928. The percentage of insured workers in the industry unemployed was 5·2 in January last, against 5·3 in January, 1929, and the monthly average from October to December, 1929, was 4·2, against 5·0 for October to December, 1928.

LOOKING BACKWARD.

FIFTY years ago it was reported in THE ELECTRICIAN *of March 20th, 1880, that electric light was being fitted in the Royal Exchange basement and the adoption of electric lighting by the Crystal Palace was also recorded, with the comment that some people found the new light "disagreeably cold" in appearance after the flaring gas jets to which they had become accustomed.*

* * *

TWENTY-FIVE years ago THE ELECTRICIAN *of March 17th, 1905, stated that an agreement had been reached between the Marconi Company and the government departments concerned for the provision of wireless equipment in the six lightships stationed in the Goodwin Sands area to enable them to communicate with a shore station at Dover.*

Reference was made to the construction by the American General Electric Company of two 50 kW 160 000 V transformers for testing insulators.

The inspectorate of H.M. Factory Department will this year be increased by two engineering and four electrical inspectors.

Prof. G. W. Howe, lectured to the Royal Philosophical Society of Glasgow last week on "The Production and Distribution of Electrical Power in Scotland."

The Society of Radiographers held a meeting on Wednesday, at the British Institute of Radiology, when Mr. L. A. Rowden read a paper entitled "Radiography, Old and New." The next examination will be held on June 19th and 20th.

On March 13th Mr. H. de A. Donisthorpe, of the General Electric Co., Ltd., lectured before the Kensington Radio Society—one of the few such societies that have survived and of which Mr. Donisthorpe was the first president. The lecture, "Radio Past, Present and Future," traced the progress of radio from its earliest days, the future being symbolised to some extent by a demonstration of a Baird television receiver.

While the value of total sales of domestic current to residence consumers in the United States was $656 000 000 in 1929, the total of appliance sales from all sources to these consumers was $808 000 000, not including a.c. radio set sales, valued at $727 000 000.

What is claimed to be the first rivetless cargo vessel has been completed at Charleston dockyard. The vessel was constructed entirely by electric welding, nine men being employed and 8 000 pounds of welding wire being used. The saving in weight is said to be 20% and on cost of construction 25%.

A ferry from Renfrewshire across the Firth of Clyde is made possible by the introduction of electricity to Dunoon, and the Town Council is considering the proposal.

The Electrical Trades Union has decided to withdraw from the joint investigation, with the employers, of working conditions on the Continent, which has been proposed as a preliminary to any wage claim by the Engineering Joint Trades movement. It is anticipated that the union will make an independent wage claim in the electrical manufacturing industry.

The Committee set up under the chairmanship of Sir Charles Sargant to consider whether any amendments in the Patents and Designs Acts, or any changes in Patent Office practice, are desirable, is continuing its weekly meetings at the Board of Trade. Any persons or associations who desire to submit suggestions or give evidence should notify their intention to the secretary to the committee, Mr. R. W. Luce, Industrial Property Department, Board of Trade, 25, Southampton Buildings, London, W.C.2, by May 1st next.

The local branch of the Electrical Contractors' Association has asked Eastbourne Electricity Committee for an increase in the agreed price for wiring electric cookers and water heaters. The Engineer recommends that, in the case of cooker connections, a minimum of £2 be paid for ten yards, and any excess *pro rata*, the Corporation to supply an iron clad switch and fuse unit, and in the case of water heater connections that the contractors be paid for the wiring at 3s. per yard, including an insulated switch mounted on a wood board. The recommendations have been adopted.

Birmingham Education Committee has reported as to the number of electrical contracts granted to Birmingham contractors, compared with those granted to outside contractors. Between January, 1927, and December, 1929, 74 tenders were accepted for new lighting installations or alterations, amounting to £18 602. Four out of these 74 contracts were secured by contractors outside Birmingham, the lowest tender being accepted in each case, and the amount of the four contracts was £2 874. Many orders for repairs have been placed during the period, all with Birmingham contractors.

Digitized by Google

PERSONAL.

CANNOCK Urban Council has appointed Mr. F. E. Watts, of Llanelly, as assistant in the meter department.

Colchester City Council has increased the salary of the eleotrical engineer by £50 per annum as from March 1st, with a further increment of £50 a year hence.

Estate of the gross value of £10 924, with net personalty £4 520, was left by the late Admiral of the Fleet, Sir Henry Jackson, F.R.S., chairman of the Radio Research Board and one of the pioneers of wireless telegraphy, who died on December 14th last, aged 74 years.

St. Pancras (London) Borough Council has been recommended by the Establishment Committee to grant increases of salary to Mr. W. H. Wells, sub-station superintendent; Mr. W. E. Wilman, junior assistant engineer; and Mr. W. J. Elstone, public lighting superintendent.

The centenary of the British Association for the Advancement of Science falls next year, when the meetings will be held in London from September 23rd to 30th. The council has resolved to nominate General Smuts as president of the association, and he has accepted the nomination.

Among the speakers at the first national conference on employment management to be held in this country will be Mr. A. P. Young, general manager of the British Thomson-Houston Co., Ltd. The conference is to be held to-day (Friday) at the Hotel Victoria, London, under the auspices of the Industrial Welfare Society.

Sir Harry Haward will retire from the office of Electricity Commissioner at the end of this month, on completion of his extended term of office. Although he will cease to hold office, arrangements have been made by the Electricity Commissioners, with the approval of the Minister of Transport, under which he will act in a consultative capacity. Sir Harry, who is 67 years of age, was one of the original five Electricity Commissioners appointed in 1920 under the Electricity (Supply) Act, 1919. Prior to his appointment he held the office of Comptroller of the London County Council for 26 years, during which time he was actively engaged for many years in the investigation of various aspects of the finances of the public utility undertakings of London, including those relating to electricity supply and the financial problems connected with the supply of electricity in the London area. During the war and afterwards he served on a number of government committees dealing with financial and administrative matters. He received the honour of Knighthood in February, 1917.

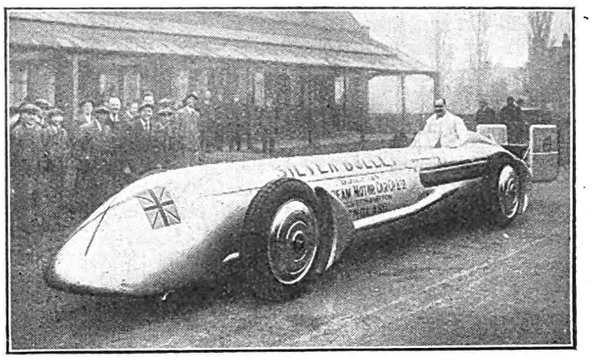
EXTENSIONS AT BURY.

Starting Up by Bury Corporation of New 10 000 kW Turbo-alternator.

THE Mayor, Alderman Lees, started up the new 10 000 kW turbo-alternator of Bury Corporation Electricity Department on March 12th, prior to a thorough inspection of the works. The contract for the turbo-alternator was placed with Metropolitan-Vickers Electrical Co., Ltd., who also erected the foundations, and provided the switchgear. The main contract for the boiler house plant was placed with Clarke, Chapman and Co., Ltd., of Gateshead-on-Tyne. The turbine is of the high pressure, impulse type, with two cylinders designed for operating at a steam pressure of 300 lb. per sq. in. gauge, and 700 deg. F. It is arranged with 24 expansion stages and multi-exhaust. The condenser is of the central flow type, and is bolted directly to the turbine exhaust flange, and mounted on suitable springs carried on concrete blocks. The total cooling surface provided is 11 400 sq. ft. The condenser consists of 4 660 tubes, each 12 ft. 6 in. long, and ⅞ in. external diameter. Feed water heating is carried out in two main stages, the resultant temperature of the condensate being raised to 200 deg. F. The alternator is rated to give a maximum output of 10 000 kW continuously, generating three phase, at 6 200/6 800 V between phases with a periodicity of 50 cycles. The boilers are of the "Woodeson" patent water tube header type, arranged with economisers of the Green's tri-tube type. The heating surface of the boilers and economisers is 9 230 sq. ft., arranged for a normal evaporation of 60 000 lb. per hour, to a working steam pressure of 325 lb. per sq. in., total temperature 700 deg. F. Stokers of the Underfeed Class "L," travelling grate type, are included in the installation. See page 379.

BUSINESS ITEMS.

THE EDISON SWAN ELECTRIC CO., LTD., announces that the Ponders End telephone numbers of the company have been changed to Enfield 2800–2808.



MR. KAYE DON at the wheel of the "Silver Bullet" on which, at the time of going to press, he anticipated making an attempt to break the world's record. The car was produced by the Sunbeam Motor Co., Ltd., and is fitted with high tension ignition wire supplied by Callender's Cable and Construction Co., Ltd.

Among the firms exhibiting in connection with the Stoke-on-Trent Historical Pageant, and the Josiah Wedgwood Bi-centenary Celebrations, to be held at Stoke-on-Trent from May 19th-24th, are Bullers, Ltd., Doulton and Co., Ltd., the Electric and Ordnance Accessories Co., Ltd., Wm. Kent, J. Macintyre and Co., Ltd., Taylor Tunnicliffe and Co., Ltd., and G. Wade and Sons, Ltd.

One of the outstanding features of the BRITISH THOMSON-HOUSTON CO., LTD., at the Ideal Homes Exhibition, which opens at Olympia, London, on Monday, will be a special tableau devoted to Mazda lamps. The central figure will be the ballet girl associated with the company's advertisement "Beauty Enriched by Light," in front of a wine coloured curtain, and the foreground will be suffused with light constantly changing in colour and intensity. Illuminated fountains will also play their part in the tableau. Over four hundred lamps of various sizes and colours will be used in the display, the majority of them being installed under the floor in the foreground. These lamps are automatically controlled by a four circuit dimmer and the total connected load will be about 22 kW. The stand is No. 149 on the ground floor.

RADIO RESEARCH BOARD.

First of New Series of Annual Reports.

IN past years a section summarising the work of the Radio Research Board has been included in the annual report of the Department of Scientific and Industrial Research, but the published results of the researches carried out directly by the Board are attracting so much attention, both at home and abroad, that it has been considered desirable to issue each year as a separate publication a more complete statement of the progress of the work carried out by the Radio Board. The first of the series of the separate annual reports is published to-day (Friday) and is obtainable (price 3s. 6d.) from H.M. Stationery Office, Adastral House, London, W.C.2. The report includes the results of investigations completed and in progress, and deals with the study of signal fading and the influence on the Heaviside layer; the propagation of long waves; the determination of the conductivity of the ground; investigation of nature of electromagnetic field of waves at a receiver; the attenuation of wireless waves over land; a study of performance of radio direction finders; the rotating loop transmitter; the development of short wave direction finding apparatus; a direct reading instantaneous direction finder; radio frequency standards and precision measurements; the study of antennæ; the performance of amplifiers; the measurement of the interference of transmitting stations; the preliminary work of short waves (less than 10 metres); a description of a linear time base for cathode ray oscillograph work; forced life tests on thermionic valves; the deactivation of thoriated tungsten filaments under certain voltage conditions; the development of high vacuum pumps; a valve wavemeter with a range of 30 000 to 15 kc/s; an azimuth repeater; and a note on electromagnetic screens.

KIOSKS FOR LEICESTER.

Eight New Transformer Sub-stations for Corporation Electricity Department.

THE GENERAL ELECTRIC CO., LTD., has recently supplied to Leicester Corporation eight transformer sub-stations of the kiosk type, the general construction and equipment of each being similar. Each unit is built up of heavy gauge steel plate welded to a rigid framework, and a welded steel roof and rolled steel cornice pieces make the whole weather-proof. Each kiosk is divided into three compartments, for the transformer, h.t. and l.t. switchgear respectively. Sheet steel doors fitted with locks and keys give access to all three compartments, the ornamental beadings fitted to the floors and sides adding to appearance and acting as stiffening pieces. Provision is made for adequate ventilation, but, at the same time, the internal apparatus is completely screened and is inaccessible to vermin. The h.t. supply to the kiosks is at 6 600 V 3-phase 50 cycles, and is brought to the h.t. busbars through a set of manually operated isolating links. In cases where the h.t. feeder is brought in and out, with the oil circuit breaker teed off, such as at the Braunston Housing Estate, three sets of links are provided, for the incoming feeder, outgoing feeder, and oil circuit breaker respectively. The h.t. supply to the transformer is controlled by a manually operated oil circuit breaker fitted with overload trips, time limit fuses, and leakage trip coil, while the necessary current transformers are inserted in each phase for the three ammeters. These instruments are also fitted with maximum demand indicators. This h.t. equipment is contained in steel plate cubicles, access to each cubicle being obtained by means of hinged steel plate doors. The operating handle of the oil circuit breaker is collapsible in order to avoid waste space between the front of the cubicles and the door of the kiosk. The transformers, all of which are of 100 kVA capacity (although eventually they will be increased in size to the maximum of 300 kVA), are delta/star connected, the neutral point of the secondary windings being brought out to a 3-phase 4-wire l.t. distribution system, giving 415 V 3-phase and 230 V single-phase. The l.t. distribution switchgear consists of G.E.C. unit type " Handguard " fuses mounted on bakelite insulated supports, the three main fuses being rated at 500 A and each of the distribution circuit fuses at 150 A.

THE PUBLIC AND FUMES.

Sir Harry Haward, vice-chairman of the Electricity Commission, addressing a meeting of the Surveyors' Institution last week, said while public attention was concentrated on the effects of gaseous fumes from the Barton station and the new Battersea station, it ignored the emissions from many smaller stations in process of being shut down and from factories and dwelling houses. Recent experiments went to show that the oxides of sulphur could be eliminated. The potential demand for electricity in the country districts during the next ten years had been computed at 280 000 000 kW per annum.

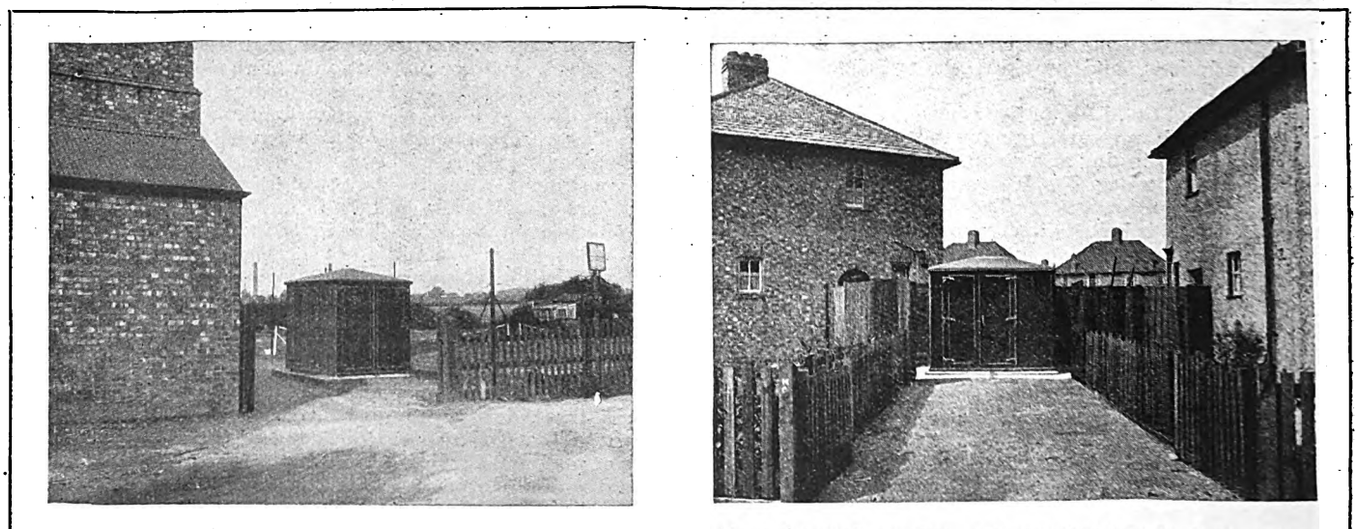
THE SOCIAL SIDE.

AT the twelfth annual reunion of the Ex-British Westinghouse Association, held on March 17th at the Hotel Cecil, London, Mr. J. S. Peck presided over a record attendance, which exceeded 150 in number, from all parts of the country. The proceedings followed the usual informal lines, the members being seated at round tables accommodating ten, an arrangement which always adds to the enjoyment of the company. The ballot for life membership was won by Mr. H. A. McGuffie, who, being already one of the select few, auctioned the ticket for 47s. 6d.; consolation prizes were won by Messrs. Rook, Stainton and Fletcher, the last receiving a toffee apple. In a speech packed with humorous reminiscences of Trafford Park, Mr. P. A. Sanders proposed the toast of " The Association." His remarks also had a serious side, and he specially paid tribute to the engineering genius of the late George Westinghouse; in particular he recalled the fact that the Lots Road power house for London's Underground Railways was originally planned for reciprocating steam plant, but Westinghouse insisted upon turbines, and, in the face of great opposition from other engineers, succeeded in having them installed. He coupled the chairman's name with the toast, which was accorded musical honours. Mr. J. S. Peck, in his reply, was also reminiscent of the early " nineteen hundreds " when H. S. Loud was in charge at Trafford Park. He told an amusing story of the light and airy way in which anyone could walk into Loud's office and tell his tale, though the room was filled with smoke and generally packed with people. His tributes to Mr. Lange, who produced a new spirit at the works, converting discord into co-operation, were keenly appreciated.

Mr. E. M. Herr, of Westinghouse Electric and Manufacturing Co., Pittsburgh, who was returning to America from a world tour, and Mr. J. Snow Huddleston, representing the newly-formed Association of Ex-Siemens men, were welcomed as guests, and both extended greetings from their respective interests. The toasts to " Absent Friends " and " The Silent Toast " were given at ten o'clock, and with the latter were coupled the names of Ex-B.W. men who had died during the past year, Messrs. Dunkley, Bradshaw, Toplis, Loud and Lieut.-Col. Cradock. Telegrams regretting inability to attend were sent by some 50 X.B.W.A. men.

Due to the closing of the Hotel Cecil, the committee are selecting another venue for next year's gathering and this and the date of the 1931 dinner will be announced later.

Henley's Dramatic Club presented at the Cripplegate Theatre, London, E.C., on March 14th, a well-produced performance of " Rookery Nook," a farce in three acts by Ben Travers. This is the eighth season of the club. The characters were:—Gertrude Twine, Miss Dorothy Josling; Mrs. Leverett, Miss Elsie Savage; Harold Twine, Mr. F. J. Batten; Clive Popkiss, Mr. Robert K. Edney; Gerald Popkiss, Mr. A. V. Burnett; Rhoda Marley Miss Kathleen Hayward; Putz, Mr. Hugh Stanley; Admiral Juddy, Mr. Frank Bettley; Poppy Dickey, Miss Kitty Thurgood; Clara Popkiss, Miss Fay Smith; Mrs. Possett, Miss Netta Taylor.



EXAMPLES of the kiosks installed by the General Electric Co., Ltd., for Leicester Corporation. That on the left controls the supply to Wyvern Laundry, in Barkby Lane, and the other picture is of the sub-station which supplies the Braunston Housing Estate.

ELECTRICAL DOMESTIC & RADIO APPLIANCES.

New Apparatus and Equipment for the Home—Items to Interest the Contractor—Accumulator Charging Plant for Garages, etc.

WITH the increasing use now being made of shop window reflectors, contractors may be especially interested in particulars of "Frink" unbreakable reflectors. This reflector is marketed by L. G. HAWKINS AND CO., LTD., 30–35, Drury Lane, London, W.C.2; it is all-metal and has a reflecting surface of pure silver, hermetically sealed against deterioration. There is no glass to break or paint to peel. The outside finish is dark statuary bronze. Other features include provision for three distributions of light from the same lamp, a very simple type of adjustable collar, and absence of springs, nuts and screws. Extensive, intensive, focussing and combination reflectors are available. For use with certain models of these reflectors the firm offers colour screens in red, amber, green and blue. The company also supplies "Intensalite" electric window signs, made in aluminium. Type R.1, frosted on the reflecting surfaces, is suitable for shallow windows dressed to their extreme height. Type R.2 is designed to increase the illumination on the display area in normal windows; its efficiency is increased by the use of a corrugated mirror on the reflecting surface. Type R.3 is intended to give the maximum intensity on the display area, with an increase in the side illumination. The individual reflectors can be adjusted to suit the window dressing, and can be equipped with colour screens.

A further accessory for shop window display lighting is the "Frink Spot-o-Flod," a combination spot and floodlight with universal adjustment. It is equipped with special fittings to permit rapid adjustment to any angle and light control from a spot 24 in. diameter to a flood of 10 ft. diameter at a distance of 10 ft. It can also be used for a wide-angle flood by removing the lens. The "Spot-o-Flod" is furnished with red, blue, green or amber colour screens in glass or gelatine. No solder is used in its construction, and all parts and accessories can be instantly applied without tools. It is equipped with 3¾ in. spherical mirror, 5 in. condensing lens and 6 ft. of cord and plug.

Messrs. L. G. Hawkins are also manufacturing a "practical office lamp" with a green and white opal adjustable shade to direct the light where required. It is doubly adjustable, to enable it to be used efficiently on roll-top or pedestal desks, and it has a heavy, baize-covered base. The standard finish is bronze; other finishes can be supplied at a small extra charge.

The MORECAMBE ELECTRICAL EQUIPMENT CO., LTD., Fahy's Buildings, Euston Road, Morecambe, have sent us brief particulars of their "Non-Fayl" electric coffee mill. It has a granulating capacity of ¾ lb. to 1 lb. per minute, and is designed to meet the needs of café proprietors, grocers and multiple shops. The coffee mill is supplied with flexible cord and adapter; its dimensions are: base, 12 in. by 8 in., and overall height, 24 in. The weight is 60 lb.

Another interesting application of electricity to the preparation of food is the "Auto-Grill" for cooking bacon. This device, which is marketed by FRANK V. MAGRINI, LTD. 19–23, Oxford Street, London, W.1, is made in two models. Model No. 8 grills from two to eight slices of bacon at a time. The cooking plates are monel metal. The overall size is 8½ in. by 13½ in., and the height when closed is 10½ in. The shipping weight is 22 lb. We understand that this "Auto-Grill" operates on 110 V, or 220 V if specified. The 16-slice "Auto-Grill" consists of two No. 8 units mounted on a single base. Both models are operated as follows: The bacon can be put into the machine in its parchment paper if it is sold covered, and cooking in this way ensures that all the flavour is retained. The top is then pulled down and the dial turned. The current is turned on, the bacon cooked and the current turned off automatically. The cover is also opened by automatic action. The pan at the base of the grill retains the clear bacon dripping.

A special type of toaster for the use of restaurants, etc., is marketed by the same firm. It is known as the "Toastmaster," and is produced in four models. The eight-slice model will make its full capacity of toast in 1¼ minutes, giving 360 large slices of toast per hour. The consumption is 5 500 W. The four-slice "Toastmaster" has a capacity of 200 slices per hour, and for many purposes it is recommended to be used in multiple instead of one or more of the eight-slice models. The three-slice and sandwich models are also automatic toasters of similar pattern.

A further variation of the double-cone principle, as applied to loud speakers, is seen in the Wates double-cone loud speaker chassis, a sample of which has been sent to us. The "Wates Universal Chassis," as it is called, employs two cones made of specially treated paper, scrolled out in both cones in an endeavour to obviate a direct line through the sound waves. The large cone responds to the lower frequencies and the small one to the upper registers. The bracket is ingeniously designed so as to be adaptable for use on any of the well-known makes of loud speaker units. Reproduction of the low and high frequencies is good, and the chassis is certainly splendid value at its low retail selling price of 11s. 6d., complete with screws, bolts and full directions for use with the various units. On test the results were infinitely better than when a single medium-sized cone was used, and vastly superior to the reproduction given by a well-known make of the horn type speaker, the Wates cone handling a large volume without distortion. Further details and trade terms can be obtained from the makers, the SHAFTESBURY RADIO CO., 184–188, Shaftesbury Avenue, London, W.C.2.

The "Davenset" accumulator charging set of Partridge, Wilson and Co.

Two new imitation coal fires are now being made by METRO-VICK SUPPLIES, of Trafford Park, Manchester. In the Tudor and Savoy 2 and 3 kW fires the coal fire effect is obtained by means of a standard flame lamp placed at the back of the fire, and each element bar is controlled by a separate switch. The reflector and fire bars are in all instances chromium plated; the available finishes for the Tudor fires are chromium plated, oxidised copper and oxidised silver; the last two finishes form the choice for the Savoy fires. Another recently introduced model is the 2 kW screen fire, which is claimed to be an efficient heater and at the same time decorative.

A new nickel-iron alloy transformer, known as the "Hypermite," is announced by RADIO INSTRUMENTS, LTD., 12, Hyde Street, New Oxford Street, London, W.C.1, the makers of the "Hypermu." It weighs only 7 oz. but has a primary inductance of over 50 henries, with a ratio of 3½–1. The "Hypermite" is claimed to be the smallest commercial intervalve transformer ever produced with such a high primary inductance. Ample reproduction of low notes is guaranteed, without loss of the higher frequencies; the new nickel-alloy core enables high efficiency to be obtained with a reduced number of turns and without introducing excessive self-capacity. The transformer may be used in the conventional manner, the primary winding being direct connected in the anode circuit of a valve; in the alternative method of resistance-capacity-auto-transformer coupling the d.c. anode current is entirely diverted from the transformer primary, reducing breakdown possibilities to the minimum, and giving also a more uniform amplification. The "Hypermite" is mounted in a bakelite moulding, and the primary and secondary are wound on three separate bakelite bobbins.

A range of electric fires has been added to the products of LANE AND GIRVAN, LTD., of Bonnybridge, near Glasgow. Particular features claimed for these fires are as follows: There are no heavy refractory supports for the coils to heat up before the maximum radiant heat is available. The "Caledonia" element is of simple design, and is screwed into position by hand to give the correct focal length from the reflector. The resistance coils in the elements are laid in deep

Digitized by Google

grooves in tough refractory formers of light section. Behind them is a vertical parabolic reflector. In some of the fires the reflectors are of hammered copper and in others they are chromium plated.

Dealers will soon be thinking once again of electric fans, and a large range of these is manufactured by FALK, STADELMANN AND CO., LTD., 83-93, Farringdon Road, London, E.C.1, under the trade name of "Antarctic." Included among the numerous fans offered are swivel and trunnion desk and bracket fans, rigid bare desk fans for d.c. only, low voltage fans for use with accumulators and house lighting plants, cabin and exhaust fans.

An Electric Radiator.

The WARDLE ENGINEERING CO., LTD., Elsinore Road, Old Trafford, Manchester, have sent us particulars of their "Maxheat" tubular electric heating system. This system is claimed to "mark one of the greatest advances in industrial heating since the introduction of the tubular system;" the "Maxheat" tube is stated to afford approximately five times the radiation area of the conventional 2 in. dia. tube, and 2½ times the radiation area of a plain tube with a diameter equal to its own external diameter. "Maxheat" tubes are available in lengths from 2 ft. to 14 ft., and in loadings of 150, 200 and 250 W per foot run of tube.

The "Maxheat" tubular electric radiator is suitable for all ordinary purposes, but it is particularly recommended for situations where cost or fire risk prohibit the use of the exposed-element type of heating unit.

Two models are available. The Senior, rated at 750 W; and the Junior, rated at 500 W. The standard finish is black heat-resisting enamel, with white metal relief. The Senior model is supplied with a three-heat switch fixed on the right-hand supporting bracket. In the Junior model the switch is of the rotary "on" and "off" pattern. Both models are fitted with a carrying handle and are supplied with two yards of three-core circular braided flexible. In these radiators the element comprises a number of fireproof porcelain units, each having four projecting arms, threaded on a steel core of square section. The nickel chrome alloy spiral is threaded in and out of the recesses formed by the projecting arms, and is held rigidly in position, no part of the surface being enclosed. The terminals are shrouded in a porcelain block, terminal wiring being effected by beaded flexible. The element can be withdrawn as a complete unit.

The "Davenset" starter charger, manufactured by PARTRIDGE, WILSON AND CO., of Leicester, forms a means of charging motor car starter batteries from a.c. mains. It operates on the principle of a gas-filled valve rectifier, and has a maximum d.c. output of 15 A at 75 V. The components—with the exception of the controls and the current measuring instruments—are completely enclosed in a black crystallised steel case, which has its sides perforated for ventilation. A hinged door, opened by the removal of two screws, is provided in the left hand side of the case; the gas-filled rectifying valve, which can be removed by detaching the two anode leads and unscrewing it from its porcelain holder, is situated immediately behind this door. On the control panel are two pairs of output terminals, marked Nos. 1 and 2. Each circuit is independently controlled by a variable resistance of the sliding type. Circuit No. 1 is arranged for charging currents up to 6 A, while No. 2 is designed for currents up to 10 A. Thus, for example, starter batteries may be charged on No. 2 at, say, 9 A, conjointly with wireless accumulators charging at, say, 3 A on circuit No. 1.

The d.c. voltage output of both circuits is adjustable from 15 V to 75 V in steps of 15 V, by an arrangement of transformer secondary tappings controlled by means of a five-position rotary switch. Two of the three d.p. rotary switch-fuses at the bottom of the control panel are the output switches, whilst the third and centre switch is the mains switch controlling the a.c. input to the transformer primary. The six fuses fitted in these switches may be easily examined by hinging back a section of the base of the apparatus. Two Ferranti moving coil ammeters are fitted as part of the standard equipment.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, have recently added to the Magnet range of bakelite fittings a detachable ceiling rose. This ceiling unit, which has a 2½ in. base diameter, with two fixing holes at 2-in. centres, is designed to be suitable for mounting direct to conduit boxes of British standard specification. The advantage of installing this plug-in or detachable type ceiling rose is claimed easily to compensate for the slight extra initial cost—particularly in mills and factories where colour washing or painting of ceilings and walls must be carried out frequently. With the new ceiling rose it is only necessary to unscrew the clamping ring and withdraw the two-pin plug. The G.E.C. have also introduced a three-hook suspension plate for ceiling roses, for earthing the metal parts of bowl pendants. It has been designed for the purpose of connecting the metal work of any three-chain suspension pendant or bowl fitting directly to the conduit box, thus ensuring earth continuity. The plate is intended for fixing between the ceiling rose and conduit box.

The "Permacore" transformer, manufactured by MULLARD WIRELESS SERVICE CO., LTD., 111, Charing Cross Road, London, W.C.2, is designed for transformer coupling on the l.f. side of a set. It has a step-up ratio of 3–1, and a high primary impedance, claimed to ensure pure reproduction even at very low musical frequencies. A primary winding of silver and a secondary of nickel claim to guard against the presence of resonant peaks. The transformer is not much larger than a matchbox, and is completely shrouded.

The Mullard P.M. filament transformer is designed to operate the recently introduced Mullard indirectly-heated a.c. valves. Its function is to step down the mains voltage to operate the 4 V a.c. valves. Every care, it is claimed, has been taken to ensure perfect safety. The details of the various types of the transformer are as follows:—

Type No.	A.C. Mains.
103	100–106
111	107–114
210	200–214
222	215–228
240	229–245
253	246–260

Details have been sent us of the range of mouldings produced by the ELMAR MOULDINGS CO., of Thimble Mill Lane, Birmingham. These mouldings are stated to be made of bakelite powders of very high dielectric strength; they can be made in various colours, and are not affected by oils, acids or water. The company specialises in moulding articles to any shape ordered, and is able to deal with large-scale requirements owing to the high-powered process installed.

The B.A.G. Diffuser, produced by BRITISH B.A.G., LTD., 23, Farringdon Avenue, London, E.C.4, has previously been described in THE ELECTRICIAN. It is now adapted for use as an operating light for dentists, and it is claimed that, besides being mobile and adjustable, the new unit gives perfect distribution of light and dispersal of shadows, together with complete freedom from glare. The standard is made of white enamelled iron, and is mounted on castors. The total height of the apparatus is 5 ft. 4 in. Daylight glassware can be supplied at an extra charge.

A new table lamp has been put on the market by HAILWOOD AND ACKROYD, LTD., of Morley Works, Leeds. The globe and body of the lamp bear deeply etched designs, and the decoration is increased by ornamental fittings in bronze finish.

New Ceiling Fitting.

A new ceiling fitting has been introduced by PHILIPS LAMPS, LTD., of Philips House, Charing Cross Road, London, W.C.2. It is designed for use with Philips Argenta lamps, and is made of three-ply opal glass. It is neat in appearance and can be easily erected, providing an efficient, attractive and economical means of lighting corridors, porches and small rooms. The fitting is secured in an instant by means of an ingenious spring clip which is held against the ceiling by the batten holder. When the lamp is inserted in the holder it appears to form part of the ceiling plate, the light from the neck of the lamp showing through the opal glass. The fitting is made for use with Argenta lamps of 40–75 W. Its design prevents dust collecting, and, as it has no exterior metal parts, it can be very easily cleaned.

In addition, Messrs. Philips have lately introduced a series of floodlight reflectors, known by the trade name of "Philiflood." The series consists of four types, designated FL.A, FL.B, FL.C and FL.D, stated to cover every floodlighting requirement. They are strongly made from vitreous enamelled steel and cast iron, types FL.A and FL.B being fitted with white enamel reflectors, and types FL.C and FL.D with silvered reflectors, similar to the well-known "Philiray" shop window reflectors. Type FL.B is of particular interest, as it is entirely unconventional in design. It is rectangular in shape, measuring 16 in. by 9 in. by 4½ in., the light aperture being 7½ in. in diameter. The great advantage of this model is that it can be made to harmonise with the surrounding architecture and does not offend the eye during the daytime. The small dimensions are made possible by the use of a 1 000 W tubular projector lamp.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

MANCHESTER CORPORATION, March 21st.—Six months' supply of electric cooking ranges. Specification (No. 267) from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

BRADFORD CORPORATION, March 22nd.—Electric light installation at Semon House, Ilkley. Specifications, etc., from the City Architect, Town Hall, Bradford.

DALKEITH CORPORATION, March 22nd.—Electrical work in connection with erection of about 28 houses at Gibraltar Gardens. Schedules, etc., from Mr. Jas. L. M. Dougal, burgh surveyor, Dalkeith.

EDINBURGH CORPORATION, March 22nd.—Electric light installation in 156 dwelling houses at Niddrie Mains (first development). Specification, etc., from the Engineer, Electricity Department, Dewar Place, Edinburgh; deposit £1 1s.

Tramcars and Electrical Equipment.

BELFAST CORPORATION, March 24th (extension of time).—Supply of (1) 50 double deck top-covered tramcars complete; or (2) 50 tramcar bodies; (3) 50 tramcar trucks with wheels and axles; (4) tramcar electrical equipments. Forms of tender, etc., from the General Manager, Tramways Department, Sandy Row, Belfast; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 24th.—Supply and erection of 33 kV and lower voltage transformers, in connection with the North West England and North Wales Electricity Scheme. Specification (N.W.E.-S.T. 4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

ECCLES CORPORATION, March 24th.—Twelve months' supply of h.t. and e.h.t. paper insulated cables; and l.t. paper and fibre insulated cables, all of British manufacture. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Cawdor Street, Patricroft; deposit £1 1s.

EDINBURGH CORPORATION, March 24th.—Twelve months' supply of materials, including underground insulated cables, conduits, house service fuse boxes and fuse boards, electrical material for interior wiring, electricity meters, etc. Specifications, etc., from the Engineer and Manager, Electricity Department, Dewar Place, Edinburgh.

KENDAL CORPORATION, March 24th.—Supply and erection of electrically driven blower, electric lift for retort house and lathe with electric motor drive, at the gasworks. Specifications, etc., from the engineer and manager, Mr. T. Crowdy, Parkside Road, Kendal.

LONDON COUNTY COUNCIL, March 24th.—Supply and erection in Blackwall Tunnel of (1a) four electrically-driven exhaust propeller fans, 8 ft. diameter, each with 15 B.H.P. motor; (1b) two centrifugal blowing-fan sets, each with 55 B.H.P. electric motor, and suction and delivery air ducts; and (2) girders, joists, platforms, etc. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £5 in each case.

MORTLACH PARISH CHURCH, March 24th.—Electrical work in connection with alterations and additions to church. Schedules, etc., from Messrs. A. Marshall Mackenzie and Son, architects, 173A, Union Street, Aberdeen.

KIRKCALDY DISTRICT COMMITTEE, March 25th.—Electric lighting installations in 20 houses at Windygates (types "A" and "B") and 24 houses at Lochore (type "B"). Plans, etc., from Mr. G. B. Deas, Central Chambers, Kirkcaldy.

GLASGOW CORPORATION, March 26th.—Electric lighting work, in connection with erection of Anderson Child Welfare Centre. Specification, etc., from the Office of Public Works, 249, George Street, Glasgow.

WEST RIDING EDUCATION COMMITTEE, March 26th.—Electric light installation at Ecclesfield New Secondary School and caretaker's house. Specifications from the Education Officer, County Hall, Wakefield.

WEST RIDING EDUCATION COMMITTEE, March 26th.—Electrical installation in extensions of Normanton Grammar School. Specification from the Education Officer, County Hall, Wakefield.

WEST HAM GUARDIANS, March 27th.—Laying of main and sub-main cables, and wiring work in various blocks at Central Home, Union Road, Leytonstone, London, E.11.

EAST AND WEST MOLESEY URBAN DISTRICT COUNCIL, March 28th.—Supply, etc., of small electric lighting plant for sewage works, with wiring and fittings for 12 points. Further particulars from the Surveyor, Council Offices, East Molesey.

LIVERPOOL CORPORATION, March 28th.—Supply of 12 step down transformers. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

BIRMINGHAM CORPORATION, March 29th.—Manufacture and supply of 1 400 tons of grooved steel girder rails and fishplates. Specifications, etc., from the General Manager, Tramway and Omnibus Department, Council House, Birmingham.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, March 29th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. C. L. Addison-Smith, 19, Heriot Row, Edinburgh.

RHONDDA URBAN DISTRICT COUNCIL, March 29th.—One year's supply of ordinary and prepayment a.c. meters, cable, joint boxes, compound cut-outs, etc. Specifications and forms of tender from Mr. J. M. Bowman, Electricity Works, Porth, Glam.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 31st.—Supply and erection of one 1 000 kVA and two 500 kVA three-phase transformers. Specification, etc., from Mr. David J. Keep, town clerk; deposit £2 2s. Technical inquiries can be made of Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1.

CENTRAL ELECTRICITY BOARD, March 31st.—Supply and erection of metering equipment required in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-G.M. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CONGLETON CORPORATION, April 1st.—High tension and low tension switchgear, transformers, kiosks, h.t. cables, l.t. cables and l.t. overhead distribution. Specifications from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £3 3s.

WATFORD CORPORATION, April 1st.—Wiring of lighting and heating points in dwelling houses. Specifications, etc., from the borough electrical engineer, Mr. A. W. Barham, Cardiff Road, Watford.

BEXHILL CORPORATION, April 2nd.—Laying and jointing of about 1 600 yards of 0·5 sq. in., three-phase, paper insulated, lead covered and armoured, 11 000 V cable of British manufacture. Specification from the Borough Electrical Engineer.

GREAT WESTERN RAILWAY CO., April 4th–24th.—Supply of electrical cables and wires (list 20) and telegraph ironwork (list 21). Specifications with forms of tender from the Office of the Stores Superintendent, Swindon (form of tender for list 20 on and after April 14th). Tenders for list 21 by April 4th and for list 20 by April 24th.

CENTRAL ELECTRICITY BOARD, April 7th.—Supply and erection of 66 kV and lower voltage transformers, in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-G.T.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

LONDON COUNTY COUNCIL, April 14th.—Manufacture and supply of h.t. and l.t. cables; and reconstruction of existing l.t. cables. Specification, etc., from the General Manager of Tramways, 23, Belvedere Road, London, S.E.1; deposit £2.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

IXELLES MUNICIPALITY, March 21st.—Supply of 845 V, 440 V and 220 V d.c. electricity meters. Cahier des Charges (fr. 6¾), from Service de l'Electricité, 20, Rue d'Alsace Lorraine, Ixelles, Belgium.

ANTWERP MUNICIPALITY, March 24th.—Supply of crane plug boxes, for electric cranes at new docks and 20 junction

Digitized by Google

boxes for cables supplying electric motors. (Reference B.X. 6 243.)

INDIAN STORES DEPARTMENT, March 24th.—Supply of cab-tyre sheathed cables for one year (order No. N. 10 896). (Reference B.X. 6 260.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 24th.—Supply of resistances and reactances (schedule C. 557). (Reference B.X. 6 046.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, March 25th.—Supply of cordless telephone switchboards (schedule C. 566). (Reference B.X. 6 071.)

EGYPTIAN PORTS AND LIGHTHOUSES ADMINISTRATION, March 27th.—Supply and installation of electric cables in the Port of Alexandria. (Reference B.X. 6 199.)

Cables for Johannesburg.

JOHANNESBURG MUNICIPALITY, March 27th.—Supply of paper insulated, lead covered, double steel tape armoured and jute served cable (contract No. 348). (Reference B.X. 6 200.)

JOHANNESBURG MUNICIPALITY, March 29th.—Supply of metallic filament traction lamps (contract No. 351). (Reference B.X. 6 246.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays, for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

INDIAN STORES DEPARTMENT, March 31st.—One year's supply of lead sheathed cable (order No. N.10 899). (Reference B.X. 6 259.)

INDIAN STORES DEPARTMENT, April 14th.—Supply, erection, etc., of three oil engine-driven d.c. generating sets. (Reference B.X. 6 231.)

VICTORIAN ELECTRICITY COMMISSION, April 14th.—Supply of 22 000 V switchgear and accessories, for sub-station "C" at Brunswick (specification No. 30/17). (Reference B.X. 6 182.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Supply of lead-covered switchboard cable (schedule C. 574). (Reference B.X. 6 202.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

VICTORIAN ELECTRICITY COMMISSION, May 5th.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19.) (Reference B.X. 6 226.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13th.—Supply of terminal strips (P. and T. 151/2 200.) (Reference B.X. 6 209.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of telegraph instruments (schedule C. 579). (Reference B.X. 6 248.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24th.—Supply of 110 kV outdoor steelwork and switchgear, for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

Tenders Accepted.

STOCKPORT CORPORATION.—Craven Bros., electric crane for electricity works, £2 445.

PLYMOUTH CORPORATION.—British Insulated Cables, Ltd., and Derby Cables, Ltd., supply of cables.

ISLINGTON (LONDON) BOROUGH COUNCIL.—Metro-Vick Supplies, one year's supply of electrical accessories.

H.M. OFFICE OF WORKS.—Patent Office and Record Office London: electric wiring, Malcolm and Allan (London), Ltd.

EAST HAM CORPORATION.—Brush Electrical Engineering Co., Ltd., four double-deck car bodies, with trucks and brakes, £1 917 each.

HERTFORDSHIRE COUNTY AGRICULTURAL COMMITTEE.—Giffens, electric light and power installation at Oaklands, £374 15s. 6d.

FORFARSHIRE EDUCATION COMMITTEE.—J. E. Fenton, electric lighting equipment at Arbroath High and Keptic Schools, £4 149.

HACKNEY (LONDON) BOROUGH COUNCIL.—Tudor Accumulator Co., Ltd., renewing plates of main battery at generating station, £756. (Recommended.)

NORTHERN IRELAND MINISTRY OF FINANCE.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens vacuum and gasfilled lamps, etc.

DIRECTOR OF NAVY CONTRACTS.—General Electric Co., Ltd., supply of about 308 000 Osram electric lamps (made at company's Wembley and Hammersmith works).

METROPOLITAN WATER BOARD.—Worthington-Simpson, Ltd., supply of four steam turbines with centrifugal pumps, and two electric generators, for Surbiton pumping station, £48 980.

GLASGOW CORPORATION.—T. B. and J. A. Mathieson, Ltd., electrical installation at City Hall, £828 7s. 6d.; Barber and Colman, electric traffic signals, £129 5s. (Both recommended.)

LIVERPOOL CORPORATION.—Edgar Allen and Co., Ltd., 200 pairs of cranked steel tramway rail fishplates, £1 2s. 4d. per pair; Stewarts and Lloyds, Ltd., about 170 street lighting poles, £6 per pole.

WIMBLEDON CORPORATION.—C. A. Parsons and Co., Ltd., supply of 7 500 kW two-phase turbo-alternator, with surface condenser, air ejector and extraction pump, £19 342, plus £484 10s. for spare parts.

WORTHING CORPORATION.—Callender's Cable and Construction Co., Ltd., provision and laying of e.h.t. ring main, distribution cables and connections at three sub-stations, also provision and laying of e.h.t. cables between Ferring and East Preston. £28 740. (Recommended.)

Turbo-Alternator, Cables and Meters.

BATH CORPORATION.—Brush Electrical Engineering Co., Ltd., one 7 000 kW Brush-Ljungstrom turbine alternator (making five Brush-Ljungstrom sets installed, total 20 000 kW); Callender's Cable and Construction Co., Ltd., cables; Metropolitan-Vickers Electrical Co., Ltd., and Ferranti, Ltd., meters.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—British Insulated Cables, Ltd., erection of overhead power line from Stourport to Banbury. The line will be 50 miles in length, and will consist of steel cored aluminium conductors supported on steel lattice towers. The voltage is 66 000, and the amount of the contract approximately £110 000. The conductors will be manufactured at the company's works.

LONDON, MIDLAND AND SCOTTISH RAILWAY CO.—Westinghouse Brake and Saxby Signal Co., Ltd., supply and installation of power signalling plant at St. Enoch's Station, Glasgow, including one 227-lever all-electric interlocking frame; one illuminated diagram; 53 main three-aspect colour light signals, with posts, ladders, fittings, etc.; 99 shunt and call-on signals; 26 route indicators; 106 power-operated point layouts; 128 a.c. condenser-fed track circuits; and 450 (approx.) a.c. relays.

GENERAL POST OFFICE.—Cable manufacture, supply, drawing in, etc., Polegate-Heathfield, Callender's Cable and Construction Co., Ltd.; Oxford—Banbury, Johnson and Phillips, Ltd. Electric lighting: Station Street Sorting Office Leicester, W. Cross and Son; Leicester Station Starting Office, W. L. Timson. Construction of cable jointing chambers and loading Birmingham-Liverpool section, Standard Telephones and Cables, Ltd. Telephone Exchange Equipment; Chester, and telephone repeater equipment, Marks Tey (Essex) and Aldeburgh (Suffolk), Standard Telephones and Cables, Ltd.

GLASGOW CORPORATION.—James Laidlaw and Sons, Ltd., electric cable troughing and supports, for Dawsholm gas works, £120 12s.; Metropolitan-Vickers Electrical Co., Ltd., 5 new motors, 212 meters, transformer, etc., £1 409 3s. 6d.; Lancashire Dynamo and Motor Co., Ltd., 20 new motors, £934 6s.; J. P. Hall and Co., Ltd., 22 new motors, £1 551 10s.; British Thomson-Houston Co., Ltd., 28 new motors, £193 18s. 6d.; Herbert Morris, Ltd., 3 motor hoists and one reconditioned, £462 0s. 6d.; Electrical Apparatus Co., 175 reconditioned meters, £118 2s. 6d.; Measurement, Ltd., 305 meters reconditioned, £213 10s.

WORK IN PROSPECT.

BEBINGTON AND BROMBOROUGH.—Houses (62). Particulars from the Surveyor.

BEVERLEY.—Houses (24), for the Town Council. Particulars from the Borough Surveyor.

CARLISLE.—Additional 100 houses, for the City Council. Particulars from the City Surveyor.

CHESTERTON.—Houses (16), for the Rural Council. Particulars from the Housing Officer, 12, St. John's Street, Cambridge.

COVENTRY.—School, for the City Education Committee. Particulars from the Director of Education.

CROYDON.—Library, Norbury, for the Town Council. Particulars from the Borough Engineer.

DARLINGTON.—Library extensions to cost £30 000, for the Town Council. Particulars from the Borough Surveyor.

DEWSBURY.—Additional 56 houses, for the Town Council. Particulars from the Borough Surveyor.

DURHAM.—55 new schools and secondary schools, Hooker Gate, Stockton, Billingham, and Crook, for the County Education Committee. Particulars from the Director of Education, Durham.

FARNHAM ROYAL.—School (520 places), for Bucks Education Committee. Particulars from the Secretary, Mr. C. G. Watkins, Aylesbury.

GRANTHAM.—Additional 52 houses. Particulars from the Borough Surveyor.

GOOLE.—Two schools to cost £43 000, for West Riding Education Committee. Particulars from the Director of Education, Wakefield.

GOLBORNE.—Houses (54), for the Urban Council. Particulars from the Surveyor.

HARROGATE.—Secondary school to cost £72 000, for the Borough Education Committee. Particulars from the Director of Education.

HODNET.—School (400 places), for Salop Education Committee. Particulars from the Clerk, Shrewsbury.

HOLBEACH.—Cinema theatre. Particulars from the architect, Mr. F. B. Ward, 8, South Brink, Wisbech.

KIDDERMINSTER.—Houses (122), for the Town Council. Particulars from the contractors, Eadie Towers and Co., Wolverhampton, and 86, particulars from the contractors, Griffiths and Sons, Wolverhampton.—Two central schools for the Borough Education Committee. Particulars from the Director of Education.

TRADE PUBLICATIONS.

THE current stock list of A.C.E.C. has been sent to us.

Specification A.500, dealing with d.c. switchboards, has been issued by CROMPTON PARKINSON, LTD., Guisley, Leeds.

An attractive calendar has been received from W. H. WILCOX AND CO., LTD., 38, Southwark Street, London, S.E.1.

List No. 824, describing starting compressor sets, has been issued by the HAMWORTHY ENGINEERING CO., LTD., Poole, Dorset.

The current stock list of "Furniculus" fires has been received from the A. E. G. ELECTRIC CO., LTD., 131, Victoria Street, London, S.W.1.

"Jacelite" flush plates—a new line introduded by J. A. CRABTREE AND CO., LTD., of Lincoln Works, Walsall—are dealt with in a new publication, No. 1 054.

"K-B" drying plants are the subject of publication No. K 129 just issued by JAMES KEITH AND BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4.

New publications of W. J. FURSE AND CO., LTD., Traffic Street, Nottingham, include leaflets W.26 and 27, describing slider and radial type electric lighting dimmers.

SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E.18, have published catalogue No. 160, section 1, dealing with l.t. feeder pillars of the company's manufacture.

Catalogue No. 74, dealing with a varied stock ranging from ammeters to electric drills, has been published by LESLIE DIXON AND CO., 218, Upper Thames Street, London, E.C.4.

A new range of h.t. straight-through joints for belted type cables is dealt with in list UD2, published by W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, London, E.C.1.

"An Industrial Lighting Problem on Glareless Lamps and How it was Solved" is the title of a new issue, leaflet No. 1 110, by BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, London, N.17.

We have received from the ELECTRO-DYNAMIC CONSTRUCTION CO., 733B, Old Kent Road, London, S.E.15, a copy of a new leaflet devoted to d.c. to a.c. rotary transformers for radio and similar purposes.

We have received from the SUFFOLK IRON FOUNDRY (1920), LTD., Gipping Works, Stowmarket, a copy of the fifth edition of the company's booklet entitled "The Superman from Mars Welding the World." The book deals with the oxy-acetylene welding of cast iron and 12 additional pages are included in this new edition.

WHAT is probably the largest job ever carried out in the British Isles for 33 000 V cables laid under water, has just been completed by W. T. Henley's Telegraph Works Co., Ltd. The contract comprised the installation of seven lengths of 0.15 sq. in. 33 kV single, paper insulated, lead covered, non-magnetic wire-armoured cable, each length being 1 400 yards and weighing nearly 13 tons, across the bed of Larne Lough. An ordinary dredging barge was specially converted for the purpose, and was loaded with the cables at Belfast, being towed round to Larne on March 1st. Preliminary work began soon after 5 o'clock on the Sunday morning, but not until about half-past-ten was the main part of the programme commenced. The installation began at the step-up 33 000/6 600 V sub-station 100 yards north of the generating station. Three motor boats took the cable barge in tow to a point as near the shore as possible, when a winch on shore was substituted for the motor boats. To the satisfaction of the Antrim Electricity Supply Company's engineers, the seven lengths of cable were laid across the lough in one tide—somewhere about five hours! The main contractors for the scheme were Henry Boot and Sons, Ltd., of Sheffield.

ELECTRICITY SUPPLY.

Electric Houses for Hemel Hempstead—Halifax and the Unemployment Grant—A New Set for Ipswich—South Wales and the Central Electricity Board—St. Pancras and the Grit Problem—South Shields and the Grid.

WOLVERHAMPTON T.C. is to give a supply of electricity to 174 houses on the Parkfield Road estate.

Hemel Hempstead T.C. has decided to adopt electric lighting in 72 houses on the Handpost Farm site.

Bury T.C. has decided to renew a portion of the h.t. switchgear at the Chamber Hall power station at a cost of £27 000.

Electricity will be available in Tain on April 1st, when the switching on of the supply will be marked by a public ceremony.

Blackpool Electricity Committee seeks sanction to borrow £8 000 for the extension of electricity mains to Hardhorn and Singleton.

The Unemployment Grants Committee has approved schemes launched by the Halifax Electricity Committee, involving an expenditure of £30 564.

Lampeter T.C. has decided to offer no objection to the application for an electricity supply Special Order by the Lampeter Electricity Supply Co.

The Mayor of Ipswich, Mr. A. L. Clouting, formally switched on the new 12 500 kW Brush-Ljungstrom generating set at the Corporation's electricity works.

Bradford Electricity Committee recommends the change over of the system of supply from d.c. to a.c. in the Horton Grange Road district, at an estimated cost of £16 712.

The Tasmanian Hydro-Electric Department is constructing the Shannon River power station to develop 15 000 H.P. This will form part of the Great Lake hydro-electric undertaking.

Colchester T.C. has applied for an additional loan of £7 637 in connection with the erection of the new station, etc., and also for £3 856, excess expenditure on the construction of e.h.t. transmission lines.

It is stated that Godalming T.C. has now withdrawn its opposition to the application of the Aldershot Gas, Water and District Lighting Co. to take over from the Urban Electric Supply Co. its Godalming electricity undertaking.

Maidstone T.C. is to extend the mains to East Malling, at an estimated cost of £3 500, those at Ditton Corner are to be linked up with extensions at Aylesford, at a cost of £1 060, and street lighting mains are to be laid at Ditton at an outlay of £500.

Durham County Council has granted an application by the Consett Iron Co. for permission to cross the Durham-Leadgate main road at Woodside Bank, with an overhead power line, for the purpose of conveying a supply of electricity to the Iveston Coal Co.'s drift.

Eastbourne Electricity Committee has received sanction to borrow £5 334 in respect of mains for parade lighting and £23 604 for switchgear and transformers required in connection with the receipt of a bulk supply of electricity.—The Committee is considering a supply to Birling Gap estimated to cost £2 550.

The Central Electricity Board has applied to the Electricity Commissioners for a Special Order authorising an increase of the Board's borrowing powers. The draft Special Order is available for inspection at the Board's Offices, London and Glasgow. Any objections must be sent to the Commissioners by April 4th.

A settlement has been arrived at between the Ayrshire Electricity Board and the West Kilbride Electric and Lighting Co. An offer by the Ayrshire Board to take over the local undertaking has been accepted by the shareholders of the company, and the charge for current for lighting purposes is to be reduced from 10d. to the uniform rate of 5½d. per kWh.

Leeds Electricity Committee has estimated its expenditure on capital account for the next financial year at £500 000.—The Committee has obtained sanction to borrow £50 000 for the erection of buildings at Kirkstall generating station and £10 000 for generating plant.—The Electrical Wholesalers' Federation has asked the Corporation Electricity Committee for permission for a deputation to attend to discuss the question of proposed purchases from manufacturers of certain materials required by contractors in connection with the carrying out of work under the assisted wiring scheme. The Committee has decided to receive the deputation.

Estimates have been obtained from the City Electrical Engineer for an electric cooking equipment for the sanatorium, Cottingham, Hull. The capital cost is estimated at from £250 to £375, the latter price including a double oven range, stock pot, fish fryer, two 15-gallon water boilers, steam oven, 30-gallon vegetable boiler, hot cupboard and 30-gallon storage water heater. The annual current consumption would range between 40 000 and 50 000 kWh, which could be supplied at one half-penny per kWh, and would amount to between £80 and £100. The cost of wiring and installing would be about £100. The proposals have been adopted by the Health Committee.

Proposals have been submitted to the Central Electricity Board for linking up their scheme of supply for South-West Wales with the counties of Carmarthen, Pembroke, and Cardigan. The h.t. mains of the scheme stop short at Llanelly, and at a recent conference at Carmarthen, regret was expressed that the counties named appeared to be excluded from the scheme. Dr. Purvis, consulting engineer for the Carmarthen Electric Supply Co., has interviewed the technical adviser to the Board, and it is believed that if a combined effort were made to link up all the existing undertakings in the three counties the Board would probably extend its main from Llanelly into the district.

A well-printed illustrated brochure, containing a record of the last five years' progress of its undertaking, has been issued by the West Gloucestershire Power Co., Ltd. An interesting feature is a bird's-eye view of the area served by the company's system, 679 sq. miles in extent. There are excellent pictures of the plant in the company's Lydney power station, which comprises a 7 500 kW and two 5 000 kW turbo-alternators, the switch-room, industrial works to which current is supplied, a demonstration electric house, the Cinderford showroom, transmission lines, masts and poles, etc. The length of mains has increased from 73 to 187 miles in the last five years, and the electricity sold from 7 159 000 to 13 263 745 kWh per annum.

At the request of the Electricity Commissioners, Stoke-on-Trent Electricity Committee is withdrawing its application for sanction to borrow £50 000 in connection with the overhead transmission lines to Market Drayton and Stafford, which it was proposed should be erected by the Corporation on behalf of the North West Midlands Joint Electricity Authority.—The Electricity Committee has obtained land for a sub-station at Strongford and has decided to seek sanction to borrow £2 500 for its erection and equipment. The Committee has approved plans for a sub-station in Kingsway, Stoke-on-Trent, to cost £1 500. Mains are to be extended to supply 40 houses to be erected by Messrs. Shenton Bros. in a new road off Milton Road, Sneyd Green.

Mr. J. Edgar, borough electrical engineer, has reported to South Shields Electricity Committee that, having regard to the fact that in all probability the Central Board's scheme will be in operation by 1932, it is only necessary to consider what additional size of unit will be required to carry safely over the next two winters. A 3 000 kW turbo-alternator will meet the case. He submitted two tenders for the plant, one from Fraser and Chalmers, Ltd., and one from the Metropolitan-Vickers Electrical Co., Ltd. The Committee decided that the Central Electricity Board be asked to expedite, as quickly as possible, the linking up of the various stations in the area, as the Committee cannot see its way at the present time to entertain the question of further expenditure for the provision of additional generating plant.

St. Pancras (London) Electricity Committee reports on the results of experiments in dealing with dust and grit which has at times emanated from the chimney shafts at the King's Road generating station, by means of water-spraying apparatus and expansion tanks. A contract was entered into with Messrs. Babcock and Wilcox, Ltd., to instal the necessary apparatus, which was applied to two boilers, and has been in continuous operation since December last. The results are as follows:—Boiler working hours, 1 035 hours; coal consumed, 2 770 tons; dust and grit collected, 67·4 tons (dry) and 126·5 tons by washing chambers; total grit, etc. elimination, 193·9 tons; retained in ash pit, 6.9 tons; total ash content of coal, 200·8 tons. Of the total ash content of the coal consumed 3·5% is retained in the ash pit and 96·5% is trapped; 33·5% by the Davidson grit arrester, which has been in operation for some time past and 63% by the new washing chambers.

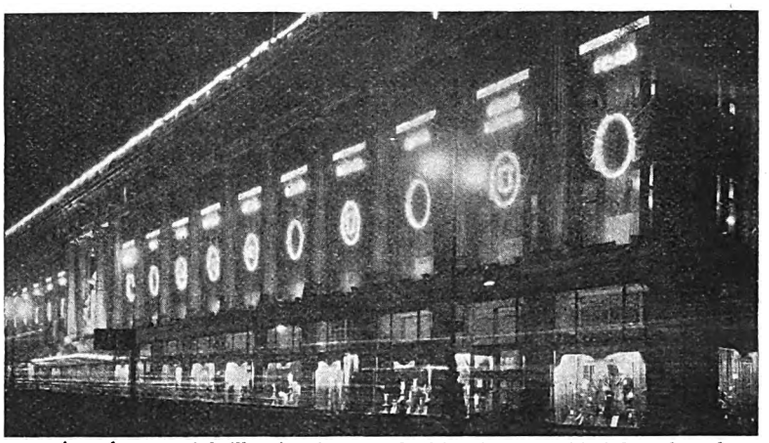
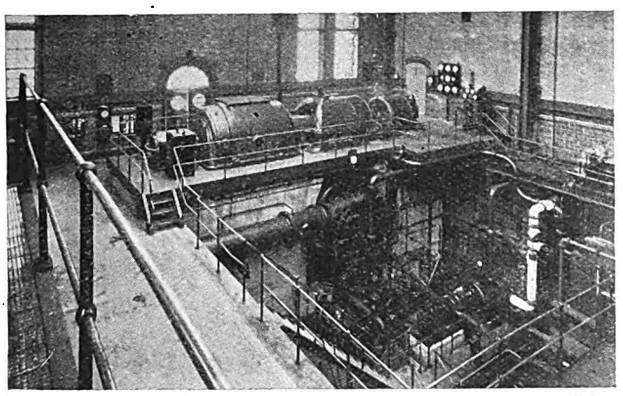
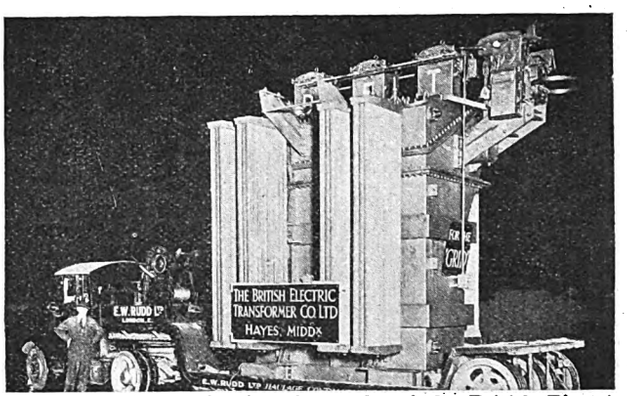
ELECTRICAL PICTURES OF THE WEEK.



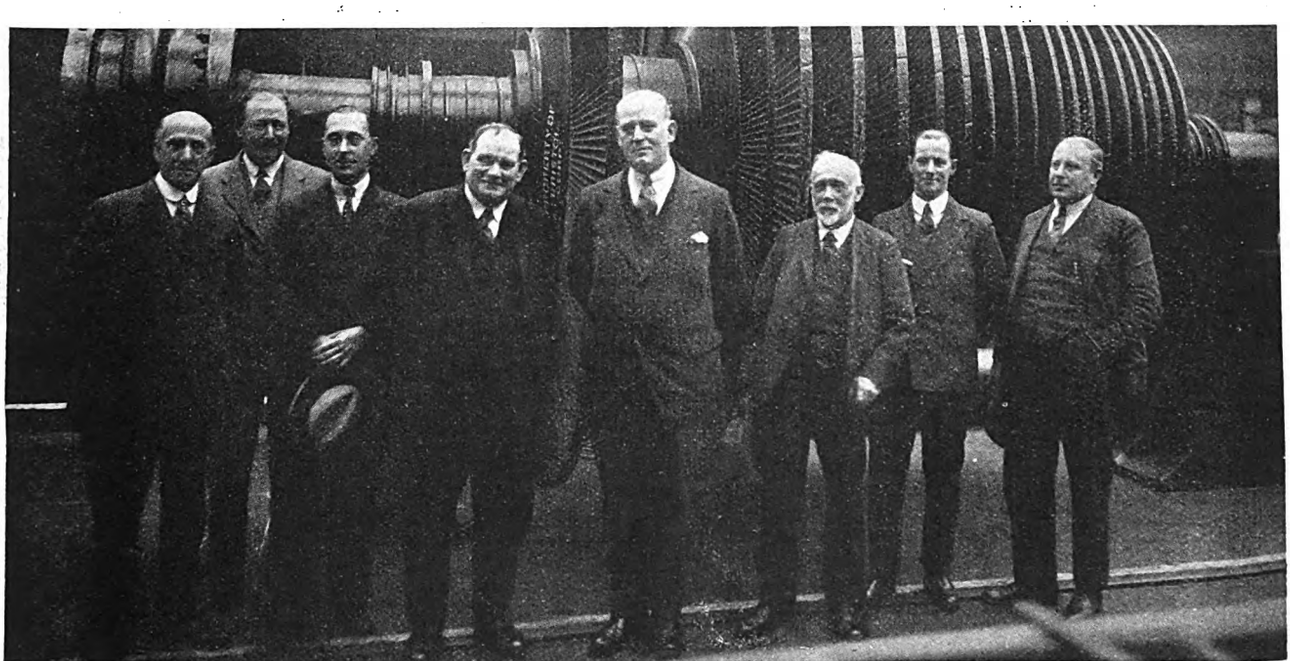
Selfridge's "Birthday Week" has again been the occasion for special illuminations, and this, the 21st birthday, has been treated with even greater thoroughness. The centrepiece on the left is an excellent example of artistic floodlighting, while the picture on the right, of part of the general scheme, indicates in moving light the various countries which the firm serves.



A general view of the new extensions of Bury Corporation Electricity Department, which were started up by the Mayor, Ald. Lees, on March 12th. The new equipment includes a 10 000 kW turbo-alternator, details of which are given on page 371.



A large transformer leaving the works of the British Electric Transformer Co., Ltd., at midnight, on March 13th. The unit weighs 42 tons, and forms part of an order for 1 600 000 kVA placed with the firm by the Central Electricity Board.



A group taken on March 14th on the occasion of an informal visit by the Lord Mayor of Sheffield, Ald. C. W. Beardsley, to the Trafford Park works of the Metropolitan-Vickers Electrical Co., Ltd. Reading from left to right, the names are:—Mr. G. H. Harrison, Lord Mayor's secretary; Mr. A. E. du Pasquier; Mr. G. H. Nelson, manager of the company's Sheffield works; the Lord Mayor; Mr. G. E. Bailey, director; Ald. Snelgrove; Coun. Oates; and Mr. R. G. MacLaverty, Sheffield district manager. The party is standing in front of the low pressure spindle of the 50 000 kW turbine the company is supplying to Portishead.

COMPANY NEWS.

Improvement of Cables and Wireless Stocks—County of London Co.'s Increased Dividend—Telegraph Construction Co.'s Loss on Trading—New Companies.

THE feature of the week in the electrical share market is the long overdue turn of the tide in Cables and Wireless issues. The 7½ per cent. "A" ordinary stock at 64½ is 5 points higher than a week ago; the "B" ordinary stock is a point better at 29½, and the 5½ per cent. cumulative preference stock has risen 3½ points from 93 to 96½. Speculators in American Telephone and Telegraph stock have called a halt, and the quotation has eased from 250 to 245. Eastern Extension 4% debenture stock is 2 points up at 78. Radio Corporation of America shares continue to be bought, and are not far off 55; International Telephone and Telegraph Stock is $5 lower at 67½. New York Telephone Bonds are above par. Anglo-Portuguese Telegraph shares have improved to 22s. 6d.

No great activity has been seen in the department for the shares of electricity supply companies. The increase in the County of London Company's ordinary dividend from 10 to 11 per cent. for the year, on over three millions of capital, has caused an advance of only 7½d. in the quotation for the shares. Market confidence in the future is evidenced by the early closing of the subscription lists for the £750 000 five-and-a-half per cent. debenture stock of the North Metropolitan Electric Power Company, whose ordinary shares have risen during the week from 46s. 3d. to 47s. 6d. Yorkshire Electric Power shares are 7½d. higher at 32s. 6d., and Whitehall Investments preference are 3d. better at 24s. 3d. Calcutta Supply shares are 1s. 3d. down.

In the electrical equipment section, W. T. Henley's, International Automatic Telephone, and Johnson and Phillips ordinary shares are all 1s. 3d. to the good; but Siemens ordinary shares have fallen the like extent. General Electric "A" preference shares have shed a shilling at 23s., but the 7 per cent. debenture stock is up from 102½ to 104. Crompton Parkinson 8% preference shares have changed hands in the neighbourhood of 22s.

The railway and tramway department is quiet. Metropolitan ordinary stock has eased from 63 to 62½, and the 3½ per cent. debenture stock has put on ½ a point to 68.

BELL TELEPHONE CO. OF CANADA.—Exchange rev. for 1929 $28 945 314, agst. $26 920 593 ; long distance rev. $10 343 894 increase $1 375 507 ; miscellaneous revs, $1 661 787, increase $325 071. Blce. carried to surplus $668 126. Net gain in telephones 47 211, agst. 45 862.

NEWCASTLE AND DISTRICT ELECTRIC LIGHTING CO., LTD.—Pft. for 1929, £68 361, plus £15 564 brt. in. After provisn. for int. on debs. and loans, redemptn. funds and depreciation (£27 500), blce. is £38 183. Div. at rate of 7%, less tax, for year is recommended. Fwd. £15 055.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Fin. div. of 8%, less tax, makg. 11% for year 1929, agst. 10% on ord. shs. is announced. On ord. shs. issued in December last int. on instalmts. at 5% will be paid until Dec. 31, 1930, after which they will rank for div. *pari passu* with the old ord. shs.

FOREIGN POWER SECURITIES CORPORATION (MONTREAL).—Revs. for year ended Oct. 31, 1929, $520 092, agst. $341 039, pfts. from investmts. $416 887, agst. $122 820. Net earngs $756 665, agst. $434 317 ; added to surplus $415 898. Earngs equal to $3.65 p. sh. on common stk. agst. $1.18 in preceding 18 months.

TELEPHONE MANUFACTURING CO. (1929), LTD.—Statutory rept. states that total number of shs. allotted is 1 000 000, all allotted as fully paid, in consideratn. of business acquired under agreemt. Company has not, up to March 10, 1930, received any cash or made any paymts. Prelim. exps. estimated at £1 000.

BRITISH ALUMINIUM CO., LTD.—Net blce. for 1929, £153 637, agst. £151 921, includg. £33 918 brt. in., and after mtg. all charges and setting aside £50 000 to depreciatn. res., £100 000 to res. fund and £10 000 to staff benefit fund. After providg. for pref. div., fin. div. of 6%, makg. 10% for year, on ord. shs. is recommended. Fwd. £35 559.

TELEPHONE RENTALS, LTD.—Statutory rpt. states that total number of shs. allotted is 2 000 000, all allotted as fully paid up in consideratn. of shs. acquired under agreemt. Receipts to March 10 : cash from sundry installatn. co.'s, £3 650. Blce. at bank £3 650. Prelim. exps. estimated at £2 000, of which £1 000 is payable in respect of duty.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—Year's tradg. resulted in a loss, but directors have made a transfer from reserves not required and have declared net pfts. for year of £77 801, to which is added £114 123 brt. fwd. Intm. div. of 2½% was paid on July 1, 1929 ; further div. of 7½% (tax free) proposed ; fwd. £102 284.

TILLING-STEVENS MOTORS, LTD.—Pft. for 1929, £82 008, agst. £81 105. Div. on ord. shs. 15% agst. 7½%, after clearing off arrears of pref. div., which was effected in cash or new ord. shs., at hldrs' option. To depreciatin., £10 000, to taxatn. res., £8 500 ; to res., £20 000. After provisn. of £1 050 for additional directors' fees, carry fwd. is £19 211.

SHOREHAM AND DISTRICT ELECTRIC LIGHTING AND POWER CO., LTD.—Total rev. for 1929, £5 608. Workg. exes., depreciatn., int., directors' fees, etc., absorbed £4 655, and blce. at debit of net rev. acct. as at Dec. 31, 1928, £463, leavg. blce. of £490. Div. of 2½% on ord. shs. is recommended. Fwd. £156. Electy. sold 239 375 kWh, agst. 156 752.

CORK ELECTRIC SUPPLY CO., LTD.—Shhldrs. have been informed by the directors that the Irish Free State Electy. Board has decided to acquire the co.'s electric lightg. undertakg. as from April 3. Shhldrs. will be advised at gen. mtg. as to the value to be paid for undertakg. and other particulars. In the meantime they are advised not to part with their shs.

HENDON ELECTRIC SUPPLY CO., LTD.—Pft., after mtg. int. on deb. stk. and intm. div. on ord. and div. on pref. and other charges, for 1929, £38 749, agst. £39 811. To repairs and renewals fund £9 125, makg. total of £74 000 ; to gen. res. £3 809, makg. £60 000. Income tax £5 800. Fin. div. 2s. p. sh., tax free, agn. makes 15% on ord. ; fwd. £10 405, agst. £9 628.

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.—Gross pft. for 1929, £473 972, plus int. from investmts., £1 831, discts. on purchases, £1 004, and amt. brt. in, £7 657. After provisn. for int. on deb. stks., loans, etc., singk. fund contributns. (£143 211) special res. company's sh. of consumers' benefit (£58 042), and allocation to co-partners' fund (£39 277), divs. are proposed of 6% on 1st pref., 8% on 2nd pref., and 10% on ord. shs. Fwd. £6 974.

HYDRO-ELECTRIC SECURITIES CORPORATION.—Net income for 1929, $6 893 863, agst. $1 159 134. After deductg. exes. and diff. of exchange, $103 968, and fees to directors and committee, $19 361, total income was $7 017 172, agst. $1 296 439. Investments, valued at $79 194 233, show advance of $35 436 435 over their original cost. Div. of $1 was paid on common shs. for 1929. Qrtrly div. of 50 cents., in respect of currt. year, is now payable.

CROYDON CABLE WORKS, LTD.—An offer has been made by Acons Nominees, Ltd., to purchase the whole of the ord. and pref. shs. of Croydon Cable Works, Ltd., at 20s. 6d. for each £1 1st pref., 17s. for each £1 2nd pref., and 12s. 6d. for each £1 3rd pref. sh., and 11s. for each £1 ord. sh. Acceptances will be received until Mar. 28, and the agreemt. is conditnl. upon acceptance by shhldrs. hldg. at least 75% of each class of sh., or less at the purchasers' optn.

CLYDE VALLEY ELECTRICAL POWER CO.—Pft. for 1929, £354 495, plus £84 586 brt. in. After provisn. for divs. on 6% cum pref. and 8% 2nd pref. and intm. div. of 3% on ord. shs. issued prior to 1929 and transferrg. £152 500 to contingency, blce. is £201 581. Fin. div. of 5% on ord. shs. issued prior to 1929, makg. 8% for year, and div. of 8% from due dates of calls are proposed. To staff benevolent fund £10 000, to writg. off cost of 1929 sh. issue, £808 ; fwd. £86 288.

MERSEY POWER CO.—Satisfactory demand for electy. continues in company's areas. Nearly 1 200 new connections were made during 1929, and sale of electricity increased 10%. Percival Lane power station has met all demands made upon it during year, and has still some reserve of plant to supply new connectns. Although costs have been increased by more than £10 000 for local rates under new assessmt. compared with previous year, yet working pfts., with int. received, for year, is £94 230. Amt. brt. fwd. from previous year is £17 081, makg. total £111 311. After providg. trades facilities, loan int. and pref. div. £43 837, there remains £67 483. Div. of 5% on ord. shs. £24 823, depreciatn. res. £25 000, fwd. £17 660.

BRITISH INSULATED CABLES, LTD.—Pfts. for 1929 advanced from £617 951 to £685 980, to which was added £250 089 brt. in. After makg. provisn. for deb. int., directors' fees, etc., div. on pref. shs., and the intm. paymt. on ord. shs., which absorbed £190 263, directors have again set aside £100 000 as depreciatn. on bdg., etc., and transferred £198 333, agst. £299 966 to res. Fin. div. of 10% is recommended on ord. shs., makg. distributn. for year again 15%., leavg. £280 807 to be carried fwd. Arising from settlemt. of claims in respect of taxtn. and other matters, a sum of £300 000, which had been provided over a period out of rev. is now no longer required. This sum has been set aside as a div. equalisatn. acct. Last year 333 333 ord. shs. and 500 000 5½% "A" pref. shs. were distributed as bonus, and ranked for div. as from Jan. 1, 1929.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—Pft. for 1929, £876 351, agst. £819 456; int. on deb. stk., loans, etc., £188 567, agst. £204 671; to res. for special depreciatn. and contingencies other than equalisatn. of divs., £175 000, agst. £150 000; to res. for plant renewals and improvements, £75 000, agst. £60 500; brt. fwd. £80 653, agst. £43 206, makg. available pft. £518 437, agst. £447 491. Directors recommend divs. of 3¾% on 7% cum. pref. shs., makg. 7% for year, 2½% on 5% pref. shs., makg. 5% for year, and 3½% on ord. shs., makg. 6% for year, all subject to tax. Fwd. £96 029, agst. £80 653. Expenditure during year on plant renewals and improvemts. amtd. to £85 217, which has been charged agst. res. for plant renewals and improvemts. Additional cap. expenditure for year amtd. to £243 480, and mainly represents extensns. to company's distributn. systems.

OSWESTRY ELECTRIC LIGHTING AND POWER CO., LTD.—The last report of the directors (for nine months ended Sept. 30, 1929) which was adopted at the mtg. on March 11, states that Oswestry Corporation has bought the undertaking for £19 300. The company's cap. and liabilities amt. to £18 450, and the assets, which will accrue to the Corporation, are put at £25 622. The directors state that after providg. for depreciatn. and int. and adding blce of £1 247 from previous year, they are justified in recommendg. a div. at rate of 10% p.a. for the nine months. The result of their negotiatns. with Oswestry Corporation was the sale to the Corporation of their undertakg. for the agreed sum of £19 300, and the Corporation agreed to pay the purchase money, with int. (6½%) as from Oct. 1, when it took over the management. At the date of the report it was expected that the purchase would be completed shortly, and then arrangemnts would be made for windg. up the company.

Company Meetings.

LIVERPOOL OVERHEAD RAILWAY CO.—Ald. M. H. Maxwell, presiding at the meeting last week, said the receipts for the past year fell by £2 738, of which £2 064 was attributable to a reduction of round trip tickets—£1 307 during the week corresponding to Civic Week in 1928. The rates payable on line and stations had been increased approximately 500%. Mr. A. T. Harding protested against the continuance of an allowance to the late manager, Mr. Neachell, and he added that it was ridiculous that the company's drivers and guards should get the same wages as main line men. The chairman agreed that the wages paid were absurd for the class of work, but they were under the Railway Act, and unless the Minister of Transport could be persuaded to change them into a light railway, they could do nothing. The report and accounts were adopted.

HADFIELDS, LTD.—Sir Robert Hadfield, presiding at the meeting on Monday, said the report recommended a dividend of 2½%, less tax, on the ordinary shares. This would leave a balance of £92 295, which it was proposed to carry forward, thus representing an improvement of £1 724 on the amount carried forward from 1928, which in itself was an increase of £4 000. Unfortunately there had been no revival of trade, only a continuance of the serious trade depression throughout this country. There had been a very large diminution in Government work, and this was to be further accentuated. The question of taxation was a serious one for this country. The cost of social services amounted to about £400 000 000, and more than half of that sum was contributed by the productive industries. He hoped the Government would give assistance somehow or other. The chairman also mentioned that small but most important parts of the engines of the Schneider Trophy aeroplanes, which created the present world's record, were made of Hadfield special steel. To show the severity of the test of the sparking plugs, he said 2 000 sparkings per minute (4 000 revolutions) took place in each of the 24 plugs, 48 000 sparkings per minute in all.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD.—Col. R. E. Crompton, presiding at the meeting on March 13th, said the rapid growth of the company's business compelled them to accelerate the work of changing their system from direct current to the new standard alternating current system, and they proposed, therefore, to embark upon an intensive programme in the current year. For this reason it was probable that expenditure of capital during the next few years would be heavy. Turning to the revenue account, it would be observed that the item, "purchase of current," from the London Power Co. increased beyond that of 1928, but this was only natural, seeing that the units sold in 1929—approximately 19 500 000—exceeded by over 3 000 000 their output in 1928. Sales of electricity produced £181 262, against £171 834 in 1928. Their average return in 1929 was 2·237d. per kWh, compared with 2·514d. Their consumers had benefited during the last five years to the extent of early 40%. Whereas in 1924 69% of their sales was represented by lighting, they found that in 1929 supply for lighting represented only 33% of the total. The surplus, shown by their report, was £32 032. Benefit due to ordinary shareholders under the sliding scale was £10 316, which it was proposed to transfer to special reserve. The amount appropriated to the co-partnership fund was £3 998. Out of 22 500 000 kWh purchased from the London Power Co. the electricity paid for by consumers amounted to 19 500 000 kWh; in other words, the efficiency in conversion and distribution was 86½%.

New Companies.

BARKER'S WIRELESS, LTD.—Cap., £500. Wireless and wireless accessory agents and contractors, etc. Office: Buchanan Buildings, 24, Holborn, London, E.C.1.

UNITED UTILITY CO., LTD.—Cap., £2 000. Manufacturers of and dealers in telephone and motor appliances and parts, etc. Reg. Office: 12, Denman Street, London, W.1.

WILLEY AND CO., LTD.—Cap., £1 000. Electrical engineers, manufacturers of and dealers in electricity meters, and other electrical apparatus, etc. Reg. Office: Water Lane, Exeter.

SCIENTIFIC APPLIANCES, LTD.—Cap., £500. Electrical and mechanical engineers, scientific appliances manufacturers, etc. Solicitor: W. H. Lane, 27, Chancery Lane, London, W.C.2.

S. O. BOWKER, LTD.—Cap., £1 000. Manufacturers, importers and exporters of or dealers in electrical equipment and fittings and accessories, wireless equipments, telephones, etc. Reg. Office: 43, Cannon Street, Birmingham.

WESTBROOK AND CO., LTD.—Cap., £500. Contractors, electricians, electrical engineers, etc. A director: G. A. Day, 17, Chichester Road, Portsmouth, builders' merchant. Reg. Office: 67, Ripley Grove, Portsmouth.

MOSBROUGH ELECTRIC SUPPLY CO., LTD.—Cap., £5 000. To carry on at Mosbrough and elsewhere in Derbyshire the business of an electric lighting and supply company, etc. Solicitors: Hall and Renwick, Eckington, near Sheffield.

BALCOMBE'S SUPPLIES, LTD.—Cap., £1 000. Importers and exporters of and dealers in electrical and metal goods, lighting, heating and cooking appliances and accessories, etc. Reg. Office: 52 to 58, Tabernacle Street, London, E.C.2.

GOODALIS (MERTHYR TYDFIL), LTD.—Cap., £500. Manufacturers of and dealers in electric and other apparatus required for use in connection with business of wireless, television, telephone and telegraph company. Solicitor: B. Hamilton, Merthyr Tydfil.

*** The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

The lead market, according to James Forster and Co., showed a steadier tone last week. The American price now stands at 5.50 cents per lb. as against 6.25 cents on February 25th, a fall of about 75s. per ton as against a drop in London since February 18th of 62s. 6d. per ton. Closing prices on March 14th were £18 10s. for March, £18 12s. 6d. for April, £18 13s. 9d. for May, and £18 15s. for June, or unchanged on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CARTER, Mr. G. H., 34, Aldermanbury, Bradford (trading as UNIT ELECTRICAL SERVICES), electrical factor. £23 9s. 3d. February 13th.

COOK, Marshall R., Southchurch Road, Southend, wireless dealer. £11 2s. 8d. November 12th.

CROSS, Ernest W., 48, Exmouth Street, Barrow-in-Furness, electrical engineer. £15 10s. 6d. January 22nd.

DE WITT, Mr. F., 145, Wandsworth Road, wireless goods dealer. £18 14s. 7d. February 3rd.

FEATHERSTONE, Mr. W. H., 15, St. Paul's Road, Walworth, electrical engineer. £71 15s. 5d. February 12th.

HARPER ELECTRIC CO., 30, Durward Street, E., electrical engineers. £27 5s. 1d. February 11th.

HENWOOD, W. R., AND CO., 9, Victoria Villas, St. Budeaux, Devonport, wireless dealers. £13 6s. 6d. January 16th.

HIGHFIELD ELECTRIC CO., 26, Sparkenhoe Street, Leicester, electrical engineers. £11 8s. 7d. February 7th.

NORTH SURREY ELECTRICAL FACTORS, LTD., 77, George Street, Croydon, electrical and wireless factors. £11 8s. 4d. January 9th.

STATION STORES, 183, High Road, Dagenham, wireless dealers. £20 2s. 7d. December 20th.

THOMAS AND STINCHCOMBE, LTD., 6, Narrow Wine Street, Bristol, radio engineers. £18 11s. 6d. January 15th.

WALLER, Joseph, 80, Hampstead Road, Hampstead, electrical and wireless dealer. £13 8s. 6d. February 5th.

WARNER, Leslie Charles, 4, School Lane, Leominster, wireless dealer. £15 9s. 3d., February 3rd; £22 13s. 2d., January 21st; and £11 17s., January 27th.

Deed of Arrangement.

WALLER, John Dallas, 21, Church Street and 51, Skipton Road, Ilkley, electrician. Dated March 7th, filed March 12th. Trustee, T. Kirkley, Lloyds Bank Chambers, Brook Street, Ilkley. Liabilities unsecured, £594; assets, less secured claims, £205.

Receiverships.

ARTANDIA, LTD.—J. M. Napier, of 317, High Holborn, W.C.1, was appointed receiver on February 28th, 1930, under powers contained in instrument dated January 17th, 1928.

CLAYTON TOOL CO., LTD.—W. F. Baker, of 93, Mortimer Street, W.1, was appointed receiver and manager on February 28th, 1930, under powers contained in first mortgage dated October 15th, 1929.

STAFFORDSHIRE ELECTRICAL ACCESSORIES CO., LTD.—D. H. Bates, incorporated accountant, of 10, Cheapside, Hanley, Stoke-on-Trent, was appointed receiver and manager on March 3rd, 1930, under powers contained in debentures dated July 29th, 1921.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

AEONIC RADIO, LTD., London, W.—Registered March 5th, £6 000 debenture, to J. L. Gottlieb, 10, Hillcrest Avenue, N.W.11 general charge (subject, etc.)

BORDER ELECTRICAL FACTORING CO., LTD., Carlisle.—Registered February 25th, £1 000 debenture, to T. B. Harris, Eastview, Blackwell Road, Carlisle; general charge.

LANGHAM RADIO, LTD., London, W.C.—Registered March 8th, debenture to Bank; general charge.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

STAFFORDSHIRE ELECTRICAL ACCESSORIES CO., LTD., Lichfield Street, Hanley.—At the statutory meeting of the creditors in this voluntary winding up, the statement of affairs showed ranking liabilities of £1 261, all due to unsecured creditors, and assets estimated to realise £1 007, subject to preferential claims of £85, and debentures totallng £1 462. The assets were insufficient to pay the debentures in full, and consequently there were no assets available for the unsecured creditors. It was reported that the company was formed in 1919 to take over an existing business. Shares to the value of £2 251 were issued to the vendor, and further shares to the value of £2 251 were allotted for cash. The debentures were issued in March, 1920, and were subsequently transferred to the bank. The accounts showed that in 1927 there was a profit of £39, and in the following year a profit of £8. In 1929 there was a loss of £350. The sales in 1928 totalled £6 067, but in the following 12 months they fell to £4 518. In consequence of a distress for rent the bank appointed Mr. D. H. Bates, accountant, of Hanley, as receiver. The creditors passed a resolution confirming the voluntary liquidation of the company with Mr. Bates as liquidator. The principal creditors are:—Kelvinator, Ltd., £133; Davies Insulating Co., £145; General Electric Co., £64; British Thomson-Houston Co., £95; Teeton, H. W., Ltd., £103; Bates, D. H., and Co., £72; Credenda Conduits, Ltd., £44.

London Gazette, etc.

Companies Winding-up.

M. E. D. A. S., LTD., 185, Hammersmith Road, London. Winding-up Order, March 10th.

SYMPHONY GRAMOPHONE AND RADIO CO., LTD. Winding-up Order, March 17th.

Companies Winding-up Voluntarily.

COOK'S WIRELESS CO., LTD.—Meeting of creditors at the London and North Eastern Railway Hotel, Liverpool Street, London, E.C.2, on Monday, March 24th, at 12 noon.

STAFFORDSHIRE ELECTRICAL ACCESSORIES CO., LTD.—By reason of its liabilities, March 11th. D. H. Bates, 10, Cheapside, Hanley, incorporated accountant, appointed as liquidator.

STANDARD ELECTRIC CO., LTD.—By special resolution, March 11th. J. Johnston, C.A., 190, West George Street, Glasgow, appointed as liquidator.

WELLSTEEDS (SWANSEA), LTD.—By reason of its liabilities, March 12th.

Notices of Dividends.

HUNT, Sydney Everest, 8A, Torwood Street, Torquay, electrical engineer and contractor. First and final dividend, 1½d. per £, payable March 26th, 4, Charterhouse Square, London, E.C.1.

LITTLER, John, 9, Hoghton Street, Southport, electrical and radio engineer. Second and final dividend, 8d. per £, payable March 20th, at the offices of A. T. Eaves, chartered accountant, 47, Mosley Street, Manchester.

Partnerships Dissolved.

BATTY, J., AND CO (Tom DAWSON and Gilbert BERRY), electrical and wireless engineers, 9, Fleet Street, Burnley, by mutual consent as from March 13th, 1930. Debts received and paid by T. Dawson, by whom the business will be carried on.

WHOLESALE ELECTRO SUPPLY STORES (Allan BUCKLEY and Clifford VOWLES), merchants and factors of electrical accessories and appliances, Lower George Yard and 10, Gaol Lane, Halifax, Yorks, by mutual consent as from February 21st, 1930. Debts received and paid by A. Buckley.

Bankruptcy Proceedings.

STANDARD PLATINUM CONTACTS, LTD., 121-3, Shaftesbury Avenue, London, W.C.2. In the compulsory liquidation of this company, the Official Receiver has issued a summary of its statement of affairs, which discloses unsecured liabilities £2 684, net assets £522, and a total deficiency of £5 661 with reference to the shareholders. In his accompanying observations, the Official Receiver reports that the Company was incorporated in August, 1927, with a nominal capital of £5 000 divided into shares of £1 each, of which £3 499 has been issued. It was promoted by Charles Edward Taroni, senr., who states that in August, 1926, he began for his son a business under the style of the Standard Platinum Screw Co., in Mortimer Street, W. The company was formed in order to take over the business so that Taroni, who was financing it although he took no practical part in its direction, might have the benefit of the limited liability afforded by the Companies Act. The manufacturing part of the company's business was conducted in Holden Road, Finchley. It has throughout been financed by Taroni, who also guaranteed a bank overdraft. In July last the lessors of the registered offices distrained for renr and furniture, plant and machinery were sold in September undet the distraint. Taroni admitted that it was owing to this distraint that the idea of a debenture being issued to him to secure part of his advances was suggested and on August 22nd last a debenture for £600 constituting a floating charge over the assets was issued to him. The circumstances connected with this debenture are such that in the Official Receiver's opinion it is invalid as a charge. Taroni has acquiesced in this view and he consented to the company's assets being realised and distributed without regard to the charge. Of course, the amount he has advanced will rank as an unsecured claim. He attributes the failure of the company to inefficient management and to the liabilities incurred in connection with the premises in Shaftesbury Avenue. The Official Receiver states that directly all the assets have been realised a dividend will be paid, but it is obvious from the figures that its amount will be small.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

322 159 J. J. Brewer and F. F. Brewer. Blocks for switches, ceiling-roses and other electrical fittings. (23/7/28.)
322 171 Pennant Manufacturing Co., Ltd., and A. D. Arter. Device for preventing the unauthorised use of electric switches. (21/8/28.)
291 101 Ganz-Fele Villamossagi Reszvenytarsasag. Apparatus for regulating voltage in a.c. distribution systems. (28/5/27.)
322 199 Ganz-Fele Villamossagi Reszvenytarsasag. Apparatus for regulating voltage in a.c. distributing systems. (1/6/28.)
322 197 J. Neale. System of railway control and signalling. (31/5/28.)
322 118 S. O. Cowper-Coles. Electrolytic removal of metal from metallic bodies. (5/6/28.)
297 769 M. Charles. Electric switches for motor vehicles. (27/9/27.)
322 208 W. S. Smith, H. J. Garnett, J. N. Dean, H. C. Channon, W. Gardner, and H. F. Wilson. Electrical insulating-materials. (25/8/28.)
322 188 Electrolux, Ltd. (Platen-Munters Refrigerating System Aktiebolag). Thermostat devices for refrigerating-apparatus. (27/8/28.)
296 311 M. J. Goldberg and Soehne Ges. Apparatus for the production of sounds and the reception of wireless signals. (27/8/27.) (Addition to 244 133.)
296 315 H. Hartman. Incandescent electric tubes. (26/8/27.)
322 190 Standard Telephones and Cables, Ltd., E. P. G. Wright, J. H. E. Baker, and A. H. Cameron. Call-finders for automatic and semi-automatic telephone systems. (29/8/28.)
322 192 S. L. Price. Telephone apparatus for transmitting and/or reproducing audible signals. (29/8/28.)
307 042 Westinghouse Brake and Saxby Signal Co., Ltd. Railway switch-operating apparatus and the like. (3/3/28.)
322 225 G. M. Wright and S. B. Smith. Photo-electric cells and circuits therefor. (31/8/28.)
322 239 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic or semi-automatic telephone systems. (5/9/28.)
322 240 Standard Telephones and Cables, Ltd., and J. K. Webb. Power cables. (5/9/28.)
322 241 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic and semi-automatic telephone exchange systems. (5/9/28.)
322 242 Automatic Telephone Manufacturing Co., Ltd., W. H. Paulett, and C. Gillings. Telephone systems. (5/9/28.)
322 244 J. Brown. Feeder-distribution boxes particularly for wireless aerials. (5/9/28.)
322 251 L. Fuller and G. J. A. Fuller. Galvanic batteries. (6/9/28.)
322 262 British Power Railway Signal Co., Ltd., and E. C. Irving. Light signals for controlling railway and other traffic. (15/9/28.)
297 363 Kalle and Co. Akt.-Ges. Manufacture of light-sensitive layers. (19/9/27.)
297 442 Schoeller and Co. Elektrotechnische Fabrik Ges. Electric cigar or the like lighter. (21/9/27.)
322 271 Igranic Electric Co., Ltd., and A. D'A. Hodgson. Radio valve circuits. (28/9/28.)
299 306 Siemens and Halske Akt.-Ges. Electrolytic production of protective coatings of peroxide of lead on electrical conductors. (22/10/27.)
322 283 Brandes, Ltd., T. D. Ward-Miller, and A. K. Paterson. Transformer coils, particularly for wireless receiving-apparatus. (11/10/28.)
322 285 E. P. Griffin and W. A. Buckley. Electric batteries. (11/10/28.)
322 288 General Electric Co., Ltd., and W. P. Gauvain. Electric power apparatus for dairy farms. (15/10/28.)
322 290 J. Schurmann and Fabrik Elektrischer Zunder Ges. Electric blasting-fuses. (17/10/28.)
313 909 Rockbestos Products Corporation. Insulated conductors. (19/6/28.)
322 293 H. E. Wimperis. Apparatus for indicating or signalling acceleration. (22/10/28.)
322 294 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Electrical amplifying arrangements. (24/10/28.)
299 780 Westinghouse Lamp Co. Electric incandescent lamps or similar articles. (31/10/27.)
299 715 Westinghouse Lamp Co. Vacuum electric tube devices. (27/10/27.)
322 308 British Thomson-Houston Co., Ltd., A. P. Young, and L. Griffiths. Electric contact-breakers. (10/11/28.)
322 309 British Thomson-Houston Co., Ltd., A. P. Young, and L. Griffiths. Electric contact-breakers. (10/11/28.)
322 316 General Electric Co., Ltd., and J. P. S. Pillans. Electrical apparatus. (15/11/28.)
322 326 R. T. Smith and C. H. Smith. Wireless direction-finding systems. (22/11/28.)
322 347 W. Dornig. Constant-speed multi-frequency electrical generating-apparatus. (8/12/28.)
322 356 Siemens Bros. and Co., Ltd., and D. A. Christian. Switch mechanisms as used in automatic telephone and like selective systems. (14/12/28.)

Applications for Patents.

November 14th.

34 799 British Thomson-Houston Co., Ltd., and F. P. Whitaker. Dynamo-electric machines.
34 804 F. J. Buckley. Magnetic mechanism.
34 776 F. B. Cox. Electric switches.
34 777 F. B. Cox. Electric switchgear.
34 768 Electric Fires, Ltd. Electric kettles, etc.
34 851 W. Engelke and H. L. Read. Light sensitive bridges, etc.
34 863 L. Koros. Arrangement for connecting discharge gaps for maintaining constant voltage. (15/11/28, Hungary.)
34 821 G. E. Liljeckvist. Means for connecting cables to accumulators, etc.
34 765 R. S. Long. Electric heater for motor cycle handlebar.
34 842 H. Muller. Apparatus for guiding and protecting cables. (15/11/28, Switzerland.)
34 768 F. L. Newhouse. Electric kettles, etc.
34 818 Gisbert, Freihers von Romberg. Plug for electric circuits.

November 15th.

34 952 Associated Electrical Industries, Ltd., and D. R. Davies. Electric switchgear.
34 911 A. Bamford. Electric plug and socket connections.
34 920 C. G. Borthwick. Automatically switching off current in motor vehicles, etc.
34 898 G. B. Burnside and Electrical Central Heating and Ventilating Co., Ltd. Electric heating and ventilating systems.
34 937 Burovox, Ltd., S. Canthery and S. C. Winfield-Smith. Telephone systems.
35 046 A. M. Codd. Telephone receivers.
35 043 Espe Werk Ges. Strewlow and Prunzel. Electrical transformer device for internal combustion engines. (17/11/28, Germany.)
34 886 Etchells, Congdon and Muir, Ltd., and F. Muir. Gate locking apparatus for electric lifts.
35 019 H. J. Garnett. Submarine cables.
34 875 Gramophone Co., Ltd. Electron emitting cathodes for electric discharge devices.
35 023 H. C. Grant and W. Kidde and Co., Inc. Electrical systems.
34 972 M. Grutzmacher. Conversion of variations of light intensity into variations of electric current. (16/11/28, Germany.)
34 984 E. C. Hamilton and E. R. Troughton. Primary batteries.
35 031 Koch and Sterzel Akt.-Ges. Electric switches. (29/11/28, Germany.)
34 936 G. Mascarini. Electrically heated boilers. (16/11/28, Italy.)
34 973 Mix and Genest Akt.-Ges. Microtelephones. (16/11/28, Germany.)
34 981 Mix and Genest Akt.-Ges. Telephone casings.
35 012 Mix and Genest Akt.-Ges. Dialling apparatus for automatic telephones. (20/11/28, Germany.)
35 019 W. S. Smith. Submarine cables.
34 948 Standard Telephones and Cables, Ltd. (W. Hatton and R. Dahl). Automatic telephone systems.
34 926 R. N. Wellington. Electric plug connectors.
34 910 P. J. de Wet. Electric terminals, etc.

November 16th.

35 089 Associated Electrical Industries, Ltd., and G. E. Bailey. Insulating bushings.
35 092 British Thomson-Houston Co., Ltd. Systems of motor control. (16/11/28, U.S.)
35 058 M. Brown and Simplex Floor Planing and Treatment Co (1929), Ltd. Single phase squirrel-cage motors.
35 099 A. Chanin and J. Nisenson. Controlling devices for wireless apparatus.
35 115 E. H. Chapman and T. B. Franklin. Location of underground conductive bodies.
35 101 Ing. F. W. Dannhauser and Co. Electric illumination of pianofortes. (16/11/28, Germany.)
35 082 V. W. Edwards. Wireless loud speakers.
35 109, 35 110 H. C. Heide (Moto Meter Gauge and Equipment Corporation). Electric indicating instruments, etc.
35 100 Kolster-Brandes, Ltd. Broadcasting systems. (17/11/28, U.S.)
35 054 A. W. Macnamara. Machines for production of electric coils.
35 108 Marconi Wireless Telegraph Co., Ltd., and N. Wells. Thermionic modulating systems.
35 102 Maschinenfabrik Oerlikon. Electric motor vehicles. (14/12/28, Switzerland.)
35 114 G. Millington and P. W. Willans. Telephone transmitters, etc.
35 121 D. N. Sharma. Television, etc., systems.
35 088 Siemens-Schuckertwerke Akt.-Ges. Manufacture of electric cables. (17/11/28, Germany.)
35104 Siemens and Halske Akt.-Ges. Influencing transmission equivalent of discharge tubes, etc. (17/11/28, Germany.)

COMING EVENTS.

Friday, March 21st (To-day).

British Electrical Development Association.—Savoy Hotel, Strand, London. Luncheon, 1 *p.m.*; followed by annual general meeting. 3 *p.m.*

Batti-Wallahs' Society.—Hotel Cecil, Strand, London. Annual dinner and dance. 7 *p.m.* for 7.30 *p.m.*

Institution of Electrical Engineers (North-Eastern Students' Section).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. J. Bennet and O. A. Chrisp on "A Survey of Switch and Control Arrangements with Examples of Modern Practice." 7.15 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference. 7.30 *p.m.*

Saturday, March 22nd.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Visit to the Post Office (London) Railway, Mount Pleasant. 4 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section).—Savoy Place, Victoria Embankment, London. Informal meeting. 7 *p.m.*

Monday, March 24th—Thursday, April 17th.

Ideal Home Exhibition. Olympia, London.

Monday, March 24th.

Electrical Contractors' Association (Ealing Sub-Branch),—Ordinary meeting.

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansall on "The Imperial Chemical Industries, Ltd.'s Steam and Electric Power Plant at Billingham." (To be illustrated by a cinematograph film). 7 *p.m.*

Tuesday, March 25th.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Ordinary meeting.

Illuminating Engineering Society.—Lecture Theatre at the Home Office Industrial Museum, Horseferry Road, London, S.W. Paper by Mr. S. Anderson on "Textile Lighting." 7 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansall on "The Imperial Chemical Industries, Ltd.'s Steam and Electric Power Plant at Billingham." (To be illustrated by a cinematograph film.) 7 *p.m.*

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Paper by Mr. F. C. Walmsley on "The E.H.T. Oil Circuit Breaker." 7.15 *p.m.*

Wednesday, March 26th.

Electrical Power Engineers' Association, Manchester.—Paper by Mr. G. L. Porter on "Tap Changing of Transformers under Load."

Electrical Contractors' Association (West of London Sub-Branch).—Ordinary meeting.

E.D.A.'s Record and Possibilities.

THE latest annual report of the British Electrical Development Association, covering the calendar year 1929, contains as usual a remarkable record of activity in a very wide field. When it is remembered that the annual revenue at the disposal of E.D.A. does not much exceed £30 000—little more than the amount usually regarded by advertising experts as the minimum on which a national campaign can be usefully conducted—the achievements of Lieut.-Colonel VIGNOLES, Mr. DALE and their capable staff can be more readily appreciated at their true value. The report is certainly not guilty of exaggerating the results attained when it records that "the influence of the Association is growing steadily, while interest in electrical matters is rapidly increasing." The increase in membership during the year is described as gratifying, and the establishment of three additional provincial area sub-committees is a valuable extension of the ground which is under intensive cultivation. There are now nine of these sub-committees in existence in addition to eleven sub-committees dealing with particular aspects of electrification. The Industrial Electric Heating and Exhibition Advisory Sub-Committees have been very active; so has the committee representing all sections of the industry set up last May to supervise the E.D.A. Electric Homes (Outlet) campaign. This has already justified itself, and is to be placed on a more permanent basis. Already nearly half a million copies of "The House You Want" have been disposed of, and it seems probable that many more will have to be printed.

Satisfaction with what has been and is being accomplished by E.D.A., as the spearhead of electrical publicity and propaganda in this country, must not blind us to the fact that a great deal more could be done if the industry contributed on a more adequate scale to the Association's revenue. One-tenth of one per cent. of the annual revenue of a supply undertaking is not an onerous subscription towards a national campaign, yet little more than half the amount that would be available if all such undertakings contributed on this scale is actually at the disposal of E.D.A. Some of the subscribing undertakings pay less than the recommended amount; others do not contribute anything, though they derive nearly as much advantage from E.D.A.'s activities as the subscribing concerns. To such non-contributing undertakings, Mr. R. P. SLOAN, speaking at the annual luncheon of the Association a week ago, aptly quoted EMERSON'S line: "He is base who receives favours and renders none." We gather than one self-confessed black sheep, through its representative at the annual general meeting which followed the luncheon, promised to mend its ways. Last year thirty-four others saw the light, and eight of the black and white variety adopted an increased rate of subscription, so that we may hope before long to see all the delinquents brought into the fold, and 100 per cent. white.

There is no fear that an increase in the available funds will lead to wasteful or unprofitable expenditure. Much useful work remains undone merely because the money required to finance it is lacking. Displays such as the pavilion at Charing Cross underground station, which has already been inspected by more than 70 000 persons, could be arranged with advantage in many other places throughout the country. Every exhibition, show and fair should have its E.D.A. stall, and there is great scope for travelling demonstrations such as the Canadian motor bungalow, of which a picture is reproduced on page 391. Advertising could be greatly extended without extravagance or redundancy, and many more booklets dealing with various uses of electricity could be circulated. One might extend the list indefinitely. The organisation exists, and it has already shown conclusively that it is capable of doing great things with very limited resources. Given adequate financial backing it would be difficult to set a limit to its possibilities.

Current Topics.

The Silver Lining.

WHEN prices tumble about our ears, bank rates fall, and unemployment figures mount, pessimism would seem to be natural. It is certainly fashionable. Most of the scribblers in the lay Press, and, of course, most of our politicians, are busy explaining to us and to the world the horrible plight of our industrial and commercial position. All this may be true at the moment on a very short view, but there is another and a brighter side. The present depression is one more step towards that condition of normality and stability which must be reached some day, and the sooner the better. Those business men whose memories and experience go back to the pre-war period suffer from no delusions on this matter. They know that a price level is a natural thing which must develop out of the needs of the market, and must represent the point at which supply and demand in that market can meet in a natural and a healthy way.

Progress Towards a Natural Basis.

FAR too many people, whose knowledge of practical economics is limited to the artificial conditions which have ruled the world since August, 1914, still cling to the impression that prices can be arranged, values adjusted, markets secured and production controlled by various artificial regulations and arrangements. Nobody else believes that such arrangements can have any permanent value in them. They may help us over a crisis now and again, but, in the end, business can never be sound until it is on a natural basis. During the war we reduced the value of the £ from 20s. to 8s. 6d. By a long, weary and troublesome process we have since got so far with the work of restoration as to make the old £ worth 16s. or 17s. There is still 3s. or 4s. worth of war-time inflation in it, and that has to go before we can once again be sure that a pound is a pound, and proceed with solid business on that firm foundation. If the present slump has achieved, as it seems possible that it may have done, a large part of this unpleasant but healthy and necessary task, then we are all the nearer to a normal state of affairs and a prospect of prosperity that is real.

Empire Radio Telephony.

IN a letter to "The Times" the Marchese MARCONI has challenged some of the statements made by the Postmaster-General in the House of Commons in support of his decision not to employ the Marconi Beam stations for long distance radio-telephony. The White Paper giving the replies of Dr. SMITH and Professor HOWE to the questions submitted by the Cabinet Committee contains so many "probablys" that the demand for a series of strictly controlled comparative tests of the Post Office and the Marconi Beam systems will be reinforced by the publication of this document. The considered view of the experienced engineers of the Marconi Co. as to the value of high aerials for long distance telephony ought not to be overridden by the cautious statement of the two experts consulted by the Cabinet Committee that the Post Office low aerial system is *probably* equally efficient. The case for further inquiry which would embrace fully comparative tests of the two systems is so strong that the Government will be well advised to refer the matter to an expert committee for a complete investigation of the whole question. There still remains grave doubt as to the wisdom or equity of separate control of long distance telephony and telegraphy, and it is to be feared that such a division cannot fail to bring about a lot of friction that would be much better avoided.

Advertising the Telephone.

AT the general meeting of the Automatic Telephone Manufacturing Co. a few days ago, Sir ALEXANDER ROGER, the chairman, said that as the result of the expenditure of nearly £70 000 in five years on advertising by the Telephone Development Association, the various branches of the British telephone industry had obtained new business to the value of over £6 000 000. He regarded this result as an indication of what might be expected to follow a more liberal policy in telephone advertising and propaganda. Dealing with the remarkable strides made by telephony in the past ten years, Sir ALEXANDER ROGER pointed out that we were rapidly approaching the time when millions of telephone subscribers throughout the world will be able to converse with one another over any distance and between any two countries. It would not matter whether we were on land, at sea or travelling through the air. The whole business world was rapidly becoming one huge multiple telephone area. Certainly in a few more years the man who wishes to escape temporarily from civilisation and its mechanical intrusions on privacy and leisure will have to go to a lot of trouble to cover his tracks.

Canada as a Market.

APART from such matters as price, customs tariff and marketing arrangements, there are several other fences to be negotiated by British electrical manufacturers who seek to sell their goods in Canada. To the extent that the approval of the Ontario Hydro Electric Commission is now being accepted in most parts of the Dominion as readily as that of the Underwriters' Laboratory at Chicago, one of the difficulties formerly encountered is becoming less serious. But approval of apparatus was not the main obstacle in the way of an increased sale of British electrical goods in the Dominion. Differences of wire sizes, conduits, threads, and so on, in the case of many of the smaller appliances are, as Mr. W. P. DOBSON, chief testing engineer for the Ontario Hydro Electric Power Commission, points out in the Canadian weekly, "Hardware and Metal," a much more powerful deterrent to prospective buyers. Canadian standards must be met in such cases or the British article will have little chance in that market, even if the approving body—whether American or Canadian—has passed it as complying with requirements in regard to quality.

Supply Voltage Variations.

LIEUT.-COL. H. W. WATTS draws our attention to the fact that in last week's issue the variation on either side of the declared pressure permitted to supply undertakings under the Electricity Commissioners' regulations was given as 2½% whereas it is actually 4%. The former figure relates to the frequency. It will be seen, therefore, that an all mains set should be designed to tolerate an overall variation of not less than 10% in order that it may perform satisfactorily where the actual supply voltage variation does not exceed the statutory ±4%. To cover actual variations a considerably larger tolerance factor would seem desirable.

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION.

Annual Luncheon—Mr. Herbert Morrison Urges Extended Publicity Effort—Appeal to Non-Subscribing Undertakings—Example Set by Gas Companies.

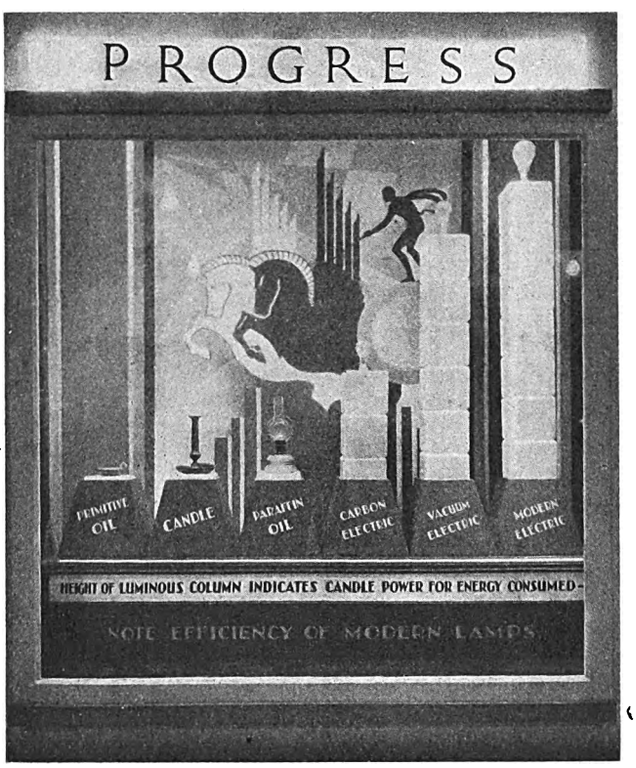
THE annual luncheon of the British Electrical Development Association was held at the Savoy Hotel on March 21st. Captain J. M. Donaldson, M.C., presided, and the large gathering included Alderman E. Huntsman (who was elected to the presidency of the Association at the annual general meeting held at the conclusion of the luncheon), Lord Meston, Sir Andrew Duncan, Sir John Brooke, Col. Sir Thomas Purves, Sir James Devonshire, Sir Archibald Page, Sir Felix Pole, Sir Philip Nash, Sir Douglas Newton, M.P., Sir Harry Haward, Sir Duncan Watson, Col. R. E. Crompton, Mr. W. W. Lackie, C.B.E., Mr. J. K. Brydges, Mr. P. Rosling, Mr. H. Willoughby Ellis, Mr. A. F. Berry, and Alderman W. Walker.

Proposing the toast of "The British Electrical Development Association," Mr. Herbert Morrison, Minister of Transport, said that if British consumption was to teach a level corresponding or that in the United States, our annual output should be 30 000 000 000 units instead of the 8 500 000 000 probably attained in 1929. In his judgment there were two things needed in the British electrical industry—first, a universal and scientific push by all the supply undertakings instead of only some of them, and, secondly, a really wholehearted publicity campaign conducted on a national scale.

It was the duty of supply undertakings to see that they were adequately equipped with a sales organisation which not merely preached the virtues of electricity, but was a service organisation ready to take the consumer by the hand and give him the best advice and assistance in the economical and effective use of electrical energy. Assisting consumers to get the maximum result with a relatively small consumption was sound business, and would lead to greater consumption by increasing the number of purposes for which electricity was used.

The Electrical Development Association was a valuable institution. Within its resources, its work had been admirable. But a prosperous industry such as electricity supply ought not to stint the Association so far as finance was concerned. Its total income made it impossible for the Association to render services on a scale proportionate to the importance of the industry. He was glad to know that an increasing number of supply undertakings were becoming associated with the organisation, but he would urge all the 50% who remained outside to come inside. He appealed on the Association's behalf for the support of all branches of the electrical world. Let them learn from the publicity campaigns being conducted by other branches of commerce, and in particular from the first-class publicity and service activities of the great gas industry, for whose energy and push he had the warmest admiration.

Electricity seemed capable of doing anything. It was now being developed for use in the heat treatment of steel with automatic temperature control, and on the other hand it was being increasingly employed for purposes of refrigeration. Like politicians, it could "blow hot and cold" at the same time. It was his ambition to enable the work of the Electricity Commissioners, the Central Electricity Board and the Ministry of Transport to become still more effective with the object of establishing a great nationally organised industry. Undoubtedly electricity was one of the bright spots in British industry at the present time. Given a live organisation locally, and adequate support for a body like the Electrical Development Association nationally, the measure of its progress in the past would be small compared with the enormous possibilities of the immediate future. They could rely upon the encouragement of his department in the development of rural supplies, to which he attached great importance, and the Government had demonstrated its desire to help by the assistance which the Lord Privy Seal had proffered under the Development Act for accelerated electricity schemes.



PROGRESS IN LIGHTING.
Part of the joint E.L.M.A. and E.D.A. Exhibit at Charing Cross Underground Station.

Mr. R. P. Sloan, C.B.E., responding, said that the national grid scheme was an anticipation of the development that would have taken place if there had been no such scheme although the process would then have occupied many years. As an instance of the tendency towards rationalisation he mentioned that on the North-East Coast they had closed down 15 small stations. To make the national scheme a success two conditions must be fulfilled. Generating costs must be reduced and consumption must be increased. The first was in the hands of the Central Electricity Board, but although the Board had many problems to solve the difficulties were under their control. In the case of the second—increase of consumption—the case was very different, and the work had to be carried out by some hundreds of independent undertakings scattered all over the country. There was only one association—E.D.A.—which represented them all. It was essential at the present time that all should combine for the purpose of increasing consumption. An entirely fresh set of circumstances had been brought about by the national scheme. The electricity supply industry would in the end have to foot the bill and be responsible for the redemption charges on the expenditure. The only way to help the scheme to success was to co-operate and do everything possible to increase the consumption of electricity in all directions. He urged everyone to help the Association and so assist in reaching this end. E.D.A. was the only association representing all interests, and it desired the support of all. He quoted Emerson's dictum: "He is base who receives favours and renders none." Criticism of E.D.A.'s activities usually came from those who did not subscribe on the recommended scale and who did not subscribe at all.

At the subsequent annual general meeting the following officers were elected for 1930–31:—President, Alderman E. Huntsman; chairman, Mr. H. Marryat; vice-president, Sir Felix Pole.

(*Extracts from the Annual Report for 1929 of the British Electrical Development Association will be found on page 393, and a photograph taken during the annual luncheon is reproduced on page 415.*)

E.D.A. SALESMANSHIP CONFERENCE.

Selling Policy and Practice of Supply Undertakings—Planning of Sales Organisations—Publicity and Propaganda—Weekly Current Bill of All-Electric Houses—Hiring and Assisted Wiring Schemes.

THE subject discussed at the E.D.A. Salesmanship Conference on March 20th, in the lecture hall of the Royal Society of Arts—the last conference of the 1929-30 session—was Selling Policy and Practice in electricity supply undertakings. Mr. A. C. Cramb (borough electrical engineer, Croydon) presided.

Lieut.-Col. W. A. VIGNOLES (director and secretary of the E.D.A.), who opened the discussion, stressed the importance of arriving at a definite sales policy in any business. It had been proved in many instances that the policy of reducing prices had increased profits as the result of greater turnover, and many of the undertakings which adopted this policy of serving the public to the best of their ability were in a sound financial position.

The next problem was the planning and development of a sales organisation. In every undertaking, except possibly the very smallest, there should be a sales manager or engineer responsible to the general manager, and the sales manager should be given adequate assistance. In a large undertaking the sales manager would require assistants to deal with (1) consumers' department; (2) sale and hire of apparatus; (3) assisted wiring; (4) installation work; (5) publicity. The directorate would have to decide whether the undertaking should sell direct to the public or through a contractor, and there were other problems, such as whether or not the rentals for hired apparatus should be designed to cover the entire cost of the apparatus and its maintenance, or whether the undertaking was to charge low rentals and depend upon securing an adequate return from the sale of the electricity which the apparatus consumed. This was an important aspect of the development of the electricity business which needed to be explored to a greater extent than it had been hitherto. The policy of charging low rentals was adopted by most gas undertakings. Again, a number of electricity supply undertakings were operating assisted wiring schemes through contractors, to the great advantage of the undertakings. It was better that consumers should be charged fixed sums for their installations, payable at intervals, rather than they should be charged, in respect of the apparatus, a small extra charge per unit on the units metered, because when the latter method was employed there was a tendency towards a definite check on the use of electricity for purposes other than lighting. Some undertakings had introduced assisted wiring and were charging an additional 2d. per unit consumed, and had wired a very large number of premises on these terms, although as a rule electricity was used only for lighting in such cases. A system such as that adopted by one undertaking, which, on introducing an assisted wiring scheme, had insisted upon the provision of at least two plugs in each installation, ought to be developed.

Publicity Allocation.

Publicity and propaganda policy should also be decided upon, and a definite sum allocated. The amount to be so expended should be about 1 per cent. of the gross revenue, this allocation including the contribution to the E.D.A. as members. Inasmuch as this latter contribution was only one-tenth of 1 per cent., nine-tenths of the total publicity allocation would be available for local publicity. In this connection he urged all concerned to make full use of the E.D.A. literature, posters and window displays. Emphasising the value of proper provision for the training of the sales staffs, he said that the work of the E.D.A. in this connection had included a recent practical course in home electrification for women in the electrical industry, which had been attended by some 130 women, and this work could be developed if undertakings required it.

Mr. E. E. HOADLEY (borough electrical engineer, Maidstone), emphasising the increasing importance of selling efforts, said that he had a most efficient sales engineer, but the latter had other things to attend to besides selling electricity. All the men employed in the department, however, were salesmen and received written instructions from time to time as to what they were required to do, and they were paid for any business they secured. Meter readers were instructed always to try to interview the householders and persuade them to use further apparatus; this policy worked very well. As an example of the success of the policy of pushing out into country districts, one district was connected up last autumn and over 100 consumers were secured before Christmas. He had a very attractive tariff for all-electric houses—i.e., houses with no coal fire—and there were 155 such houses in the district. Hiring rates included maintenance service. Since the war the Maidstone Corporation had built 1 100 houses, and, at last, the electricity department had persuaded them to put up six electric houses, as an experiment, alongside six all-gas houses. Careful statistics over a period of twelve months had shown that, whilst the cost of gas houses was 3s. 9d. per week, the all-electric houses cost 3s. 9½d. A further 314 houses were being erected by the Corporation and there would be no gas mains on that estate. The electricity supply would be charged for on the basis of a first charge collected with the rent, and 1d. per unit collected through a slot meter.

Value of Efficient Demonstration.

Mr. A. C. BOSTEL (County of London Electric Supply Co.) said that, except in the use of vacuum cleaners and irons, little development had been made in regard to demonstrations, but the public did take advantage of apparatus which was demonstrated to them by efficient salesmen. The policy of linking up with the various manufacturers had proved itself, especially in the sale of vacuum cleaners, and he urged that the pushing of electrical apparatus must be extended along those lines. He stressed the importance of the adequate training of salesmen, and criticised the inadequate salaries offered to men of good qualifications.

Mr. W. MILLNER (Westminster Electric Supply Corporation) said that the hiring of vacuum cleaners led in many cases to purchase. The hiring out scheme was based on the return of the capital within seven years, but there were few kinds of apparatus in respect of which it took seven years to recover the capital expenditure, and in the case of irons it was nearer three years. The cost of maintenance of fires was almost negligible; it had worked out at less than 8d. per fire per annum over a series of years. The necessity for hiring would be less as time went on, having regard to the reductions in the cost of apparatus. Electrical apparatus was advertised more by persons outside the industry than by those inside it, apart from the manufacturers, of course, and the electrical industry was allowing the stores and other non-electrical concerns to secure a large proportion of domestic sales which were the legitimate right of the industry.

Mr. E. BROWN (Hackney Electricity Department) said that the assisted wiring scheme in Hackney was confined to small domestic premises. The undertaking had its own contracting department, and originally had carried out the free wiring itself, but the work had increased considerably, and for some time practically the whole of it had been sub-let to local contractors, who were members of the "Hackney Electricity Circle," an organisation sponsored by the undertaking. The practice was to endeavour to obtain first an order for an installation on a cash or credit basis; if this could not be obtained, easy purchase terms were offered; and if there were no favourable prospect of obtaining an order on either basis, free wiring was offered.

The CHAIRMAN urged that plain, simple tariffs should be arranged.

Col. WATTS (Epsom) said that in his district there were 300 all-electric houses, the weekly cost of the supply being from 3s. 6d. to 3s. 8d. The hiring of radiators should not be done too freely.

ELECTRICITY IN MEDICINE.

At the I.E.E. on March 20th, Dr. Bernard Leggett, M.R.C.S., L.R.C.P., A.M.I.E.E., read a paper on "The Medical and Surgical Applications of Electricity."

The paper gives a general review of the important applications of electricity in scientific medicine and surgery. As the greatest field is without doubt the diagnostic and therapeutic applications of X-rays, a large proportion of the paper is devoted to a general consideration of X-ray radiology. The subjects of ultra-violet radiation, diathermy and other applications of electricity to stimulative therapy are also dealt with. The author draws attention to the comparatively small importance of radiology in this country, as compared with its importance upon the Continent and in America.

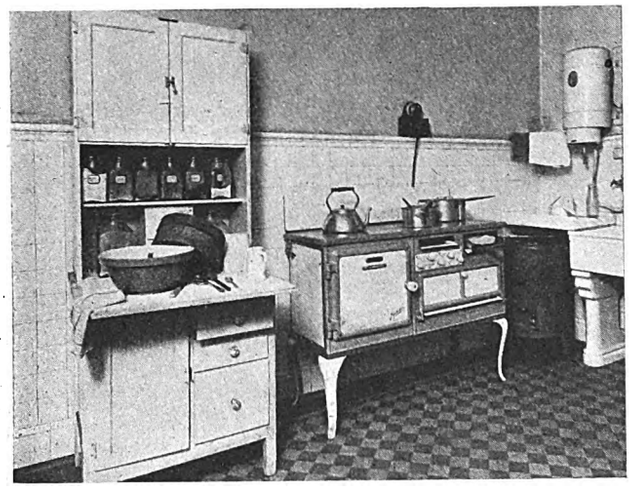
ELECTRIFIED HOMES.

Factors in Recent Progress—Educational Methods—Greatly Improved Showrooms—Tariffs—Better Standard of Installation Work—Domestic Apparatus—Distribution Costs.

By C. F. WELLS, A.I.E.E.

STATISTICS issued by the Electricity Commissioners show that domestic supplies are becoming a larger and larger percentage of the total annual sales of electricity, and that the present figure is about 25%. The number of units sold for domestic purposes has increased threefold in the last six years and the price per unit for domestic purposes shows a substantial decrease of over 40% during the same period; the average for the country is now just over 3d. a unit. Amongst the reasons for this striking development are the low prices and the facilities which are offered to consumers to hire and hire purchase apparatus.

Educational propaganda has of late done much to popularise the use of electricity in the home, and women whose confidence in electrical appliances is growing as the result of experience which has been gained, are demanding labour-saving appliances generally. The Electrical Association for Women, which came into existence five years ago, has done much to help in this direction, and the steps taken to arouse interest in the teaching of electrical methods in girls' schools and domestic science centres should prove of the utmost value. In this good work, supply authorities can assist by giving every facility for the installation of up-to-date electrical equipment at schools and educational establishments in order that women demonstrators may be properly trained. Arrangements have recently been made by Electrical Distribution of Yorkshire, Ltd., for the equipment of three large secondary schools for the West Riding County Council. Each equipment amounts to about 50 kW. In one school the apparatus has been in use for 12 months with very satisfactory results.



An all-electric kitchen showing Jackson cooker, wash boiler, immersion type water heater and sink.

Development in salesmanship has kept pace with the improvements in electrical appliances. Early efforts to sell apparatus were often frustrated by deficiencies in appliances. As the result of co-operation between manufacturers, contractors and supply undertakings, improvements have been rapid and supply authorities and contractors are able to recommend with confidence the products of British manufacturers. The fact that we have to-day several million consumers is some evidence that apparatus in general is giving satisfaction.

A number of showrooms have recently been established which are a big advance on those of a few years ago, and to-day nearly half the authorised undertakers in the country have showrooms. At one time showrooms were little more than a shop window; an improvement in the displays followed and now the modern showroom usually takes the form of an all-electric flat, the apparatus being exhibited in surroundings similar to those under which they will be placed in actual use.

Undertakings with large sparsely populated areas have found exhibitions a convenient and successful way of demonstrating electrical appliances to consumers. The village hall is rented for this purpose or alternatively arrangements made with a builder to furnish and equip a new house for a week's demonstration. The company with which the writer is associated has found this a most useful way of developing the domestic load in its area. The travelling exhibition is beginning to make its appearance and we may expect to see many of these on the road before long.

It is essential that service should be the keynote of negotiations with consumers and that the services of courteous skilled attendants with sound technical knowledge should be available at all times to ensure the continued satisfactory operation of domestic appliances, otherwise we may experience a re-action which will retard progress. The collection of data by those concerned in this work will be found of great value in dealing with consumers enquiries. Above all these men should have personal experience gained in their own homes in the use of the apparatus.

It has often been emphasised that to bring about the general use of electricity in the homes of the people it must be sold at a low price but when we remember that a supply is already available for domestic purposes at 1d. per unit or less in the majority of districts, we must realise that there are other important factors to consider, and that in some areas the price for such purposes is already as low as can be justified. The question as to the best form of tariff continues to receive much attention. The two part tariff is increasing in favour and is leading to the freer use of electricity. Application of this tariff to prepayment consumers still presents difficulties, a satisfactory solution of which will do much to popularise the more general use of electricity in small houses. A two-part tariff framed on sound lines offers advantages both to the supply undertaking and the consumer—to the undertaking by providing a reasonable contribution by each consumer towards standing charges and to the consumer by allowing him to use both lighting and other appliances with one set of wiring.

The revaluation of premises under the Rating and Valuation Act of 1925 has led some undertakings to revise their charges in a downward direction where the standing charge is based on the rateable value, but the Act has also resulted in heavy burdens through the increased assessments placed upon most undertakings.

One still sometimes hears of unsatisfactory wiring work, but the periodical revision of wiring rules combined with the activities of the Electrical Contractors' Association has brought about a better standard of work. Standardisation of materials has also assisted in this direction. Plugs and sockets to B.E.S.A. specification should be used on every installation, and an effort made to minimise the large number of different sized plugs now on the market. Many thousands of installations have been carried out on the surface wiring system.

Inadequate Attention to Lighting

Although the possibilities of electric lighting are to-day more widely appreciated than formerly, it is seldom that the lighting of the house receives the attention it deserves. As a result of co-operation between supply engineers, builders and architects, lighting fittings of decorative value combined with utility are coming into more general use and can be obtained to harmonise with the general scheme of decoration. Because of the scarcity of plug points, portable standards are too infrequently seen. Colour has always possessed a universal appeal and the application of colour lighting in the home enables an impression of cosiness and warmth to be obtained.

Although improvements in the efficiency of incandescent lamps make electricity the cheapest form of illuminant, the cost of lamps to-day in this country compares unfavourably with other parts of the world. This is retarding progress in obtaining and retaining the small class of consumer. This point is particularly important when one remembers that the smaller houses are now the principal non-users of electricity. For this reason assisted wiring schemes are recognised by every progressive undertaking as a necessity and nearly 300 undertakings now have a scheme in operation; the cost of wiring can no longer therefore be regarded as a difficulty in obtaining additional consumers.

Many undertakings have connected 50 per cent. of the premises in their area of supply, and the rate at which new

Digitized by Google

consumers are being connected shows a large increase. For the past three years, Electrical Distribution of Yorkshire have added new consumers to their mains at the rate of over 7 000 a year.

Although the design of electric cookers has not substantially altered during the last few years, refinements have been effected in the finish, chiefly by the use of enamelling, both for the interior and the exterior. The solid type plate is reliable

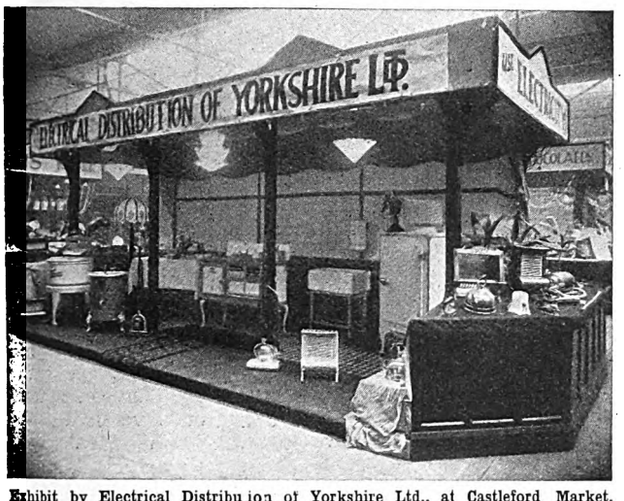


Exhibit by Electrical Distribution of Yorkshire Ltd., at Castleford Market. Princess Mary showed keen interest in this display and spent some time examining the various electric domestic appliances.

and has reduced maintenance costs, but it cannot be regarded as the last word in boiling plates, and it is hoped that research will be undertaken which will lead to further improvements.

Standardisation of cooker parts has recently been discussed by manufacturers, but it is important that this should not take place prematurely, especially as the thermal storage cooker, used extensively in Sweden, has received little attention in this country and may yet develop. There are still two schools of thought on the vexed question of top and bottom *versus* side and bottom heat.

The merits of electric cooking are well established. The saving in the weight of the food cooked is important and enables substantial economies to be obtained over other methods of cooking. The large number of cookers sent out on hire during the last few years is evidence that the prejudice which at one time existed against cooking electrically, has been overcome; there are several undertakings each of which has over 5 000 cookers on hire. Aluminium utensils with specially stiff bottoms are now sold by several manufacturers for use with electric cookers so as to ensure a good contact with the boiling plate; these effect economy in both time and electricity. The boiling of small quantities of water should be carried out in an electric kettle.

Radiators with elements of the solid bar type and also with resistance wire elements are available in large varieties, and each year brings an increase in the number sold. Both the panel and the tubular system of room heating are also receiving attention, but the application of these systems has been confined largely to the heating of public buildings. The portability and the sense of warmth which one experiences from radiant heaters give them a greater appeal, but, although the electric fire is a real labour saver, an improvement in its efficiency must take place before the domestic chimney disappears. A system which will give good results is a combination of either tubular heaters or panel heaters used in conjunction with electric fires. The chief potential load in the house is for heat, and this field offers enormous possibilities.

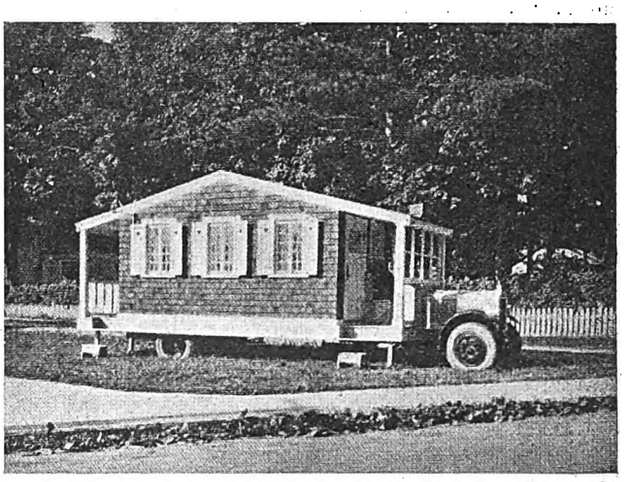
Storage cylinders with automatic temperature control are now being sold in large quantities and with suitable hiring facilities, and the experience which has now been gained, their use should become much more general. The use of an immersion heater or circulator in conjunction with the existing house cylinder is not a very efficient arrangement, but it is comparatively low in first cost and often enables a supply of hot water to be obtained especially during summer months when the kitchen range may be out of use, for a small capital outlay. Further, it does not involve any alteration in existing pipework, and often provides additional facilities for the airing of clothes which is sometimes a difficulty experienced in all-electric houses. Some undertakings are developing a night load by offering a special tariff for off peak water heaters. The instantaneous type of water heater is unpopular with most supply authorities because of the heavy loading which often brings voltage trouble; these heaters however, have not a very wide application. The development of the water heating load merits more attention, and the same facilities as are afforded for the hire of cookers should be more generally extended to water heating apparatus.

Increased Sale of Refrigerators.

The number of refrigerators sold in this country, although not a big figure largely due to their first cost, shows a steady increase. Now that the use of preservatives for keeping food is severely restricted, domestic refrigerators are in greater demand not only for the house but for small shops. The multiplication of bacteria in food is minimised by the elimination of heat, but the ordinary ice box will not give a sufficiently low temperature, *i.e.*, below 50° F. for this and, furthermore, the supply of ice in this country is uncertain and troublesome. There are on the market refrigerators operating on the ammonia absorption system which required some form of heat to cause the circulation of the refrigerant and also a supply of cooling water to abstract this heat. The motor driven compressor type is, however, in more general use, although somewhat higher in first cost.

Many electrical appliances, more especially vacuum cleaners, which have done so much to dispel the spring cleaning bogey, are being sold direct to the consumer by manufacturers as in America. Good business is now being done in wash boilers and washing machines which, with hire and hire purchase facilities, can be obtained at prices within the reach of many householders; thus another household problem is solved by the electrical method. Irons, toasters, fans, hair dryers are in general use and other purposes to which electricity has been recently applied in the home are medical lamps and wireless. "All-mains" sets are fast replacing the older type in which batteries and accumulators require constant attention. It is said that in America to-day, very few receiving sets employing accumulators or batteries are made.

A great deal has been said of late about the reduction in the cost of generating electricity which to-day has, for the most part, reached a high degree of efficiency. The cost of distribution mains, however, forms the major part of supplying domestic consumers, and until a substantial reduction in costs is made in this direction a further fall in the charge of electricity for domestic purposes cannot be anticipated. These



Electric kitchen on wheels used by a Canadian company. Information as to costs can be obtained from N.E.L.A., 420, Lexington Avenue, New York.

costs are felt particularly by the small undertaking, and one looks forward to the unification of our industry when the development of the business is left to large and efficient undertakings able to give efficient service at the lowest prices.

BIRMINGHAM ELECTRIC CLUB.

We regret that in the report of the annual dinner of the Birmingham Electric Club, which appeared in our issue of last week, the name of the Lord Mayor of Birmingham was incorrectly given as Alderman F. Samuelson instead of Alderman W. L. Lancaster.

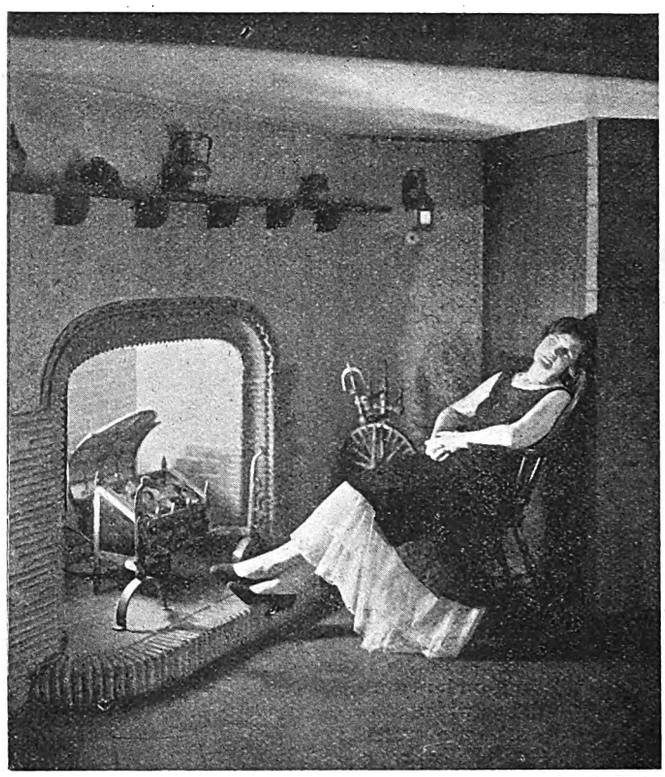
SELLING WOMEN ELECTRICITY.

Sympathetic Imagination—Symbolism or Realism—Demonstration the Most Effectual Salesmanship—Value of Illustration.

By WARWICK HOLMES.

WHAT many salesmen and development engineers take long to realise is that in introducing mechanical appliances and electrical services to non-technical audiences they must think and talk *ob*jectively and not *sub*jectively. It isn't what electricity *is*, it is what it does that matters. A dissertation on the constitution of the tool is subjective; an exposition of the results of its performance is objective. Women read beauty columns of magazines not to learn the chemistry of lipsticks, but to feel more confident about the lure-power of carmine in certain environments. Scientfiic and electrical toys have brought fathers back to the nursery; radio mania has made screw-driver parties of musical evenings, the air is vibrant with volt and amp. prattlings of adolescents; but woman, the traditionally illogical, remains objective. The thought process yields questions of this kind: "What is it for? What will it do for me? What will it cost to use? Will my servants understand it? . . . Above all, "Will it deliver the goods? . . ."

That is why I believe much advertising space and money is being wasted together with equivalent volumes of salesmen's breath by advertising and sales policies which tell, either laboriously or imperfectly, of some process in the manufacture of an article. A verbal close-up of a professor's tenacity in discovering an incorrodible and non-oxidisable resistance wire for culinary application may be thrilling to boys at the polytechnic, but leaves the Eve of any age as cold as Britannia. This supposed advertisement, which is, of course, purely imaginary, is not untypical. Sympathetic imagination and an everlasting desire to know how other people live should activate the grey matter of our directors, our advertising consultants and copywriters—above all, the man who meets the woman face to face—the Man behind the Counter—the Man with the Bag and Book.



G.E.C. Photo.

". . . talk to women like men who know they are very much like themselves. . . ."

It is not because I think the face-to-face salesman any less important part of the plant that I name him last, or because I think advertising policy any more or less important than sales technique. Whether in the board room or the show room, the same set of psychological considerations govern the success of a sales' policy. Audience behaviour study is as important for the originator as for the administrator of sales promotion methods. Sauces have been boiling over for the last hundred years, but did more harm to the open type heating elements of electric stoves than to the robust constitution of their coal-consuming forbears. The answer to "Will it deliver the goods?" is neither the close-up of the metallurgical professor, nor the unconvincing figure of a quite unnecessary *palais-de-danse* housewife, but just a woman like the one you think would use the goods best who might say to you "Spilled sauces won't stop your Dreadnought."

To add another illustration, think of electric lamp salesmanship, much of which I insist is clever and undoubtedly has the desired ratio of effort to result. Would you expect women to open their purses to the research story of a glass works, or to read that "you-find-needles-in-a-bundle-of-hay-with-Superlite," and then order a dozen? The home beautification and becomingness which results from artistic electric lighting is a fine example of selling women electricity. The man who writes "Oil lamps put years on our grandmothers, but Overlux takes them from *you*," knows something of how other people live.

Whether because of a lag behind the rest of Europe in the artistic perception of our mediocrity, or because of a squared-toed British liking for what is called "the real thing," symbolism in advertising and salesmanship is nothing like as popular as on the Continent. In Germany it is very successful and much believed in by sales managers of domestic utilities. There are national advertisers who have spent hundreds of thousands in Great Britain in establishing and maintaining the popularity of some personality. Many now regret it owing to all kinds of difficulties, limitations and inflexibilities which a personality involves. The tendency to model an advertising figure towards some ideal remote from the product, the popularity of which it is intended to promote, is not as uncommon as you might think. With the curious idea that female figures used in connection with advertising domestic appliances to women should be packed with sex appeal, studios have been asked to evolve the most ineffectual "bits." These curious, presumably man-entangling creatures have long silken legs, tiny hands and feet and eyes like an empty room. They manipulate refrigerators, vacuum cleaners and all kinds of appliances without effort, but without conviction. They are a sort of Rhine maiden out of water.

We set out to talk about selling women electricity. Now the kind of woman a woman wants to see using the goods you want her to buy is a woman like herself—or, in less self-sufficient cases, like she'd like to be. Why not illustrate them? Nobody ever does. There *are* women, of course, like the *palais-de-joie*, creatures beloved of advertisers, but they don't get homes, and therefore don't buy vacuum cleaners. If you're going to have realism, why not be square-toed and illustrate advertising with some reference to fact? Anyway, what have our handsome men done? Why always illustrate this domestic appliance, advertising for women with pictures of more women? It is on lines like this that I think there is room for original thought.

All those questions to which an intelligent woman investigating domestic electrification demands an answer are replied to convincingly by demonstration. That is why demonstration is the most effectual salesmanship. That is why I consider model flats, cookery talks and showroom kitchens of the greatest value in propagating the electrical idea. Practical sales people know that demonstration is the sure way for securing orders for electric cookers, heaters, refrigerators, vacuum cleaners and electric laundry appliances. The training of demonstrators and continual interchange of experience by discussion in conference is therefore important. Because I believe in this, I have written often in the home magazines urging women to have everything demonstrated till they are sure they know it backwards. Demonstrators who are showing the same appliances day after day should beware of acquiring actions like conjurers. This legerdemain makes an audience feel that "any fool" could do it until

Digitized by Google

they get home and try it by themselves with nothing but a maker's handbook between them and a machine which has neither eyes nor ears and speaks not. Selling women electricity demands the resourcefulness which will allow a " prospect " to start and stop a washing machine herself, to try a pillow case through the ironing machine, to regulate herself the heat of an oven by manipulating the switches.

Readers of home and women's magazines and the home pages of daily and evening papers throughout the country are familiar with the kind of practical article designed to acquaint women with electrical conveniences. These articles are generally contributed by writers as expert as editors are able to find, and illustrated with the best photographs the contributor is able to secure from the manufacturer. The latter can have no idea of being conspicuous in editorial pages through having available for publication really good photographs or they would surely instruct their service agents or someone on the sales staff to secure the kind of photographs which ensure publication.

Few manufacturers in Great Britain get further with the art of illustration than instructing an operator to make some painfully accurate photographs of their goods. These are subsequently painted up to look " too good to be pure " and are reproduced in an oppressive way on a white background. This sort of illustration is useless to editors and stands no chance of publication. Selling women electricity in home magazines demands natural pictorial photography. Genuine domestic backgrounds are wanted. The pictures need healthy composition, intelligent lighting and must combine eloquent and demonstrative qualities. The manufacturer may be forgiven if he cannot suggest where such photographs can be made. The electrical contractor and sales department of supply undertakings cannot be forgiven, for both of them are in touch with the women who buy and use electricity. Such photographs are wanted every day by editors and journalists, and yet they are most difficult to obtain. Manufacturers will willingly spend £40 for a page advertisement, but will grudge £5 for a set of good photographs suitable for illustration of an editorial article for consumer readers. Illustrations of how foolish this is arise every day when I and my associated authors are forced to illustrate articles with photographs depicting goods of manufacturers who are not advertisers. This is because the advertisers' photographs are not suitable for editorial illustration, and those of the manufacturers who do not support the magazine are in every way what the editor wants.

Selling women electricity comes to this: Don't tell them what electrical appliances are, but what they can do; don't have soppy models in your advertising; talk to women like men who know they are very much like themselves; have more and better trained demonstrators; don't be mean and unperceiving about the value of photographic illustration.

E.D.A.'s ANNUAL REPORT FOR 1929.

Marked Progress in All Branches—Gratifying Increase in Membership—Financial Position—Appeal to Non-subscribing Undertakings.

MARKED progress was made in all branches of the Association's work during 1929. There was a gratifying increase in membership, and three additional provincial area committees were established.

During the year 34 additional supply undertakings were enrolled and eight undertakings adopted an increased rate of subscription. This satisfactory development is attributable to the great increase of interest in the Association resulting from the work of the area sub-committees and officers.

Large numbers of visitors attended the Industrial Electric Heating Exhibition organised in Manchester. The sub-committee concerned also organised a section at the Bradford Engineering Society's Exhibition.

The Exhibition Advisory Sub-Committee, in addition to assisting the organisation of a number of electrical exhibitions, undertook the complete organisation of displays at Ealing, Torquay and Brighton, and provided and maintained an exhibit at the North-East Coast Exhibition from May to October. The 1 314 film displays were attended by 49 122 people. Over 200 persons attended the E.D.A. Conference at the British Industries Fair. An impressive display of four stands was provided by the Association at the Manchester Smoke Abatement Exhibition in November.

In the course of the E.D.A. national advertising programme of 1928–29 209 advertisements appeared and 27 932 direct replies were received. Stereos sold for additional local advertising numbered 234, and 345 window displays were sold.

Each month throughout the year the Association issued a sales and publicity programme which provided a valuable link between the national propaganda of the Association and local publicity and selling schemes carried out by suppliers and contractors.

The special committee, appointed in May for the purpose, has been responsible for the E.D.A. Electric Homes (Outlet) campaign launched last September. Well attended conferences were held at the end of that month in London, Birmingham, Leeds, Manchester, Newcastle, Glasgow, Edinburgh, Bristol and Cardiff. Of the campaign programme 4 600 copies were issued. By the end of the year the first edition of 300 000 copies of " The Home You Want " was practically exhausted, and a second edition was placed on the press.

The E.D.A. electric homes national wiring specification has now been adopted by the Council. A number of demonstration houses, wired in accordance with the specification, are in preparation.

It is intended that the E.D.A. Electric Homes (Outlet) campaign shall be established as a permanent activity, or at least be carried out for a number of years.

Record attendances were secured at the first three conferences at the Royal Society of Arts of the 1929–30 session, which fell within the year covered by the report. The editorial press service has been extended. It is estimated that 10 000 persons were directly addressed at the 147 lectures given by Mr. G. S. Francis, of the E.D.A. staff.

The Association has undertaken to investigate and report to the British Indian Electric Committee upon the question of co-operative propaganda suited to Indian conditions. The expenditure is being borne by the Committee.

Membership of the Association at December 31st, 1929, included 349 electricity supply undertakings (+29), and 1 711 manufacturers, contractors and wholesalers (+114), a total of 2 060 (+143). The supply membership now represents 81% of the total output of the country. New members in 1929 were:—

Municipal undertakings: Bingley, Bromley, Buxton, Caerphilly, Clitheroe, Ealing, Eccles, Hammersmith, Heckmondwike, Loughborough, Mold, Rathmines, Rochdale, Spenborough, Swinton and Pendlebury.

Company undertakings: Leicestershire and Warwickshire Electric Power Co., North Wales Power Co., Cumberland Waste Heat Owners Co., Ltd., Electricity Supply Board, Dublin, Electrical Development and Securities Trust, Ltd., Jersey Electricity Co., Ltd., Llanwrst Electric Supply Co., Ltd., Midhurst and District Electricity Co., Ltd., Newquay Electric Supply, South-East Yorkshire Light and Power Co., Ltd., Truro Electric Supply, West Cornwall Electric Supply.

Oversea undertakings: Auckland Electric Power Board, Brisbane City Electric Co., Ltd., East African Power and Lighting Co., Rio de Janeiro Lighting and Power Co., Singapore Municipal Council, Waitemata Electric Power Board, Société Electrique de Production S.A. of Athens.

Undertakings adopting increased subscriptions were: Bath, Birmingham, Oldham, Stafford, British Power and Light Corporation, Northampton Electric Light and Power Co., Midland Electric Corporation, Worcester.

Revenue from subscriptions in 1929 amounted to £31 974, against £37 377 in 1928, the decrease being accounted for by a reduction of special subscriptions towards the factory and workshop lighting and refrigeration campaigns from £7 650 to £1 000. The annual subscriptions totalled £30 974 in 1929, compared with £29 727 in the previous year.

The report concludes with the following statement:—

" The Association is having a very definite effect on public opinion, and is undoubtedly assisting very largely the cause of electrical development and contributing to the prosperity of the industry.

" Every electricity undertaking and firm in the industry are benefiting from this work, whether they are members and subscribe to the funds of the Association or not; non-subscribers are in fact receiving benefits for which others have paid.

" The Council, therefore, make an earnest appeal to all electricity supply undertakings, and all manufacturing, wholesale and contracting firms in the country to support the Association by becoming members and subscribing to the funds on the prescribed scale."

SAFETY IN DOMESTIC ELECTRIFICATION.*

"Effective," "Ineffective" and "Criminal" Earthing—Distrust of 3-core Flexibles—Case of Appliances with Lampholder Adaptors—Factory Experience—Insulation the True Ideal.

By T. C. GILBERT.

FOR the moment let us assume that our contractor is installing a screwed steel conduit system in his valiant attempt to obtain his completely earthed job. We will follow him a little further along his perilous path. The actual conduit complete and continuous, another difficulty arises, for we will assume that the supply authority is one that will not earth service cut-outs or meter casings. Is our contractor to earth his adjacent main switch-fuse? If he does he is probably laying a trap for some unwary person by providing a convenient earth connection for a possible fault on meter or cut-out, not at all unlikely when we take into account the positions in which such apparatus is often fixed. If he does not earth it, as his inclination will probably be, he will find himself up against his consultant, to say nothing of the disapproval of the Register, and so the trap will be laid as the easiest way out for our harassed contractor.

Improved Earthing.

Three-pin plugs and sockets will, of course, have been fitted throughout the house and all appliances will be earthed, *without* the assistance of the manufacturer, as has been pointed out above. Earthing devices having been improvised on most of the appliances and improved on others, the earthing of them will fall into three categories—effective, ineffective and criminal.

Under the first heading we will put the cooker, geyser or water-heater and similar apparatus, these all being screwed direct to the conduits or to feed-water pipes. (We will not mention the possibility of high resistance between hot-plate and hob, reaching in one instance, quoted by "Megohm" of the "Electrical Times," the value of 100 megohms, as this is not common except where hot-plates have been replaced by other makes.) Under the heading "ineffective" we will place all apparatus connected and ostensibly earthed by 3-core flexibles and further depending upon 3-pin plugs and sockets. Practical experience leads our contractor completely to distrust 3-core flexibles and their connections, and he is confirmed in this view by the foremost earthing advocates, as will be shown later. Messrs. Reyrolle state in their booklet, "The All-Earthed House," that reliance cannot be placed upon 3-pin plugs and sockets, and we must consider that they have full knowledge of this subject. There is thus a double possibility, almost a probability, of failure, and each failure may mean a life, but we will be content to leave the ordinary appliance connected by this means under the heading of ineffective, even if it should happen to be the electric kettle used together with, or in the neighbourhood of, an earthed cooker, when it should rightly come under the heading of "criminal."

Under this latter heading I shall include bowl radiators, toasters, artificial sunlight projectors—in fact, all apparatus with an exposed element or live point with which it is possible to make contact; also earthing the chains and metal work of bowl fittings and the metal case of the h.t. battery eliminator fed from d.c. supply. I would also, in view of my own experiences, include under the "criminal" heading the earthing of all portable medical apparatus.

The proved unreliability of earthing when effected by means of 3-core flexibles and 3-pin plugs should really cause us to place *all* apparatus so connected under the heading of "criminal," as suggested above, especially where reliance is placed upon any wiring system except heavy screwed conduit. I may perhaps be permitted to recapitulate the weak links in the chain: the failure of earth conductor or connections in 3-core flexibles, open earth circuits in 3-pin plugs; the use of unsuitable or unreliable wiring systems; the vital question of workmanship; and the possibility of failure of the main earth connections, which is very common, as all practical engineers know. With all these weak links real protection can only be a happy chance and earthing would appear to be completely unworthy of our serious attention.

This terrible unreliability of earthing is not denied but, in fact, stressed by the foremost advocates of earthing. I may perhaps be permitted to quote one or two of their suggestions for overcoming it.

The able advocate whom I have already quoted, Mr. W. R. Rawlings, A.M.I.E.E., states that earthing by ordinary means with ordinary systems is "a menace and a false security." Mr. Rawlings' utterances on this subject reveal long experience of the difficulty and deep study of the problem. As we know, his remedy for this unreliability is the universal use of the earthed concentric system, concentricity being maintained right down to the lamp and appliance. This I have already dealt with above. Mr. H. W. Clothier, M.I.E.E., in an article on earthing in the "Electrical Review" of March 18th, 1927, makes the following amazing proposal in dealing with the question of the failure of the earth connection:—

> "A simple way of checking its continuity is to use the earthing conductor as a common return for the ordinary electric bell system of the house, coupling one terminal of the remote bell pushes to the end of the earth wire and the corresponding pole of the battery to the nearest part of the cold water system. An accidental break in the earth wire would then be detected by the failure of the bell to ring and, this indication having been given, the break could readily be found because the earth wire is on the surface and the connection to the water pipe visible."

This terrible proposal is repeated in a reprint of the article, included by Reyrolle and Co. in their booklet, "The All-Earthed House," but again no attention is given to the possible extension of the mains voltage on to the electric bell system by this means with all its ghastly possibilities, which has apparently not occurred to the author. It only needs the failure of the connection of the earth wire to the water pipe, or a break on its way there, seeing that it is bare and visible and therefore liable to damage, and a fault to occur on any piece of earthed equipment, to put 230 V a.c. on to the bell pushes, with all its powers of fire and death (Fig. 2). As pointed out by Mr. Clothier, the bells will cease to ring, so that somebody, possibly the householder himself, will commence to tinker with them, and although he may fail to make the house bells ring, I am prepared to gamble that he will be more successful with those in the churchyard! Surely this is a remedy worse than the disease it is intended to overcome, and when we consider the existence of a bell push over the bath I think we should be justified in placing this remedy under our "criminal" heading.

Mr. R. H. Rawll, A.M.I.E.E., another well-known complete earthing advocate, notably in the "Electrical Review" for February 11th, 1927, confesses his complete distrust of earthing in a further interesting article in the same journal (August 16th, 1929) entitled "My Electric House." He states "There are two power-plug sockets in the dining-room and kitchen, and one in each of the remaining rooms, with the exception of the bathroom, which is not so equipped for safety reasons." I quite agree with Mr. Rawll that it is far better not to instal power, or any other plugs in bathrooms, but then I do not believe in earthing as a safety measure, whereas Mr. Rawll does. Surely he has only to earth such portable apparatus as is used in his bathroom and thus achieve safety? As Mr. Rawll himself remarks at the beginning of the article, "It is well known that very few electrical men practice what they preach as regards electricity in the home."

Laying a Trap for the Public.

Mr. W. T. Taylor, M.Inst.C.E., M.I.E.E., author of "Electricity Supply Transformer Systems," in a letter to THE ELECTRICIAN of August 15th, 1929, states:—

> "Wiring installations based on present-day regulations do not provide a cure for the public from circuit hazards and dangers—to have one earth connection at the supply end only and then to earth each fitting independently is not much unlike laying a trap for the public unknowingly and accidentally to fall into at some time or other—it is not a cure and the provisions are not really and truly safe."

At the recent I.E.E. debate already referred to, Dr. Ekström pointed out another serious snag—the difficulty, if not the impossibility, of securing an earth connection of sufficiently low resistance in country houses or farms. In view of the vast rural electrification schemes that are now going forward, this question requires really serious investigation. Here are potential consumers who will shortly be coming on to the

* The first part of this article appeared in last week's issue.

Digitized by Google

mains not in dozens, but in thousands. How are we to protect them in the use of their portable apparatus ?

It can, of course, be said that a contractor who holds these curious views can always please himself—where no consultant or other authority is concerned—as the I.E.E. Regulations are not the law of the land and he is not, as yet, compelled to adhere to them. This is perfectly true, but he at once lays himself open to the charge that his work is " not in accordance with the regulation " ; probably the registration authorities will also have something to say on the matter should it come to their notice, as omitting to earth is one of the deadly sins, especially abhorred. Should a consultant or supply authority insist upon the regulations being strictly adhered to, the responsibility will then rest upon their shoulders, but the earthing in the past he has sooner or later fallen down with a bang, and he sees no reason why electrical progress should fall down with him. Hence his welcome to the saner type of accessory.

It is not the easiest thing in the world to persuade clients to accept these accessories, especially when their hearts are set upon some of the fancy metal finishes ; but the fact that the contractor *can* persuade them is, I think, another proof that he is not always seeking the easiest path, but considers his clients' safety even up to the point of selling them something that they are not enthusiastic about.

To be constructive, is it not possible to extend the all-insulated ideal beyond our accessories—to our appliances ? Even if the idea of eliminating *all* metal from our domestic

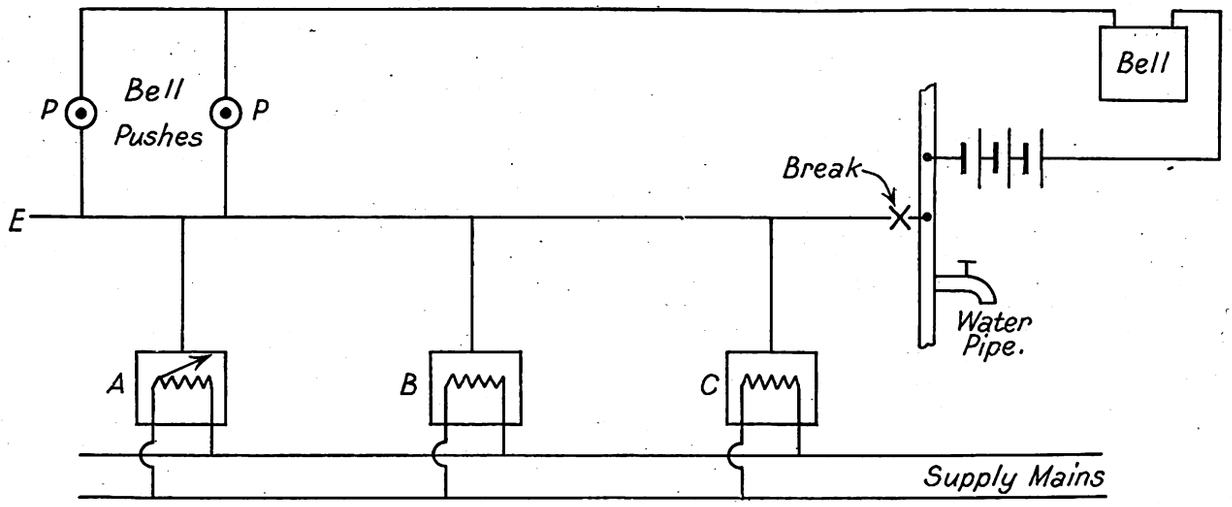

Fig. 2.

A, B and C are appliances connected to the supply mains, with their metal casings earthed to the earth wire E; break in E is shown at X, with simultaneous earth fault on appliance A. Result: The full line voltage exists between the terminals of the bell pushes P/P. Also the metal casings of A,B and C, and of all other appliances connected, are at full line voltage above earth.

contractor will almost certainly be blamed for the failure of any earthing devices fitted, although he may have had no say whatever as to whether they should or should not have been provided.

Appliances Purchased from Stores.

Whatever care is taken by a contractor in his installation, whatever forethought he has expended in consideration of his client's safety from shock or worse, all can be set at nought by the unrestricted retailing, by primarily non-electrical stores, of the various type of electrical appliances that have a popular appeal. The majority of these appliances are fitted with lampholder adaptors, extremely useful although very much abused attachments. It is not possible under present conditions to prohibit the use of the lampholder adaptor, as advocated in some quarters, even if it were desirable to do so, but while it is in existence real earthing continuity can be but a dream. Very few of the appliances that are purchased through stores are ever seen by a contractor until some fault or other develops on them—usually sooner than later, as the electrical qualities of the appliance are not generally the stores' first consideration—so it would appear on the face of things that any steps taken with the idea of promoting a greater degree of domestic safety can only begin with the treatment of the appliance itself, seeing that we have now condemned the external method of protection.

The charge that is so often laid against contractors, that they are indifferent to the question of their clients' safety, is not well founded. This is proved, I think, by the enthusiastic way in which the average contractor has welcomed the advent of bakelite or similar wiring accessories and is using them to a greater and greater degree. This is in spite of the fact that such accessories are almost invariably more expensive than the ordinary metal type, and it is practically certain that in most cases this slight extra cost is borne by the contractor himself. Also, although stock breakages are greater, the contractor is pressing manufacturers for an extension of the range of bakelite accessories to cover practically all his requirements. He knows their complete insulation will ensure the safety that he has so long sought and that it will not be merely problematical ; he knows, too, that when he has relied upon installations—which I have seriously advocated in other quarters and still think possible—is too Utopian (Gilbertian is Mr. Rawlings' word !), cannot we find a sort of halfway house to this ideal and concentrate upon improved insulation ? There is little doubt that contractors would seize upon such improved appliances with as much eagerness as they have exhibited towards the insulated accessory, and even manufacturers seem to be coming round to this way of thinking.

So much so, that I believe a sustained demand from the installation side for appliances in which the first consideration had been insulation and not appearance or price would lead to the development of a new type which would again lead to the solution of our problem. The President of the E.C.A., Mr. Willoughby Ellis, at the recent annual dinner of the Association, made an earnest plea for the supply and use of better appliances and apparatus. If only we could guide this improvement mainly into the channel of complete, or at least improved, insulation, we should be conferring a benefit upon the consumer, the contractor, and above all the electrical industry in general, by completely solving the danger problem.

What signs are there of a move in this direction ? At the I.E.E. debate already referred to I exhibited a hairdryer with its outer casing completely constructed of an insulating composition, and without any external metal such as screws, nuts, etc., whatever : it excited great interest and was apparently new to many engineers present. It was of Continental manufacture, of course, but that will not prevent many of us making it standard for the future, representing, as it does, practically 100% safety. I am certain that our own manufacturers could supply this type of appliance if only sufficient demand were made for it.

Cleaners with Insulated Switches.

One of the best-known firms manufacturing suction cleaners is now supplying its machine fitted with an insulated switch, flexible rubber hand grip and cord protector ; that is, all parts normally handled by the operator are non-metal. Further, they have provided insulating bushes between the body of the machine and the main steel tubular portion of the handle, which should effectively prevent this becoming alive from motor faults. It is practically impossible under ordinary

Digitized by Google

conditions for an accident to occur with such a machine, and this arrangement represents a greater degree of safety than any earthing device could possibly provide. Even electric drills are now obtainable with insulated bodies.

If such articles as electric irons were constructed with completely, instead of only partly, insulated handles, and an insulating shield fitted over the top of the iron, we should be getting nearer our ideal. Heating and cooking apparatus, of course, presents the greatest problem for the insulator, but it is almost impossible to obtain a shock from the coloured portion of many electric irons that are provided with the attractive porcelain-enamel finish, or from the many types of vitreous enamelled radiators and cookers. The danger points on these various appliances are the, usually, nickel-plated heads of screws or bolts with which the exterior is fairly well sprinkled, but it should not represent a very great problem to eliminate these.

New Insulating Materials.

In connection with portable heaters and cookers, further developments in insulating materials will probably assist the solving of the danger problem. For instance, Micalex, which is of great electric strength and apparently unaffected by high temperatures, will provide us with a material that may possibly prove to be a substitute for metal in several directions. Although this material as at present available requires a moulding temperature of something around 400° C., yet test results suggest that its application is worth serious study.

I am *not* abandoning my ideal of the complete elimination of all metal from domestic installations, yet for the present I should be satisfied with the halfway house that I have indicated, that is improved insulation and the abandonment of the earthing idea as an ideal, to be retained only for such cases where it may prove to be impracticable effectively to insulate. I firmly believe that manufacturers are developing the insulating mind, and it is up to us to stimulate this development.

Having got rid of all our metal appliances and accessories in our domestic installation, the logical thing to do will be to eliminate our metal conduits with all their disabilities and lack of flexibility when extensions or alterations have to be considered. Luckily we can do this forthwith and quite easily, tough rubber cables forming an excellent substitute for the more cumbersome systems. I believe that it is only the innate conservatism of the average consultant and architect that prevents the great advantages of tough rubber wiring being more generally recognised. Corrosion and vermin proof, this system should prove ideal for our rural electrification schemes, as for farm and similar work there is nothing to equal it for reliability.

With our metal conduits gone, and with service cut-out, meter casing and all accessories constructed of insulating material, we are well on the road to our goal, and only require a range of all-insulated main switch fuse gear to provide a practically safe installation. Rumour, although sometimes a lying jade, states that we shall not have to wait very long for this, which is excellent news for our contractor. The provision of non-metallic standard lamps and other fittings is, of course, a very simple matter.

It is often pointed out to me that if only the earthing clauses of the Regulations were made compulsory for all installations, in the same way that they are compulsory for installations in factories and workshops, all would be well, in the same way that all is well in the factories, presumably. In fact, so persistent is this belief that there is a definite move in one quarter to try and bring this into effect by means of suitable legislation. I am afraid I cannot accept the statement as very convincing when we come to examine the record of accidents in factories. Under the Factories and Workshop Act compulsory earthing has been in force for many years, yet we have to record over 200 fatal, and hundreds of non-fatal accidents in factories and workshops, in 15 years, all on pressures below 250 V. A large proportion of these accidents were due to the failure of earthing devices, and, if these cannot be made reliable in a factory, where everything favours earthing and nothing else has to be considered except safety, then we cannot place much reliance upon them in the domestic sphere, where appearance must be considered to a certain extent and frequent inspection is impossible.

Further, I do not think that conditions in a factory and the conditions in the home can be considered as even faintly approximate: in the factory we have at least semi-skilled operatives handling electrical equipment with which they are familiar from long experience, but in the home we have completely ignorant users of electrical appliances, not forgetting the large amount of apparatus now handled by children.

On top of this, we find the following significant paragraph in the report of the Senior Electrical Inspector for Factories and Workshops for 1927:—

> "The general adoption of lampholders made entirely of insulating material in respect of the external parts would go far towards eliminating lampholder fatalities."

Thus, even in the factory, insulation must be resorted to eventually to ensure absolute safety; it is, therefore, certain that it will prove equally essential for the domestic installation. And of course we all know that the "Home Office" type of lampholder and handlamp is a completely insulated job; let us get down to "Home Office" appliances. Complete insulation cannot, and need not, be seriously advocated for the factory; we are dealing with the domestic installation where undoubtedly the greatest risks exist.

It is further suggested that the education of the public regarding the handling of electrical apparatus would also make for a greater degree of safety; as Mr. L. B. Atkinson said at the Cheltenham Conference, "It was the industry's duty to let people know that they could not play the fool with 250 V when they might be in contact with an earth."

This is perfectly true, but the task is not easy: the public does not want to be educated, and is apt to take fright at the mention of the word "shock" unless the contractor, upon whose shoulders the bulk of this educational work falls, is extremely tactful. I have known cases where people have been perfectly reasonable about the danger question themselves, and take all the necessary precautions when handling portable gear, but they will not permit the use of such apparatus in their nurseries, or anywhere that children are likely to handle it, to the detriment of the industry in general.

It is a very sad state of affairs if, as we advance to the attack upon the great number of unwired houses in this country, armed with a list of advantages of electricity in one hand, we have to carry a red flag in the other. We were told by several speakers at the E.C.A. dinner in January of this year of the vast amount of domestic business waiting to be done. Surely this should be worth the devotion of serious study by the industry directed towards the elimination of the danger menace. With a satisfactory solution we need never mention "danger" again, and any contractor who has attempted to explain to an old lady client exactly what an "earth" is (at the same time trusting to luck that she will not cancel her order for appliances) knows what an inestimable benefit this would confer upon the industry.

Education cannot take the place of fool-proof appliances, and I consider it the duty of the industry to evolve such safe appliances. Many of the articles we are to-day placing literally into the hands of the public—and their children—are flimsy and dangerous; even the best that we can procure do not represent what we *should* be able to get, and *could* get with a change of ideas as to what constitutes safe appliances and what does not. The purpose of this article is to try and elicit what the average contractor and manufacturer really does think about it all.

Revision of Outlook Needed.

The careful reader will have gathered that this is no attack upon our Regulations. I am not advocating the scrapping of any portion of the Regulations, or even an evasion of them, but rather a revision of outlook more in keeping with present-day problems. At the moment the ideal is earthed equipment, with a permissible substitution of insulated appliances or accessories. I want to reverse this and make insulation the ideal, with the substitution of earthed metal equipment permitted *only* in the event of the impossibility of obtaining an insulated pattern. That this would make for practically certain safety is generally agreed; contractors know it, and should strain every nerve to see that manufacturers learn it also. Improved insulation, if complete insulation is impracticable at the moment, should be our ideal, and I have little doubt that before long complete insulation will prove to be easier than has been admitted up to the present.

Earthing is effective and sound in some cases, especially where fixed apparatus is concerned, but there is no reason why we should ride the earthing idea to death and hail it as the only, or at least the most effective, means of protecting the user of portable apparatus. The electrical industry must grapple with this question of domestic safety, and I do most seriously suggest that the matter be considered from what will be, for many, a new standpoint. Earthing has had a good innings, and yet to-day stands discredited in the eyes of the practical man; why not give insulation a trial?

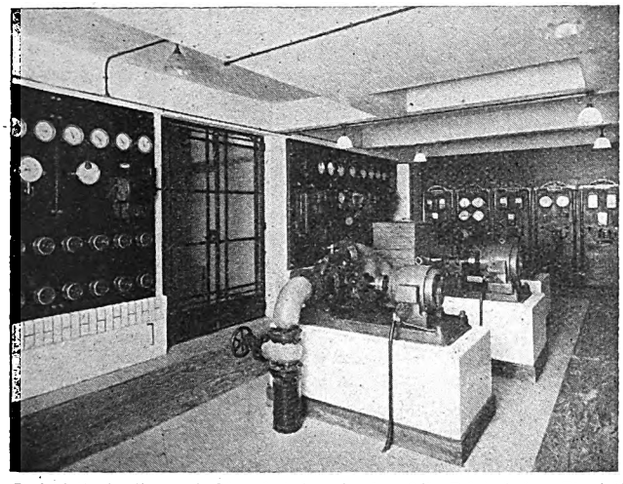
PROGRESS IN ELECTRIC WATER HEATING.

Geysers—Thermostatic Control—Night Storage—Heating of Buildings—Electrode Boilers—Direct Operation from 3-phase e.h.t. Mains.

By PHILIP KEMP, M.Sc., M.I.E.E.

THE earliest attempts to heat water by electricity on a commercial basis consisted of the introduction of resistance coils into water containers of relatively small capacity. By the expenditure of a considerable amount of energy in a short time, the necessary supply of hot water was obtained. The next stage in the development saw larger vessels come into use, and the principle of thermostatic control began to be utilised. The subject of thermal storage now began to attract attention, the prospect of a long-hour night load being particularly welcome to supply undertakings. In spite of the low tariff rates which could be granted for this class of load, however, there was little further development beyond apparatus of 20–30 gallons capacity, until the electrode boiler came into the field as a practical engineering proposition. This type of apparatus is specially suited for the heating of large quantities of water, since it can be operated directly off a high tension supply.

The first type of apparatus may be compared with the gas geyser, and might be described as a local system in which a hot water container, complete with its own heater, is fixed



Part of the heating control board at the extension of the Polytechnic. The full load capacity of the electrode boiler plant is 1 850 kW at 6 600 V.

in close proximity to the fitting which it is intended to serve. There is a great field for commercial development in this direction, in view of the many thousands of small domestic hot water systems already in existence, in which the heat at present is obtained from a range boiler or from a separate gas or coke-fired boiler. In small and compact systems, immersion heaters, each of 2 kW capacity, may be fitted in the storage tank which is probably of 25–40 gallons capacity. The conversion of such systems to electric heating has, however, its own disadvantages. The piping runs are very often inefficient, due to the absence of lagging, and the question of economy is of far greater importance with electric heating than with other methods where the efficiency is so very much lower. Apart from these considerations, a relatively high short-hour load is not one which will warrant the lowest tariff rates. To heat the water for a good bath requires an average of 4 B.T. units, and if the time allowed for running the hot water into the bath is, say, 15 minutes, then a loading of 16 kW must be adopted. Electric geysers can, however, be employed with advantage with wash basins used intermittently. In such cases a 4 kW loading is ample.

The introduction of thermostatic control enabled heaters with a lower rating to be employed. These are kept in circuit all the time until the water temperature attains its maximum value. The thermostat then cuts out the heating elements. When hot water is drawn off, the temperature of the tank falls and the heaters are cut in again automatically. This system differs in certain fundamental points from the geyser principle. In the latter case the heating period is limited to the time during which water is being drawn, and, as this is a very small proportion of the total time, the loading of the immersion heaters must be high. With thermostatically-controlled heaters, the full 24 hours is available for heating, so that the rating of the heating elements is much less. It is not, however, desirable to design the heaters so as to necessitate their being in circuit all the time, as this would render the recovery of temperature very slow after a heavy draught of water had been drawn.

Large blocks of flats are now being successfully supplied with hot water which is electrically heated. The comparison of electric heating in such a case with heating by means of a coke-fired boiler, for example, is entirely misleading, if merely based upon the relative cost of the electric energy and the fuel, since these costs are only a fraction of the total overall costs. The space required by the heating equipment, including fuel storage, chimney, distribution piping, possible annoyance of smoke and dust, labour involved in stoking, and entire dependence upon the efficiency of the stoker are also factors.

In some cases a constant hot water supply is included in the rental of the flat, in which event a group system can be employed, one storage tank supplying a group of, say, twelve flats. The working temperature of these group systems is a matter of importance, and the thermostat should be set for a maximum water temperature of 170° F.

The heating of buildings by means of circulating hot water through pipes and radiators is quite common, but the fact that the water itself can be heated economically by electrical means is not so well appreciated. Small central heating systems may employ the immersion heater to advantage, but there are several important factors which militate against its use in the heating of large buildings. The capital outlay is large as a consequence of the great number of resistance elements required; the wiring of the controls becomes very costly and complicated; and finally, only a low tension supply is permissible. On account of these reasons the immersion heater gives place to the electrode boiler for large installations.

The electrode boiler can only be used on a.c. since electrolysis would be set up on d.c. The liberation of the gases as the result of this action would be highly dangerous. This electrolytic action does not occur on a.c. at commercial frequencies to any noticeable extent, and to eliminate all possibility of trouble due to any small gas bubbles being formed on the electrodes, the water is circulated in the electrode boiler itself, by means of a special circulating pump.

Electrode Boilers and Thermal Storage.

The electrode boiler is eminently suitable for use in connection with a thermal storage installation, taking energy during off-peak hours. The energy is stored in thermal form in large well-lagged water containers, entirely distinct from the electrode boiler itself. A second circulating pump serves to transfer the thermal energy from the boiler to the storage vessels. Such a plant can be operated directly from three phase e.h.t. mains, the boiler shell being efficiently earthed as this forms the star point of the system. As the water in the boiler heats up, its conductivity increases, and steps are taken to ensure that the load shall remain constant.

The storage tanks attain their maximum temperature at the end of a night heating period. During the following day hot water from the storage vessels is circulated around the piping system and the radiators by means of pumps. A portion of the cooled return water is returned direct to the storage vessels, but the remainder is mixed with hot flow water, also from the storage vessels, by means of a mixing valve which is thermostaticallly controlled. By this means the temperature in the main flow pipe is kept constant, and the temperature of the building does not fall as the day wears on. The whole of the temperature drop due to the expenditure of energy is taken by the water in the storage vessels. The thermostat controlling the temperature of the flow water can be set at any figure, within limits, so that the amount of heat expended on the building per day can be varied to suit the external temperature. After a warm day, a saving can thus be made on the following night's run, by adjusting the load on the boiler.

A heating plant of this type can compare favourably on economic grounds with any other modern system, providing electrical energy is obtainable at a reasonable price, but it must be reiterated that to make such a comparison on the basis of fuel costs alone is entirely misleading.

TRANSPORT FOR CONTRACTORS.

Value of the Small Motor Vehicle—How the 7 h.p. Van can be of Service—Running Costs, Depreciation and Repairs.

By W. A. GIBSON MARTIN.

THE small, utility type of delivery van with a low petrol consumption, and a small initial cost has proved itself an economical and useful commercial vehicle, capable of giving satisfactory transport either as a tender to one or more larger vehicles, or as a service van. Firms operating 15 cwt. or one-ton vehicles frequently utilise their ordinary transport for light loads, merely because there is no alternative and cheaper method: and where maintenance contracts are undertaken, a vehicle much larger than necessary is often pressed into service. In many cases, it is not economical to use a large van; but, apart from this reason, other work may be held up for lack of transport, pending the return of a large vehicle from an urgent job which could have been done more quickly and more cheaply by the smaller type or vehicle.

A 7 H.P. chassis can be fitted with a body adapted for the electrical trades, to carry loads up to half a ton, with a two-cylinder water-cooled engine, giving 40 m.p.g. of petrol, 1 000 m.p.g. of oil, for a total initial cost of £156. Alternative, there are a 7 H.P. and an 8 H.P. chassis with four-cylinder engines, capable of carrying a 5 cwt. load, with about the same running expenses and with an initial cost of about £140. The 7 H.P. is also listed with a body intended to be used as a pay-vehicle, costing £135 10s., and would prove exceedingly useful in the event of large number of men being employed some distance from head office or bank.

Comparison with Larger Types.

The value or otherwise of the small van, however, depends upon the cost of running it: and the running costs, in turn, depend upon the use which the electrical firm has for this type of van. Compared with the 12 to 15-cwt. vehicle, there is a saving in petrol, oil, tyres, duty, and depreciation, while garage, insurance and allowance for repairs are practically the same in both cases. The manufacturers of commercial vehicles habitually quote cost-per-mile figures, but, unless the electrical contractor can form some estimate of his annual mileage, cost-per-mile figures may be very misleading. A daily average five days per week of 20 miles will work out at approximately 5 000 miles per annum. In practice, however, most firms find 40 or more miles on the average for a small van per day, which gives a yearly mileage of 10 000; on this basis, the total running costs including full time driver's wages at £3 per week, work out at £263 per annum. Increasing the mileage to 20 000 (a figure often exceeded by large firms in service work) has the effect of adding approximately £36 to the annual cost.

In the adjoining column are given running costs in detail for 5 000, 10 000 and 20 000 miles per annum. It will be seen at once how the running expenses increase with the mileage, and the standing charges remain the same irrespective of mileage; in other words, the cost per mile for the first group remains stationary, while the cost per mile decreases considerably in the second group of costs as the mileage increases. It is often said that the more a van is used, the cheaper it becomes; this is only half true, for a greater mileage reduces the cost per mile, while it, in reality, increases the total cost. 5 000 miles per annum costs in total £244, which is almost 1s. per mile; if the mileage is increased to 20 000 in one year the total cost is £296, but the cost per mile is brought down to just over 3¼d.

Taking the items in the order given in the running costs schedule, petrol and oil are assumed to be purchased in the ordinary way. If these supplies can be bought in bulk at a cheaper rate, the items under these headings will be slightly reduced. The life of a set of five tyres is assumed to be 15 000 miles; this is a conservative estimate, as many transport operators obtain 20 000 and more from one set. Government duty and insurance are self-explanatory, while the amount of £12 should be sufficient in normal circumstances for the cost of garage. Some contractors do not include this in their running costs, as the vehicle is kept on the premises, the rent or value of which is not increased thereby. To be accurate, however, the motor transport account should be debited with a charge for garage which would have to be met in the event of there being no suitable accommodation on the premises.

Depreciation is, at best, merely a calculation. On the 20 per cent. per annum basis, the van would be written down to nil in five years. In all probability, however, the vehicle would be exchanged after two or three years' use, in which case the commercial vehicle agent would offer approximately three-fifths or two-fifths of the original cost, thus making the exchange allowance correspond with the amount at which the vehicle would stand in the books at the time of exchange.

A sum must be allowed for repairs. During the first year, this should be confined to decarbonising and valve grinding, as the maker's guarantee will be operative during the whole period. During the second and third years, however, repairs must be borne in total by the owners; any balance allowed in the first year and not utilised may be carried forward towards the higher costs of repairs in the following year or years. The allowance under this head has been increased with the mileage, as greater use naturally involves greater likelihood of repairs outside the guarantee being required.

On all three mileages, full-time wages have been allowed. This again is conservative, as it is most likely that the van would be driven by an apprentice or other junior who would be employed in any case where the mileage is only 5 000. In the case of service vans, of course, they may be driven by the electrician, who undertakes the maintenance, and therefore the wage allowance may be deleted. At the same time, it must be realised that to cut costs by permitting unskilled or cheap labour to drive a light van is most unwise, and may possibly lead to greatly increased costs in other directions, chiefly under the heading of repairs.

The small van scores enormously by its ease of handling, its ability to drive right up to the job, its convenience in traffic, and its general speed. It is comparatively cheap to have a special body made for a certain type of work, and to transfer this body from one chassis to another instead of buying a complete vehicle every two or three years. These are all advantages which cannot be expressed in pounds, shillings and pence. Neither can a chart of running expenses allow for the convenience of having a tender to the fleet of one-ton vehicles, or even for the fact that by adding a small van, a single 15-cwt. vehicle is made to be of almost double service to the electrical dealer.

RUNNING COSTS OF 7 H.P. VAN.

PETROL: 40 m.p.g., 1s. 7d. per gallon. Initial Cost, £156.
OIL: 1 000 m.p.g., 6s. per gallon. 20 per cent. Depreciation, £32.
TYRES: 15 000 miles per set of five, £7 16s. 3d. per set.

THE MARCONI LICENCE.

A booklet entitled "The Marconi Licence," published by "The Wireless and Gramophone Trader," St. Bride's House, Salisbury Square, E.C.4, price 6d., post free, explains in simple terms the benefits conferred in the 19 major patents involved. It is written by a leading patent authority who has been long connected with the radio trade. The booklet guides manufacturers who wish to produce receivers and gives essential information to those whose business includes the resale of manufactured instruments and who may be as liable as the manufacturers themselves in any action for infringement.

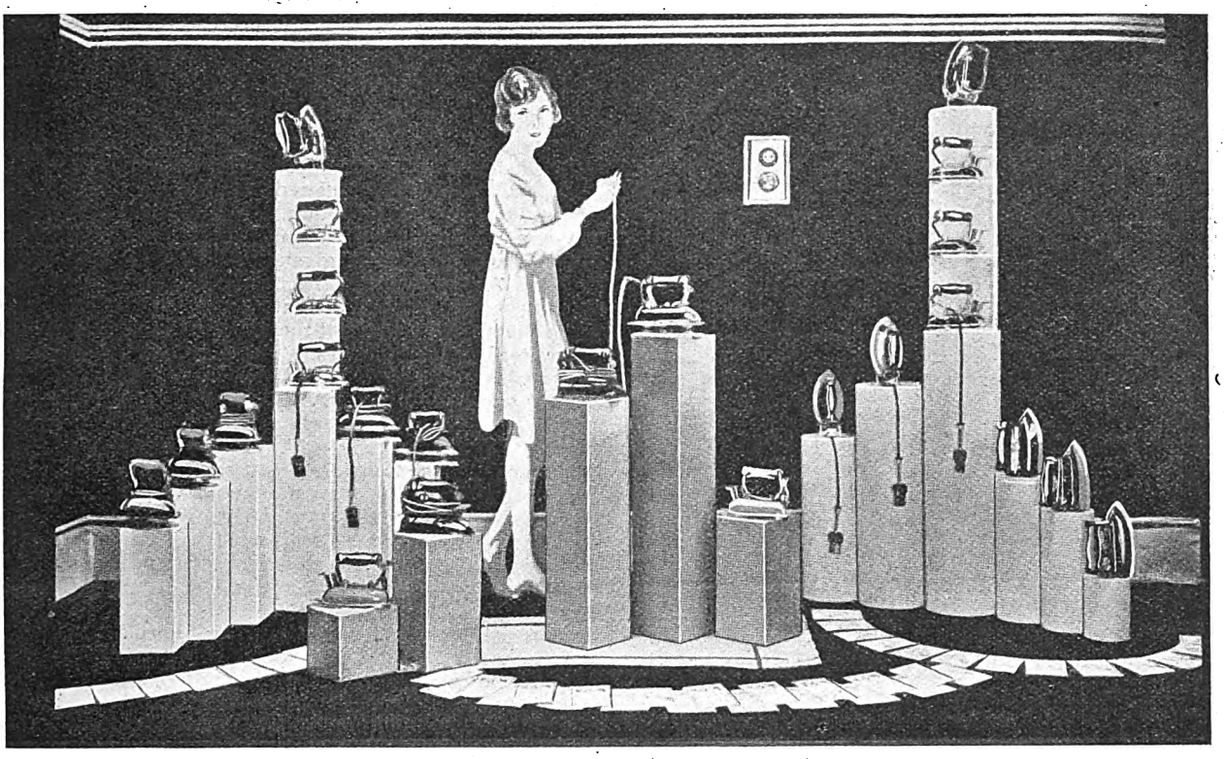
SPRING TRADE PROMOTION.



THE April window display designed for use during the E.D.A. Spring-time Campaign, details of which are given below. A brief list of some of the new appliances developed in connection with spring trade are included in the following pages together with some of the recommendations sent to us by manufacturers of domestic epuipment.

THE end of March proclaims the commencement of spring trade and though the public demand for new fittings, accessories, etc., does not make itself felt until the middle of April, no time should be lost by electrical contractors in arranging stocks and windows in readiness for what should be an unusually successful commencement to the spring and summer demands. Throughout the winter months special propaganda work has been conducted by the Electrical Development Association on the one hand, and the Electrical Association for Women on the other; the Electric Homes (Outlet) Campaign has been active since October last and some thousands of copies of the E.D.A. Electric Wiring Specification have been distributed. Demonstration houses wired in accordance with this specification have been organised in Birmingham, Derby, Bristol, Southport, Burton-on-Trent and Stoke-on-Trent, while special sale conferences have been held each month at all provincial centres.

With regard to the circulation of the wiring specification, which was prepared by the E.D.A. Electric Homes Campaign Committee and recommended for use in the case of small and medium-sized houses, it is suggested that the specification should not be circulated broadcast to the public, but that it should be supplied to anyone making application for it. In the third edition of "The House You Want," which is now ready, the specification is mentioned, and the reader is invited to apply for a copy at the address on the back of the booklet.

The specification, issued by an independent body, should be of definite assistance in this direction. If used by the contractor in quoting for an installation, it should make the consumer realise that the contractor is conforming to a definite standard. On the other hand, the architect or the builder using the specification will feel that this is a convenient method by which to secure tenders on a uniform basis; this will have the result of raising the quality of installation work and securing more adequate wiring. Contractors should note that the association is advertising the specification in architectural and building papers, and will forward a specially bound copy to any architect interested.

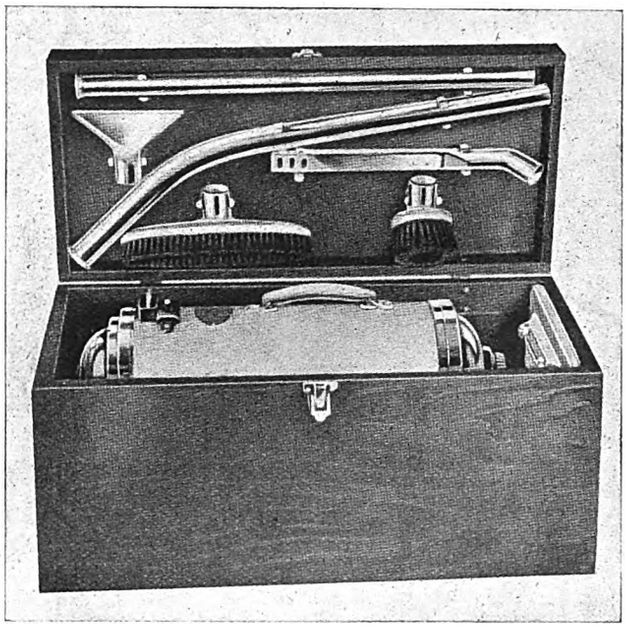
Special literature in connection with spring trade has also been prepared, spring cleaning being covered by no less than twelve new publications, washing and ironing by seven similar booklets, and cooking by a further series of five. Window displays also form part of the E.D.A. spring trade campaign and above is reproduced a specimen window devoted to irons. The components used, including the life-size figure, cubes, etc., are all obtainable from the association as well as the poster also reproduced on this page.

Stocks to carry is always a troublesome question at this time of the year and in order to assist readers as far as possible we give on the following pages a number of descriptions relating to new appliances and equipments, in addition to mentioning a number of items which, though not altogether new, have been either improved or extended in range. We do not claim to have covered the whole of the domestic appliances field, for space does not permit of such a comprehensive survey, but the information given will at any rate serve as a useful guide to the contractor anxious to make the most of spring time possibilities.

Electric cooking devices are always popular when the summer months approach, and in this connection may be mentioned the recently introduced "Arora" oven, which cooks a meal for six persons and can be combined with a portable boiling plate and grill. The dimensions of the oven, which weighs 55 lb., are: height, 21½ in.; width, 21½ in.; and depth, 19 in.; the cooking space is 15 in. by 14 in. by 13 in. The 3-heat switch gives consumption at the rate of ¾, ⅜ or ⅛ units per hour. The

Digitized by Google

finish is black stove enamel. Similarly finished metal table and metal stand are offered for combining with the oven; a special switchboard, with two fuses, two 3-pin plugs for oven and boiling plate, and an extra plug and switch for controlling any other electrical accessory, can also be obtained. With the oven are supplied two wire grid



The "Vac-Tric" cleaner described below.

shelves, also a solid shelf to allow of the oven being divided into two parts. When using the shelf the top half can be run at low temperature, while the bottom half is at full cooking temperature. The elements are entirely enclosed in metal tubes. In addition to the safety heating tubes, the oven is provided with 3-terminal block with "earth" connection.

The thermometer, when ordered, is fixed to the oven door and marked to show inside temperatures. The following may be taken as an approximate guide to temperature: With the switch at High, 340 deg. F. obtained in 30 mins., or 400 deg. F. in 40 mins.; with the switch turned to Low, a moderate temperature can be held for a considerable time after first heating.

Where the cost of electricity supply is very low and where quick initial heating is desired, the oven is supplied with two extra heating tubes, if required, at slight extra cost, when the initial heating time is halved; but, as offered, the oven may be operated from any existing lighting installation without extra cost of power wiring where an "all in" domestic tariff for lighting and cooking is available. The makers are the ARORA CO., LTD., of Rosebery Street, Leicester.

Tho new "Vac-Tric" cleaner, manufactured by VAC-TRIC, LTD., Waterloo Road, North Circular Road, Cricklewood, London, N.W.2, is of the cylindrical type and built on similar lines to the firm's previous model; many improvements have, however, been incorporated. The motor is mounted on rubber cushions in a cork-lined cylindrical case; it develops approximately ¼ H.P. at a speed of 10 000 r.p.m. The suction produced is claimed to be 20% higher than that of any competitive make of machine and one of its oustanding features is stated to be silence. A comprehensive set of accessories is included.

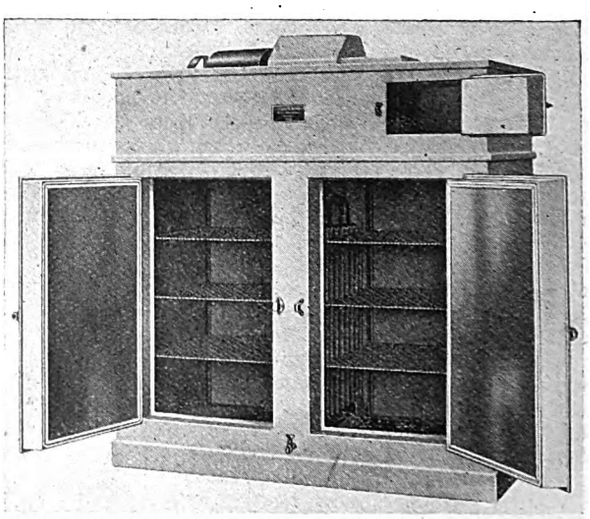
The REVO ELECTRIC CO., LTD. (Britannia Works, Tividale, Tipton, Staffs), announce a new iron known as the "Sovereign." It is chromium-plated, with all the numerous advantages of this finish. Other features include a perfect contact connector, a convenient stand incorporated with the heel of the iron and a bakelite adapter. The iron is guaranteed for five years. The new Revo connector is now fitted to all the firm's irons and kettles. It has special tubular sockets, slotted and supported by a spring steel ring which ensures perfect contact for the whole length of the pins. Large terminal screws are provided for flexible leads to ensure definite contact and a firm grip on the conductor. The flexible covering is firmly gripped by the two halves of the porcelain, while the bell-mouthed spiral spring prevents chafing. The standard Revo iron has been redesigned. It is heavily nickel-plated and the ebonised handle and thumb rest provide a tireless grip.

Another new Revo product is the "Matchless" fire. Its heating element is laid in refractory troughs of parabolical section. The hammered copper reflector is scientifically shaped to project a maximum of radiant heat into the room; and a stout guard over the element serves many useful purposes, such as heating a kettle. The fire is light in weight and is fitted with a convenient handle. A particular feature is the arrangement whereby, when one or more of the three sections of the element is switched on, the heat is evenly distributed over the reflector. The wall plug is arranged to control one section of the element, the remaining two sections being each controlled by a separate switch.

The Sadia table stove, offered by SADIA, LTD., of 22, Newman Street, Oxford Street, London, W.1, has been designed to meet the demand for a cheap and efficient table cooking apparatus. Three-heat regulation is given by a special plug instead of a switch. An aluminium deflector plate prevents the heat from spoiling the table. The body and legs are fire white enamelled, while the boiling plate is of the usual high speed Sadia quality, guaranteed for two years. The stoves are delivered with two yards of flex complete with earth wire.

Four suggestions are made by the BRITISH RESISTOR CO., LTD. (Clare Road, Halifax). The first of these is the new type "Globar" electric grill. The grill is fitted with four "Globar" non-metallic elements, each 14 in. long, connected two in series and the two sets in parallel, and arranged for three-heat control; the total loading is 4 kW. The cooking area is 14 in. by 8 in. Chops or steaks are grilled from the underside. It is claimed that this offers advantages as compared with grilling from the top. The non-metallic elements are unaffected by spilled liquids, fats, etc. The second suggestion is the circular type "Globar" hotplate, fitted with a three-heat switch. It has four 7 in. "Globar" elements, two in series and the two sets in parallel, and can be supplied in loadings from 2 000 to 2 500 W inclusive. The external diameter of the "Globar" hotplate is 9 in., and the depth is 6 in.

The company's third recommendation—an electric heat accumulator—is, let us hope, a rather doubtful suggestion for spring trade, but with the variety of weather we enjoy in this country it may, after all, be as well to prepare for the worst. The item in question is the "Imbery-Whitehouse" heat accumulator, intended to eliminate the disadvantages found in some types of similar apparatus. No refractory container is employed, and no water is used. The principle employed in this warmer—viz., heat accumulation—dispenses with the necessity for any electrical connections to the heater when in



A new refrigerator manufactured by A.-S. Refrigerating Machines, Ltd.

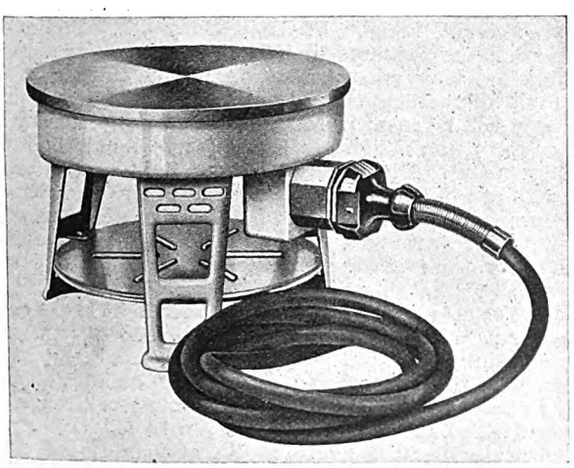
use in bed. The dimensions of the heat accumulator (Type B.1) are 12 in. by 6 in. by 3 in. All parts are interchangeable. Special alloy metals of heat resisting properties are used in the construction of the heater, which is constructed to operate on all voltages from 100 to 250 inclusive. The total watts rating is 500. The elements are stated to be of a special type. The outer container is of welded sheet metal, filled with dried refractory sand to give good heat absorption. The outer container and plug connections are nickel plated. Two yards of special flexible with adaptor are provided as standard.

Digitized by Google

Among their large range of domestic appliances L. G. HAWKINS AND CO., LTD. (30–35, Drury Lane, Kingsway, London, W.C.2), wish to call attention to three lately introduced items—the "Universal" automatic iron No. E9092, the automatic toaster No. E9422, and the new "Universal" cleaner with motor-driven brush and 15 in. nozzle. The iron is designed for a.c., and the current is automatically cut off at 575 deg. F. The toaster is set by a simple lever, the toast being delivered automatically with the required degree of brownness. The device is highly nickel-plated and handsomely chased; the loading is 550 W. The "Universal" cleaner needs no introduction to our readers.

The most noteworthy feature of the No. 1 electric irons produced by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD. (38–39, Upper Thames Street, London, E.C.4), is the lifelong guarantee given to the element—subject only to very reasonable conditions. Considerable care is claimed to have been taken in making this iron comfortable to use; a particular quality is the side entry connector, which prolongs the life of the flex and always keeps it well away from the user's arm. Another useful device is the "Xcel" safety kettle fitted with an automatic cut-out which breaks the circuit at a temperature somewhat above boiling point. The cut-out embodies a bridge contact across two spring terminals, held in position by a fusible nut engaging with a screw in the kettle bottom, which releases the contact bridge when the kettle runs dry. This drops into a well pressed into the kettle bottom, the break being assisted by a spring. A special arrangement is now provided so that the bridge cannot possibly earth to case, and the contact cannot again be made under any circumstances until a new fuse is fitted. A new fuse can be screwed on with the finger and thumb without the aid of any tools, and the kettle is then ready for service again. Each kettle is supplied complete with one spare fuse, and the cost of new fuses is negligible.

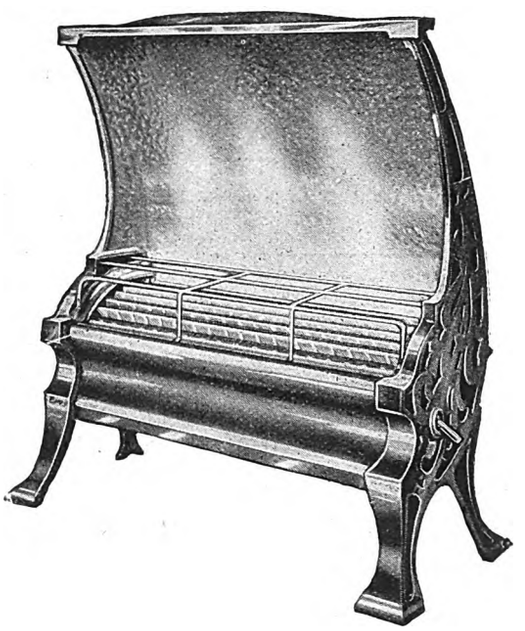
The "Xcel Minor" cooker meets the needs of those whose cooking requirements are limited to from two to four persons, and it will be found extremely economical. The hob is vitreous enamelled, the oven door-front white porcelain enamelled, and the remainder stoved black. For a small extra charge, it can be supplied in mottled enamel. The grill-boiling plate boils efficiently, and will heat the oven or grills at the same time. The spirals are entirely protected by fireclay tubes. When boiling only is required a deflector plate is inserted in the oven to throw the heat upwards. Messrs. Siemens also particularly recommend their electric towel-rails (upright pattern), which are strongly constructed from brass tubing throughout with nickel plated finish. The source of heat is a tubular enclosed element, placed at a convenient height for circulating warm air currents



The table stove introduced by Sadia, Ltd.

through the towels hung over the two top rails. A plug connector at one end facilitates connection to the supply circuit. The rails are fixed by screws through the circular flanged feet. The consumption is 175 W.

A new type of junction box for use with the "Magnet" wiring system has been introduced by the GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). This junction box, which is moulded from "Wittonite" composition, and fitted with bakelite moulded terminal heads has features in design which make it especially suitable for tropical situations, where the two chief factors to be contended with in the installation of electrical apparatus are insects and condensation. At the same time it should be found efficient for home requirements. Neat in appearance and robust in construction, it is suitable for use with either "Magnet" bond lead covered or C.T.S. (tough rubber) cables. The box is circular in shape with a smooth "Wittonite" cover having a centrally situated recessed thread for screwing to the base. The centre screw of the base is slotted and carries a milled nut so that a bonding wire can be rigidly gripped. There are also four wiring terminals, slotted to facilitate wiring, the terminals themselves being fitted with bakelite moulded heads so as to avoid live points being exposed if the cover is removed. Eight inlets are provided so that eight twin cables up to 3/·036 S.W.G. can be accommodated after removing the guarding webs. Round the top of the base is a channel to take a plastic compound for sealing, if it is deemed advisable to seal the box. Another new product of the G.E.C. is an Osram valve. This is the DA 60, a 60 W power valve developed to meet the requirements of manufacturers of large power amplifying equipments, such as talking pictures, cinema amplifiers, public address systems, etc. It has been designed to be capable of a continuous dissipation of 60 W at the anode, and special attention has been paid to its construction in order to restrict the working anode voltage to a maximum of 400. The valve is fitted with a special type of base, similar to that used for the DET 1 type; when operating it, however, provision should be made for sufficient air circulation to prevent overheating. When two or more of these valves are operated in parallel, separate grid bias should be adjusted at various periods to compensate for slight changes in the characteristics of the valves, and to maintain the anode current at the required figure but care should be taken to switch off the power supply when making alteration to this grid bias, when inserting or removing a valve from its socket, or when any adjustments are made to the circuits. The average characteristics for the DA 60 are as follows: Filament V, 6·0; filament current, 4·0 A; amplification factor, 2·5; impedance, 835 Ω (measured at 400 anode volts with grid bias adjusted to limit the dissipation to 60 W); maximum anode V, 400; maximum anode dissipation, 60 W.



The new "Revo Matchless" fire.

A new range of fixed condensers has just been placed on the market by the MULLARD WIRELESS SERVICE CO., LTD. (111, Charing Cross Road, London, W.C.2), and forms a useful addition to the Mullard P.M. series of radio components. The condensers are of the rolled type with paper dielectric, hermetically sealed into metal containers, and are finished in the company's standard matt black enamel. Three ratings, namely 1, 2 and 4 μF are available. The condensers are designed for working pressures of 250 V d.c., and each is tested at 500 V d.c. between plates, and flash tested at 1 000 V a.c. between plates and case, before leaving the works. The method of hermetically sealing together with special processes in manufacture is claimed to render the condensers immune from damage due to climatic changes.

Two points of value are the provision of substantial solid terminals and soldering tags for connecting purposes, and, secondly, the extension of the base to form two fixing lugs with fixing holes instead of slots.

The popular "Junior Cooker" of the JACKSON ELECTRIC STOVE CO., LTD. (143, Sloane Street, London, S.W.1) has been

Digitized by Google

previously described in THE ELECTRICIAN. We are informed that its popularity is steadily increasing, and the makers find a good reason for this in the small size of the modern family. The average number of persons in a family to-day is between four and five, whereas some years ago the number was six or seven. Kitchens are smaller, the butcher is being asked

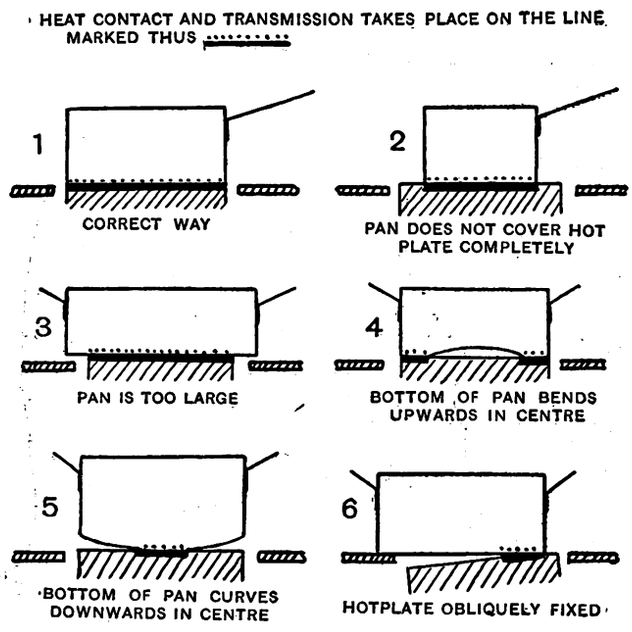


Fig. 1.—Correct and incorrect use of utensils with enclosed boiling plates. (See table below.)

for smaller joints and cooker sales show a decided tendency towards smaller models. With these facts before them, the firm is now offering the " Junior " model in two sizes, Cat. No. 50.J (for two or three persons) and Cat. No. 51.J (for four or five persons). These cookers can now be supplied with marblon mottled enamelled exterior or as small table models.

Though not strictly electrical, supply engineers, showroom managers and contractors will be interested in the " Siginflex " electric cooker utensils made by SIGG, LTD., of 469, Holloway Road, London, N. These utensils have been

TABLE I.

Time and cost chart in respect of the boiling of 4 pints of water with a " Margo " hotplate, size 8$\frac{11}{16}$ in. diam., with a loading capacity of 1 800 W. Assumed cost of electric current : (*a*) 1d. per unit ; (*b*) 1$\frac{1}{2}$d. per unit.

In order to bring 4 pints of water (taken at 65° F.) to the boiling point of 212° F. it requires :				Efficiency obtained	Waste of time and expense, based upon the correct figures shown under illustration No. 1.

specially designed for use with electric cookers, and in commenting upon their own products the manufacturers state that the use of the correct type of $\frac{1}{4}$-plate machined flat utensils is of the greatest importance to both the consumer of electricity and the supply department, because these utensils safeguard against buckling and warping and heavy current wastages, and also free the department from the statement, so often broadcast, that cooking by electricity is much dearer than by gas. The company has put on the market a standard set of utensils comprising 3 or 4 pint " Leicester " kettle, three useful stewpans, and frypan, the cost of which works out at 42s. These, it is suggested, could be hired with the stove for a nominal charge of 1s. per week, becoming the consumer's property on the fifty-second payment, and showing the 10s. return on each set, or an average profit on capital outlay of 25%. Where it is a question of price, and price alone, Sigg, Ltd., have another range of utensils, also machined flat, which gives $\frac{1}{8}$ in. thick base—and in this case a set of five stewpans, together with a 4 pint kettle of the " Leicester " type can be supplied at 30s. per set. These can be hired at 9d. per week on the same basis, and as the cost works out on an average of 7d. per week, it would show an average profit of 30% on the capital outlay.

The A-S REFRIGERATING MACHINES, LTD., a subsidiary company of the General Electric Co., Ltd., of Magnet House, Kingsway, London, has introduced on the market a new series of standard commercial sectional cabinets, having interior storage capacity ranging from 40 to 80 cubic feet. The standard outside finish is white enamel, but other colours can be supplied if desired. The main compartment has two doors provided with special air-tight gaskets. The fittings are of stainless metal, and three removable galvanised shelves are fitted in each compartment ; hanging rails can, however, be provided, if desired. Ice is made in cans, and it must be noted that the time required for freezing is extremely short (2–2$\frac{1}{2}$ hours). A-S machines can be operated by electricity, gas, oil, petrol or steam engine, water, etc. The condenser housing which rotates in the cooling water contains a small twin cylinder compressor, which is held in position by gravity and a lead weight. Any kind of water can be used as cooling water. It need not be clean or soft. The cycle of refrigeration in the A-S Automaton is : SO_2 is used as cooling medium, and the vapour is drawn from the evaporator through the outer channel of a hollow steel connecting shaft into the compressor. After being liquified, it collects at the bottom of the condenser. The condenser also contains special lubricating oil and the condenser housing rotates. The liquid SO_2 therefore together with the oil are taken by centrifugal force to the top of the housing, where a scoop collects them in the separating chamber. The oil, being the lighter, rises to the top and overflows. This ensures that the compressor works in a continuous oil bath. The SO_2, being the heavier, sinks to the bottom and is syphoned into the SO_2 reservoir, and from there it returns to the evaporator. The arrangement is such that the plant is self-regulating, and only the right quantities of liquid SO_2 are allowed to return to the evaporator. The cycle then starts anew.

Electric vacuum cleaners are suggested by the BRITISH VACUUM CLEANER AND ENGINEERING CO., LTD., of London, S.W.6, particular stress being laid upon the " Goblin-de-Luxe." This is a bagless type of machine the consumption of which is 170 W and weight 7$\frac{1}{2}$ lb.

ILLUMINATION DESIGN COURSE.

Preliminary Details of the Programme Arranged for the 21st E.L.M.A. Course.

ARRANGEMENTS have now been made by the Electric Lamp Manufacturers' Association for the 21st Illumination Design Course to commence at the Lighting Service Bureau, 15, Savoy Street, London, W.C.2, on May 5th. Preliminary details of the programme to be followed have been issued, and Monday, May 5th, registration will commence at 9.30 a.m., to be followed by a reception at 10 a.m. The remainder of the day will be spent as follows :—Lighting yesterday and to-day (10.15 a.m.), lighting terms (11.15 a.m.), light and visibility (noon). During the afternoon light control will be dealt with at 2 p.m. ; electric lamps and their characteristics at 3 p.m. ; and the Lumen method of design at 4 p.m. The programme for Tuesday morning will be : 9.45 a.m., industrial lighting ; 11 a.m., lighting for special industries ; and 11.45 a.m., a factory lighting design. In the afternoon : 2 p.m., light and the shopkeeper ; 3 p.m., uses for light in the shop ; and 4 p.m., electrical advertising. On Wednesday morning a shop lighting design will be dealt with at 9.45 a.m. ; school and office lighting at 11 a.m. ; and the possibilities of home lighting at noon. The afternoon programme will commence at 2 p.m. with light and architecture, to be followed at 3.15 p.m. with architectural lighting. Street lighting and traffic control at 9.45 a.m., special lighting problems at 11 a.m., and new lighting fields at noon, are the arrangements for Thursday morning ; with salesmanship at 2.30 p.m., and lighting service and general discussion at 4 p.m. in the afternoon.

Weymouth Electricity Committee seeks sanction to borrow £10 000 for mains and services.—A new main is to be laid to supply houses proposed to be erected near the Westham playing fields, at an estimated cost of £240.—The Committee has decided that the necessary facilities for improved lighting of the Great Western Railway cargo stage be provided, subject to the railway company paying the cost of the installation and the current consumed.

THE IDEAL HOME EXHIBITION.

Large Increase in Number of Electrical Exhibits—The Pavilion of Light and the "Daily Mail" Competition.

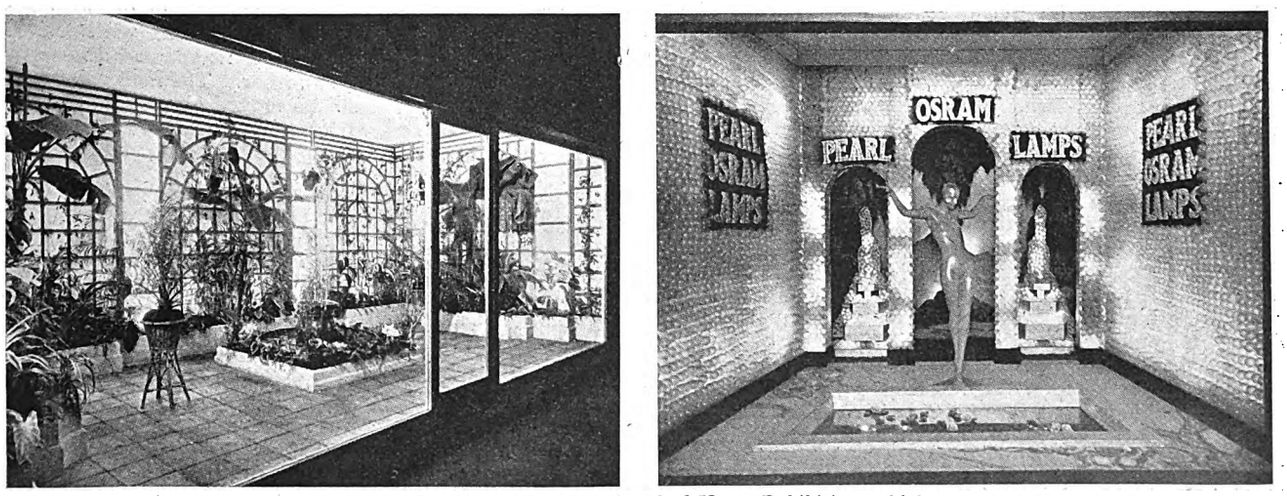
ONE of the outstanding features of the Ideal Home Exhibition, which opened at Olympia, London, on Monday, is a Pavilion of Light, a concrete expression of ideas formulated in connection with the £1 000 competition organised by the "Daily Mail" in conjunction with the GENERAL ELECTRIC Co., LTD. This competition, open to British architects, decorative artists and electrical contractors, was designed to demonstrate the important part which lighting plays in the home and to show its true relationship to architecture, furnishing and decoration. As a consequence, the Pavilion of Light crystallises modern ideas in connection not only with artistic electric lighting, but also with electric heating and other electric applications to the service of the home. The pavilion occupies a prominent position in the central aisle at the foot of the main stairway to the gallery. By means of floodlighting and colour-sprayed lamps operated by an automatic flashing device, the colouring of the façade is brought out to emphasise the appropriateness of the appellation "Pavilion of Light." A suite of six rooms is devoted to the competition referred to, and the winning designs are incorporated. These rooms comprise a lounge, dining room, bedroom, nursery, kitchen and bathroom. The first four are equipped in accordance with schemes drawn up by architects and collaborating artists, and the two latter in accordance with schemes submitted by electrical contractors. Probably the room among those connected with the competition which creates the most lasting impression is the dining room. The extraordinary character of it can to some extent be gauged when it is stated that the walls and the ceiling are of black glass. The centre of the wall at each end of the room has a projecting ornamental feature with cupboards incorporating rose and silver mirrored glass arranged alternately, as well as vertical niches forming part of the lighting effects. A special feature in louvred illumination is introduced at the base of this architectural fixture. The threshold of the doors is lighted from below, and an etched panel, lighted from behind, forms a dado between the two doors. The central feature of the room is a dining table fashioned entirely from glass. The top is illuminated by light which is also projected downwards upon a tank containing gold fish. A circular illuminated fountain is mounted on the table top with two small glass electric lighting table standards of unique design close by it. The bedroom is another original example of the development of artistic utility in electric lighting and heating in the home. Pale blue relieved with a rose tint forms the primary colour. A special concealed lighting unit is set at the top of the drapery of the bed, and a concealed reading unit with the light passing through a diffusing glass panel is effective across the full width of the head of the bed. Illuminated wardrobes are recessed in the walls, and an unusual feature is a combined heating and lighting standard with a heated mirror. The area of the dressing table is illuminated through the floor, a soft light being passed through diffusing glass. From above, a large fitting is suspended and its illumination also covers the area of the dressing table. At the side of the table, lighting fixtures of unusual design and of a portable nature are placed, while the table also carries a heating unit. Convention is adhered to more closely in the lounge where special bracket units, designed for semi-indirect lighting, form an attractive feature, while a domed fixture occupies the centre of the ceiling. This fixture has glass panelling fitting close to the ceiling, whilst its underside is an inverted bowl. Table standards, figure and picture lighting, and an electric fire, designed to suit the room, are other features.

The kitchen is, of course, all-electric, while the bathroom is fitted with electrical appliances ranging from a thermostatically controlled water-heater to an illuminated shaving mirror and a vibratory exerciser. A nursery is another of the competitive rooms and this incorporates everything which may be deemed essential in a children's playroom; it is lighted by a method which shows full appreciation of the circumstances. There is a lay-light above and four recessed lighting units forming wall panels. Another feature is a decorative landscape illuminated from behind so as to give it a daylight effect.

Apart from the sections in the Pavilion which the competition embraces, there are several others of interest. The garden lounge will appeal particularly to a very wide circle, not only on account of its general attractiveness of setting, but also because of the effectiveness of its lighting arrangement. An illuminated fountain forms the centrepiece, and tall palms flank it. Creeper-covered trellis provides the background to the lounge at its three sides (the front is open) and at the foot of the trellis throughout its whole length is a floor border of blooming tropical plants. Four illuminated glass pilasters, flush with the trellis, form a novel method of lighting a picturesque retreat such as this. The salon is another of these non-competitive rooms possessing many attractions, and the special applications of modern systems of lighting it reveals will be found most instructive. Illuminated glass panels are introduced as louvres in a frieze, these forming a particular feature of the lighting effects. The sun parlour is an apartment where artificial illumination approximating to actual sunlight is demonstrated.

One room is devoted to a spectacular display of pearl Osram lamps, consisting of a brilliantly illuminated tableau in which a figure stands by a bathing pool in a pavilion, the walls of which are constructed of thousands of lamps. The colours of these walls constantly change, giving the effect of an iridescent mosaic. Through open archways are seen glimpses of a garden with fountains of pearl lamps playing jets against a background of distant mountains and an ever-changing skyline.

(To be continued.)



TWO of the interior exhibits in the Pavilion of Light at the Ideal Home Exhibition, which opened at Olympia, London, on Monday. On the left is the Garden Lounge, and on the right an Osram lamp display. Details of the Pavilion are given above.

PARIS AGRICULTURAL MACHINERY SHOW.

Electrical Exhibits—Barrow Motors—Shellers, Root Cutters and Grinders—Universal Farm Mills—Washing Machines, Cream Separators and Egg Graders.

By THEODORE RICH.

MANY of those connected with farming in this country do not realise what rural electrification means, but if they saw the variety of machines arranged for electric drive at the Paris winter show, they would look upon such a service as something more than a passing fad.

Something like 22 000 Communes have been supplied with electricity at their operating centres, of which about 18 000 could be termed predominantly agricultural in character. This does not mean that everybody in the commune can be connected up at once, but those who are responsible for the supply have to run branches to outlying consumers, provided a minimum revenue is guaranteed on the basis of first cost.

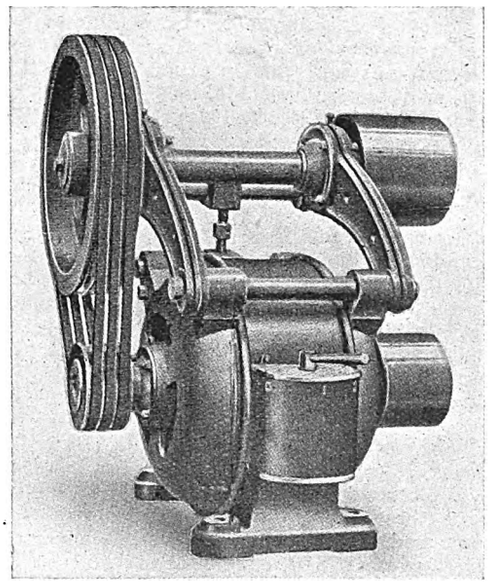

Fig. 1.—Rouillaud "Agror" motor.

Before the fall of M. Tardieu's first Government a programme was drafted for the spending of 300 000 000 Frs. (£2 400 000) during 1930 for rural electrification. It must be remembered that considering the comparatively small amount provided, so far to aid rural communities, the progress made so far has been extraordinary. The French Government believes that the problem of rural electrification lies at the retail end and that given facilities the demand will grow, leaving to existing power supply authorities the right to furnish the energy required, assuming that such undertakings have a staff competent to carry out their duties without bureaucratic interference.

The result of the policy has been a continuous expansion in the use of power for agricultural purposes on the farm. Electric heating is increasing in France, but in general it has not grown as fast as with us in the towns. Electricity has caught on especially at dairy farms. The cream separator, if of large size, takes a lot of starting, the churn, the butter worker, and more recently the milking machine, can all be very conveniently run by electricity, and its use obviates the use of line shafting.

For general farm work the barrow motor is very popular. With it, not merely can dairy machinery be driven, but odd jobs can be done around the farm; practically all have some form of speed reduction and varying gear, and a number have a short belt drive to a counter shaft fitted with step-cone pulleys. Perhaps the most popular barrow motor is the Wisler. It is made from 3 to 8 H.P., is fitted with a gear box that can be clutched on to the main shaft, the box being fitted with six speeds for a range from 40 to 750 r.p.m., a pulley being attachable to any one of six projecting shafts.

The Alsthom Co., the amalgamation of the French Thomson Houston Co. of Paris with the Société Alsacienne of Belfort, makes a barrow motor with a belt reduction.

The geared tripod motor is a development of the last three years. A half-horse power single-phase commutator motor with a geared head is arranged on a tripod adjustable for height. It is designed to operate any machine around a farm usually operated by hand, the connection being by means of a coupling which can be temporarily attached to the shaft of the machine to be driven, and a fork on the low speed shaft of the motor; speed regulation is arranged by brush adjustment. The first of these machines was made by Wisler, of Senlis, Oise. This motor has been used largely for cream separator work, its starting torque being very good. Another type of portable motor is made by the Société Electro-Moto-culture of Carcassonne. The motor is arranged under the fly-wheel of the machine to be driven, running it with the aid of a spring-controlled friction drive, the motor seat being cylindrical, suitable cradles being arranged below the fly-wheels of machines to be driven, so that the motor can be carried about from machine to machine as required.

Messrs. Rouillaud, of Vincennes, for some little time have been making motors for agricultural work. Fig. 1 shows a new type. A starting and regulating rheostat is attached to the motor, to give a high power factor and efficiency at ·4 full load. The motor shaft and countershaft have ball bearings, the adjustment of the triple belt tightness is made by a capstan bolt with reversed screws; the speed ratio is 3·5 to 1. The motor is of the three phase squirrel cage type, and the cage has the double layer winding arrangement originally invented by Buchcrot, the commercial advantages of which have only been recognised during the last year or so; the starting current is therefore low. The reduction arrangement naturally runs very quietly. The motor known as the "Agror" is made in sizes from ½ to 6 H.P., by Charles Rouillaud, of Vincennes, Paris.

A quite new piece of apparatus is the Law electrically-driven universal sheller, root cutter and grinding machine (Fig. 2). The driving part consists of a motor, ·9 H.P., arranged vertically on a tripod. The motor is of the three-phase type arranged for 1 500 or 3 000 r.p.m., the speed change being arranged with a reverse by means of a hand-wheel which is turned in either direction as required. A little ammeter gives an indication of the load. The motor is supported by means of radial fins inside a cylindrical shell, any material to be dealt with falling down outside the motor frame into a drum that is suspended underneath. The machine is arranged so that by putting different discs on to the vertical spindle like gramophone records and arranging suitable changeable housings, the same motor frame can do a number of jobs. With one type of disc and feed device, and an action like that of an impact coal pulveriser, meal can be made of different finenesses from all kinds of grain; grain can also be crushed or shelled. With another type of disc and feeding hopper, swedes, beet-roots and such like can be cut to chunks or chips for cattle food. With a third set of accessories, potatoes can be bruised for cattle food, oyster-shells broken up for poultry, and solidified nitrate of soda broken up for use on the fields, and cyder apples cut up. With a special head, cattle cake can be broken up. The farmer buys the motor, and any or all the accessories he wants. Different heads can be fitted with the aid of pivoted bolts and wing-nuts, so that no spanner is necessary for changing from one duty to another. The motor has a flexible connection, and can easily be moved about a barn to a convenient position, and with the hopper below, which is fixed up with the aid of toggle loops, the spreading of dust is avoided.

M. Wisler's Vision.

This machine was invented by M. Wisler, of Senlis, an engineer with agricultural experience, who after the war saw a future for electricity on the farm and has built up a business intended, almost exclusively, for the making of electrical motors, gears and appliances for use on the farm.

The Belgian Melotte Co. showed some cream separators with built-in motors. Driving a cream separator is not a simple job, careful design being necessary to obtain satisfactory results. There were to be seen 29 makes of cream separators, so the French seem to be anxious to get back the reputation for butter-making they used to have thirty years ago, when Brittany butter was to be found in so many shops at home.

Two German machines were interesting to watch, one being an arrangement for grading eggs. The eggs were first inspected over an illuminated slot as they were passed down a sloping chute, to see if they were fresh—the process is

Digitized by Google

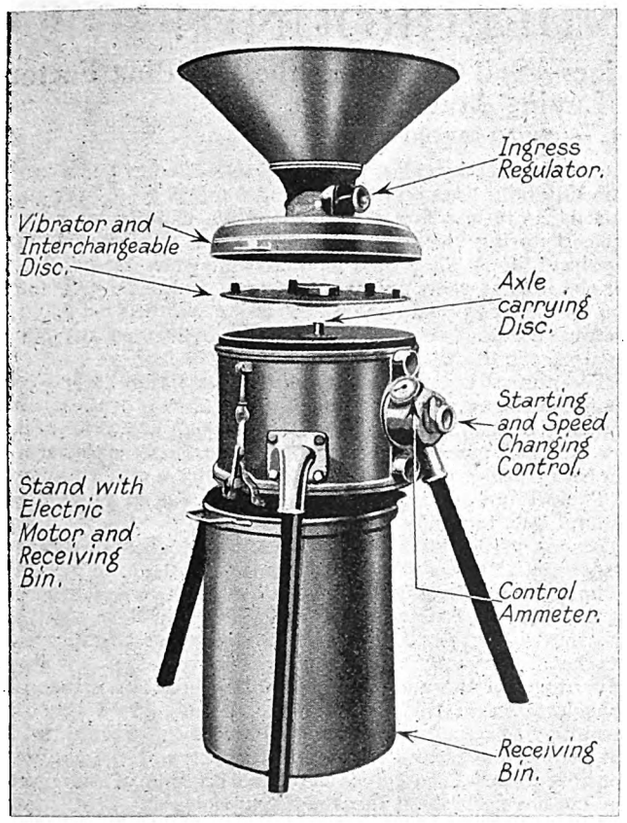

Fig. 2.—Law electric sheller, root cutter and grinder.

usually termed candling. They then roll on to a slowly revolving platform with little traps that tip up according to the weight of the egg. Another machine was like a wire-cut brick machine, in which butter or margarine is extruded by pressure and cut up and packed automatically, with great accuracy regarding weight—both these machines were electrically driven.

Milking machines seem to be popular in France. One maker has supplied 2 800 of one type; when driven electrically they make a very handy unit. Seven makes of milking machines were to be seen at the show.

A material proportion of the arable land in France is devoted to the vine. Cultivation of the ground between the narrow rows has led to the development of miniature motor tractors and special tools. A good deal of scientific work is being done in connection with wine making, and a number of electrically driven wine pumps on barrows, portable and other wine presses and barrows were shown. Material attention is given to cyder making, though French cyder is often poor stuff to British tastes.

As such large areas have now been to a material extent electrified, quite elaborate wine plant is placed on wheels, so that a contractor or co-operative society can take the gear to a number of villages in turn. The motor drive is a convenience because of its cleanliness and absence of fumes as compared with a petrol engine.

The French farmers as a rule have a considerable aptitude for co-operation, and for many years there have been co-operative organisations for the buying of seed-grain, artificial manures, machinery and so on. The existence of electricity in so many thousand villages has made it possible to use the electric motor in lieu of the portable steam-engine for a number of jobs. In England much threshing has been done for years by contract, in France a good deal of threshing is done by co-operative societies. Threshers are usually smaller than with us; in some parts small machines are kept in barns and the grain thrashed in the winter under cover. One difficulty in some rural areas is that a number of small farmers want to do the job on the same stormy day; which gives trouble, if the village transformers are on the small side, to minimise light load losses.

Some co-operative groups own comparatively large threshers, and send them round to the farms of the members and hitch them on to the low tension mains at convenient points.

One trouble with threshing machines is that owing to the high speed of the drum and the weight of the shaking gear a good deal of starting is required, and with unskilled workpeople there has been trouble owing to the overloading of motors when starting up.

This has been got over by a special fool-proof motor designed by M. Dassenoy of Metz (Fig. 3). The stator is of the normal type, the rotor slides on the shaft sideways over a keyway; alongside it is a cylindrical armature. On starting, the current pulls on the armature part and pushes the squirrel cage out of the field against a spring so that there is a differential action. The magnetic cylindrical armature places itself in the field of the stator and presents a very low reluctance; the current flow being limited by the corresponding self-induction, which is high enough not to put a shock on to the network. It must be remembered that in France some of the overhead lines are very light in section and the transformers also small owing to the use of 110/190 V. The rotor commences to turn round with the shaft light; as it revolves the suction of the stator on the magnetic armature diminishes, the rotor slides along the keyed shaft, and by means of a slightly cored clutch the driving pulley, which is loose on the shaft, takes up its job at a point near synchronism.

There is therefore practically no shock on the network, the power factor is high and it is possible to work at the most economical part of the curve close to the overload point. If an excessive load is put on, the excessive stator current pulls on the armature and de-clutches the driving pulley. Despite the heavy mechanical load at starting there is no necessity for a circuit breaker or slip-ring starter, the clutching in and out being operated magnetically. There is not merely the starting up coupling effect but also the automatic throw out, making it practically fool-proof. This type of motor is placed on the top of the thresher frame out of the way. Several hundreds of these motors are in use attached to threshing gear; this fact alone shows the extent to which electro-farming is progressing in France.

There are still in France quite a number of large farms and a number of large barns, many dating back a hundred years and more. A system of crop handling by means of runways and semi-automatic grabs has been developed which will handle crops and dump them where required with a minimum of labour; in many cases barn roof timbering has to be altered to allow clear runs for the trolley apparatus. To avoid complicated reversing gear one way traversing-haulage gear is operated by a weight usually made of concrete blocks. A load comes to the barn, it is lifted by automatic grabs, run along to where it is wanted and then dumped, the weight hauling the grab and trolley back to the eaves for reloading.

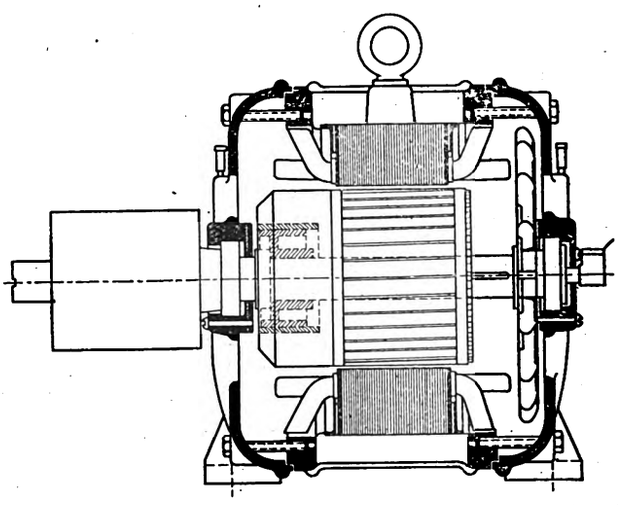

Fig. 3.—Dassenoy threshing motor.

These gears are specially adaptable for operation by electric motors. The winch gear, which is of the friction type, is ingenious and simple.

(To be concluded next week.)

The National Electric Light Association has issued statistics of the electric labour-saving devices in use at January 1st in about 20 million homes in the United States. These include: Flatirons, 18 800 000; suction cleaners, 8 720 000; toasters, 7 420 000; washers, 6 680 000; fans, 5 880 000; percolators, 5 500 000; space heaters, 3 220 000; sewing machines, 3 000 000; refrigerators, 1 880 000; ranges, 880 000; ironers, 580 000; oil burners, 500 000; and dishwashers, 75 000.

OVERHEAD OR UNDERGROUND?*

Comparison of Costs for Rural Transmission Lines—Soil Conditions the Deciding Factor—Dr. Schramm's Cable Laying Machine.

By ALFRED EKSTROM, B.Sc., M.I.E.E., and VIDAR EKSTROM, C.E.

DURING the last few years the use of underground cables instead of overhead lines for rural transmission has been greatly developed on the Continent. No overhead 11 kV rural transmission lines are built at all in Holland nowadays. There are now over 6 000 miles of 11 kV underground cable in permanent use in that country.

In Germany even 30 kV rural transmission lines are built underground instead of overhead. A special cable-laying machine, by means of which the cost of laying cable in rural areas is considerably reduced, has been constructed by Dr. Schramm, of Saarbrücken, for this purpose.

In an article recently published in THE ELECTRICIAN (November 8th, 1929) Colonel Crompton and I proved, in regard to the 33 kV grid feeders, that there are many districts in England where the soil conditions are so favourable that underground cables could be used to financial advantage.

Even if the service of an overhead line is satisfactory, that of an underground cable will obviously be still more satisfactory, the cable being protected from atmospherical disturbances such as lightning, frost, snow, sleet, storms, etc., and being preferable in a country where aviation is of importance.

At a previous meeting of the Overhead Lines Association it was proposed that rural transmission lines should be standardised at 11 kV, and I am of opinion that this will prove successful in most cases.

In this paper I give some comparative costs for overhead lines and underground cables for rural transmission, restricting myself, on this occasion, to the tension of 11 000 V. The following tables are informative :—

TABLE I. (OVERHEAD LINES.)

Line							
1	Conductor sq. in. ..	0·0225	0·03	0·04	0·06	0·075	0·1
2	Max. kVA at 5% voltage drop	294	388	521	650	765	890
3	Max. amp. cos $\phi = 0{\cdot}8$	15·4	20·4	27·3	34·1	40·2	46·8
4	Cost of O.H. line per mile	£392	£422	£462	£536	£590	£662
5	9·5% of costs 10 × line 4	£372	£401	£439	£510	£560	£629
6	Copper losses × 1 300 hours at 0·6d. ..	44	61	78	80	88	90
7	Losses due to interrupted service ..	10	13	18	22	26	30
8	Total costs	426	475	535	612	674	749

TABLE II. (UNDERGROUND CABLES.)

Line							
1	Conductor sq. in. ..	0·0225	0·03	0·04	0·06	0·075	0·1
2	Max. kVA at 5% voltage drop	294	388	521	650	765	890
3	Max. amp. at cos $\phi = 0{\cdot}8$	10·6	15·2	21·6	27·7	33·4	39·2
4	Cost of cable per mile .	378	456	514	605	702	830
5	Cost of cable boxes and and joints per mile ..	34	34	35	35	36	36
6	6·8% of costs (lines 4 + 5) × 10	£280	£333	£373	£435	£502	£589
7	Dielectric losses 0·22 kW per mile × 8 760 hours at 0·3d. ..	24	24	24	24	24	24
8	Copper losses × 1 000 hours at 0·6d. ..	28	40	53	55	61	63
9	Losses due to interrupted service ..	2	2	3	4	5	6
10	Costs available for cable laying	92	76	82	94	82	67
11	Total costs	426	475	535	612	674	749
12	Capitalised cost per mile cable laying ..	135	112	121	138	121	99

Table I gives data for an overhead 11 kV line, ten miles in length. Line 2 gives the maximum load, in kVA, at the end of a line of ten miles in length, provided that there shall be no drop in voltage above 5%. Line 4 gives the estimated costs of one mile 11 kV lines of varying copper areas, built on impregnated wood piles, at the present price quoted for copper, etc. The capitalised cost of wayleaves is included and assumed to be about £32 per mile. Line 5 gives the annual costs for interest (5%), depreciation (1·5%), and maintenance and upkeep (3%)—a total of 9·5%—on a ten mile overhead line, in accordance with line 4.

The annual cost for interest is calculated at 5% on the first cost of the line. As it is presumed that urban corporations are the authorised undertakings which will have the greatest interest in this supply, we have calculated with an interest as low as 5%. The annual cost for depreciation is calculated at 1·5% on the first cost of the line, assuming that the average life of an impregnated wood pole is 30 years.

The annual cost of maintenance and upkeep is calculated at 3% on the first cost of the line. This figure has been taken, as a reasonable average value, from figures obtained by thorough investigations, made in Sweden a few years ago, on carefully built lines on impregnated wood poles. In regard to this figure it was found that there are usually no costs for upkeep during the first few years after the erection of an overhead line. They then increase somewhat irregularly, and for the first 15 years an average figure of about 2·5%, and for the following 15 years one of about 4% was arrived at. The average annual cost can, therefore, be estimated at from 3% to 3·5% for the whole lifetime.

The annual copper losses in line 6 are estimated to correspond to the maximum load (see line 3 above) of the ultimate capacity of the line at a load factor of 15%, at a price of 0·6d. per unit. Annual losses in income due to interrupted service, shown in line 7, are based on statistics from undertakings.

Table II gives the corresponding data for an 11 kV underground line, ten miles in length.

Line 1 gives the conductor, in square inches, of three-core underground cables of varying copper areas. Line 2 gives the same maximum loads in kVA as for overhead lines. On account of the electric capacity of the cable line, it will be possible to transmit a considerably higher maximum load than with an overhead line with the same drop in voltage. This is an advantage for the underground cable, which is not taken into consideration in this comparison. Line 3 gives the corresponding maximum current in amperes, assuming that cos $\phi = 0{\cdot}8$, and taking the electric capacity of the cable into consideration. Line 4 gives the cost of one mile of underground hessian-covered, lead-sheathed, paper-insulated, three-core cable of varying copper areas, delivered free to the actual place of work. These prices are based on figures received from a British cable manufacturer, and the cable complies with the B.E.S.A. specifications. As the cable is assumed to be laid 4 ft. below the surface of the ground, it is sufficiently protected from damage by farming operations to eliminate the necessity of its being steel-armoured, or covered by bricks. Line 6 gives the total annual costs for interest (5%), depreciation (0·8%), and maintenance and upkeep (1%)—a total of 6·8%—of a ten mile cable line, in accordance with lines 4 and 5. Interest is calculated at 5% on the first cost as in the case of an overhead line. Depreciation is calculated at 0·8d. on the first cost of the line, assuming that the life of a cable is 45 years.

Cable Maintenance Charges.

The annual cost for maintenance and upkeep of an underground cable is calculated at 1% on the first cost of the line. From experience in Sweden a figure of only from 0·1% to 0·2% has been obtained. In Holland 1% is considered as the maximum figure, and we have calculated with the higher Dutch figure.

Cable dielectric losses (line 7) are calculated at 0·22 kW per mile, during 8 760 hours, at a price of 0·3d. per unit, which might be reasonable for a permanent demand. Annual copper losses (line 8) are estimated to correspond to the maximum load (see line 3 above) of the ultimate capacity of the line and 11½% load factor for the losses at a price of 0·6d. per unit. In these calculations we have assumed a load factor of 17%, which can be considered as normal for a supply of this kind.

In order to find the load factor of the copper losses, we have used Prof. Rossander's method and have assumed that the consecutive diagram A of the load complies with the formula :—

$$y = \varepsilon_0 + (1 - \varepsilon_0)t$$

where

y is the load at the time t,
$y = 1$† at the time $t = 0$,
y = the relative minimum load ε_{01} at the time $t = 1$‡,

$$\lambda = \frac{1 - \varepsilon}{1 - \varepsilon}$$

and

ε is the load factor, or the distance IB on the curve.

The diagram of the copper losses will vary in proportion to the line C, as it is proportionate to the square of the load resulting in a load factor as shown by the line ID.

It is obvious that within certain limits the load factor for the copper losses in an underground cable will be smaller than

* Abstract of paper read at the meeting of the Overhead Lines Association on March 19th.

† For convenience the maximum load is taken as 1.

‡ For convenience the 8 760 hours in the year are taken as 1.

Digitized by Google

that in an overhead line, as the capacity current reduces the load to a certain extent. Close investigation shows that the load factor of an underground cable or an overhead line can, in this case, be assumed, with sufficient accuracy, to be 11½% and 15% respectively.

Line 10 gives the annual cost available for the laying down of the cable, if the annual cost of the cable shall not be higher than that of the corresponding overhead line (see Table I). Line 12 gives the corresponding capitalised costs for line 10, for the laying of the cable per mile.

The tables above show :—

(1) That if the annual costs for an underground cable are not to exceed those for an overhead line, the first cost for the laying down of the cable must not be more than about £12 per mile, i.e., 1s. 4½d. per yard.

(2) That although the *first cost* of an underground cable line is about 27% higher than that of an overhead line, the *annual* costs are the same in both cases.

Experience has shown that where the cost of laying an underground cable is about 2s. 7d. per yard for manual labour,

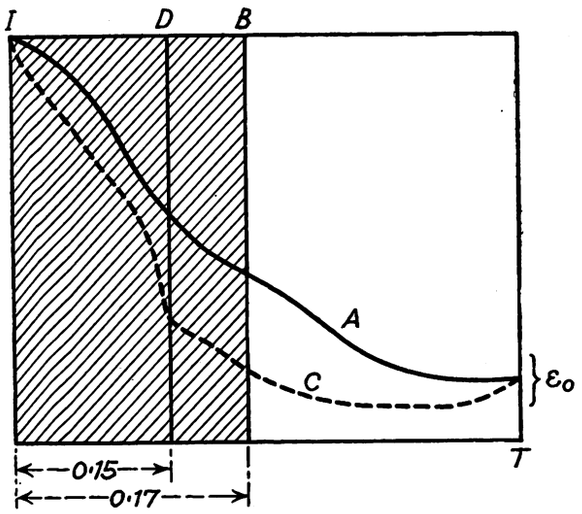

Fig. 1.—Diagram of copper losses.

this cost can be reduced to about 9d. per yard by laying, by machine, wherever the soil is suitable. The wayleaves for machine laying are estimated at about £10 per mile.

Even if it were possible to get the cable prices, mentioned above, reduced—the Continental cable prices are, in fact, considerably lower—these figures prove that the financial advantage of using underground cables instead of overhead lines is largely dependent upon having an efficient cable-laying machine.

We wish, however, particularly to draw attention to the fact that *the condition of the soil is obviously the deciding factor as to whether underground cable should or should not be used.* Where the soil conditions are such that the annual costs for laying cable underground do not exceed those of an overhead line, underground cable should be used ; where this is not the case, overhead lines should generally be built.

The cable-laying machine devised by Dr. Schramm, which has been very successful, is composed of four main parts :—

(1) The ditch digger, which digs a trench 18 in. wide by any depth up to 5 ft. 3 in.

(2) The belt conveyor, which carries the dug-up earth behind the machine, where it is poured into the trench by a swinging spout.

(3) The cable truck, which is drawn by the digger, and which carries the cable ; also serves to roll down the loose earth.

(4) The cable conveyor, carrying the cable from the drum on the cable truck to the open part of the trench behind the digger.

An important feature in the design of the machine is the requirement that it must be able to travel over any rough ground. For this reason both the ditch digger and the cable truck are carried on caterpillars. Arrangements were also necessary to make these vehicles easy to steer when in operation or when travelling along the road.

The weight of the digger, together with that of the attached belt conveyor, is so balanced that the uniform pressure on the earth under the caterpillar tracks is only 5 lb. per sq. in. The machine is driven by a four-cylinder Diesel engine. Eight speeds are available, four for the work of cable-laying and four for travelling. The digger, together with the whole cable-laying machinery thus advances, according to the speed chosen, at the rate of 205, 260, or 304 ft. per hour, and is able to cover 1·6, 1·75, or two miles an hour while travelling from place to place. Back speeds of 190 ft. per hour when in operation, and 1·5 miles per hour when travelling are available. It is, therefore, possible to lay a maximum of, say, 2 450 (1·4 miles) ft. in an eight-hour day.

It should be noted that the digger is capable of excavating unengineered roadways or tightly packed gravel paths, about 24–28 in. thick, with fairly large sized pebbles. Further, very large stones will not hinder the operation of the machine, provided that they are bound together with smaller stones, or are not too close to one another. Some difficulty was found with hard red clay soil. In order to dig this soil it was necessary to fix particularly sharp ripping teeth on to the shovel blades. The teeth are attached to the shovel in such a way that they can easily be taken off and replaced by spares when they become blunt—in the case of such a hard soil, this is necessary within an hour or two. In normal conditions the teeth should be re-sharpened about every four weeks.

Primarily the cable laid down in the trench was covered with protection bricks. It was soon found, however, that these bricks were no protection against axe blows. They are therefore no longer used and the cable is laid 8 in. deeper in the ground, which has proved entirely satisfactory. The cable route is marked by a stone at every bend.

The weight of the loaded cable truck is 11·5 tons, and the centre caterpillar track presses on the earth, which is thrown in front of it by the swinging spout, with about three-fifths of this weight.

In order to avoid too high a capacity earth current of large network, inductive soils of suitable sizes should be inserted in a few points in the district. When laying cable for shorter distances, it is advisable to use the digger alone. The smallest type of such a digger excavates ditches to a width of 12 in. by a depth of up to 4 ft. 8 in., and is particularly useful on account of the easy control. Its medium height enables it to be driven along an avenue quite close to the trees.

The earth is thrown, by the transversal conveyor, behind the caterpillar tracks on either side, so that the loose earth lies just next to the open ditch. Large obstacles are sometimes found near the ditch, e.g., large stones pushing through the ditch walls on either side. When these are seen the digger is automatically brought to a standstill by safety sliding couplings, thus preventing it from being over-strained.

Before the above paper was read the President of the Association (Mr. Theodore Stevens) announced that the Electricity Commissioners, in a memorandum they had framed on the subject of rural electrification, had confirmed the standardisation of 11 000 V for the principal transmission systems for rural work, as advocated by the Overhead Lines Association. The memorandum was in the hands of the printers and would be issued shortly, but, in the meantime, the Council of the Association had been informed that it could use this information and that undertakings in rural areas could also use it in negotiations for bulk supplies.

ELECTRICITY IN WIRRAL RURAL DISTRICT.

In reference to the inauguration of the supply by Birkenhead Corporation to Burton, which we reported in a recent issue, it is interesting to note that with the completion of the Burton and Puddington scheme there will be a public supply of electricity in all the 27 parishes and one urban district in the Wirral area, with the exception of three parishes, whereas under the Wirral Order the Corporation were required to lay compulsory mains in only seven parishes and one urban district (excluding Moreton). The total length of compulsory l.t. distributing mains which the Corporation were required to lay under the Wirral Order amounted to only 11½ miles, but the length of such mains laid by the Corporation in the area amounts to 59 miles. The total length of h.t. mains erected and laid in the district is 27½ miles, and this has all been carried out within three years. The contractors for the overhead lines are W. T. Henley's Telegraph Works Co., and for transformers the English Electric Co. and the Brush Electrical Engineering Co. The consumers in the area number 2 670, and they have been supplied with 565 cookers and 1 614 electric fires and other appliances. Since the supply commenced the charge for lighting has been reduced from 6¼d. to 5d. per kWh.

BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION.

Annual Meeting—Points from the Report for 1929—Unemployment Committee—New Classification of Electrical Machinery and Apparatus—Standardisation.

THE annual meeting of the British Electrical and Allied Manufacturers' Association was held at the offices of the Association, 36, Kingsway, W.C.2, on March 20th. Lieut.-Col. R. K. Morcom, C.B.E. (Belliss and Morcom, Ltd.), presided, both the chairman (Mr. V. Watlington) and the director being absent owing to illness.

Before moving the adoption of the report, the chairman referred to the great loss the Association had sustained during the year in the death of Dr. Ferranti, and the regrettable retirement from the Council of one of its oldest members, Mr. Nalder.

Referring to the report, the chairman said severe compression had to be exercised by the Council to keep it within reasonable limits. A large volume would not contain a full account of the general activities of the Association during the year. Perhaps the most striking feature of the report was the indication it contained of the excellent position which the Association occupied in the opinion of the best judges, more particularly their good friends "the Press." Their valuable statistical department had brought the Association more into the public eye. They could also feel some pride in their happy relations with government departments and with the other associations.

Mr. M. J. Railing (General Electric Co., Ltd.) seconded, and after discussion, the report was unanimously adopted.

The chairman announced that the following firms had been elected members of the Council: British Electric Transformer Co., Ltd., Metropolitan-Vickers Electrical Co., Ltd., Micanite and Insulators Co., Ltd., Nalder Brothers and Thompson, Ltd., and Allen, West and Co., Ltd., and the election of auditors and a vote of thanks to the chairman for presiding concluded the proceedings.

The Year's Work.

The report of the Council for 1929 records the regretted retirement of Mr. F. H. Nalder, who had served on the Council from the foundation, owing to continued ill-health, his place being taken by Mr. A. F. Harris.

Towards the end of last year an Unemployment Committee was set up and appointed four of its members to confer with the Government as occasion might require.

Three Sections of the Association have in preparation applications to the Board of Trade under the Merchandise Marks Act, 1926.

A simple form of intertrading agreement between members has been approved by the Council and is now before the Sections.

The Board of Trade invited the Association's assistance towards a new classification of electrical machinery and apparatus for the purpose of the Census of Production, 1930. The new classification improves on the old, as being more in accordance with the actual conditions of manufacture which modern progress has created.

In regard to the trade position the report states that in many ways the economic position was unsatisfactory during 1929. Orders received for purely industrial installations on home account were less than in any year since 1924. On the other hand, certain compensating elements were present. On balance, the industry was not producing at more than its normal volume for home account. Considering the foreign overseas market as a whole, the most active area was, undoubtedly, Europe, which showed a marked expansion. Owing, however, to the effect of reparations deliveries-in-kind, this market has tended to become more and more a German preserve. It is significant, however, that the British electrical manufacturers, in spite of difficulties beyond their control, have been able to extend quite considerably their range of operations in this market.

The report summarises the past and probable future effect of certain general economic and political movements on the prospects of electrical manufactures, and considers that the almost complete cessation of foreign lending by this country, the adjustment of the reparations in kind difficulty and the change in the attitude of the central bank towards industrial development must have a favourable effect on the prospects of electrical manufacture and serve to adjust the international competitive position. Considering the past year as a whole the Council is of opinion that its most interesting activities have been along the lines of that general development patiently advocated by the Association, and that future production cannot but be favourably influenced by those activities. Prospects on home account are decidedly better than they have been for some time, but competition has become so intense in overseas markets that any considerable expansion of exports would be a matter for congratulation.

Standard Specifications.

The Standardisation Committee have been fully occupied during the year in allocating, reviewing, and co-ordinating the standardising work of the various Sections of the Association and in checking and passing the final proofs of no less than 42 specifications; as they came from the B.E.S.A. for approval. The publication of revised editions of certain important B.E.S.A. specifications marks the completion and consummation of several years' close application on the part of the technical committees of the various Sections. Outstanding among these are oil-immersed switches and circuit breakers for alternating-current circuits (B.S.S. 116), electricity meters (B.S.S. 37), and steam turbines (B.S.S. 132).

The Transformer Section Technical Committee, in preparing memoranda to serve as a basis for the British replies to certain questions put by the International Electrotechnical Commission to all its constituent national committees, have done some very useful creative work. The proposed rules for interturn insulation of h.t. and e.h.t. transformers, and their recommendations on the co-relation of transformer insulation and line insulation will undoubtedly receive serious international consideration.

The American Institute of Electrical Engineers awarded to a member of the Standardisation Committee, Mr. A. B. Field, their first Lamme gold medal.

At the close of 1929 there were 243 students in members' works. The countries sending the largest numbers were India, Africa, Egypt, Australia, New Zealand, China and South America. Efforts made by the Education Committee to discourage applicants with indifferent qualifications, or none at all, have been so frequently frustrated by the uninvited arrival in England of such men that the tendency now is not to consider any recommendation unless made or *viséd* by the members' branch offices abroad. These observations particularly apply to Indian students.

On a report from the Department of Overseas Trade, submitted by the Export Committee during the year, describing the propaganda of foreign industries in the British colonies, the publicity department was given carte blanche to engage in similar propaganda, and is now so engaged.

During 1929 the economic and statistical department was specially active in correlating statistics and information bearing on the British electrical industry, and the results of its labours during the year were incorporated in the most important economic publication yet issued: "The Electrical Industry of Great Britain." This monograph was published on November 28th and had a remarkably favourable reception.

Arrangements are being made for British participation in the Second Plenary World Power Conference to be held in Berlin in June. The Council considers that this will be one of the most important international engineering conferences ever held.

BAY OF FUNDY TIDES.

President Hoover's request that Congress appropriate $45 000 to defray the cost of a joint investigation by the United States and Canada into the probable effect on fisheries of damming the Passamaquoddy and Cobscock bays in Maine and New Brunswick, relates to a proposal to generate electricity by utilising the great tidal rise and fall of the Bay of Fundy. An American company which proposes to develop power from the movement of the tides in those bays is unable to obtain authority to construct dams because of protests from the fisheries. At Passamaquoddy Bay, with an average spring tidal range of 23·2 ft., it is estimated that from 500 000 to 700 000 H.P. could be generated.

NEWS IN BRIEF.

Television Broadcasting—A New Accumulator—Whitworth Society's Commemoration Dinner—Canadian Hydro-Electric Development.

GRADUATE assistants in mechanical and electrical engineering are required by the Newcastle-upon-Tyne Education Committee at Rutherford Technical College.

Czecho-Slovakian imports during January last included electrical machinery and apparatus valued at 26 million crowns, compared with 42 million crowns in January, 1929.

Imports into the Irish Free State during January, 1930, included electrical goods valued at £50 095, compared with £40 804 in January, 1929. Exports of machinery and electrical goods in January of the present year were valued at £55 389, compared with £6 784 in January last year.

Bournemouth Corporation has ordered the erection of 24 police telephone boxes.

Buckinghamshire Constabulary are now equipped with electric torches giving a red or white light for night signals to road traffic.

A telephone service from all parts of Great Britain and Northern Ireland to Kaunas and Klaipeda, in Lithuania, has been commenced.

A three-act play, "The Red Arrow," was produced at Boldon Colliery Miners' Hall this week by the author, Mr. T. Louden, an electrician at the colliery.

An eight-valve wireless set, with headphones to each bed and three loud speakers, has been presented to the East Park Home for Infirm Children by members of the Glasgow Radio Circle.

It is reported that two men who gagged and bound three women in a house in Park Street, London, W., last week, and stole therefrom property valued at £1 000, were disguised as electricians.

The transmission of sound television will take place from the London transmitters at the end of this month between 11 and 11.30 a.m. weekdays, excluding Saturdays and Sundays, and from midnight to 12.30 a.m. on Tuesday and Fridays. Sound will be transmitted on 356 metres and vision on 261 metres. The Baird Television Co. is responsible for the quality of the transmissions, the B.B.C. merely acting as agents.

The French railways have given orders to a British firm for a new type of electric accumulator. The new accumulator is manufactured by the "Young" process, the principle of which has not been divulged. It is said to effect a useful saving of weight and to eliminate sulphating. It is claimed that the accumulator can be fully charged in an hour and a half, instead of the usual ten hours, and that it has resisted drastic tests, such as continuous short circuiting.

The executive committees of the engineering trade unions had a combined meeting in London on March 19th, Mr. J. T. Brownlie presiding, and rejected the suggestion of a joint inquiry into working conditions and costs of manufacture in foreign countries. The Electrical Trades Union, and one or two other unions that have abandoned hope of the success of a combined wages movement and have withdrawn from the joint conference, were not represented at the meeting.

The seventh Annual Commemoration Dinner of the Whitworth Society was held on Tuesday, March 18th, with the president, Mr. W. H. Fowler (Manchester) in the chair, and 60 Whitworths were present. The president presented a copy of "The Whitworth Book" to each of the Whitworth Scholars of 1929. Sir Henry Fowler, C.B.E., chief mechanical engineer L.M. and S. Railway, has accepted nomination as the next president, and has invited the Society to visit Crewe next July. The committee decided to make another donation to a technical college in the present year.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of March 27th, 1880, stated that Dr. Werner Siemens had been granted permission to construct an electric railway between Wedding Platz and Belle Alliance Platz, Berlin, without any intermediate stations.*

It was announced that the works of Mr. W. T. Henley at North Woolwich had been taken over at the beginning of the month by W. T. Henley's Telegraph Works Company, Ltd., in which Mr. Henley retained a considerable interest.

An official proposal was brought forward that the Society of Telegraph Engineers should change its name to the "Society of Telegraph Engineers and Electricians."

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of March 31st, 1905, a generator of 5 750 kW installed by the Shawinigan Water and Power Company, Quebec, was described as "the largest electric motor-generator ever built."*

A proposal to connect Tasmania with the Australian mainland by wireless telegraphy was made by the Commonwealth Postmaster-General.

Electric welding apparatus was shown in operation at the Paddington Electricity Exhibition, also an electric light bath for treating various complaints.

At a luncheon of the I.S.B.A., at the Hotel Cecil, London, on April 4th, Mr. Barrington Hooper will give a Publishers Views of Trade Press Advertising. Mr. Thos. Bell will preside.

Marchese Marconi, on Wednesday, switched on 3 000 lights in the town hall at Sydney, N.S.W., by wireless impulses transmitted from his yacht "Elettra" and relayed via Dorchester and Grimsby.

An estimate has been prepared for a new administration building and showrooms for the electricity department in New Street, Hull. If a free hand is allowed in the design of the building, it is estimated that the cost will be £85 000. The Finance Committee is to consider and report on the matter.

Walsall Corporation requires an electric showroom attendant.

Cheshire C.C. has voted £1 000 for the provision of traffic light signals on the roads.

Hastings Corporation has decided to instal a refrigerator plant at the White Rock Pavilion, at an estimated cost of £330.

A teacher of electrical engineering and a teacher in the engineering department (mechanical and electrical engineering) are wanted at the Oldham Municipal Technical College.

London County Council wants assistant masters to teach in the electrical departments at the Poplar School of Engineering and Navigation and the Hackney Technical Institute.

Bombay Corporation has asked the Bombay Electric Supply and Tramways Co. to switch off the light throughout the city at 8.21 p.m. every day, for about three seconds, as an indication of the correct time.

"The Perfect Servant who Rules the World," "Where the Money Goes," "Country Currents" and "History of Electricity" were the titles of four films shown at the last of the present session of E.D.A. North-West Area Sales Conferences.

The Dominion Water Power and Reclamation Service of the Department of the Interior of Canada Ottawa, has issued its annual review (Bulletin No. 1361) which shows that at January 15, 1930, the total water-power resources of the Dominion were estimated to be 20 347 400 H.P. under conditions of ordinary minimum flow, or 33 617 200 H.P. ordinarily available six months of the year. The total hydraulic development amounts to 5 727 162 H.P., an increase of about 378 000 H.P.

Mr. R. Ogilvie Buchanan read a paper before the Royal Geographical Society on Monday on hydro-electric power developments in New Zealand. Since the war, he said, this development had increased from 49 000 to 149 000 H.P. in 1927, and the first stages of two new stations, adding a further 90 000 H.P., had been put into operation during the last two months. The electricity produced was equal to 0·17 H.P. per head of population, which was only exceeded by Norway, Sweden, Canada and Switzerland. The total water power available was estimated at 4 870 000 H.P.

The annual general meeting of the North-East Coast Branch of the Electrical Association for Women at Carliol House, Newcastle-on-Tyne; a luncheon at Tilley's, Blackett Street, Newcastle-on-Tyne; and a visit to the Lemington Glass Works, by invitation of the General Electric Co., Ltd., will take place to-day, March 28th. The annual general meeting will take place at 11 a.m., the luncheon, for which the charge is 5s., at 1 p.m., and the visit to the Lemington Works at 2.30 p.m. The speakers at the luncheon include Miss Haslett, Mr. D. Maxwell Buist (Central Electricity Board), and Mr. R. P. Sloan.

IN PARLIAMENT.

Committee Approves Bournemouth Corporation's Trolley Vehicle Proposals.

THE House of Commons Committee, dealing with this Bill last week, consented to the clauses authorising the Corporation to substitute electric trolley vehicles for its existing tramways, and to run trolley vehicles on 14 new routes, and protecting Corporation services against competition. Mr. A. R. Fearnley said he considered trolley vehicles particularly suited to towns of medium size, and they had a slight advantage over omnibuses in the matter of running costs.

Electrical Fire Risks.

The Cardiff Corporation Bill, which was before a House of Commons Select Committee last week, includes a clause authorising the Corporation to make by-laws refusing to supply electricity to houses which do not conform with requirements framed for the purpose of preventing fire. Mr. G. Morley New said there had been two unfortunate fatalities in Cardiff in 1927 due to faulty electrical fittings. The fittings were outside and were made without the knowledge of the department. After the second inquest the coroner had written to the Corporation suggesting that unless the municipality had greater power, such unfortunate fatalities might occur again. The by-laws would, of course, be subject to the consent of the appropriate Minister. The Committee approved the clause.

Metropolitan Railway Extension.

A House of Commons Committee last week passed the Metropolitan Railway Bill authorising a new railway line between Stanmore and Wembley. The capital involved is £500 000.

Replies to Questions in House of Commons.

Of the railways in the Tyneside area, 68 miles of running track have been electrified.

Around the coasts of England, Scotland and Ireland there are in operation 10 wireless beacons on shore and three in light vessels.

The sum recently advanced to the Perak Hydro-Electricity Co. by the Government of the Federated Malay States is £850 000. It carries interest at 5 %.

Grants of 60% are made to local authorities for the erection of approved automatic traffic signals. Every effort is made to encourage the use of British apparatus.

Licences granted under the Wireless Telegraph Acts are not inclusive, and the Postmaster-General cannot pledge that he will refrain from entering into commercial competition with those to whom he grants them.

To a considerable extent, the automatic telephone exchanges in London are new exchanges which meet growth of work. The general growth of work is such that no reduction of telephone staff has taken place or is at present anticipated.

At Poplar in 1928 the average price obtained for electricity for lighting and domestic supplies was 2·63d. and for power 1·23d., while at Notting Hill the average for lighting and domestic supplies was 4·7d., and for power 1·52d.

Subject to the assent of the Legislative Assembly, the Government of India intends to purchase the property of the Indian Broadcasting Co. and to carry on experimentally for a year the service hitherto conducted by that company.

When the time comes for fresh wireless legislation, the question of obtaining powers to deal with occasional cases of interference with broadcast reception by the operation of electrical plants in cinemas and business premises will be considered.

Wireless telephone calls to Canada pass through New York and calls to South America are routed via France or Germany. The Communications Co. have asked the Government to lease them their stations in order to provide a direct service to four Dominions, including Canada, and to the Argentine.

No exclusive right to operate wireless telegraph services has been granted to any company, although the Post Office beam stations were leased to the Imperial and International Communications Co. for 25 years, and the Imperial wireless services worked from those stations were transferred to the company.

Under existing legislation the provision of wireless apparatus on cargo or fishing vessels of less than 1 600 tons gross is not compulsory. The President of the Board of Trade will make inquiries as to the possibility of making it compulsory for one ship in a trawler or drifter fleet to carry wireless, in order to give information regarding storms to the rest of the fleet.

In reference to a statement by Col. Howard Bury that the greatest experts in wireless, including Senatore Marconi, have stated that the larger aerial is the best, and a suggestion that the various systems of wireless telephony should be tested by an independent committee, the Postmaster-General says the views of Senatore Marconi were heard and submitted to independent experts, and the test which was immediately practicable was made about last May.

The area of supply of the Wessex Power Co. has been divided into three main portions. A scheme for the first portion has been approved and is being carried into effect. A scheme for the second portion, comprising North Berkshire and other areas, has been submitted, but the Commissioners have asked for amendments and extensions, which are at present under discussion. The Central Board are keeping in touch with the company in the matter.

In reference to a statement that the County of Lordon Electric Supply Co. charges 5d. per kWh for lighting and ¾d. per kWh for current supplied under the all-in tariff, in addition to the quarterly standing charge, while the unit charges are 6d. and 1d. respectively in Romford, the Minister of Transport says the question of securing greater uniformity of charges and tariffs throughout the district of the London and Home Counties Joint Electricity Authority is being investigated by the Authority, but it is understood that they are not at present in a position to make any report on the matter.

The number of gas-lighted coaches included in British steam worked railway rolling stock in November 1st, 1928 was about 30 000, or 50% of the whole. Since that date further progress has been made with the conversion to electric lighting in the normal course. The following proposals (which are additional to the ordinary programme) involving expenditure under this head have been included by the companies among the works which they are undertaking in fulfilment of their obligation to the Government in connection with the repeal of the Railway Passenger Duty: Great Western Railway Co., £80 000; London, Midland and Scottish Railway Co., £208 840; and London and North Eastern Railway Co., £56 000. It is understood, however, to be uncertain whether the last item will be proceeded with. In addition, the L.M. and S.R. Co. have obtained a grant under the Development Act in respect of the expenditure, estimated at £287 500, involved in the substitution of electric lighting for gas in a further 1 250 coaches. The practice of the railway companies is to equip all new passenger stock with electric lighting equipment, with the exception of certain restaurant cars in which gas is utilised.

PERSONAL.

MR. C. W. Ford, of the St. Helen's Cable Co., Slough, is a candidate for the forthcoming elections for the Slough Urban District Council.

Mr. S. G. Monk, head of the electrical engineering department at the Technical College, Devonport, has been elected to the Council of the Plymouth Rotary Club.

Mr. T. Medcalf, passenger transport manager with Swindon Corporation, who has retired after 27 years' service, has been presented by the staff with a silver salver and an expanding bookcase.

At the meeting of directors of Yorkshire Electric Power Co., Mr. George Herbert Peake, deputy-chairman, was appointed chairman to fill the vacancy caused by the death of Mr. Arthur Greenhow Lupton.

Mr. G. C. Hadfield, of Southport, has been appointed showroom manager and salesman by Nottingham Electricity Committee. Mr. Hadfield at present holds a similar position with Southport electricity undertaking.

Croydon Electricity Committee reports that Mr. B. C. Ward, distribution superintendent, has been appointed deputy engineer and manager of the Bermondsey Borough Council's electricity undertaking, and has appointed Mr. L. Gripper, distribution engineer, to fill the vacancy at the grade scale.

Mr. Walter Donovan, Jun., after four years in the United States, has resigned his position on the engineering staff of Messrs. Cutler-Hammer Incorp. of Milwaukee, Wis., with whom he has been engaged for some three years, and has joined the firm of Donovan and Co., where he will take charge of the automatic and a.c. control section of that business.

At the annual general meeting of the Batti Wallahs Society at the Hotel Cecil, London, on March 18th, the following officers were elected for the ensuing twelve months:—PRESIDENT: Mr. Wm. McClelland; HON. SECRETARY AND TREASURER: Mr. M. Whitgift; COMMITTEE: Messrs. A. E. Apps, G. M. B. Hilton, H. S. Jacob, W. Lang, H. S. May, and A. E. Mohring. The office of Vice-President was abolished.

BUSINESS ITEMS.

THE GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, London, W.C.2, has received an order from the Union Construction Co., Ltd., for electrical equipment for the new high-speed tramcars they are constructing for the Uxbridge Road services of the London United Tramways. The order comprises 94 high-speed motors of 70 H.P. on the one-hour rating, 500 V, 96 cam type controllers and 48 sets of line switches with overload release. The motors are of unusually high capacity for the small diameter of driving wheel to be used—viz., 28 in.

A contract for a new passenger liner has been placed by Furness, Withy and Co., Ltd., with VICKERS-ARMSTRONGS, LTD. The ship will be 576 ft. long by 76 ft. 6 in. beam, and is designed to accommodate about 850 first class passengers. The liner, which will be of about 23 000 gross tons, is intended for the New York–Bermuda service, and will be electrically propelled. The whole of the electrical machinery and control gear is being manufactured by the GENERAL ELECTRIC CO., LTD., the turbo-alternators which will supply the power to the propulsion motor and for auxiliary purposes being of G.E.C.–Fraser and Chalmers' construction.

The ELECTRIC FURNACE CO., LTD., of 17, Victoria Street, London, S.W., has received an order for an Ajax-Northrup high-frequency furnace of 25 cwt. capacity from a French steelworks, which had previously installed two smaller furnaces of the same type. This furnace will have an output of over one ton per hour. Since the first commercial sized high-frequency furnace was installed in Sheffield about 2½ years ago, the Electric Furnace Co., Ltd., has installed, or has under construction, 27 Ajax-Northrup furnaces of a total capacity of 5 350 kW, in addition to 78 laboratory-sized furnaces of the same type, which have also been supplied. This company has also recently received orders for a 3½ ton Héroult furnace for Spain, and for 64 tube heaters and 24 frame heaters for a French firm.

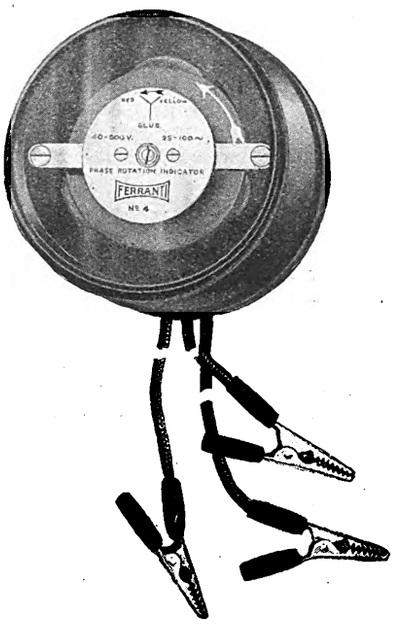
A novel service scheme has been initiated by WALKER BROS, Quality House, Temple Street, Birmingham, for domestic users of electricity. Essential features of the scheme are as follows: Three times per annum a qualified electrical engineer will call at subscribers' residences with the necessary testing instruments, and will test the electrical installation for leakages; examine the installation for defects; make any adjustments, and do any repairs to lights or bells which do not make the total time spent more than one hour per visit; discuss with and advise the subscriber regarding any electrical difficulty or proposed scheme of electrification. The inclusive charge for this service is one guinea per annum. It is stipulated that no material shall be used on any of the service visits for this fee, and if any is required, it will be charged for at the normal rates.

As agents for the ENGLISH ELECTRIC CO., LTD., London, the contract has been placed with SIEMENS (AUST.) PTY., LTD., by the Hydro-Electric Department, Tasmania, for the water-driven turbo units and automatic switchgear for the Shannon River power station. The new station will contain two 7 250 H.P. reaction turbines, direct coupled to three-phase alternators, each set being provided with a direct coupled exciter, as well as an auxiliary generator for operating the switchgear control circuits and automatic devices. The switchgear for controlling these two units will be entirely automatic in operation, with the exception of the actual starting up and synchronising, and the station will run unattended. The station will normally operate in parallel with the existing Waddamana station, about six miles separating them. As is well known, the latter station receives its water supply from the Great Lake, but when originally constructed, it was not at that time considered economical to make full use of the total head of water available. Thus a head of approximately 300 ft. remained unutilised. The purpose of the new station is to make use of this loss of head, the water passing through the Shannon station before being used at Waddamana. The turbines will be of the single-discharge, overhung type, and each will be rated as follows: Net head, 244 ft.; quantity of water, 300 cu secs.; output, 7 250 H.P.; speed, 500 r.p.m. The rating of each alternator is: Output, 5 800 kVA; pressure, 6 600 V; frequency, 50 cycles. The water turbines and alternators, including main valves, governor gear, etc., will be of "English Electric" design, and will be manufactured partly at the English Electric works in England and partly by the Clyde Engineering Co., Ltd., Sydney. The switchgear will be designed and manufactured by the English Electric Co.

NEW PHASE INDICATOR.

Portable Instrument for Indoor or Outdoor Use.

A RECENT addition to the range of testing instruments manufactured by Ferranti, Ltd., is a phase rotation indicator which is a very useful portable instrument for workshop or outside testing use and is fitted with leads terminating in clips to facilitate its rapid connection to the circuit to be tested. It consists of a miniature 3-phase induction motor, the disc of which rotates in a direction corresponding to the phase rotation of the circuit to which the instrument is connected. The instrument leads are coloured red, yellow and blue, and an arrow on the disc indicates the direction of disc rotation (counter clockwise) when the instrument is connected to a circuit having the B.S.S. phase rotation of red, yellow, and blue. The voltage range is 40–500, and the frequency range 20–100 cycles. The instrument case is 2⅞ in. in diameter and is of black moulded insulating material. The complete indicator, which weighs only 8 oz., is supplied in a leatherette case, which can be conveniently carried in the pocket.



The new phase rotation indicator by Ferranti, Ltd.

THE SOCIAL SIDE.

THE G.E.C. Choral Society's season culminated with a concert at Magnet House on March 14th, which was without doubt the most successful which they have so far given. The main programme consisted of the well-known "Hiawatha's Wedding Feast," in which the part of Chibiabos was taken by Mr. Alec John, and, the more unusual and possibly more interesting "Deacon's Masterpiece," with words by Oliver Wendell Holmes set to music by Percy E. Fletcher. The rendering of these two works was extremely effective,

The annual dinner and dance of the Batti-Wallahs' Society was held at the Hotel Cecil on March 21st, with its usual great success. This is the last function of the Society to be held at the hotel. In future the luncheons, etc., will take place at the Hotel Metropole, Northumberland Avenue, W.C.2. Mr, F. W. Purse made a short speech proposing the toast of the Society and its President, Mr. H. L. Howard, and expressed the hope "that your radiant light may never grow dim." The President made a surprise presentation of a gold watch to Mrs. M. Whitgift.

The second dinner of the Association of Ex-Siemens' Men was held on March 20th, at Gatti's Restaurant, London, W.C., when Mr. G. Palgrave Simpson occupied the chair. When the toast of "Chairman" was proposed, a great point was made of the spirit of comradeship that kept the old members of the Siemens' organisations together, and that the chairman represented a link with the old days when this co-operation developed.

The Manchester Electro-Harmonic Society held the concluding concert of the present season on March 21st. Mr. J. A. Robertson, president, occupied the chair, and in one of his characteristic speeches, reminded the company that he was retiring from the presidency of the Society—a position which he had held for some seven years. He then made the announcement that Mr. H. C. Lamb, the chief electrical engineer of Manchester, had accepted the invitation to be the next president.

On the invitation of the directors, the employees of A. P. Lundberg and Sons, Ltd., Liverpool Road, N.7, took part in a social evening at Rawdon Hall, Holloway, N., on March 15th.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

AYLESBURY CORPORATION.—Twelve months' supply of (section A) paper insulated, lead-sheathed steel taped and armoured cable; (B) overhead material; (C) galvanised ironwork for overhead mains and service work; (D) insulators; (E) a.c. meters; (F) joint boxes, cut-outs, pole boxes, compound switches and meter boards. Specifications from Mr. W. A. Turnbull, Electricity Works, Exchange Street, Aylesbury.

EAST AND WEST MOLESEY URBAN DISTRICT COUNCIL, March 28th.—Supply, etc., of small electric lighting plant for sewage works, with wiring and fittings for 12 points. Further particulars from the Surveyor, Council Offices, East Molesey.

Transformers.

LIVERPOOL CORPORATION, March 28th.—Supply of 12 step down transformers. Specification, etc., from the City Electrical Engineer, 24, Hatton Garden, Liverpool.

WAUNARLWYDD WELFARE HALL, SWANSEA, March 28th.—Electrical installation. Specification can be seen on application to the Secretary.

BIRMINGHAM CORPORATION, March 29th.—Manufacture and supply of 1 400 tons of grooved steel girder rails and fishplates. Specifications, etc., from the General Manager, Tramway and Omnibus Department, Council House, Birmingham.

MIDLOTHIAN AND PEEBLES DISTRICT ASYLUM, ROSSLYNLEE, March 29th.—Six months' supply of electrical fittings, etc. Forms of tender from Mr. C. L. Addison-Smith, 19, Heriot Row, Edinburgh.

PATRINGTON GUARDIANS, March 29th.—Electric lighting installation at Patrington Poor Law Institution (120-130 points). Specification can be seen at the Institution.

RHONDDA URBAN DISTRICT COUNCIL, March 29th.—One year's supply of ordinary and prepayment a.c. meters, cable, joint boxes, compound cut-outs, etc. Specifications and forms of tender from Mr. J. M. Bowman, Electricity Works, Porth, Glam.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, March 31st.—Supply and erection of one 1 000 kVA and two 500 kVA three-phase transformers. Specification, etc., from Mr. David J. Keep, town clerk; deposit £2 2s. Technical inquiries can be made of Mr. H. W. Couzens, 9, Old Queen Street, London, S.W.1.

CENTRAL ELECTRICITY BOARD, March 31st.—Supply and erection of metering equipment required in the area of the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-G.M. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CONGLETON CORPORATION, April 1st.—High tension and low tension switchgear, transformers, kiosks, h.t. cables, l.t. cables and l.t. overhead distribution. Specifications from Messrs. Arthur Ellis and Partners, 9, Park Place, Cardiff; deposit £3 3s.

BINGLEY DISTRICT SUB-COMMITTEE, April 1st.—Electric light installation at Crossflatts Council School and schoolhouse. Specifications from Mr. B. Leah, Education Offices, Bingley

WATFORD CORPORATION, April 1st.—Wiring of lighting and heating points in dwelling houses. Specifications, etc., from the borough electrical engineer, Mr. A. W. Barham, Cardiff Road, Watford.

BEXHILL CORPORATION, April 2nd.—Laying and jointing of about 1 600 yards of 0·5 sq. in., three-phase, paper insulated, lead covered and armoured, 11 000 V cable of British manufacture. Specification from the Borough Electrical Engineer.

NANTWICH RURAL DISTRICT COUNCIL, April 3rd.—Wiring and supply of lamps for electric lighting of Council houses in Alpraham, Haslington, Shavington and Walgherton. Specifications, etc., from Mr. H. Crabtree, 21, Pillory Street, Nantwich.

PORTSMOUTH PIER, April 3rd.—Re-wiring and wiring of bandstand. Specification, etc., from the Manager, South Parade Pier, Portsmouth.

ST. PANCRAS (LONDON) BOROUGH COUNCIL, April 3rd.—Supply of e.h.t. switchgear. Specifications, etc., from the Electricity and Public Lighting Department, 57, Pratt Street, Camden Town, London, N.W.1; deposit £2.

ST. PANCRAS (LONDON) BOROUGH COUNCIL, April 3rd.—Supply of l.t. switchboards. Specification, etc., from the Electricity and Public Lighting Department, 57, Pratt Street, Camden Town, London, N.W.1; deposit £2.

GREAT WESTERN RAILWAY CO., April 4th–24th.—Supply of electrical cables and wires (list 20) and telegraph ironwork (list 21). Specifications with forms of tender from the Office of the Stores Superintendent, Swindon (form of tender for list 20 on and after April 14th). Tenders for list 21 by April 4th and for list 20 by April 24th.

SHEFFIELD CORPORATION, April 4th.—Supply of one wheel press, with electric motor, for the tramways and motors department. Forms of tender from Mr. A. R. Fearnley, general manager, Division Street, Sheffield.

CENTRAL ELECTRICITY BOARD, April 7th.—Supply and erection of 66 kV and lower voltage transformers, in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-G.T.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

STOKE-ON-TRENT CORPORATION, April 9th.—Supply and erection of e.h.t. and l.t. overhead transmission lines. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

DUNDEE CORPORATION, April 10th.—Supply of e.h.t. and l.t. paper insulated, lead-covered and double steel tape armoured cable. Specifications, etc., from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

COVENTRY CORPORATION, April 14th.—Electrically-driven pumping machinery, for Whitley pumping station. Specification (£10) from Sir Alexander Binnie, Son and Deacon, Artillery House, Artillery Row, London, S.W.1.

LONDON COUNTY COUNCIL, April 14th.—Manufacture and supply of h.t. and l.t. cables; and reconstruction of existing l.t. cables. Specification, etc., from the General Manager of Tramways, 23, Belvedere Road, London, S.E.1; deposit £2.

BATTLE URBAN DISTRICT COUNCIL, April 16th.—Electrically-driven borehole pump, at Powdermill Lane pumping station, and two sets of electrically-driven boosting pumps at Starr's Green booster station. Plant to be of British manufacture and complete with electrical equipment and cable connections. Specification, etc., from Messrs. J. Taylor and Sons, Caxton House, Westminster, S.W.1; deposit £5.

CENTRAL ELECTRICITY BOARD, April 16th.—Construction of site works and foundation works for the transforming stations at Ribble (Preston) and Lancaster. Specification (N.W.E.—P.F.1) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s. 0d.

DUNDEE CORPORATION, April 23rd.—One year's supply of stores and materials to the tramways department. Specifications, etc., from the General Manager, Transport Office, Dundee.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

SOUTH INDIAN RAILWAY CO., LTD., March 28th.—Transformers for power, lighting and signalling in connection with Madras Improvements—Electrification. Specifications (10s.), from the Company's Offices, 91, Petty France, Westminster, S.W.1.

JOHANNESBURG MUNICIPALITY, March 29th.—Supply of metallic filament traction lamps (contract No. 351). (Reference B.X. 6 246.)

VICTORIAN RAILWAY COMMISSION, March 30th.—Supply of d.c. neutral relays, for power signalling purposes (contract No. 43 457). (Reference B.X. 5 793.)

INDIAN STORES DEPARTMENT, March 31st.—One year's supply of lead sheathed cable (order No. N.10 899), (Reference B.X. 6 259.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, March 31st.—Supply of spare parts for B.P.O. dial No. 10. (Reference B.X. 6 097.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 1st.—Supply of submarine cable (schedule C. 561). (Reference B.X. 6 070.)

CAPE TOWN MUNICIPALITY, April 2nd.—Supply of five sets of electrically-driven pumps and accessories, including motors, switchboard, etc. (specification No. 485/29). (Reference A.X. 9 096.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, April 3rd.—Supply of eleven 4-ton electric cranes for Durban Harbour. (Reference A.X. 9 119.)

PORT ELIZABETH MUNICIPALITY, April 10th.—Supply of electric cable and overhead line material (specification No. 40). (Reference B.X. 6282.)

VICTORIAN ELECTRICITY COMMISSION, May 5th.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19.) (Reference B.X. 6 226.)

POWER SECURITIES CORPORATION, May 15th.—Works and materials in connection with Pykara hydro-electric scheme, including transmission line towers (specification E2; price 22s. 6d.); (insulators E5; 7s. 6d.); steel-cored aluminium ductors (E6; 4s. 6d.); steel earth wire (E7; 4s. 6d.); guying materials (E13; 4s 6d); generating plant (E14; 37s. 6d.); crane (E16; 7s. 6d.), and transformers (E18); 7s. 6d.). General conditions, 3s. 6d. Specifications, etc., from Messrs. Balfour Beatty and Co., Ltd., 66, Queen Street, London, E.C.4.

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of cable clamps, for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators; for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

Tenders Accepted.

CANNOCK URBAN DISTRICT COUNCIL.—English Electric Co., Ltd., switchgear.

MANCHESTER CORPORATION.—Revo Electric Co., Ltd., supply of electric cookers.

HULL CORPORATION.—Tangyes, Ltd., two centrifugal pumps, a.c. motors, etc., £512.

LEEDS GAURDIANS.—Marshall and Reilly, electric light installation in six children's homes, £60.

AYR CORPORATION.—Darroch and Espie, electrical work at 80 houses at Newton Glebe, £339 1s. 10d.

CROYDON CORPORATION.—Commercial Electric Co., supply of electric fittings and appliances for six months.

LONDON COUNTY COUNCIL.—E. Showell and Sons, Ltd., supply of controller segments, fingers, tips, etc. £663.

PERSHORE RURAL DISTRICT COUNCIL.—Abel and Smith extension of electric light installation at the Sanatorium.

QUEENBOROUGH CORPORATION.—W. J. Hounsell, overhauling and re-wiring lighting system at Town Hall, £28 2s. 6d.

BURTON-ON-TRENT CORPORATION.—Ferguson, Pailin, Ltd., supply of switchgear for Curzon Street sub-station, £967 2s.

ILFORD CORPORATION.—D.P. Battery Co., Ltd., supply of battery for Orwell electric vehicle, £167 18s. (Recommended.)

COLCHESTER CORPORATION.—Electroflo Meters Co., Ltd., supply and erection of measuring and recording instruments, £1 015.

ARMAGH COUNTY EDUCATION COMMITTEE.—C. R. Craig, electric lighting installation at Armagh new public elementary school, £398.

KENSINGTON (LONDON) BOROUGH COUNCIL.—Bate Electrical Co., Ltd., supply of electrical fittings for 12 months. (Recommended.)

BANGOR (CO. DOWN) CORPORATION.—Edison Swan Electric Co., Ltd., steel electric lamp standards, with lamp brackets, street lanterns, etc.

BOMBAY CORPORATION.—Balmer Lawrie and Co., renewing wiring at municipal buildings, using Johnson and Phillips materials, Rs. 1 195.

DURHAM COUNTY EDUCATION COMMITTEE.—Embleton and Barker, Ltd., electric light installation at Grove Estate School, Consett, £73 12s. 4d.

BRIGHTON CORPORATION.—A. Reyrolle and Co., Ltd., e.h.t. switchgear, £743; George Ellison, l.t. switchgear, £543. (Both recommended).

OSSETT CORPORATION.—Electrical Distribution of Yorkshire, Ltd., supply of fittings, £12 14s.

COWDENBEATH CORPORATION.—A. Rolland and Co., electrical work in connection with erection of 32 houses, £171.

HALESOWEN URBAN DISTRICT COUNCIL.—Robinson Bros., wiring houses on Long Lane Estate, £26 7s. 4d., and houses at Colman Hill, Cradley, £244 7s. 6d.

HERNE BAY URBAN DISTRICT COUNCIL.—Herne Bay Electricity Co., Ltd., supply of 28 Flambeaux lights for use in connection with central windscreen, £29 15s.

Meters and Transformers.

PLYMOUTH CORPORATION.—British Electric Transformer Co., Ltd., supply of transformers; Ferranti, Ltd., and Smith Meters, supply of meters. (All recommended.)

HASTINGS CORPORATION.—Crompton Parkinson, Ltd., switchboard, £115 13s.; British Thomson-Houston Co., Ltd., oil switch unit, £116 2s. (Both recommended.)

WORKSOP RURAL DISTRICT COUNCIL.—R. B. Isle and Co., electic wiring of 26 houses now being erected at North Carlton, near Worksop, wiring only parlour type £6 7s. 3d., non-parlour type £5 17s. 3d.; power or heating (one point), parlour type £1 10s., non-parlour type £1 10s.

IRISH FREE STATE COMMISSIONERS OF PUBLIC WORKS.—H. E. Harrison and Co., electric lighting works at Stationery Office, Beggars Bush Barracks, Dublin; Irish Free State Electricity Supply Board, conversion of gas lamps to electric, and supply of h.t. cables, at Papal Nuncio's residence, Phœnix Park, Dublin; Brooks, Thomas and Co., Ltd., conversion of gas plant to electric drive at Phœnix Park pumping station.

LONDON COUNTY COUNCIL.—Electrical Installations, Ltd. installation of electrical fittings and wiring in connection with erection of Streatham Vale Elementary School, £699. (Recommended.) Also tendered: G. H. Denne and Son, Ltd., £739; A. Dean and Co., Ltd., £754; J. Briggs (Electric Contractors), Ltd., £796; T. Clarke and Co., Ltd., £827; A. Hawkins and Son, £839; Pinching and Walton, £844; Smethurst and Co., (London), Ltd., £856; Berkeley Electrical Engineering Co., £1 037.

METROPOLITAN ASYLUMS BOARD.—Alpha Manufacturing and Electrical Co., Ltd.: electric light installation at casual ward, Lambeth, £162 (recommended). Also tendered: H. Lewis and Co., £163; T. Clarke and Co., Ltd., £173; A. Hawkins and Sons £175; Phillips and Sons (Chiswick), Ltd., £193; K. Hedin, £206; Toy and Winslow, £213; the Telephone and Electrical Maintenance Co., £216; Read and Partners, Ltd., £218; S. Reed and Sons, £220; C. Rickards, Ltd., £232; Piggott Bros., and Co., Ltd., £242; General Installation Co., £340.

WIMBLEDON CORPORATION.—Sub-station equipment and transformers: G. Ellison, Ltd., l.t. switchgear equipments, £2 158; English Electric Co., Ltd., h.t. switchgear equipments, £1 022: A. Reyrolle and Co., h.t. switchgear equipments £2 626; Metropolitan-Vickers Electrical Co., Ltd., one 2 000 kVA 10 000/2 000 V transformer, £635; British Electric Transformer Co., Ltd., 20 200 kVA (outdoor) transformers, £1 990; Foster Engineering Co., Ltd., one 200 kVA (outdoor) transformer, £119; and Johnson and Phillips, Ltd., four 1 000 kVA (outdoor) transformers, £1 400.

GENERAL POST OFFICE.—Cabling, Peterborough-Market Deeping, Siemens Bros. and Co., Ltd.; Canterbury-Seabrook, Standard Telephones and Cables, Ltd. Electric Lifts—Terminus (London, W.C.) Telephone Exchange, J. Bennie, Ltd.; Birmingham Head Post Office, Smith, Major and Stevens, Ltd.; Telephone Exchange Equipment, Crawley (Sussex), Automatic Telephone Manufacturing Co., Ltd.; Holborn and Tandem, Automatic Telephone Manufacturing Co., Ltd.; Telephonic Repeater Equipment, Torquay, The General Electric Co., Ltd.; Guernsey (Channel Islands), General Electric Co., Ltd.

GLASGOW CORPORATION.—Re-conditioning of 300 tramcars, total £208 147: Motors, General Electric Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd.; controllors, English Electric Co., Ltd., and Metropolitan-Vickers Electrical Co., Ltd.; roller bearing axle boxes, Ransome and Marles Bearing Co., Ltd., Hoffman Manufacturing Co., Ltd., and Skefko Ball Bearing Co., Ltd.; air brake equipment, Consolidated Brake and Engineering Co., Ltd., and Electro-Mechanical Brake Co., Ltd.; magnetic track brakes, Metropolitan-Vickers Electrical Co., Ltd., and Electro-Mechanical Brake Co., Ltd.; truck forgings, Brush Electrical Engineering Co., Ltd., and P. and W. MacLellan, Ltd.; upholstered seats, Bennet Furnishing Co.

ELECTRICITY SUPPLY.

Hydro-Electric Scheme for the River Elk—Lanark Farmers and Rural Electrification—Westmorland and South Cumberland Lighting Order—Ulster and the Shannon Scheme—Electrical Development in Northern Ireland—Extensions to Newton Abbot Power Station.

SHOREDITCH (London) B.C. has decided to borrow £100 000 for electricity purposes.

Bolton electricity department is to lay mains in Victoria Road, at a cost of £1 500.

Glasgow Electricity Committee has authorised mains extensions at a cost of £2 116.

Mains extensions, at a cost of £6 184, have been authorised by Sheffield Electricity Committee.

It has been decided by Lerwick T.C. to make inquiries regarding a grant for an electricity scheme for Lerwick.

The use of overhead cables by the County of London Electric Supply Co. for a supply of electricity to Eastwood has been approved by Rochford R.D.C.

Shoreditch (London) Electricity Committee has voted estimates for providing certain feeder mains (£4 764), distributing mains and services (£9 408), and meters (£10 000).

An intimation has been received by Torrington T.C. from the Bideford and District Electric Supply Co. that the extension of the supply to the borough is to be proceeded with at once.

Braunton P.C. has entered into a new agreement for public lighting with the Braunton Electric Light Co. The charge is to be the same as for private lighting, which represents an increase of 1d. per kWh.

Aberdeen T.C. has decided to apply for a Special Order to authorise the extension of the Corporation area of electricity supply to include the parishes of Banchory-Devenick and Maryculter.

South Stoneham R.D.C. has decided to offer no objection to a scheme put forward by Southampton Corporation for extending the supply of electricity to Thornhill, Netley, and part of Hamble, by means of overhead cables.

The Ontario Provincial Government contemplates the further extension of its rural hydro-electric power distribution services by the re-adjustment of the service charge and provision of loans for farm installations and permanent equipment.

Mr. J. M. Andrews, Minister of Labour for Northern Ireland, recently said he did not think there was any great foundation for a rumour that Ulster was being offered supplies of electricity from the Shannon scheme. He would strongly oppose the taking of any such supply.

Montreal City Council has approved hydro-electric power development works to cost $2 500 000, the power station to be constructed at the foot of the Lachine Rapids. The power from the new station will be used by the City for its own needs, including the lighting of streets, etc.

Buckie T.C. has sent to ratepayers a circular stating that the Council will not proceed with any electricity scheme costing ratepayers anything on the rates. The charge for energy is to be 8d. per kWh and wiring will be done on a cash or deferred payment basis at consumers' option.

It was reported at last week's meeting of the Kent Rural Community Council that friendly relations had been established with the Central Electricity Board, who were prepared to consider sympathetically the recommendation of the Committee with regard to the routes of the pylons for overhead transmission lines.

The Lanark County Executive of the Farmers' Union has been investigating the possibility of having an electricity supply for rural areas in the county, and has asked the Board of Agriculture to outline a scheme for them at economic rates. Farmers in the area are being asked to state whether they will be prepared to take a supply.

Sheffield Electricity Committee is seeking grants in respect of works proposed to be carried out in acceleration of normal development, comprising the change over of existing single- and two-phase mains to three-phase mains in various districts, and the extension of mains in anticipation of future development, at a total estimated cost of £88 489.

East Ham Tramways and Electricity Committee has passed estimates, amounting to £635 and £1 860 for the alteration and extension of the lighting feeder cables in Shelley Avenue, and from Nelson Street to Stamford Road, and £3 504 for the laying of distributor cables in Bendish, Holme, Laurence, Malvern, Temple, Stamford and Oakfield Roads.

East Grinstead U.D.C. is negotiating with the Weald Electricity Co., Ltd., for a bulk supply of electricity. The Consulting Electrical Engineer advises the Council to ask for nothing less than a 200 kW supply, and as there is a possibility of an agreement being entered into for a term of years, an increase of 100 kW per annum should be allowed for.

Hastings Electricity Committee is to improve the street lighting, at a cost of £434, and to supply electricity to Crowhurst Park, at a cost of £362, and to St. Mary's Estate, Bexhill Road, where the Bexleigh Estates, Ltd., is to erect 106 houses. The cost in the last case will be £840.—The Committee seeks sanction for a further loan of £10 000 for house services.

The East Kootenay Power Co. proposes to apply to the Provincial Water Controller at Victoria, British Columbia, for the right to dam the Elk river at a point about 10 miles below the town of Elko, and to erect a hydro-electric plant for the generation of between 15 000 and 20 000 H.P. A dam impounding the waters of the river at Phillip's Canyon will be constructed.

Torquay Corporation has decided to purchase and instal at the Newton Abbot generating station, at a cost of £34 540, two water-tube boilers and auxiliaries, as part of the £100 000 scheme which has been sanctioned by the Electricity Commissioners for the installation of a 7 500 kW set. The present plant has a capacity of 16 000 kW and is not considered sufficient to meet next winter's demand.

Shipley U.D.C. is to apply to the Unemployments Grants Committee for a grant with respect to the scheme for the change-over from the d.c. to the a.c. system in the centre of the town.—The stall-holders are to be circularised in regard to a scheme for the electric lighting of the market stalls. The charge proposed is 1s. 6d. for each night when required, the stall-holders giving a guarantee to take a 12 months' supply.

The Westmorland and South Cumberland Electric Lighting Order is being promoted by the Cumberland Waste Heat Owners' Co. It is proposed that the Order should give powers to supply electricity in considerable areas in the counties of Westmorland, Cumberland and Lancashire, the rural district of Sedbergh, and the parishes of Thornton-in-Lonsdale, Ingleton, Burton-in-Lonsdale and Bentham, in the Settle rural district.

The Northern Ireland Government has appointed Mr. J. M. Kennedy, of Messrs. Kennedy and Donkin, to report upon electrical developments in Northern Ireland. He has already presented an interim report. Since 1922 the output of electricity in Northern Ireland has increased from 40 000 000 to 71 750 000 kWh per annum, and of this quantity 65 500 000 kWh are provided by the Belfast Corporation. The Belfast supply is being extended to Lisburn, with the possibility of future development to Portadown and Dungannon.

The Minister of Transport (Mr. Herbert Morrison) opened the "Beautiful England" campaign at the Guildhouse, Eccleston Square, London, last Sunday. The development of electricity, he said, was vital to the beauty of the lives of the housewives. There must, therefore, be generating and transformer stations and overhead transmission lines. He was encouraging the employment of competent architects to secure designs for stations which were appropriate to the neighbourhood, and he agreed that care should be taken to secure that the masts were not unsightly and that routes should be carefully chosen.

The electricity supply to Holywood, co. Down, was inaugurated on March 19th. The supply is taken in bulk from Belfast Corporation's 22 000 V transmission line, and is stepped down to 6 000 V in a sub-station in Holywood. The current was switched on by the Duke of Abercorn, Governor of Northern Ireland, in the presence of Ministers of the Ulster Government, the Lord Mayor of Belfast, the chairmen and officials of public bodies of the Northern Counties, and apparently the entire population of Holywood. Coloured festoons and fireworks supplemented the striking effect of the change which was brought about by the electric lighting of all street lamps in the town. Messrs. Johnson and Phillips, Ltd., were the contractors for the distribution system, and the undertaking is under the management of Mr. Pryce Jones.

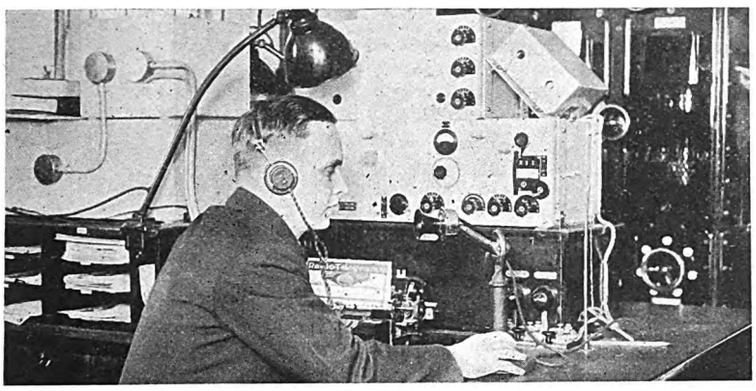
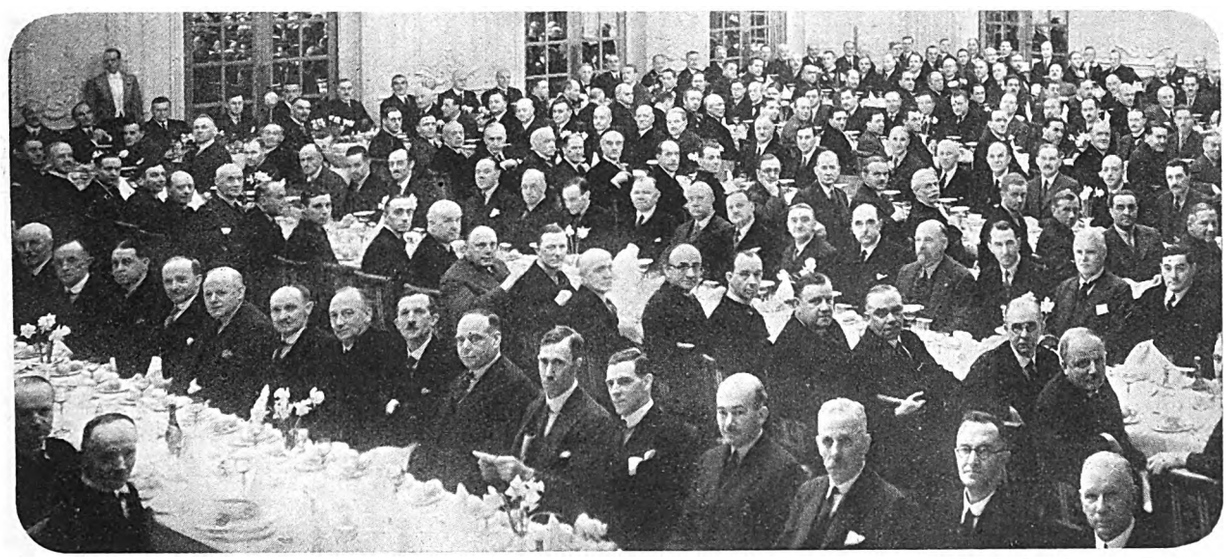
ELECTRICAL PICTURES OF THE WEEK.

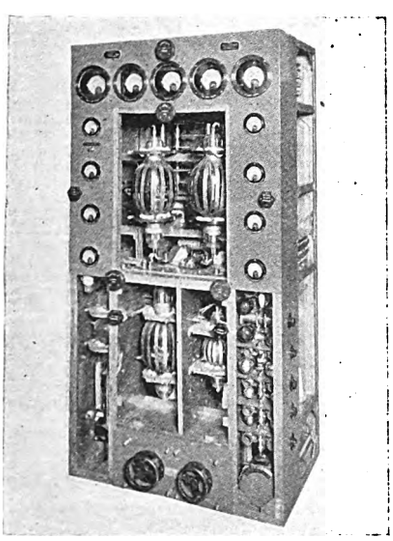


The wireless cabin on board the "Europa," the new North German Lloyd vessel which holds the Blue Riband of the North Atlantic. The equipment allows of long and short wave transmission and is capable of handling heavy "traffic" without delay.

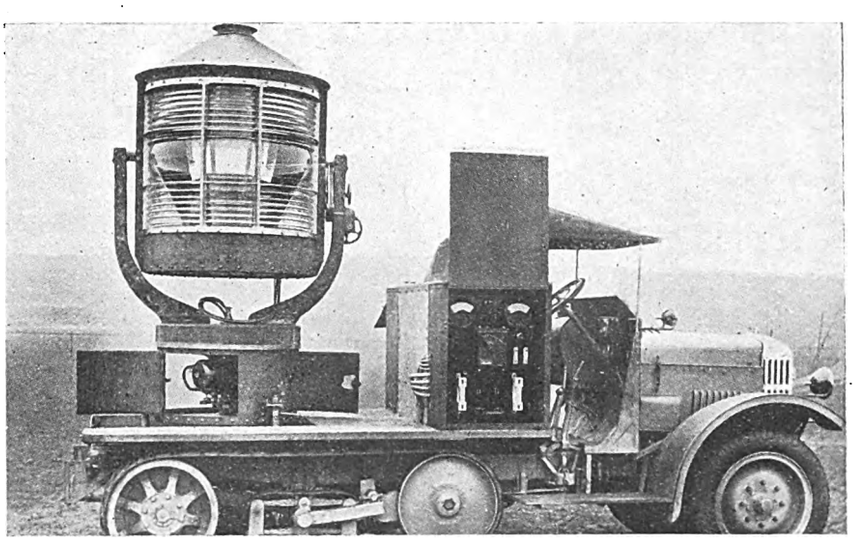
A novel manner of demonstrating, at the Ideal Home Exhibition, the suction powers of the new "Tellus" vacuum cleaner. The exhibition opened at Olympia, London, on Monday.



Members of the Electrical Development Association at the annual luncheon held at the Savoy Hotel, London, on Friday, with Mr. Herbert Morrison as the guest of honour. A report of the speeches is given on page 387, while extracts from the annual report appear on page 393.



The short wave wireless transmitter used by Marchese Marconi last week for carrying on telephone conversation between his yacht "Elettra" in the Mediterranean and Sydney, N.S.W.



One of the ground lights made by Chance Brothers, of Birmingham, for the Air Ministry, for use at the landing grounds on the Cairo-Karachi air mail route. The lights have been erected on specially constructed lorries arranged with self-contained generating plant. The equipment may be used as a beacon, searchlight, signalling lamp or flood, ample control of the beam being provided.

FINANCIAL INTELLIGENCE.

Principal Features of Accounts of Electricity Supply Companies for 1929—Recent Market Quotations—Dividends and Yields.

By "AUDITOR."

BANK RATE (1929–30).

1929.		1930.	
Feb. 7	5½%	Feb. 6	4½%
Sept. 26	6½%	Mar. 6	4%
Oct. 31	6%	Mar. 20	3½%
Nov. 21	5½%		
Dec. 12	5%		

The following tables, which show the principal features of the accounts of certain electricity supply undertakings for the 1929 financial period, afford a comparison of the figures with those relating to the previous year :—

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Total Connections	739 355 H.P.	716 678 H.P.
Profit	£876 351	£819,456
Net Profit	687 784	614 785
Preference Dividend	181 948	181 878
Ordinary Dividend	240 461	184 961
Depreciation and Contingencies Reserve	930 437	761 359
Plant Renewals and Improvements Reserve	41 703	51 920
Capital Expenditure	7 255 929	7 012 449
7% Cum. Pref. Shares	1 500 000	1 500 000
5% Pref. Shares	1 538 952	1 538 952
Ordinary Shares	4 007 681	4 007 681
4½% Cons. 1st Mort. Deb. Stk.	2 110 908	2 110 908
6% 2nd Mort. Deb. Stk.	1 250 000	1 250 000
Loans (secured)	414 030	426 610
Loans (temporary)	45 759	45 396
Creditors	407 414	397 498
Debtors and Cash	571 847	368 911
Carried forward	96 028	80,653

At the price of 19s. 9d. the 5% pref. yield 5 1/16%, and at 104 the 6% second debentures return 5⅛%. The ordinary shares are quoted at 23s. 9d., yielding 5¼% (dividend 6%).

SCOTTISH POWER CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Profit	£213 218	£116 659
Net Profit	132 530	79 927
Preference Dividend	16 800	16 800
Ordinary Dividend	104 565	58 515
General Reserve	420 000	156 000
Investments in Subsidiaries	2 791 847	1 421 547
Advances to Subsidiaries	648 326	176 405

COMPANY NEWS.

Improved Quotations for Electrical Securities—Newcastle Company's Increased Demand from Collieries—British Insulated Cables Meeting—New Companies.

THE market for electrical shares—supply, transport and equipment—has fully participated in the all-round advance in prices of investments which followed the lowering of the bank rate last week. The leading cable-manufacturing shares, in particular, have been strong, Callender's and Henley's ordinaries each rising 6s. 3d. to 77s. 6d. and 127s. 6d. respectively, while British Insulated at 77s. 6d. are 3s. 9d. up, and Enfields at 97s. 6d. are half-a-crown to the good. Associated Electrical Industries shares have jumped from 25s. to 29s. Automatic Telephone Manufacturing shares have improved from 37s. 6d. to 38s. 9d.

The stocks of Cables and Wireless, Ltd., have maintained their improvement in spite of some profit-taking, and the "B" and 5½% cumulative preference have continued the recovery. Buying of American Telephone and Telegraph stock has sent the price up 10 points further to 255; but Radio Corporation of America shares are easier at about 52. International Telephone and Telegraph stock, at 65½ has also lost a couple of dollars. Small increases are shown by several British cable telegraph undertakings. Marconi International Marine shares have improved from 43s. 9d. to 45s.

Electric railway debenture stocks are, for the most part, a few points higher; and District ordinary has jumped from 72½ to 77, while Metropolitan, at 65, has put on 2½ points, and Central London at 75, two points. Underground Electric Railways ordinary shares have put on 1s. and are quoted at 23s. 6d.

There is a long list of rises, also, in the electricity supply section. Central Electricity Board 4% stock is up 3 points at 82½. Clyde Valleys, at 38s. 9d., show a rise of 3s. 9d. compared with a week ago; Bournemouths and Metropolitans have each put on half-a-crown, to 62s. 6d. and 41s. 3d. respectively; and Midland Counties are up from 27s. to 29s. Among "foreigners," Calcutta Electric Supply ordinary have risen 2s. 6d. to over 48s., and Victoria Falls Power ordinary are nearly 59s. 6d.

Directors' Reports, etc.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Fin. div. of 1s. p. sh., less tax, makg. 8% for year (same as previous year) is announced.

NORTHERN OHIO POWER AND LIGHT CO.—Regular qrtrly. divs. of 1½% and 1¾% on 6% and 7% pfd. respectively, will be payable on Apl. 1.

QUEBEC POWER CO.—Gross rev. for 1929, $3 543 795, agst. $3 198 487; net rev. $1 502 526, agst. $1 199 725. Div. totalled $1 162 974, agst. $901 985, surplus $339 552, plus surplus brt. fwd. $163 869. To res. $100 000. Blce. $403 421.

DIRECT SPANISH TELEGRAPH CO., LTD.—Divs. of 10% on pref. shs., less tax, and 8% on ord. shs., tax free, for year 1929 are recommended. Half-year's div. on pref. shs. to June 30, 1929, and intm. div. of 4% on ord. shs. were paid on Oct. 1, 1929.

SCOTTISH POWER CO.—Credit blce. for 1929, includg. £3 399 brt. fwd., £154 009. Int. on loans, £18 079; to res., £7 853; div. on pref. for year, £16 800; div. on old ord. for year and new ord. on instalmts. paid during year at rate of 8% p.a., less tax, £104 565; fwd. £6 710.

CAMBRIDGE ELECTRIC SUPPLY CO., LTD.—Blce. of net rev. acct. for 1929, after providg. for int. and income tax and includg. amt. brt. fwd., £39 914. Intm. div. of 3% was paid in Nov. last. To gen. res., £10 000; writg. off blce. of cost of increased cap. and premium on debs. redeemed, £4 222; fin. div. on ord. shs., 5%; to staff benevolent fund, £1 500; fwd.; £4 848.

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS CO., LTD.—Net income for 1929, £26 854, agst. £28 133, after provisn. for deb. int. Pref. div. for year, £11 102 (same), to reconstructn. of tramway, £1 040; provisn. for expired cap. outlay, £14 962, agst. £11 144; fwd., £760, agst. £1 010. Receipts show decrease of £6 381, attributed to depressn. in trades in area served.

CONSOLIDATED GAS, ELECTRIC LIGHT AND POWER CO. OF BALTIMORE.—Gross operatg. rev. for 1929, $28 017 878, agst. $26 126 194. Net operatg. and non-operatg. rev. $10 392 708, agst. $9 221 162. Surplus, after provisn. for fixed charges, and pfd. and common divs., $3 359 072, agst. $2 359 072. Total surplus $13 357 011. Common divs. were at rate of $3 p. sh. p.a. to Sept. 30, 1929, at $3·60 p. sh. after that date.

WESTINGHOUSE ELECTRIC AND MANUFACTURING CO.—Gross earngs. for 1929, $216 364 588, agst. $189 050 302, net mfg. pft., $21 992 601, agst. $18 182 332, plus other income $2 323 743, agst. $4 146 991, net income available for divs. and other purposes, $27 062 611, agst. $20 814 940. Divs. of $1 p. sh. on both classes of stk. were paid for each of first three qrtrly. periods of year. In Dec. directors declared qrtrly. div. of $1.25 p. sh., thus placing pfd. and common stks. on regular annual div. basis of $5 p. sh.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—The directors have authorised an issue of cap. stk without par value at an issue price of $50 p. sh. and the offer of such stk. to the stkhldrs. for subscriptn. by them in ratio of one sh. for each eight shs. without par value registered in their name. On or about April 4 warrts. will be mailed to such stkhldrs. evidencg. their subscriptn. rights. Subscriptn. rights must be exercised on or about May 1, 1930. Offering letter to stkhldrs. was mailed March 14. A regular qrtrly. div. of 50 cents p. sh. will be payable April 15.

WASTE HEAT AND GAS ELECTRICAL GENERATING STATIONS. LTD.—Net pft. for year ended Jan. 31, 1930, £30 566, agst. £28 470, plus £17 614, agst. £15 044 brt. in. Div. 8% (same), includg. intm. of 2½% already paid; fwd. £22 580, agst. £17 914. There has been no expenditure on cap. acct. durg. year. Amts. received as hire purchase instalmts. have been invested in 5% conversn. loan, Central Electricity Board 4% stk. and Treasury bills. Weardale power statn. has been handed over to Newcastle-upon-Tyne Electric Supply Co. Output from the other power statns. was satisfactory and showed increase over previous year.

AMERICAN WATER WORKS AND ELECTRIC CO.—Gross earngs. for 1929, $54 119 003, agst. $51 044 689, operatg. exes., taxes, etc., $27 182 287, agst. $26 027 658, leavg. $26 936 716, agst. $25 017 031, gross income. After providg. for int. and amortisation of disct. of parent company and subsidiaries, $9 661 486; pref. divs. of subsidiaries, $5 292 919; minority int., $23 305; and allocation to res. for renewals, etc., $4 137 525, blce. for divs. and surplus was $7 821 478, agst $6 209 495. Consol. net income, after 1st pfd. divs., was equivalent to $3·50 p. sh. on 1 432 163 shs. of common stk. outstandg.

Company Meetings.

NEWCASTLE AND DISTRICT ELECTRIC LIGHTING CO., LTD.—Col. F. R. Simpson, presiding at the meeting last Friday, referred to the noticeable development in the use of electricity for domestic purposes during 1929. An expenditure of £30 974 had been incurred on mains during the year to cope with the increasing demand. The development was being encouraged by special low tariffs. With regard to the North-East Electricity Scheme, he stated that the Central Electricity Board proposed to enter into temporary arrangements with the company for the operation of its station. The company was under an obligation to supply the board with electricity in such a manner as they might direct, and the board would be obliged to supply the company with the electricity required for its undertaking. This would not affect the earning capacity of the company. The cost of the change-over from 40 to 50 cycles would be borne by the board. No statement had yet been received about the findings of the recent public inquiry into electricity charges in Newcastle. The report was adopted, and the dividend of 7%, less tax, for the year approved.

MERSEY POWER CO., LTD.—Mr. G. H. Cox, presiding at the meeting on Tuesday, said the year under review had shown a gratifying increase in output, amounting to 10%, but the fact that under the Local Government Act, public utility services were not derated (relieved of 75% of their rates), as were other industrial undertakings, deprived their profits of the entire benefit of the augmented sales. Not only did they secure no such relief, but owing to the transfer of the burden of rates, their assessment was now made on £37 600, whereas it used to be made on £3 800. The result was that whereas they paid £2 426 in rates in 1928, they paid £13 942 in 1929, and they estimated a payment of £20 500 this year, unless they obtained a more favourable assessment through the appeal now pending. It is a heavy and a most undeserved burden which must ultimately fall on the consumer. Sales of electricity for the year had been 79 000 000 kWh, The total area of supply was 97 square miles, against 76 in 1920. The working profit, with interest received, was £94 230. It was proposed to pay a dividend of 5% on the ordinary shares, to place £25 000 to depreciation reserve, and carry forward £17 660. The report was adopted.

ERICSSON TELEPHONES, LTD.—Mr. W. M. Crowe, presiding at the meeting on March 19th, said the net profit for 1929 was £64 087, compared with £31 011. They were now manufacturing several complete automatic totalisators for the Racecourse Betting Control Board, for erection on racecourses in this country within the next few months, and they had every hope of securing further contracts in the near future. Their automatic telephone department continued to make healthy progress. Although some progress was made, this country still lagged behind in the telephone field, and our position remained tenth among the world's users. We had 3·9 telephones per 100 inhabitants, compared with 16·5 in the U.S.A.; Canada, 13·7; New Zealand, 10·3; Denmark, 9·2; Sweden, 7·9; Norway, 6·5, and so on. Despite the striking disparity between ourselves and America, our Government proposed to spend £10 500 000 on development this year, against £140 000 000 by America. It was obvious from these facts that more energetic expansion must take place in this country if we were to enjoy the full benefits of an efficient, extensive, and rapid method of communication. The first two headings on the assets side of the balance sheet, comprising land, buildings, plant, fixtures, etc., together amounted to £221 482, against £222 271 in the previous year. Stocks at £357 558 compared with £234 688. The increase reflected the greater volume of contracts in hand. The undistributed profits were equal to six-and-a-half years' net preference dividend. He was sure these facts justified the shares being priced considerably higher than the present market quotation. The report was adopted, and a dividend of 8% was declared.

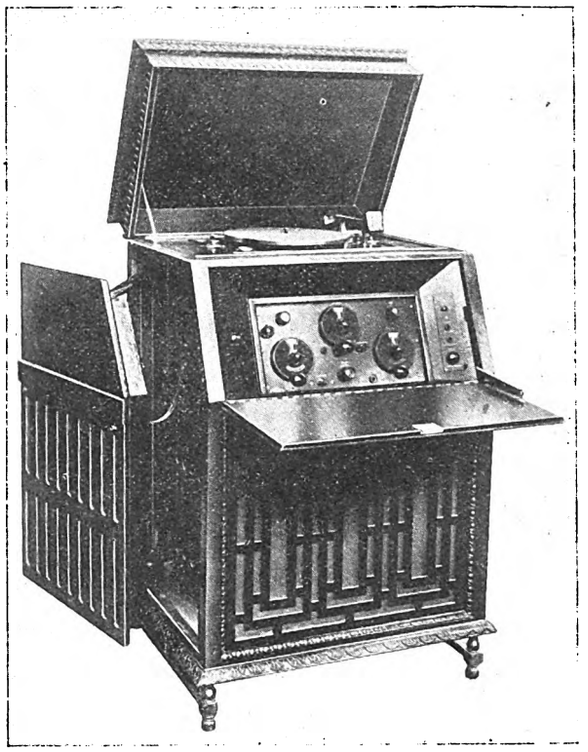
DAVIS AND TIMMINS, LTD.—In the absence of Mr. F. Le Neve Foster (chairman) owing to illness, Mr. G. E. Timmins (managing director) presided at the meeting on March 19th, and read Mr. Foster's address, in which he stated that the accounts for the past year showed a profit of £26 069, compared with £23 417 for the previous year, after providing for depreciation and commission to managers. The net profit, including £21 317 brought forward, was £47 385. After payment of the interim dividends on the preference and ordinary shares, the balance was £38 535. The directors proposed the payment of six months' dividend on the preference shares and a balance dividend on the ordinary shares of 12%, making 20% for the

Digitized by Google

year, less tax, and it was also proposed to transfer £4 912 to general reserve account, leaving, after transferring £1 154 to income tax account, £20 819 to be carried forward. They had established superannuation schemes both for that company and its subsidiary. Already more than 50% of eligible employees had joined and were contributing. So far, the benefits of the derating scheme only affected the company for a quarter of last year, but the total reduction in the amount of rates payable by the company and its subsidiary, compared with the full year prior to the Act, amounted to something in the neighbourhood of £1 900. So long as the Government did not take from industry with one hand what they had given with the other, he believed this relief would be a factor in the restoration of the industrial prosperity of the country. Since last they met there had been a serious world slump in raw commodity values, which had inevitably caused a general slackening up of trade. If this fall were permanent, after they had passed through the dislocations which were incident to so heavy an adjustment of values on the inventories of stocks, etc., it appeared to him that the conditions which should result should certainly tend to the advantage of this country, whose interests were so predominantly manufacturing. The company's results so far this year on sales showed a slight increase over the sales for the corresponding period last year, although competition for orders appeared to be certainly keener. The report and accounts were adopted.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION, LTD.—In the absence of Mr. D. Sinclair (chairman), Mr. G. H. Nisbett presided at the meeting last Friday, and read the speech prepared by Mr. Sinclair, in which he said the cost of electricity, at £179 196, showed an increase of £10 393, which was almost balanced by additional sales. Two years ago he stated that in the early years of purchasing electricity it was expected the cost would be slightly higher than the cost to that company to produce, and last year he reported that they had neither lost nor gained much by the change. In the year under review, however, the cost per unit purchased was distinctly higher. This was due to the fact that each of the undertakers who were taking supply from the West Midlands Joint Authority anticipated an increase in load last winter, and asked for additional supplies. The authority spent over £600 000 in new plant, but the industrial load fell rather than increased, and the sinking fund charges on the new plant had to be met by an increased charge for current. The directors saw no reason to modify the statement made two years ago that ultimately the authority would supply current cheaper than the company could generate for itself. The sum of £44 675, transferred from credit balances, largely represented the excess of the purchase price over the balances remaining on the books in respect of assets sold. They would have preferred to retain the areas sold, but their rights would have expired in 1940, and in the meantime the supply was being developed in the areas on a system that was not entirely suited to the purchasing authority. They therefore agreed to stand aside, so that it could develop the supply in such areas in conformity with its existing system, and a price was agreed that was fair and reasonable to both parties. A further £30 324 had been transferred from profits, and the reserve account now stood at a total of £100 000. The net profit of £151 365 was £3 000 less than the profit of the previous year, but when it was borne in mind that they paid substantial increases on the cost of electricity and rates, and did not increase their charges, the result could be considered as satisfactory. A final dividend of 5½%, making 8% for the year, was approved.

NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO., LTD.—Mr. R. P. Sloan, presiding at the meeting on Tuesday, said it might be remembered that at the last annual meeting he expressed disappointment at the decrease in the amount of electrical energy they were called upon to supply to collieries during the previous year. Whilst the position as a whole did not change to any extent during the past year, it was satisfactory to note that additional colliery supplies—which included the supply to six new pits—went a long way towards making up this setback. The consumption of electrical energy in shipyards and engineering works showed a distinct improvement compared with the previous year. There also was an increase in their supplies of electrical energy to the iron, steel and general engineering trades. He referred at the last annual meeting to the question of charges for ordinary lighting and domestic supplies, and stated that they had decided to issue revised tariffs, both for domestic and shop consumers. These revised tariffs became effective in the case of shops as from January 1st, 1929, and in the case of domestic supplies as from April 1st, 1929. The sum represented by these concessions to consumers was about £50 000 per annum. Within a week or two of their first publishing these tariffs, a number of local authorities within the area applied to the Minister of Transport for an Order reducing



THE "Neutrosonic-de-Luxe" radio gramophone set shown by the Igranic Electric Co., Ltd., at the Ideal Home Exhibition. A description of the company's exhibits will be given in our next issue.

their statutory maximum prices by such an amount as would represent a substantial reduction in the charges which they had just announced. As a result of this application, the Electricity Commissioners held an inquiry in Newcastle, in December last. The company strongly opposed this application, on the grounds that their then charges were reasonable, and pointed out that if they were compelled to reduce these charges below their present level it would result in their having to limit, if not discontinue, development of supply to the smaller class of consumer. They had not yet received the award of the Minister. The year's profit showed an improvement of £56 895, which he thought might be considered satisfactory, bearing in mind the effect on their profit of the substantial reductions in the charges to domestic consumers to which he had just referred. The directors recommended the payment of a dividend on the ordinary shares at the rate of 6%, leaving £96 029 to carry forward.

INTERNATIONAL AUTOMATIC TELEPHONE CO., LTD.—At the meeting on Monday, Sir Alexander Roger, chairman, said the net profit for the past year was £135 849, compared with £130 823 for the previous year. The directors recommended a final dividend at the rate of 6¼% per annum on the ordinary shares, making 10%, less tax, for the year, plus a bonus of 2½%, less tax; and a dividend of 10%, less tax, for the year on the deferred shares, with a bonus of 2½%, less tax. Out of the Automatic Telephone Manufacturing Co.'s works, and through their alliances and associations, they were able to place at the disposal of their customers all the advantages of pooled research and development, and of technical and financial assistance, and the economies consequent on the ability to purchase bulk supplies. After some years of strenuous work, they had made many valuable alliances and connections with the result that they were now a prominent link in an important chain of companies covering the U.S.A., Great Britain, and Germany and elsewhere, who together undertook engineering, construction, management and operation of complete telephone installations; examination, negotiation, and acquisition of telephone concessions, and the financing of

Digitized by Google

telephone operating properties and extensions to existing plant. The International Automatic Telephone Co., and the Automatic Telephone Manufacturing Co., with other important British interests, had agreements with American associated companies, operating principally through the Cable, Telephone and General Trust, as a result of which control of telephone operating companies was secured, long term credits arranged, and equipment sales facilitated, all for the purpose of creating tied-house business for the manufacturing units to be divided in agreed proportions. Members of their group also had arrangements with interests outside the group itself; all these arrangements were generally co-ordinated with their group activities. The number of patents owned and available through the associated companies was over 7 000, while the group to which they belonged spent annually on telephone developments and research a sum approximating to £250 000. If the sister branches of telephony—namely, cables and wireless—were included, the amount would probably be in the neighbourhood of £500 000 per annum. The report and accounts were adopted.

Automatic Telephone Mfg. Co., Ltd.—Sir Alexander Roger, presiding at the meeting last Friday, said the profit for the past year was £122 703, after applying £50 000 to depreciation. It was proposed to repeat last year's final payment of 6¼% on the ordinary shares, making a total of 10% for the year, and a bonus of 2½%, less tax. During the year four new director exchanges—Metropolitan, National, Hillside Park and Hendon—were completed, while good progress was made in the installation of Amherst and Primrose Hill. Metropolitan and National exchanges were both 10 000-line equipments, housed in the same building, which would ultimately accommodate a third 10 000-line exchange, to be known as "Empire," making 30 000 lines of Strowger director equipment under one roof. There were now 24 automatic exchanges in the Greater London area, and a like number were due for construction during the next few years; they were assured that a fair share of the work would accrue to that company. In Manchester installation was well advanced on the new director exchange at Blackfriars, while special indicator positions were being equipped in Central and City exchanges. Other completed contracts included Strowger exchanges at Dringhouses and Haxby, in the York area, together with extensions at Leeds, Newport, Cwmbran and Epsom. In the Nottingham area work was proceeding on new Strowger exchanges at Beeston and Bulwell, and extensions were being added to Central, Arkwright Street and Sherwood. They had recently been awarded a contract for equipping the Bristol area for Strowger operation. The scheme embraced ten exchanges, totalling nearly 20 000 lines. There were now in operation, in this country alone, 163 automatic exchanges, of which that company had been responsible for 49. A substantial contract had been awarded to the company by the Racecourse Betting Control Board, and they were manufacturing totalisator equipment for Newmarket, Cheltenham, Leicester, Folkestone, Pontefract, Wolverhampton, etc. In connection with the Central Scotland Electricity Scheme, a contract had been placed with the company for supervisory apparatus, indicating at a central control station from 15 power distribution centres such factors as voltage, current, power, steam pressure. The Telephone Development Association had spent, during the past five years, nearly £70 000 on advertising the telephone service, and they were satisfied that there had accrued to the British telephone industry new business to the value of over £6 000 000. The Xcel electric domestic appliances business overseas was increasing, and they had shipped consignments of these products to Australia, New Zealand and South Africa. The report was adopted.

BRITISH INSULATED CABLES LTD.

Increased Profit—Benevolent Fund for Workpeople—Overseas Railway Electrification—New Work in Hand—Plant Extensions.

Mr. D. Sinclair was unable to preside at the 34th ordinary general meeting last Friday owing to indisposition. Sir Alexander Roger presided, and read Mr. Sinclair's speech, in which it was stated that the company had made a profit of £685 980, compared with £617 951 for the previous year. After bringing forward the balance of £250 089, and paying directors' and trustees' fees, debenture interest, preference and interim ordinary dividends, a disposable balance remained of £745 806. Allowing £100 000 for depreciation of property and plant, and transferring £198 333 to reserve account, £447 473 remained available for dividends. A further dividend of 10% on ordinary shares was recommended, making, with the interim dividend already paid, a total distribution of 15% for the year. This left £280 806 to be carried forward. The item "dividend equalisation account" appeared for the first time in the balance sheet, a sum of £300 000 having been set against it. Hitherto provision had been made to cover contingencies such as exceptional taxation and liabilities that could not be exactly estimated. It was now considered that £300 000 could not be required for such contingencies, and the board had decided to utilise it for founding a dividend equalisation fund.

Referring to the £50 000 set aside last year as a compassionate fund for workpeople, the interest on which was to provide allowances for the company's workpeople and dependents, the Chairman said this sum had been invested in British Government securities, and had given relief to many deserving cases.

Investments stood at £1 263 753, compared with £909 562 a year ago, the increase being primarily accounted for by the acquisition, in conjunction with another company, of practically the whole of the share capital of a cable manufacturing company of considerable size. The results had justified expectations, from the point of view both of business and of earnings on the investment.

A tour of the Near East had been made on the company's behalf by Sir Alexander Roger and Mr. Johnstone Sinclair, who reported that the company's name for good work stood high in the East. As a result of their visit the company was hoping for a still larger volume of business. They had practically completed, during the year, the track electrification of the main line of the Great India Peninsula Railway, to the entire satisfaction of the consulting and railway engineers. This work, with the Bombay suburban electrification carried out for the same company a few years ago, constituted the most important railway equipment work yet carried out in the British Empire. Bearing in mind the important similar work they had done in Australia and South Africa, the Chairman remarked they believed their experience to be unique, and such as to enable them to undertake similar work on the largest scale for the British railways when their conversion to electric traction took place. This, they thought, could not now be much longer delayed.

They had practically completed the Scottish overhead "grid" system, and many of the lines were in use. They believed the work had given entire satisfaction to the Central Electricity Board.

New work in hand included a large extension of the supertension cable work for the London Power Co., an underground trunk telephone line for the Post Office from Manchester to Chester, and an overhead connecting link between the national "grid" system and the new Clarence Dock power station for Liverpool. Large contracts were good to have, but they liked best the aggregate of everyday orders, as being the most profitable, because of the fact that mass production methods could be applied to them. Their factories were generally well employed, with a volume of orders in hand in excess of last year. A large number of process improvements had been introduced, and considerable extension of plant had been made for the production of aluminium wire, while extensions for the making of condensers and enamelled wire were in progress. Plant was being put down for the manufacture of "Rockbestos" wire, for which they had obtained world rights outside the two Americas. This was a conductor insulated with a special preparation of asbestos in such a way as to be especially suitable for use in situations where permanence in high temperatures was a desideratum, such as for heating and cooking apparatus and winding wires for generators and motors.

The report and accounts were adopted.

NEW COMPANIES.

S. SCHOFIELD AND CO., LTD.—Cap., £8 000. Electricians, etc. Reg. Office: 41, King Street, Huddersfield.

R. S. MACE, LTD.—Cap., £500. Dealers in electrical fittings, etc. Reg. Office: Lichfield Chambers, Upper Priory, Birmingham.

HIGHWAY APPLIANCES, LTD.—Cap., £500. Electrical and general engineers, etc. Reg. Office: 47, Victoria Street, London, S.W.1.

GEORGE C. BOOTH, LTD.—Cap., £3 000. To acquire business of electrician, etc., carried on by George C. Booth at Silver Street, Whitby.

J. A. MCCREA AND SONS, LTD.—Cap., £5 000. Electrical, lighting and mechanical engineers, etc. Reg. Office: 55, Brown Street, Manchester.

ALLDIS AND BROWN, LTD.—Cap., £1 000. Electricians, electric welders, etc. Solicitor: H. Wallace-Copland, 6 and 7, Market Street, Stafford.

E. M. ROBINSON (NOTTINGHAM), LTD.—Cap., £500. Electrical, wireless and general engineers. etc. Solicitors: J. J. Spencer and Son, Nottingham.

STEELE BROS. (LONDON), LTD.—Cap., £750. Electrical and laundry engineers, etc. Reg. Office: Victoria House, Southampton Row, London, W.C.1.

S. SARGENT AND SONS, LTD.—Cap., £100. Electricians, wireless engineers, wireless component suppliers, etc. Reg. Office: 23A, Bride Lane, London, E.C.4.

R. F. PEACHEY AND SONS, LTD.—Cap., £1 000. Contractors, electrical engineers, etc. Reg. Office: 20, Brownlow Mews, Guilford Street, London, W.C.1.

F. J. BAYNES AND CO., LTD.—Cap., £100. Heating, ventilating, electrical and general engineers and contractors, etc. Reg. Office: 99, St. Paul's Road, London, N.1.

CHURCH AND COLLIS, LTD.—Cap., £2 000. Electrical and mechanical engineers, etc. Solicitors: Kimbers Williams and Co., 79, Lombard Street, London, E.C.

ADVANCE RADIO CO., LTD.—Cap., £2 500. Manufacturers of and dealers in wireless sets, apparatus, etc. Solicitors: Garton and Co., 21, Maddox Street, London, W.1.

ARISTOPHONE AND PERFECTION RADIO, LTD.—Cap., £100. Radio engineers, radio valve and apparatus manufacturers, etc. Solicitors: Symington and Blair, 94, Hope Street, Glasgow.

BAILEY AND INCLEDON (1930), LTD.—Cap., £2 000. To carry on business of electrical and general engineers as formerly carried on by Bailey and Incledon, Ltd., at 34, Duke Street, St. James's, London, S.W.

ST. HELEN'S BAY ELECTRICITY SUPPLY CO., LTD.—Cap., £6 000. Electric light and power supply company, etc. Solicitors: J. D. Langton and Passmore, 71, Powis Street, Woolwich, London, S.E. 18. (Public co.)

EDWARD PRIOR ELECTRIC CO., LTD.—Cap., £3 000. To acquire business of an electrical engineer carried on by Mrs. L. Prior, at 30, Church Road, Burgess Hill, Sussex. Reg. Office: 30, Church Road, Burgess Hill, Sussex.

CRAVEN ENGINEERING CO., LTD.—Cap., £2 000. Electrical and mechanical engineers, manufacturers of electric washers and other electrical devices for household or trade use, etc. Solicitors: R. W. Wrench, Devonshire Street, Keighley.

MONMOUTH ELECTRICITY CO., LTD.—Cap., £25 000. Electric light and power company in all its branches. Reg. Office: Magnet House, Kingsway, London, W.C.2. (Public co.)

FRANCO NEON, LTD.—Cap., £1 000. Electrical and general engineers, makers of, and dealers in, illuminated and other signs, etc. Reg. Office: 25, Oxford Street, London, W.1.

WARRENPOINT ELECTRICITY SUPPLY CO., LTD.—Cap., £3 000. To acquire benefits of Warrenpoint Electricity Special Order, 1929. Reg. Office: Electricity Works, Warrenpoint.

TOLWORTH ELECTRICITY CO., LTD.—Cap., £1 000. To carry on any operations in relation to marketing electric light, cooking, heating, power and other electrical fittings and equipment, etc. Secretary: T. B. Lane, 17, Ambleside Gardens, Ilford.

PORTABLE X-RAYS, LTD.—Cap., £100. To adopt an agreement with Portable Radiographs, Ltd., and to carry on business as radiographers, radiologists and electrotherapists, etc. A first director: E. A. Titley, Doebank, West End Lane, Pinner.

R. KING AND SONS, LTD.—Cap., £5 000. To acquire business of electrical and mechanical engineers and machinery merchants now carried on at 5A, Speedwell Street, Oxford, by R. King, W. G. King, H. A. King and W. E. King as "R. King and Sons."

ADAMSON AND OLIVERSON, LTD.—Cap., £1 000. Manufacturers of and dealers in wires, lamps, fittings, accumulators, batteries, dynamos, motors, magnetos, valves, telephonic and telegraphic instruments and apparatus, wireless goods, etc. Solicitors: Titley and Paver Crow, 6, Princes Square, Harrogate.

THE LEAD MARKET.

According to James Forster and Co., the market has been subject to control during the week, and prices have shown little change from day to day. The American price remains at 5.50 cents per lb. Closing prices, on March 21st, were:—£18 12s. 6d. for March, £18 13s. 9d. for April, and £18 15s. for May and June, 2s. 6d. per ton higher to unchanged on the week.

ELECTRICAL TRADE MARKS

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

EMKABER.—506 793. Class 8. Instruments, apparatus and parts thereof for use in wireless telegraphy and telephony. Emkabe Radio Co., Ltd., 47, Farringdon Road, London, E.C.1; manufacturers and importers. October 10th, 1929.

TENCELITE.—508 553. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching, but not including electric cables, and not including any goods of a like kind to electric cables. Berry, Wiggins and Co., Ltd., Tensulam House, Water Lane, Stratford, London, E.15; manufacturing chemists. December 7th, 1929. To be associated with No. 508 552 (2 705) iv and another.

MIHALOR.—506 806. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Telehor Aktiengesellschaft, Hindersinstrasse, 14, Berlin, N.W.40; manufacturers. October 10th, 1929.

AREGA.—509 376. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Cheetham and Trevithick, 8, Clarendon Road, Edgbaston, Birmingham; engineers. January 10th, 1930.

CUTAX.—508 623. Class 13. Electric switches and circuit breakers, all being metal goods. Dr. Paul Meyer Aktiengesellschaft, Lynarstrasse 5-6, Berlin, N.65; manufacturers. December 9th, 1929.

MOSTYL.—498 608. Class 8. Wireless telephonic apparatus, gramophones and talking machines and parts thereof. Gramostyles, Ltd., Camden Gramophone Works, Camden Street, Birmingham; manufacturers. January 2nd, 1929.

MADRIGAL.—508 988. Class 8. Wireless telephonic and telegraphic instruments and apparatus and component parts thereof. Radio Instruments, Ltd., 12, Hyde Street, London, W.C.1; manufacturers. December 20th, 1929.

PHILLIMA.—505 339. Class 13. Electric lamps and electric lighting fittings consisting mainly or wholly of ordinary metal. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, Emmasingel 13d, Eindhoven; manufacturers. August 16th, 1929. To be associated with No. 505 340 (2 698) xv.

OPALAX.—508 952. Class 50. Finger plates, door fittings, covers and bases for electric switches and bells, electric light fittings and plugs; containers, buckles and clasps; bathroom fittings; picture frames and mouldings; lamp shades, ceiling and the like roses; and vases; all being goods, not included in other classes, made from compositions in which cellulose predominates. Arthur Willy Kanis, 66, Aldersgate Street, London, E.C.1; manufacturer. December 19th, 1929. To be associated with No. 508 951 (2 706) xxxix and another.

CHORISTER. 508 413. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. H. J. Fletcher and Co., Ltd., Bridge Works, 134, New North Road, London, N.1.; merchants and manufacturers. December 3rd, 1929. To be associated with No. 470 878 (2 522).

NOCTOPHONE. 509 474. Class 8. Apparatus for use in transmitting voice sounds or images and scenes to a distance by telegraphy. Baird Television Development Co., Ltd., 133, Long Acre, London, W.C.2; manufacturers.—January 14th, 1930. To be associated with No. 478 273 (2 564), and another.

HYRONIC. 509 901. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Lissen, Ltd., Lissenium Works, Worple Road, Isleworth; Middlesex; manufacturers. January 30th, 1930.

ACADEMY. 509 597. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. The Johnson Talking Machine Co., Ltd., 96, Clerkenwell Road, London, E.C.1; manufacturers. January 17th, 1930. To be associated with No. 393 635 (2 208) and others.

WOTAN. 505 177. Class 13. Electric lamps (ordinary) and electric lighting fittings, being metal goods not included in other classes. Osram Gesellschaft Mit Beschrankter Haftung Kommanditgesellschaft, the responsible partner of which is Osram Gesellschaft Mit Beschrankter Haftung, Ehrenbergstrasse 11 to 14, Berlin, O.17; manufacturers. August 9th, 1929. (By consent.)

THOR JUVENATOR (sign). 504 817. Class 49. Electric apparatus for use in physical training exercises. Hurley Machine Co., 22nd Street and 54th Avenue, Cicero; manufacturers. July 26th, 1929. Registration of this trade mark shall give no right to the exclusive use of the word "Juvenator."

DIOLITE. 505 146. Class 6. Electrical machinery and parts of such machinery. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. August 8th, 1929. To be associated with No. 505 147 (2 710) xiii and another.

VOLEX. 500 577. Class 8. Electric dry cells, electric dry batteries and electric accumulators, not for medical purposes. Ward and Goldstone, Ltd., Sampson Works, Frederick Road, Pendleton, Manchester; manufacturers. March 2nd, 1929. To be associated with No. 326 380 (1719) xiii.

TRIDURITE. 500 911. Class 8. Insulated electric cables. British Insulated Cables, Ltd., Prescot, Lancashire; manufacturers. March 13th, 1929. To be associated with No. 429 988 (2374).

"REX." 507 801. Class 8. Electricity meters. Société des Compteurs de Geneve, 8, Rue des Vieux-Grenadiers, Geneva; manufacturers. November 13th 1929.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CATLOW, Henry A., 153, Tyldesley Road, Atherton, wireless expert. £41 14s. February 14th.

CESTRIAN ELECTRICAL CO., Northgate Street, Chester, engineers. £43 15s. February 18th.

COHEN, Mrs. Aida, 16, Woodstock Road, Golders Green, (late trading as ELECTRICAL FITTINGS CO.), electrical engineer. £11 4s. 6d. January 7th.

FENNEMORE AND CO., Market Square, Sandy, electrical engineers. £15 11s. 8d. February 19th.

FOOT, K., 26, New Road, Chingford, wireless goods manufacturers. £19 8s. 6d. February 10th.

LEAKE (Harold) AND SON, back St. Annes Road West, St. Annes-on-Sea, electrical engineers. £21 6s. 1d. February 14th.

PILKINGTON, Mr. T. E., 151, Acombe Street, Moss Side, Manchester, radio engineer. £16 15s. 6d. January 9th.

ROYCE, Mr. J., c/o S. H. Nicholson, 105, Gower Street, W.C., wireless dealer. £14 7s. 4d. February 11th.

SHILVOCK, G., AND SONS, 38, Regent Street, Rugby, electrical engineers. £13 4s. 5d. February 10th.

SUMMERS, Mr. E., The Parade, Perranporth, electric light and power engineer. £10 5s. 2d. February 13th.

SUTTON, Mr. A., Corner House, Chase Road, Epsom, electrical contractor. £11 5s. 10d. February 18th.

Deeds of Arrangement.

ANDERSON, HENRY WILLIAM, 2, Causey Buildings, Causey Street, and 32, Ashfield Road, Gosforth, electrician. Dated March 18th, filed March 19th. Trustee, J. C. Graham, 5, Higham Place, Newcastle-on-Tyne. Liabilities, unsecured, £587; assets, less secured claims, £50.

WILSON, Walter Douglas, trading as ELECTRICAL ENGINERING CO., Oxford Street, and residing at 4, Berwick Street, Workington, electrical engineer. Dated March 15th, filed March 22nd. Trustee H. J. Rigg, 13, Bridge Street, Workington. Secured creditors £66; liabilities unsecured £1 860; assets, less secured claims, £443.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

AEONIC RADIO, LTD., London, W. Registered March 13th, £4 500 debenture to J. L. Gottlieb, 10, Hillcrest Avenue, N.W.; general charge (subject, etc.).

DAKOL ELECTRIC, LTD., London, S.W. Registered March 13th, £2 000, £2 000, £1 000 and £1 000 debentures, balance of £12 000; general charge.

DUNOON AND DISTRICT ELECTRICITY SUPPLY CO., LTD., London, W.C. Registered March 10th, debenture for £7 500 and further advances, with premium of 10% on maximum amount at any time due, to Johnson and Phillips, Ltd., Columbia House, Aldwych; general charge.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

COOK'S WIRELESS CO., LTD., St. Helens Street, Ipswich. Pursuant to section 238 of the Companies Act, 1929, a meeting of the creditors in this matter was held on March 24th at the Abercorn Rooms, Liverpool Street Hotel, E.C., when Mr. Dansie, the governing director of the company, presided. Prior to the meeting of creditors the shareholders had nominated Mr. Ensor of Ensor, Son, and Goult, C.A., 30, Museum Street, Ipswich, to be the liquidator of the company. Mr. Ensor submitted a statement of affairs which disclosed liabilities of £4 323, of which £3 123 was due to the trade, and there were directors' loans amounting to £1 200. There were also liabilities on bills discounted amounting to £91, which were not expected to rank. The assets consisted of cash at bank £239; cash in hand, £16; stock-in-trade, estimated cost £1 700, expected to realise £1 360; trade fixtures, fittings, utensils, etc., put down at £100; two motor cars valued at £30; good book debts, £773; doubtful and bad debts, £342, estimated to produce £140; making total assets of £2 658, from which had to be deducted preferential creditors, leaving net assets of £2 619, or a deficiency of £1 704.

The accountant said the company was incorporated on February 15th, 1924, to take over a business of manufacturers of and dealers in wireless and electrical apparatus, which had been carried on by Mr. Fish and Mr. Dansie in partnership. The purchase price of the business was £876, which was satisfied by the allotment of 700 £1 shares at par, and by the payment of £176 in cash. The assets taken over included stock at cost £400; fixtures and fittings £100; motor cars, £100; cash, £97; and goodwill, £178. A further 32 shares had been issued since that time making the total capital issued and allotted £732.

Mr. Ensor said that for the six months to June 30th, 1924, the sales were £1 969, and, after charging the directors' fees, there was a net profit of £55. For the next twelve months the sales increased to £11 974, and there was a net profit of £35. For the next twelve months to June 30th, 1926, there was a profit of £146 on a turnover of £16 955, but in the next year, although the turnover increased to £23 781, there was a loss of £432, while for the twelve months to June, 1928, the turnover was £26 503, and there was a net profit of £100. For the six months to December 31st, 1928, the turnover was £10 821, and there was a profit of £165, while for the six months to June, 1929, the sales dropped to £5 453, and there was a loss of £362. During the whole of that period the directors were entitled to fees amounting to £1 834, but of that amount the sum of £1 200 has been left on loan in the business, and that amount was shown on the statement of affairs to-day. It would appear, therefore, that for the five years the directors had only drawn fees amounting to £624. In answer to questions the chairman said that Mr. Fish retired from the business in September, 1928, and the present directors of the company were himself and his wife. He realised that the position was not as it should be when he consulted Mr. Ensor and his solicitor three or four weeks ago. The company had been trading under difficulties prior to that date, but they had continued trading hoping that the business would improve. Unfortunately, however, the wireless trade at the present time was absolutely flat. Several creditors said that with regard to the latter remark they could not consider that to be their experience in the wireless trade to-day. After further discussion it was resolved that the appointment of Mr. Ensor as liquidator of the company should be confirmed. A committee of inspection consisting of the representatives of the five largest creditors was appointed.

London Gazette, etc.

Companies Winding-up Voluntarily.

ALMONDSBURY AND DISTRICT ELECTRIC SUPPLY CO., LTD. By special resolution March 20th, W. H. Goodenough, of the firm of F. J. Ackland and Co., accountants and auditors, appointed as liquidator.

"M.P.A." WIRELESS, LTD. Statutory meeting of creditors at the Holborn Restaurant (Caledonian Room), Holborn, London, W.C.1, on Friday, April 4th, at 12 noon.

Bankruptcy Information.

BALL, Ernest, Old Hall Street, Middleston, Lancashire, electrica contractor. Receiving order, March 17th. Debtor's Petition. First meeting April 2nd, 3 p.m., Official Receiver's Offices Byrom Street, Manchester. Public examination May 21, 10.45 a.m., Court House, Church Lane, Oldham.

BURDEN, Frederick James, 19, Durngate Street, Dorchester. Receiving order March 20th. Debtor's petition.

GARDNER, Kenneth Lancelot, 7, Bridge Street, Wisbech, Cambridge, dealer in wireless apparatus. Receiving order, March 18th. Debtor's petition. First meeting April 1st, 11.30 a.m. Official Receiver's Office, 41, Sidney Street, Cambridge. Public examination April 17th, 11 a.m., Court House, King's Lynn.

WARNER, Leslie Charles, 4 School Lane, Leominster, Hereford, Wireless dealer. Receiving order, March 17th. Debtor's petition.

Notices of Dividends.

BATES, Victor Harold, High Street, Linton, Cambridge, trading as the Linton Radio Service, wireless engineer. First and final dividend 1s. 6½d. per £, payable March 31st, Official Receiver's Office, 41, Sidney Street, Cambridge.

PEOVER, Harry, electrical apparatus and tool merchant, Market Lane, Newcastle-upon-Tyne. First and final dividend, 1s. 11d. per £, payable March 26th, Official Receiver's Office, 81, St. Mary's Place, Newcastle-upon-Tyne.

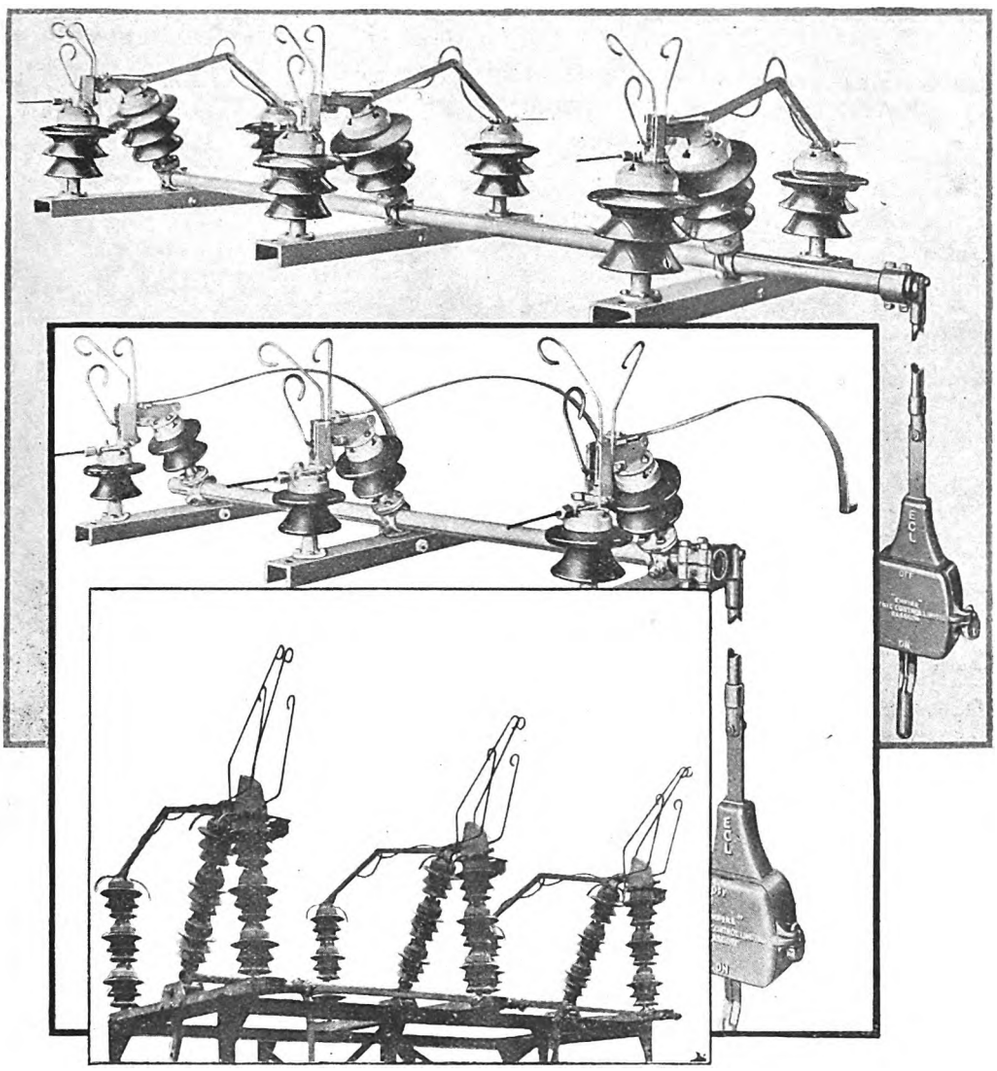
Notice of Intended Dividend.

HOBSON, Joseph, electrical engineer, 1A, Thorncliffe Grove, Whitworth Park, Cross Street, Pendleton, Salford. Last day for receiving proofs, April 5th. Trustee, F. Murgatroyd, Byrom Street, Manchester, Senior Official Receiver.

Application for Discharge.

MCLEOD, John Stuart, trading as MCLEOD BROTHERS, 189, Blackburn Road, Bolton, and also with a partner as McCloud Brothers, at 55, Chorley New Road, Horwich, radio and electrical engineer. Hearing, April 15th, 10 a.m., Court House, Mawdsley Street, Bolton.

Digitized by Google



HORIZONTAL DISCONNECTING SWITCHES

THESE disconnecting switches are made in two types, with three and two insulators respectively.

Both are illustrated above, the two-insulator type effects a slight economy by eliminating the third insulator on each phase, the moving insulators being coupled to the line by arched flexible strips secured by gun-metal clamps.

The detail work is of a very high standard, the pivot bearings being of stainless steel in order to obviate possible corrosion; the units are mounted on heavy, rigid, hot-galvanised channel steel; the insulators are carried upon forged steel brackets, and all iron and steel parts are hot galvanised; all other metal parts are cadmium plated.

The small illustration shows a three insulator switch (66,000 volts, 400 amps).

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

302 904 British Thomson-Houston Co., Ltd. Electrical frequency-changers. (23/12/27.)
322 363 W. McGee and Son, Ltd., and G. S. Young. Cooling arrangements of enclosed dynamo-electric machines. (19/12/28.)
303 156 Waygood-Otis, Ltd. Elevator door-control system. (30/12/27.)
302 931 Siemens-Schuckertwerke Akt.-Ges. Arrangement for exciting synchronous machines. (23/12/27.)
322 367 F. B. Woolford. Electric furnaces. (24/12/28.)
322 371 K. Breusing and U. Gottesmann. Rapidly producing uniform metal deposits electrolytically. (28/12/28.)
322 372 Siddall and Hilton, Ltd., and R. Siddall. Seats for tramcars, buses, and the like. (29/12/28.)
304 653 British Thomson-Houston Co., Ltd. Transmission of pictures. (23/1/28.)
322 382 F. Farrant. Electric lamps. (15/1/29.)
318 913 L. Zwilling. Electric gas-lighters. (12/9/28.)
304 724 Associated Electrical Industries, Ltd. Thermally-responsive electric switches. (25/1/28.)
305 463 Birtman Electric Co. Vacuum cleaners. (1/2/28.)
322 386 C. D. Sutton and Cambridge Instrument Co., Ltd. Electrical measuring instruments. (26/1/29.)
311 395 C. Lorenz Akt.-Ges. Apparatus for the transmission or reception of ultra-short waves. (12/5/28.)
306 943 General Railway Signal Co. Train-dispatching systems. (28/2/28.)
306 460 Marconi's Wireless Telegraph Co., Ltd. Radio-communication systems and the like. (20/2/28.)
322 403 Soc. Anon. Calor and L. Trouilhet. Electrically heated smoothing-irons. (22/2/29.)
322 409 J. Salomon. Disc-shaped electro-motors. (19/2/29.)
307 842 British Thomson-Houston Co., Ltd. Restraining-devices for railways and the like vehicles. (14/3/28.)
311 370 C. Zeiss. Illuminating bodies with concave reflector and diffusely radiating incandescent bulb. (10/5/28.)
310 800 Associated Telephone and Telegraph Co., Ltd. Telegraph concentrators. (30/4/28.)
310 420 J. T. Dourgnon. Indirect-lighting system for apartments and for other uses. (25/4/28.)
322 423 K. Geyer and F. Ulbrych. Holder for electric incandescent lamps. (28/5/29.)
322 181 A. K. Croad (Sand Spun Patents Corporation). Magnetic clutches. (27/7/28.)
291 721 International General Electric Co., Inc. Earth-fault electric protective arrangements for alternating-current generators. (4/6/27.)
322 481 J. L. Baird and Television, Ltd. Television apparatus and the like. (6/6/28.)
291 799 Dr. R. Blum, Jun. Electrically-heated apparatus for the treatment of the body. (8/6/28.)
322 482 A. Szente. Electromagnetically-wound clockwork mechanism. (4/7/28.)
302 678 Siemens and Halske Akt.-Ges. System for transmitting alarm signals over telephone lines. (20/12/27.)
322 485 G. Lakhovsky. Apparatus for collecting electrical oscillations. (31/7/28.)
294 945 British Thomson-Houston Co., Ltd. Means for protecting electrical apparatus. (1/8/27.)
322 434 J. A. Crabtree and J. R. Dolphin. Insulating-covers for electrical switches, bell-pushes, ceiling-roses and the like. (25/8/28.)
322 470 Standard Telephones and Cables, Ltd., and E. K. Sandeman. Loud-speakers and the like. (29/8/28.)
322 487 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Composite signalling systems such as combined telegraph and telephone systems. (29/8/28.)
322 471 J. Y. Johnson (I.G. Farbenindustrie Akt.-Ges.). Treatment of gases and vapours with electric arc discharges. (29/8/28.)
322 509 Baron Marks (Hart Manufacturing Co.). Electric time-switches (30/8/28..)
322 443 C. McAllister and A. Munn. Electric switches. (3/9/28.)
322 510 General Electric Co., Ltd., and F. Hopewell. Automatic electrical voltage or current regulators. (3/9/28.)
322 477 H. C. Wingfield. Automatic switch indicator for electrical prepayment meters. (4/9/28.)
322 513 H. E. Angold and Smith Meters, Ltd. Induction-type electricity meters. (4/9/28.)
322 517 W. Hahn and H. Warncke. Device for the control of the measure of transmission in telephone systems, amplifying systems, or the like. (6/9/28.)
307 044 Hirsch, Kupfer-und Messingwerke Akt.-Ges. Ironless induction furnaces. (2/3/28.)
322 520 R. Maddison and Associated Electrical Industries, Ltd. Terminals for electrical heating-elements. (7/9/28.)
307 733 Newcombe-Hawley, Inc. Electrostatic acoustic device for transmitting and receiving purposes. (12/3/28.)

Applications for Patents.

November 18th.

35 188 A. Avis. Poles for overhead cables.
35 251 J. C. Brown. Electromagnetic sound reproducers.
35 240 A. Chorine. Printing telegraphs.
35 292 L. Denbow. Electric switch.
35 171 W. O. Duncan (Aldawade Electrical Appliances Pty., Ltd.). Water, etc., heaters.
35 274 International General Electric Co., Inc. Alternating current generators. (16/11/28, Germany.)
35 258 Marconi's Wireless Telegraph Co., Ltd. Radio-communication systems. (17/11/28, U.S.)
35 260, 35 261 Marconi's Wireless Telegraph Co., Ltd. Radio receiving systems. (16/11/28, U.S.)
35 255 J. Meluish. Telephone sets.
35 129 G. W. Parker. Electric trolley omnibuses.
35 215 Siemens-Planiewerke Akt.-Ges. fur Kohlefabrikate. Connecting current capacity parts. (25/10/29, Germany.)
35 216 Siemens and Halske Akt.-Ges. Control apparatus for optical electrical sound carrier reproducing devices. (19/11/28, Germany.)
35 142 W. A. Stevens. Regulating regeneration in electric vehicles.
35 234 Symphony Gramophone and Radio Co., Ltd., and H. C. Willson. Radio receiving apparatus.

November 19th.

35 337 British Thomson-Houston Co., Ltd. Electromagnetic compasses. (19/11/28, U.S.)
35 338 British Thomson-Houston Co., Ltd. Volume control means for radio receivers, etc. (19/11/28, U.S.)
35 340 British Thomson-Houston Co., Ltd. High frequency signal transmitting systems. (20/11/28, U.S.)
25 392 L. da S. Conto. Electromagnetic clutches. (20/11/28, Brazil.)
35 387 Electrical Research Products, Inc. Continuous loading of conductors. (31/5/29, U.S.)
35 323 Felten and Guilleaume Carlswerk Akt.-Ges. Submarine cables. (23/1/29, Germany.)
35 315 P. L. R. Fraser. Wiring for electric circuits.
35 363 Hirsch Kupfer und Mersingwerke Akt.-Ges. Electric annealing furnace. (15/12/28, Germany.)
35 348 F. W. Le Tall (Westinghouse Electric and Manufacturing Co.) Load conveying systems.
35 374 Lissen, Ltd., and R. P. Richardson. Manufacture of dry cells.
33 346 Marconi's Wireless Telegraph Co., Ltd. Radio receiving systems. (19/11/28, U.S.)
35 388 J. Robinson. High frequency electrical apparatus.
35 389 J. Robinson. Piezo-electric devices.
35 394 Siemens-Schuckertwerke Akt.-Ges. Lubricating arrangements for electric spindles, etc. (23/11/28, Germany.)
35 370 Siemens and Halske Akt. Ges. Transmitting communicating currents with discharge tubes.
35 286 J. B. Tucker. Electric switches.
35 368 S. Zullo. Telephone message apparatus.

November 20th.

35 409 H. E. Ashdown. Dynamo-electric machines.
35 478 Associated Electrical Industries, Ltd., and A. Rudman. Circuit interrupters.
35 461 L. J. F. Austin and Clear Hooters, Ltd. Electric horns.
35 527 Automatic Telephone Manufacturing Co., Ltd., and R. Taylor. Telephone systems.
35 462 J. L. Baird and Television, Ltd. Television, etc., systems.
35 529 J. L. Baird and Television, Ltd. Television apparatus, etc. (31/1/29.)
35 530 J. L. Baird and Television, Ltd. Television apparatus, etc. (4/2/29.)
35 404 Firm of G. Barker and G. P. Barker. Electric water heater.
35 480 P. Girod. Electrodes of electric furnaces. (27/8/29, France.)
35 486 International General Electric Co., Inc. Alternating current generators. (20/11/28, Germany.)
35 503 T. F. Langlands, W. Smith, and C. W. Rettig and Co., Ltd. Electric drive.
35 479 F. W. Le Tall (Westinghouse Electric and Manufacturing Co.) Electric signalling systems for elevators, etc.
35 499 S. Offenbacker. Electrodes for high frequency currents.
35 452 G. Pellizarri and Pellizari and Figli. Cooling device for electric motors.
35 416 H. Rabinovitch. Electric signals for traffic regulation.
35 473 Standard Telephones and Cables, Ltd., and R. W. Bradley. Pressure indicating devices.
35 475 Standard Telephones and Cables, Ltd. Moulded articles, and methods of forming same. (2/1/29, U.S.)
35 476 Standard Telephones and Cables, Ltd. (J. Dorgelo and K. C. van Rijn). Toll telephone systems.
35 474 Standard Telephones and Cables, Ltd. (Western Electric Co.) Carrier current signalling systems.
35 477 Standard Telephones and Cables, Ltd. (J. P. Verlooy.) Toll telephone systems.
35 401 K. Walton. Insulated connections for electric wires, etc.
35 411 G. Wilkinson. Electric heat storage radiators.

COMING EVENTS.

Friday, March 28th (To-day).

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington, London, W. Annual general meeting. 5 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Joint meeting at the invitation of the Manchester Association of Engineers. Paper by Mr. J. Calderwood on "Marine Diesel Installations, with particular reference to Auxiliary Machinery." 7.15 *p.m.*

Royal Institution of Great Britain, 21, Albemarle Street, London. Lecture by Sir E. Rutherford on "The Transmutation of Matter." 9 *p.m.*

Saturday, March 29th.

Association of Mining Electrical Engineers (Western Sub-Branch).—Informal discussion on H.M. Electrical Inspectors' Report for 1928.

Electrical Association for Women (North-East Coast Branch).—Lecture Theatre, Carliol House, Newcastle-on-Tyne. Annual meeting. 11 *a.m.*

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir E. Rutherford on "Atomic Nuclei and their Structure." 3 *p.m.*

Finsbury Technical College Old Students' Association.—Trocadero Restaurant, Piccadilly Circus, London. Annual dinner. 6.30 for 7 *p.m.*

Monday, March 31st.

Institution of Electrical Engineers (Western Centre).—University College of the South-West of England, Exeter. Lecture by Miss M. Partridge on "Economics of Rural Electricity Supply for Domestic Purposes." 6 *p.m.*

Institution of Electrical Engineers.—Victoria Embankment, London. Informal meeting. Discussion on "Loud-speakers." (Opened by Captain P. P. Eckersley.) 7 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—University, Edmund Street, Birmingham. Paper by Mr. B. Leggett on "The Medical and Surgical Applications of Electricity." 7 *p.m.*

Tuesday, April 1st.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting.

Electrical Association for Women (Bristol and District Branch).—Electricity Offices, Colston Avenue. Lecture on "Rural Electrification," by Mr. E. W. Tole. 3 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansall on "The Imperial Chemical Industries, Limited's, Steam and Electric Power Plant at Billingham." (To be illustrated by a cinematograph film.) 7 *p.m.*

Wednesday, April 2nd.

Electrical Contractors' Association (London Branch).—General meeting.

Electrical Contractors' Association (Southern Section).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting.

Electrical Contractors' Association (Dublin Branch).—Ordinary meeting

Institution of Electrical Engineers (Wireless Section). — Victoria Embankment, London. Paper by Mr. R. H. Barfield. on "Recent Developments in Direction-Finding Apparatus." 6 *p.m.*

Institution of Electrical Engineers (Tees-Side Sub-Centre).—Cleveland Technical Institute, Middlesbrough. Annual general meeting, 7 *p.m.*; paper by Mr. L. C. Grant on "The Breaking Performance of High-Power Switchgear and of a New Form of Quenched-Arc Switch." 7.30 *p.m.*

Thursday, April 3rd.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting.

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting.

Electrical Association for Women.—Visit to Ideal Home Exhibition, Olympia. Special inspection of the Pavilion of Light.

Friday, April 4th.

Institution of Electrical Engineers (Meter and Instrument Section).—Victoria Embankment, London. Paper by Messrs. E. H. Rayner, W. G. Standring, R. Davis and G. W. Bowdler on "Studies in Low-Power-Factor Measurements at High Voltages." 7 *p.m.*

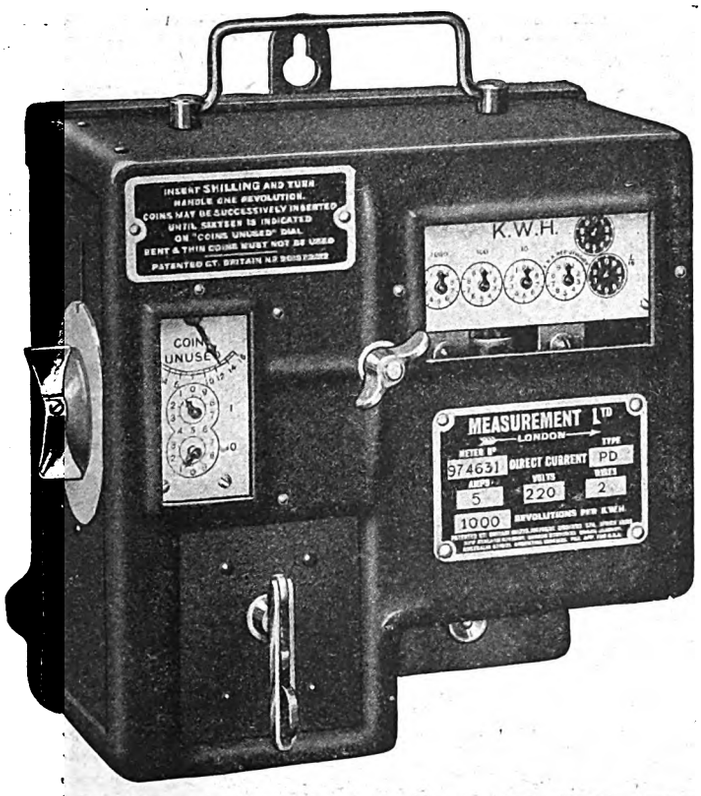
Your Guardian against Bad Debts, Inaccuracies and Irregularities

PREPAYMENT METERS (A.C. & D.C.)
1d. and 1s. coin.



THE outstanding advantages and sound British Construction of "Measurement" Meters are an insurance against unreliability and inaccuracy: special attention has been paid to immunity against fraud.

Write for particulars of our A.C. and D.C. prepayment Meters.

OUTSTANDING FEATURES.

i. The coin box is independent of the meter cover.

ii. Price change wheels can be fitted in situ in one minute.

iii. The operation of mechanism is independent of gravity, etc.

iv. The meters are small in bulk and light in weight, the A.C. prepayment meter weighing only 14½ lbs. and the D.C. prepayment meter 19 lbs.

PRICES ARE COMPETITIVE.

Transformation of Lots Road.

TWENTY-FIVE years ago when Lots Road, Chelsea, power station was completed to supply current for the electrified Metropolitan District Railway and the Bakerloo, Piccadilly and Hampstead-Highgate tubes, the 6 000 kW Parsons turbo-alternators then installed were the largest sets that had yet been built. Since 1905 not only has there been a large growth of traffic on the original Underground system, but the Central London and City and South London tubes have been added, as well as the London United Tramways, and the original tube mileage has been greatly increased. Car mileage on the railways supplied by Lots Road has grown from 32 500 000 in 1908 to an estimated mileage of 96 250 000 in the current year, so that the figures have nearly tripled in 23 years. From time to time additions were made to the original machinery to meet the steadily growing demand for current, but five years ago it became apparent that something more drastic was required. Recognition of this fact led in 1925 to a decision to replace almost the whole of the original plant by stages.

This decision was made easier by the knowledge that the advance in boiler and turbo-alternator design, since the original plant was installed, had made it possible to increase the output of the station very considerably without enlarging the actual buildings. The new 15 000 kW turbo sets are rather smaller than the 6 000 kW sets of a quarter of a century ago. Since the first 15 000 kW set was installed in 1915 six of these sets have been put in, three of them to replace the original 6 000 kW sets, and a seventh is now in course of installation. In this way the output of the power station has been raised from 70 000 kW in 1925 to 90 000 kW at the present time. When the programme now in hand is completed there will be nine 15 000 kW sets, providing for a total station load of 105 000 kW, with two stand-by sets. There will be room for two more, so that the eventual capacity of the station will be 165 000 kW. The present maximum demand is 92 000 kW with a load factor of 48%, so that Lots Road, as re-equipped, should be in a position to cope with the probable current demand of the Underground system for some time to come. The "heart" of the Underground has in fact been thoroughly rejuvenated.

Modernisation of the station has involved replacement of the switchgear and the provision of an entirely new high tension control board from which the entire electrical system of the power house and feeders will be controlled. The boiler plant is also being reconstructed. The original boilers, of which there were 64, had a capacity of 16 000 lb. of steam per hour at a pressure of 200 lb. and a temperature of 500 deg. F. In place of some of these, eight new C.T.M. Babcock and Wilcox boilers of 39 000 lb. capacity at 290 lb. pressure and 700 deg. F. were brought into use, four in 1922 and four in 1925. In order to facilitate the general reconstruction without interfering with the working of the station, four new C.T.M. boilers of 50 000 lb. per hour capacity were erected in 1927 in a corrugated iron shed at one end of the main power house. Since then 16 of the old boilers have been replaced by eight new ones, of 50 000 lb., to supply the two latest turbines. Eight more are being erected to replace a further 16 of the old type. The thermal efficiency of the whole station is stated to be 16¼%, while that of the new plant is given as 22%—a very satisfactory figure. When it is remembered that the entire reconstruction programme is being carried out without interference with the working of the station, and without enlargement of the original buildings, the achievement becomes the more noteworthy both as an example of ingenuity and resourcefulness and as an object lesson in the progress made in 25 years towards efficiency in the design of electrical machinery and boiler house plant with economy of space and its resultant saving in the cost of the buildings required to house them.

Current Topics.

Co-operation in Lighting.

AT many recent electrical functions one or more of the speakers has stressed the need for co-operation between different branches of the industry. We are indebted to the General Electric Company in collaboration with the "Daily Mail" for a splendid example of co-operation of a different kind—the "Pavilion of Light" at the Ideal Home Exhibition. As Mr. M. J. Railing, the joint managing director of the G.E.C., pointed out at a Press luncheon a few days ago, architects, decoration experts and electricians combined to produce this beautiful demonstration of the possibilities of modern lighting in the domestic sphere. Mr. RAILING expressed his conviction that although we should by all means keep ourselves informed of what other countries were doing, British electricians, architects and decorators working together could achieve results as good if not better than those of any other nationality. Certainly the "Pavilion of Light" is one of the most popular features at Olympia.

Mr. Morrison in Trouble.

MR. MORRISON is again in trouble with the gas interests on account of his enthusiastic references to electricity at the E.D.A. luncheon a fortnight ago. "The Gas World" rebukes Mr. Morrison for partisanship, but surely since the government of which he is a member is backing the national grid he, or any other Cabinet minister may legitimately urge the electrical industry to greater efforts to secure that increase of consumption without which the grid cannot be financially successful.

More Kite Fatalities.

Is there a limitative element in accidental deaths as well as in suicides? The inquiry is prompted by the electrocution of two more American boys by contact between their kite strings and a 2 500 V overhead transmission line. The coroner in this case recommended that high tension wires should be placed underground—even in America coroners are not always entirely practical in their outlook—but it would seem to be more to the point to endeavour to stop the sale of metallic kite strings. There are cheaper ways of preventing accidents of this kind than burying all transmission lines, but coroners are apt to be a trifle vague—like the majority of the population—where economics are concerned.

Sugar and Electricity.

AT first sight the crisis in the sugar planting industry does not appear to have much contact with electricity. Yet when one goes more deeply into the matter a connection is soon discoverable, so ubiquitous has the use of electricity become. Sugar mills of up-to-date pattern are electrically lighted, and some use electric power for driving their machinery. Even in England, although beet sugar is not comparable in national importance with the cane sugar production of the West Indies, British Guiana, Mauritius, Natal, Queensland and Fiji, some of the more progressive factories are electrified. That at Wellington, in Shropshire, uses 150 electric motors, and has its own power house equipped with two 1 250 kVA turbo-sets. The British sugar beet industry has still some years of the special Government subsidy before it, so that its real testing time has not yet come, and when the subsidy expires the world situation may have improved. The cane-growing countries are in much worse case and their position was placed before the Chancellor of the Exchequer last week by a deputation from the Sugar Federation of the British Empire in a manner which impressed even the far from impressionable Mr. Snowden. If the sugar industry in the West Indies, British Guiana and Mauritius—the most severely affected Empire producers—is allowed to go under as the result of the pressure of accumulated stocks in Cuba and elsewhere, the market for electrical equipment in these colonies will practically disappear, our dependence on foreign grown sugar will be increased and the Imperial Treasury is likely to be faced with demands for grants in aid to balance the budgets of the impoverished colonies.

American Accident Figures.

MR. C. R. BEARDSLEY, chairman of the Accident Prevention Committee of N.E.L.A., publishes in the N.E.L.A. Bulletin for March a statistical study of the trend of accidents in the electrical supply industry in the United States between 1923 and 1928. He reaches the conclusion that accident prevention "has not progressed within reasonable approach to the possibilities," although it is far superior to the results of 15 years ago. There is to-day an excessive spread between the best and worst concerns and between different geographical areas. "Single companies of which executives are known to be personally and continuously interested have obtained consistently fine results year after year far below national averages." Mr. Beardsley adds that known employees' accident costs in the American supply industry certainly reach nearly $7 000 000 a year and probably a good deal more, a sum which, as he justly observes, would "buy a lot of prevention." In 1928 the average fatality rate for all United States supply companies employing from 1 000 to 5 000 persons was 1·41 per 1 000 employees, and the number of days lost through accidents was 121 per 100 employees.

De Luxe Electric Gramophones.

THE electrically amplifying gramophone and the radio-gramophone are now superseded in interest by the "continuous" or automatic electric gramophone—which can be had either as a super-gramophone alone, or combined with radio. These instruments have been prominent at recent exhibitions, where models capable of playing 36 records consecutively, or—when fitted with a different type of "magazine"—both sides of eight records have been shown. The switchboard on one side of the cabinet carries a "brilliancy control"—for emphasising either high or low notes as desired—in addition to switches, volume control and a radio knob giving direct tuning to three stations. A remote control for the gramophone can be plugged into a socket in the cabinet, and needles are changed automatically after each side of a record is played. In another make of the new instrument selective playing of both sides of ten records is provided for. A wooden tablet, connected to the gramophone by a length of flex, carries a switch, volume control and 20 push buttons, so that any of the records can be heard at will; while pressing all the buttons ensures a long entertainment with no further trouble. These new gramophones are very delightful inventions; we hope, however, that flat dwellers who own them will use the volume control with discretion.

DERBY POWER STATION EXTENSIONS.

Starting up of New 20 000 kW Turbo-alternator—Details of New Boiler House Equipment Installed—The Volcano Burner.

THE 1929 extensions to Derby Corporation power station were started up on Friday, March 28th, by Mr. J. H. Thomas, and new boiler equipment was brought into operation by Mr. T. P. Wilmshurst.

Speaking at a luncheon which followed the opening of the extensions, Mr. Thomas expressed his faith in electrical development, and though he had often received severe criticism at the hands of mine owners and miners themselves, he believed that extended electrical facilities would be for the ultimate good of the country.

Mr. Frank Hodges, of the Central Electricity Board, stated that during the past three years that body had sanctioned contracts to the amount of £13 000 000. With regard to the coal industry, he was of the opinion that pulverised fuel stations were making a contribution to the solution of the problems of the coal trade, as they used low-grade fuel which would otherwise remain in heaps at the pithead. It would, therefore, be preposterous if for any reason at all colliery owners put up the price to an artificial figure, thereby tending to raise the cost of current to the consumer.

The first extension to the original plant at Derby was made in 1896 and included a 1 000 H.P. Ferranti engine and alternator. Further extensions were decided upon with the opening of the Derby electric tramways system in 1904, and four direct current Parsons turbo-generators were installed to provide the supply. The single-phase alternating current system was also augmented with the addition of two more 1 000 H.P. Ferranti engines and alternators. Further steam raising plant, incorporating water tube boilers with mechanical chain grate stokers, was also installed.

Consequent upon the increasing demand for electrical energy, the Electricity Committee in 1907 advised the Council to acquire the adjacent property and erect an entirely new station. This was designed and carried out by Mr. T. P. Wilmshurst and his staff. The new station was officially opened on April 8th, 1908. The plant installed consisted of two 750 kW Parsons direct-current turbo-generators and three water tube boilers. Shortly afterwards a third generator was installed. In 1913 Mr. Wilmshurst presented a report showing the advantages that would be effected by installing larger plant operating at 6 600 V, three phase, 50 periods, for generation and distribution. The report was adopted and a 2 000 kW Parsons turbo-alternator, running at 3 000 r.p.m., was installed.

Two further sets of 2 000 kW capacity were installed, and in 1917, due to the demand in connection with the supply of war material, still further equipment was required and the Government directed to Derby a 4 000 kW Parsons turbo-alternator which was on order for a South African undertaking.

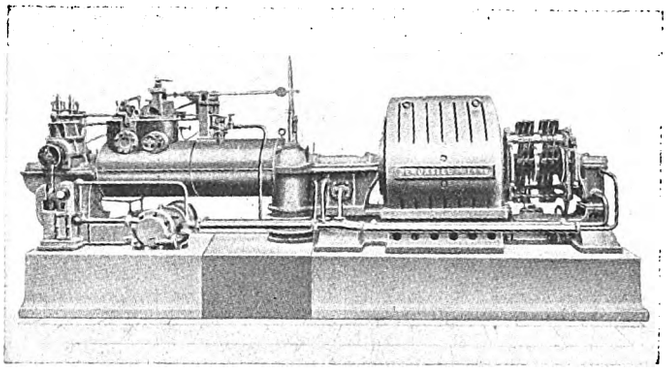

Fig. 1.—300 kW Parsons turbo-set installed at Derby in 1904.

It was decided in February, 1920, to instal a 7 500 kW set with its complement of boiler plant, and the completed station in 1922 consisted of 19 750 kW of Parsons turbo-generating sets and eleven B. and W. land type boilers, each having an evaporative capacity of 25 000 lb. per hour, operating at a pressure of 180 lb. and a final steam temperature of 550 deg. F.

In 1924 the demand necessitated the preparation of plans for further extension, work in connection with which was put in hand early in 1925. In this direction the Committee decided to adopt pulverised fuel firing for the boiler equipment, and became one of the first municipal undertakings to adopt this system of firing; it was further decided to increase the steam pressure and temperature from 180 lb. per square inch at 550 deg. F. to 325 lb. per square inch at 750 deg. F.

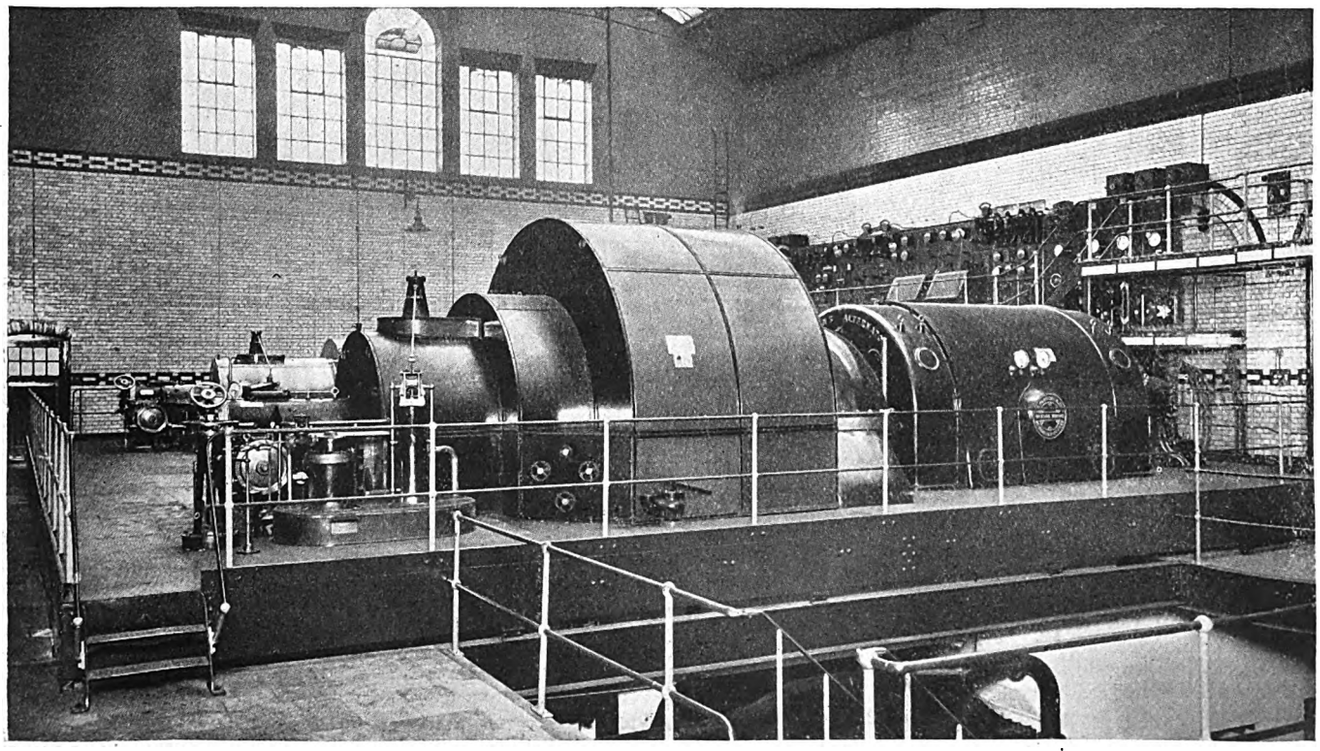

Fig 2.—20 000 kW Parsons turbo-generator installed at Derby in 1929. Compare this with the original 300 kW Parsons turbo-set installed a quarter of a century earlier. The two pictures are not on the same scale.

Digitized by Google

For the purpose of housing the steam generating plant a new boiler house was erected on the site of the boiler house of the original generating station. Two B. and W. marine type boilers were installed, each having an evaporative capacity of 60 000/80 000 lb. per hour, with air cooled combustion

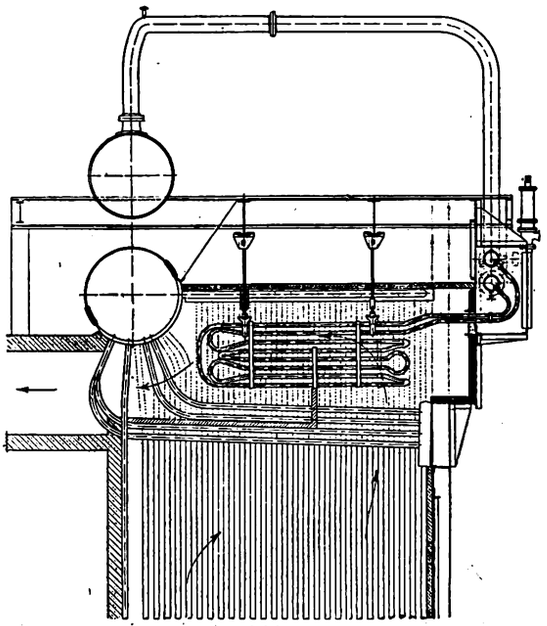

Fig. 3.—Arrangement of "M.L.S." superheater in combustion steam generator.

chambers and equipped for pulverised fuel firing on the Lopulco system. In conjunction with the boiler plant a 10 000 kW Parsons turbo-alternator was installed to operate at the higher steam pressure. To make room for this machine in the turbine room, the two 750 kW direct current machines erected in 1908 were removed. A third boiler was installed in the new pulverised fuel boiler house in 1927-28, similar in capacity to the first two units, but having water-cooled surface in the combustion chamber.

TABLE OF PROGRESS AT DERBY.

UNITS SOLD.

* Coal dispute.

NOTE :—The coal consumed from 1925 onwards is of low grade quality, having an approximate value of 9 000 B.T.U.'s per lb.

The Derby station is a selected station under the Central England Scheme and the work carried out under the latest extensions represents the completion of the first boiler house, fired entirely by pulverised fuel, as laid down in the original design and the replacing of two of the old type turbo-generators with a machine of increased capacity and of modern design.

It is a matter of interest to record that at the close of the year 1929, approximately 100 000 tons of coal had been pulverised and burned in this station since pulverised fuel was originally installed and the immediate benefit therefrom is represented by the fact that the coal cost of each kWh generated is now amongst the lowest obtaining in the country. This has led to a reduction in the tariff of charges to the consumer and an increase in the demand or consumption of electricity as will be seen from the table above showing the growth of the undertaking. Another notable feature of the extensions is that almost 50% of the material has actually been manufactured in Derby and is virtually a home product. This is particularly interesting as in this station it is possible to demonstrate in operation the products from the numerous engineering workshops situated in Derby, most of whom obtain their motive power from the plant which they have constructed. The whole of the work covered in the present extensions has been carried out to the plans and specification prepared by Mr. G. H. Lake, the borough electrical engineer.

On the site which formerly housed six Lancashire boilers yielding at maximum capacity 42 000 lb. of steam there now stands a plant with a capacity of 400 000 lb.

The two steam generators just completed are, it is claimed, different from any plant installed in this country, and have been designed to secure the utmost advantage which is to be gained from the conditions created by the combustion of pulverised fuel. In the early days of pulverised fuel, as no brick furnaces were able to withstand for any length of time the heat produced, the burners were designed with a view to retarding combustion by restricting the air supply, and so removing the intense flame from the vicinity of the refractory walls. There were actually two schools of thought, one maintaining the necessity of having brickwork in the combustion chamber, the other, that, as pulverised fuel is essentially self supporting owing to the more intimate mixture of the air with the finely ground particles of coal, it would be quite practicable to redesign the boiler unit and by surrounding the combustion zone with water tube walls effect the advantages such designs offered. Experience with experimental plants constructed for commercial operation led one to believe the latter theory to be correct and the two units installed at Derby are designed on these lines. This made possible higher furnace ratings and reduced combustion chamber volumes. The field for burner design was also widened and a burner was developed to induce considerable turbulence into the stream of coal and air entering the furnace, and by admitting the whole of the air for combustion through the burner a short and intense flame was produced.

Coal is brought to the site in electric lorries and discharged into a hopper in the boiler house annexe, a grid preventing oversized lumps entering the equipment. An enclosed bucket elevator raises the coal to the top of the boiler house and discharges it to a scraper conveyor feeding the raw coal bunker, which has a capacity of 325 tons, the elevator and conveyor being capable of handling 30 tons per hour. A stand-by elevator is now in course of construction.

The pulverising equipment has been increased by the installation of a third mill required to complete this section of the boiler house plant as originally planned. The new mill is of the Raymond 6-roller type similar to the earlier pulverisers and having the same capacity, namely, 6 tons of coal per hour. Two new pulverised fuel bunkers have been erected

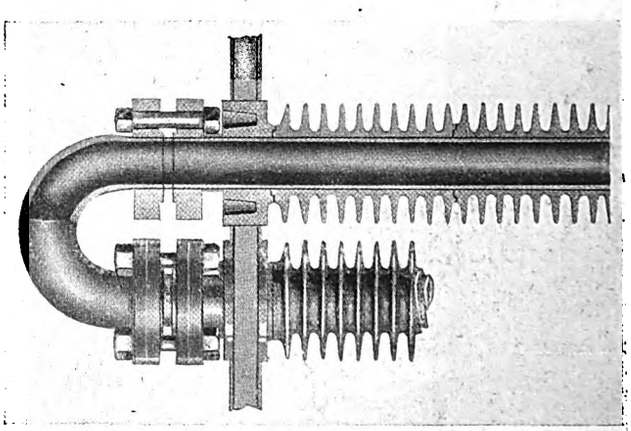

Fig. 4.—Foster Economiser—Construction of element and special joint.

to store fuel for the new boilers. These are of the same capacity and construction as the existing bunkers and are fed from the same screw conveyor. A second screw conveyor is now operating, and the arrangement of supply and discharge chutes is such that the three cyclones and the five pulverised fuel bunkers are completely interconnected through each conveyor. A new design of feeder is installed for the new boilers, having a capacity considerably greater than the older form, only two being required per boiler compared with six of the screw type feeders. The "Duplex" feeder is secured to the bottom of the pulverised fuel bunker and consists of

Digitized by Google

two parallel flat plates separated by a casing to form an enclosed box. Both plates are provided with two holes, those in the lower disc being at right angles to the openings in the upper plate. Coal enters the box through the upper openings and is carried round by a revolving scraper until it passes out through the holes in the bottom plate which communicate with the throats of two Venturi tubes connected to the primary

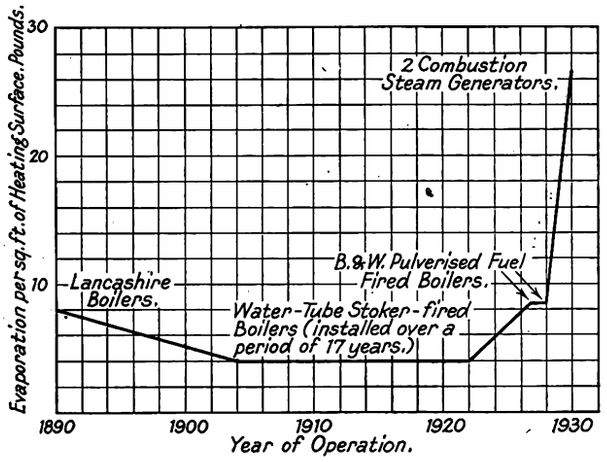

Fig. 5.—Evaporative efficiency of boiler heating surface at Derby Corporation power station.

air fan. The current of air flowing through the Venturi pipes entrains the coal and carries it down to the burner inlet and the Venturi tubes are given a lead downwards to minimise wear by reducing the number of bends in the burner piping. The feeder rotor is mounted on a vertical spindle which extends upwards into the bunker, and carries at its upper end a revolving agitator to prevent the coal arching over the feeder openings and to ensure a steady flow of fuel through the feeder.

Each boiler is equipped with one burner of "Volcano" pattern, built up from the floor of the ash pit and projecting into the combustion chamber through the water screen, the tubes of the latter being set to suit.

The steam generators are fitted with "M.L.S." convection superheaters, each of 1 580 sq. ft. heating surface. They each have 40 single pass multiple loop elements 95 ft. in length, made from solid cold drawn mild steel tubing, $1\frac{7}{8}$ in. outside diameter by 7 W.G. thick.

With regard to the electrical equipment installed it is interesting to note that the first Parsons generating plant put into operation at Derby, in the year 1904, consisted of three

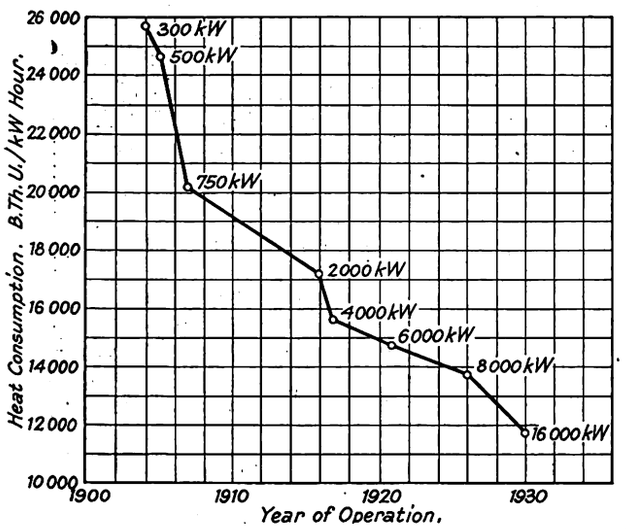

Fig. 6.—Heat consumption of the Full Street station.

d.c. turbo-generators rated for a normal load of 300 kW, but designed to give an overload to 350 kW for one hour without overheating. The speed of the sets was 3 000 r.p.m. The latest addition to the Derby generating plant, namely, the 20 000 kW turbo-alternator, gives a heat consumption per kWh of approximately 55% less than that of the 300 kW machine. The new set is designed to give an economical output of 16 000 kW and a maximum continuous output of 20 000 kW at a speed of 3 000 r.p.m. with a power factor of 0·8. The alternator generates three-phase current at 6 600 V and is of the revolving field and stationary armature type, excitation being provided by a direct-coupled exciter. Voltage regulation is carried out entirely in the exciter shunt field circuit. The turbine is of the single cylinder pure reaction type with Duplex exhaust. It is believed to be the largest single cylinder machine running at the speed of 3 000 r.p.m. ever supplied in this country. It is essentially a high efficiency machine, and by the use of the Duplex exhaust it is able to take full advantage of the vacuum of 29 in. with which it works. The blade heights vary from $1\frac{1}{2}$ in. at the inlet where the rotor is 22 in. diameter to 15 in. on a rotor diameter of 44 in. at the final exhaust. The condenser is of the surface two-flow type, having an interior cooling surface of 19 250 sq. ft., and comprising 6 130 tubes each $\frac{3}{4}$ in. external diameter. The quantity of cooling water circulated is 16 800 gallons per min.

The switchgear throughout is of the back-to-back double busbar arrangement, and it is accommodated in cellular type stone cubicles. Each cubicle contains the apparatus for one circuit equipment, arranged and mounted in separate cells formed by horizontal shelves and vertical barriers. Each cell is enclosed by a hinged steel door padlocked, and, where necessary, interlocked to ensure access with safety. In order

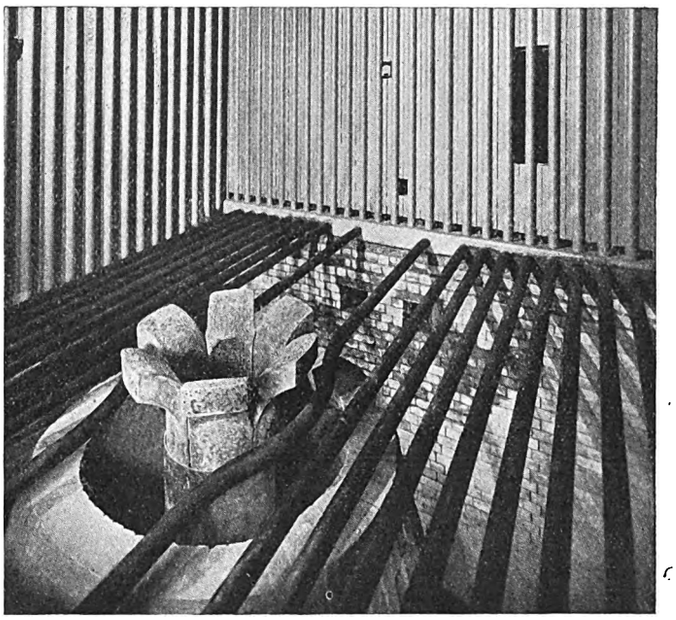

Fig. 7.—Interior of combustion steam generator, showing "Volcano" burner.

to maintain this isolation, the connections passing from one cell to another are taken through porcelain insulators cemented in the stone structure. All the oil circuit-breakers are solenoid operated by means of small barrel type control switches mounted, along with red and green indicating lamps, on the respective black enamelled slate panels of the control board. The control board is of the flat panel type, and is located in the turbine house and mounted on a gallery above the original bank of switchgear cubicles. All the isolators are mechanically operated and interlocked.

The list of contractors responsible for the work in these extensions were:—Derby Corporation Works Department (building and site); International Combustion, Ltd. (pulverised fuel plant); Combustion Steam Generator, Ltd. (steam generators); Superheater Co., Ltd. (superheaters); Eco Power, Ltd. (economisers); Underfeed Stoker Co., Ltd. (air preheaters); Davidson and Co., Ltd. (draught plant and dust collectors); Aiton and Co., Ltd. (pipework); J. Booth and Sons, Ltd. (structural steelwork); C. P. Parry and Co., Ltd. (soot blowers); C. A. Parsons and Co., Ltd. (turbo-generator and auxiliaries); British Thomson-Houston Co., Ltd. (switchgear); Hopkinson and Co., Ltd., Gummers, Ltd. (valves and fittings); Industrial Combustion Engineers, Ltd. (boiler instruments); Hobdell, Way and Co., Ltd. (heat insulation); F. C. Construction Co., Ltd. (turbine foundation reinforcement); G. F. Tomlinson (circulating water screening chamber); F. W. Brackett and Co., Ltd. (circulating water screen).

MODERN BOILER HOUSE PRACTICE—II.*

Boilers Designed for High Pressures—Dual Generation—Superpressures—Pipes, Joints and Valves—The Future.

By F. JOHNSTONE TAYLOR.

IN the previous article under this heading the writer dealt with what may be regarded as standard boiler practice of the present day in large power stations using steam at or about 300 lb. and fired by coal of the usual grades deemed suitable for mechanical stokers.

As the very large units, irrespective of pressure, which now figure in the super stations are fired to a considerable extent by pulverised fuel, these are dealt with in the next article under that heading, the present one being devoted to the important considerations relating to what have been classified as high pressures, that is those at or around 500 lb., the special considerations relating to pressures of the 1 000 lb. order being outside of the scope of the present notes.

The whole matter of high pressure steam is much too vast to be dealt with in a short article. There have been a large number of excellent articles by well known experts on this subject during the last few years in the leading technical journals, both in this country and America and high pressure steam has been proved in practice to effect economies which are amply justified by the extra cost of such plant. The

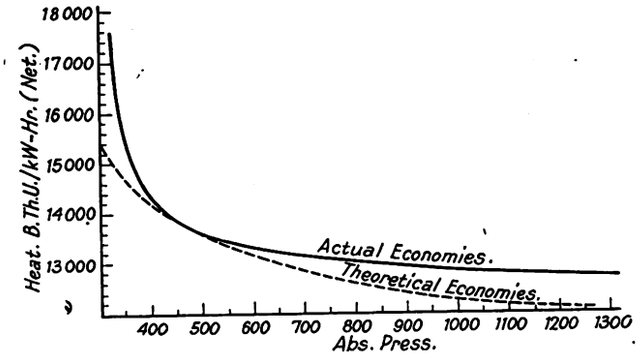

Fig. 1.—Actual and theoretical economy curves for H.P. steam.

high pressure turbine is a relatively simple proposition and is a sound commercial one in sizes which admit of the large range of expansion required for h.p. steam. This introduces what is perhaps the most attractive field for high pressures at the present moment, and that is additions to power stations where h.p. boilers supply steam to h.p. turbines, which in turn exhaust into others of standard type at the pressures usually associated with them, a practice which has been followed in several instances. At the same time it has, of course, been known for many years that h.p. steam is economical from the theoretical standpoint, and now that engineering progress has made it possible by the use of forged steel boiler drums, special material for turbine blading, etc., actual economies substantiate these theories, as the curve in Fig. 1 will show. Here the theoretical economy curve is constructed from the regenerative cycle thermal efficiencies of various stations modified by a fixed plant efficiency ratio of 60·8% in consideration of a boiler efficiency of 87%, a turbo-generator efficiency ratio of 77%, auxiliary usage 4·4%, and operating losses of 5%. Some high pressure actual economy points are below the dotted theoretical curve which shows the actual gains of some of the newer stations to be greater than the theoretical gains due to pressure alone. This improvement over the theoretical curve is caused by the installation of more heat saving equipment, better loading and other favourable local conditions.

Standard types of water tube boiler such as the Babcock, Yarrow, Thompson, Nesdrum, Woodeson, and others which have proved their merits in the past have been adopted without much difficulty to working at pressures around the 600 lb. limit, the Yarrow boiler illustrated in the previous article being actually designed for 600 lb. Principal interest centres in the manufacture of the drums. These are in some instances produced from an octagonal ingot, which, forged to a round billet is then bored to take a mandrel. Upon this mandrel it is expanded during a second forging operation to approximately finished diameter, while a third forging operation increases the length without increasing the diameter, but reducing the thickness of the shell. In the form shown in Fig. 2 the drum is bored to finished size and the ends are closed over a mandrel which leaves the openings for the manhole covers. Otherwise these boilers, as already shown, do not depart materially from the orthodox. Babcock boilers are doing duty at the Langebrugge (Belgium) station at 800 lb., and here again the essential features of the orthodox design remain, though the arrangement of tubes is somewhat different in that there are two banks, one five high, which is lowermost, and the other fifteen high, while between them and at right angles is the superheater element. But the boiler drums which are 42 in. dia., are built up of plates in the usual manner. They are 1⅝ in. thick, reinforced where the tubes enter by plates of the same thickness. The tubes are 3 in. dia. and 13 ft. long, while the superheater tubes which are expanded into cylindrical headers are 1½ in. dia. The 48 in. dia. steam and water drum is of forged seamless steel construction, and it provides a reserve water capacity making it easy to operate the boiler under all sets of conditions, such as in starting up and under variable loads, rendering it unnecessary to provide pumps having 100% reliability such as are requisite with the series type of h.p. boiler.

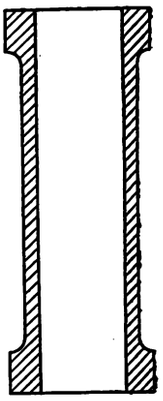

Fig. 2.—H.P. boiler drum.

Fig. 3 shows the principal features of the Babcock boiler as designed for high pressures, but other constructions will become apparent in the next article as pulverised fuel is now intimately associated with h.p. working. The feed from the economiser passes directly into the boiler, which makes it necessary to build the economiser for a somewhat higher pressure than the boiler. It is formed of seamless steel tubes expanded into forged steel boxes. These boxes are spaced

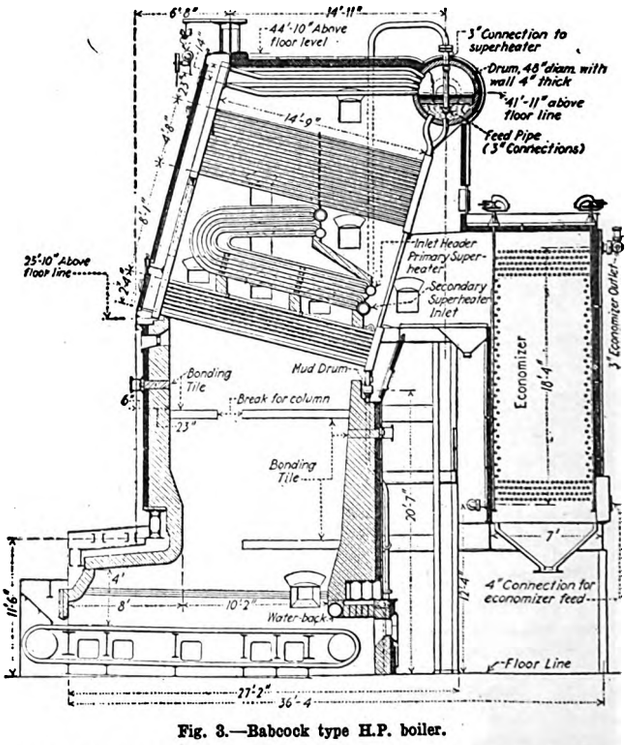

Fig. 3.—Babcock type H.P. boiler.

apart to allow the removal and replacement of the economiser tubes from between the boxes with tubes at an angle which allows the tubes to be removed and replaced with a relatively narrow aisle width. The ends of the horizontal circulating tubes of the boiler are bent so that they enter the drum in circumferential lines which are twice as far apart as the

* The first article of this series was published in our issue of March 7th, and the third will appear in THE ELECTRICIAN to be dated May 2nd.

Digitized by Google

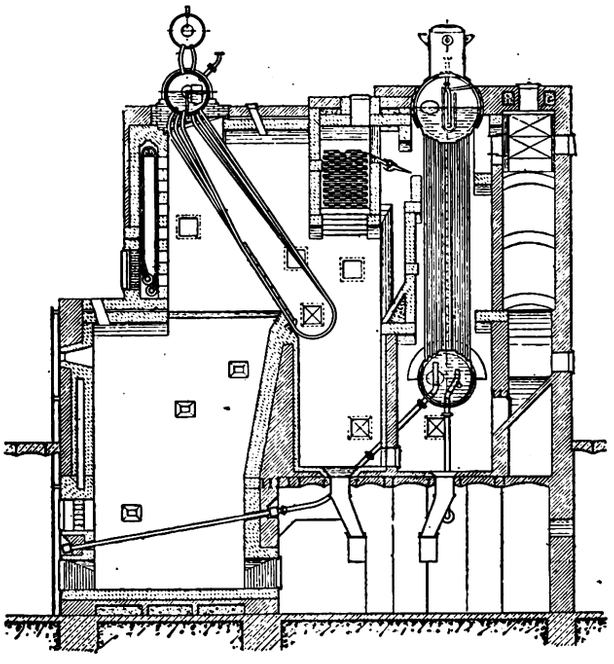

Fig. 4.—Sulzer H.P. boiler (dual generation).

distance between the horizontal circulating tubes where they enter the headers. There are two circulating tubes running from the top of each uptake header to the steam and water drum.

The essential features of a dual generation boiler are seen in Fig. 4. That is to say, there is a h.p. and l.p. side, the two parts being virtually distinct, except for the fact that the l.p. side functions as a feed heater to the h.p. side—on the left—which it will also be seen has a radiant heat superheater built into the furnace wall, while that of the l.p. side located between the two is of the usual type, and the l.p. boiler itself on the right will be seen to follow Sulzer's standard practice which received notice in the previous article. There is something to be said for this special construction, especially when very high pressures are used. The less costly l.p. section is quite adequate to

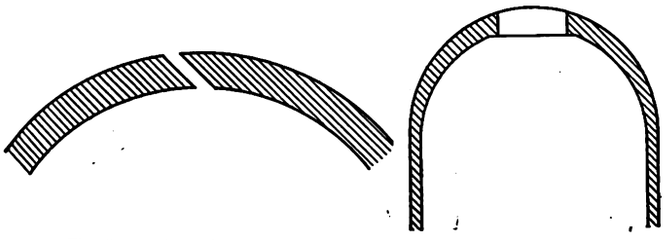

Fig. 5, *a* (left) and *b* (right).—Construction of H.P. boiler drums.

abstract the heat from the partially spent flue gases, and the arrangement thus avoids the installation of costly h.p. heating surface in the region of low gas temperatures. The l.p. section can provide these large surfaces, leaving the other section the duty of intensive heat absorption in the high temperature zone. The l.p. boiler, too, provides distilled water for the h.p. end. The forgings used for the h.p. drums are produced by Krupps in the form of hollow forgings as already indicated, but the method used by the German firm of Thyssen is worthy of mention, as by their method the drums are formed, relatively cheaply, from a plate with a single longitudinal welded joint. After careful heat treatment and rigid inspection, the edges of the plates are planed and then passed through bending rolls giving a scarf lap joint to be welded of the form shown in Fig. 5*a*. The welding is done in a special machine, after which the shell receives a final rolling to shape. The ends are then closed to the form shown in Fig. 5*b*, and the thickening around the centre should be noted. Thereafter under a special method of testing, the drums are actually stressed up to the elastic limit after which a final annealing is claimed to leave them entirely free from any strain or local hardness.

The radiant type of superheater mentioned above may also be considered as a feature of the modern high pressure boiler. Originating about ten years ago in the form of cast iron blocks shrunk on steel tubes, which in turn gave way to cast steel and later to forged steel elements, further improvements have now been made which include a change in both the form and spacing of the elements. For instance, in the Foster Wheeler type which is in extensive use in America, round tubes 2 in. in diameter, widely spaced both from each other and from the furnace wall behind them have taken the place of the flat-faced elements of previous designs and are stated to be eminently satisfactory. The tube construction is lighter and requires much less supporting steel, first because it is light, and secondly because it requires no reinforcement. Round tube elements placed 8 in. from the furnace wall and spaced on wide centres, receive heat on all sides by radiation, in addition to quite an appreciable amount received by convection. The entire tube area, therefore, is available for heat transfer, with the net result that a greater amount of heat can be transmitted per unit length of element installed, or per unit area of wall space occupied. It may be regarded as altogether a good arrangement.

Fig. 6 shows the type of boiler built by the German Siemens-Schuckert Co. to operate on the Benson system. The Benson system, which is perhaps the most logical for producing steam at 1 000 lb. and upwards, functions on the " critical condition " principle in that the steam is generated at the critical condition (3 000 lb. and 705 deg. F.) where the specific volume of saturated steam equals that of water and the latent heat of evaporation is zero. Under these conditions there is no steam and water mixture, so that boiler drums for the separation of steam and return tubes for water circulation are unnecessary. In the arrangement shown there is a water tube boiler of orthodox type on top, while the three banks of tubes below and at right angles to the upper ones constitute the Benson element, and they are small bore tubes having the feed entering the lowermost bank at high temperature. Here, being heated to temperature somewhat above the critical, it passes into highly-superheated steam at 3 200 lb. and enters the upper bank which functions as a superheater. Thence to a throttle valve which reduces the pressure to about 1 500 lb., the steam enters the middle bank where it is re-superheated to about 770 deg. F.

Typical American practice is shown in Fig. 7, which depicts a 1 400 lb. pressure unit by the Combustion Co., at the North-

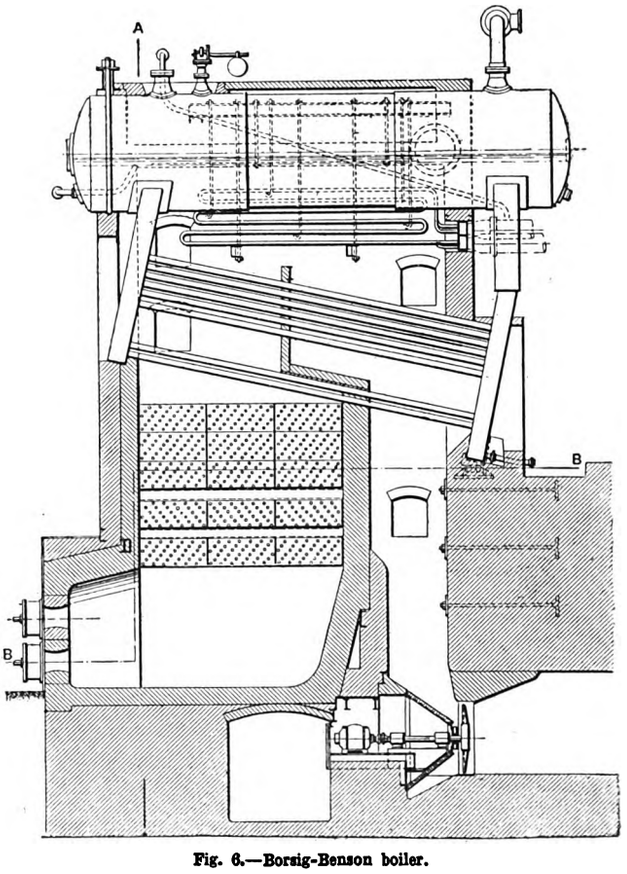

Fig. 6.—Borsig-Benson boiler.

East Station, Kansas City. They are, it will be observed, fired by pulverised fuel.

The use of high pressure has brought with it the necessity for pipes and pipe joints and valves to suit the conditions.

Digitized by Google

Expansion bends, for instance. The orthodox types prove unsatisfactory under h.p. conditions on account of the relative weakness of the outer wall. This has brought into general use the corrugated bend formed from solid drawn soft steel tube, which is strong, flexible, and capable of withstanding vibration when necessary.

Butt Welding Pipes.

In respect of joints, there is something to be said for butt welding pipes whenever possible, end-on in position. Such pipes require to be kept in true alignment by means of roller-guides in order to prevent cross stresses coming upon the butt-welded joints which, as an additional precaution, can have collars welded over the butt weld. Flange joints as a rule have welded flanges, as rivetted ones are unsatisfactory with high pressures and the caulking is often ineffective under such conditions. The welding is done by the carbon arc method and it should be continuous right through the flange,

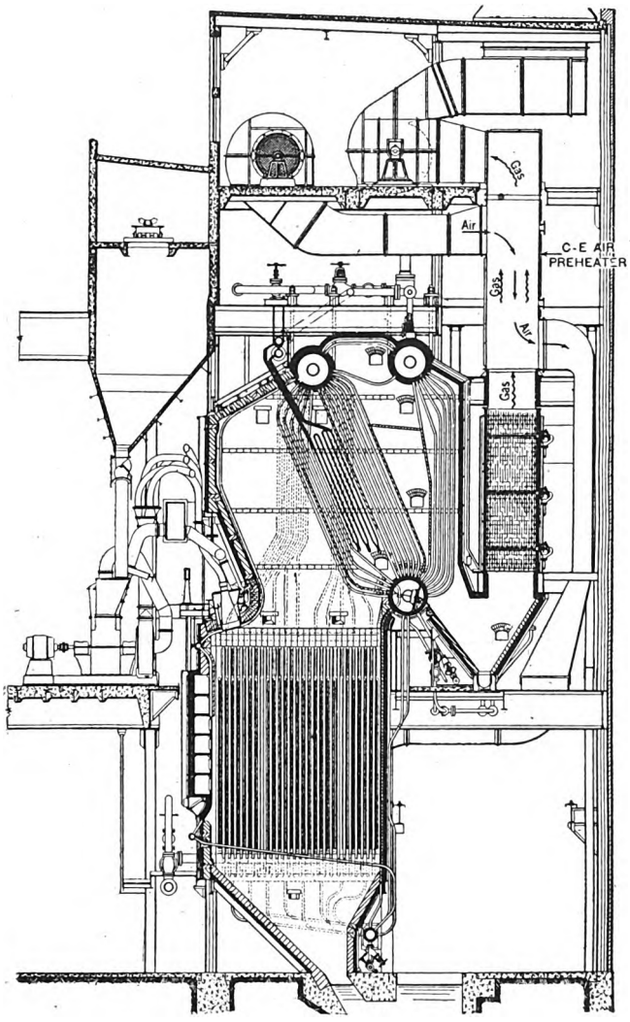

Fig. 7.—American type H.P. boiler.

back to front, with a generous fillet worked up at the back. Heavy flanges are required to preclude any tendency to springing, and the joints are made on a raised face within the bolt holes. As to jointing material, corrugated metal rings with a thin wash of cement have proved satisfactory, while the bolts should be of 20-35-ton steel.

The pipe joints at the previously mentioned Langebrugge station are of the form shown in Fig. 8. The flanges are both faced off square, and between then is inserted a disc of mild steel about ¼ in. thick, machined all over and bored to the pipe diameter, while there is a series of vee-shaped concentric ridges on the faces. It is these ridges on the steel ring which form the actual joint, while the bolt holes are reamed in position for the accommodation of fitted bolts as shown.

For relatively small solid-drawn steel tubes, the joint shown in Fig. 9 is well suited. Here the ends of the pipe are screwed with a vanishing thread and the pipe ends are expanded into the flanges after being screwed into position. The end of the pipe thread at the flange is then sealed by welding, a metal-to-metal joint being made on the flange faces within the bolt circle. At the periphery of the flange there is a clearance, but it is very small—about 2/1 000 in. in fact—but it enables any bending of the flange to be detected.

Valves are perhaps rather outside of the scope of these notes but for high pressure special considerations enter into the design which demand such refinements as forged steel bodies and seats of material which will stand up to the conditions which are very severe, the slightest leakage having a drastic cutting effect, but several good designs are now listed by the leading valve makers.

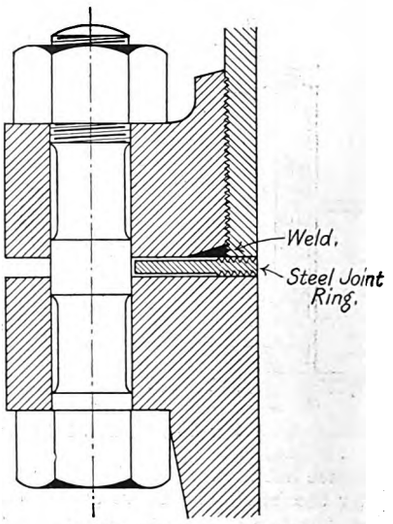

Fig. 8.—H.P. flange pipe joint.

It is altogether impossible to state in a general way what prospects the future holds for the use of steam at pressure much over 600 lb. One has to study the results at those stations now operating under such conditions and then to take local considerations into account. Perhaps the most comprehensive data available at the moment is that due to Mr. Moultrop concerning the American Edgar station. According to "The Engineer" of May 20th, 1927, results at the Langebrugge station with 800 lb. show an average fue economy of about 35% as compared with results from steam at lower pressure and temperature used in the same station. Information concerning the Lakeside station, Milwaukee, appears in "Engineering" of January 6th, 1928, while the results at the previously mentioned Edgar station are commented upon at some length in a leading article in "The Engineer" of April 19th, 1929. According to Mr. Moultrop, as our contemporary points out, the use of steam at 1 200 lb. pressure is entirely practical for power station work, and it does actually give the efficiencies expected. This last point is particularly reassuring, for were the benefits illusory the practicability becomes of academic interest only. The opinions of users of high pressure steam are worth more than all the calculations in the world as to what is or is not to be gained by increasing pressures, and these opinions, so far as we know, all bear out the view that the advantages outweigh the difficulties. From the figures given by Mr. Moultrop it would appear that the 350 lb. section of the Edgar station is running with a thermal efficiency of about 23·8 per cent. This is exceedingly good and quite high enough to tempt many engineers to rest satisfied with the pressure.

When the complete high pressure equipment has been installed, so that all the 350 lb. turbines are driven by the

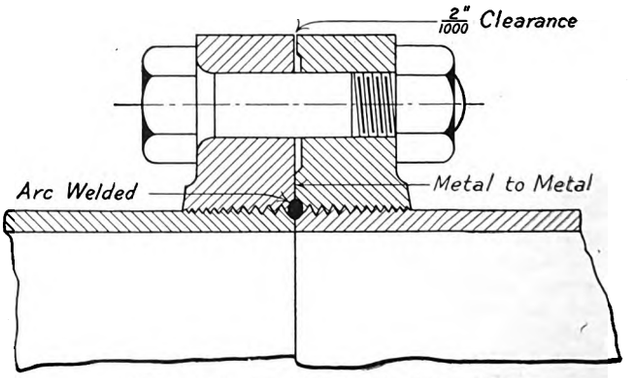

Fig. 9 H.P. pipe joint with screwed flanges.

exhaust of 1 200 lb. sets, a thermal efficiency of practically 27 per cent. is counted upon, the fuel consumption being 0·9 lb. of 14 050 B.Th.U. coal per kilowatt-hour. For an efficiency of this order one can forgive a few development troubles, even had they been of much more consequence than those experienced at Edgar.

MODERNISATION OF LOTS ROAD.

Replacement of Original Turbo-sets and Boiler Plant—Great Increase in Capacity—£1 000 000 Five Years' Programme Nearing Completion.

LOTS Road power house was completed in 1905 to provide current for the operation of the Metropolitan District Railway and the three tubes that now form the London Electric Railway; when inaugurated it represented the most modern installation of its kind in the world, the 6 000 kW turbo-alternators being the largest that had then been built. The power house has now to supply not only the Metropolitan District and the London Electric Railways, but also the Central London and City and South London Railways, and the London United Tramways. In 1908 the total car mileage on

New control room, Lots Road.

railways supplied by Lots Road power house was 32 500 000; the estimated figure for 1930 is 96 250 000, an increase of about 196%.

As new demands were made through the opening of tube extensions and increases in the speed and frequency of train services, the capacity was augmented by the addition of new machinery, but in 1925 it was recognised that further additional demands could not be met adequately except by the replacement of practically the whole of the original plant.

On the completion of the present programme the plant will comprise nine 15 000 kW turbo-alternators, with a station load of 105 000 kW, two sets being stand-bys. A further installation of two 15 000 kW sets is contemplated. By the autumn the output will be 95 000 kW. Increase in capacity has been accompanied by a commensurate increase in efficiency. The task of reconstruction has been in progress for five years and will be completed next year, at a cost of not less than £1 000 000.

The original equipment comprised eight turbo-alternators of 6 000 kW capacity each. Three extra sets, each of 15 000 kW, were installed between 1915 and 1925. Since then three of the old 6 000 kW sets have been removed and replaced by three 15 000 kW machines. A further 15 000 kW set is now in course of erection, displacing a fourth 6 000 kW set. The two latest large sets are working at a higher steam pressure (275 lb. per sq. in.) and temperature (650 deg. F.). The other four large sets are running under the old steam conditions (185 lb., 500 deg. F.). With the exception of the set erected in 1915, all are capable of conversion to the higher steam pressure, with a minimum of alteration.

New Control Room.

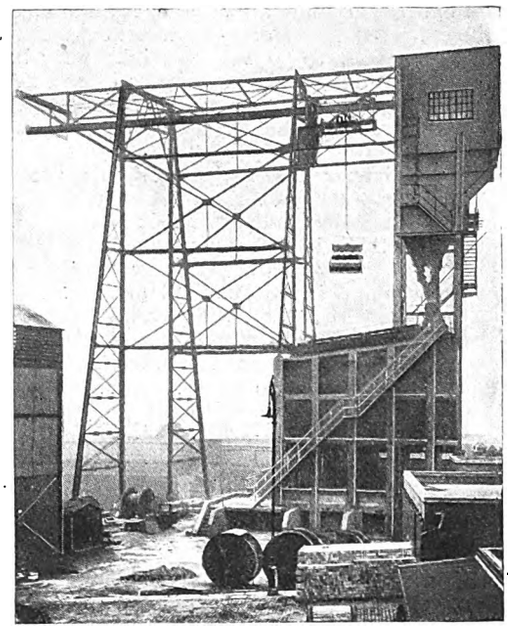
The whole of the h.t. switchgear is being replaced, the new switches having a rupturing capacity of 750 000 kVA. Over half of this work has been completed, including the provision of more ample busbars, together with a ring main bus. Generator reactors are being installed.

An entirely new h.t. control board has been erected in a new control room at the eastern end of the engine room building, and the existing control board on the gallery will be dismantled. The d.c. auxiliary board has also been transferred to the new control room and is in service in that position. The whole of the electrical system of the power house and feeders will shortly be controlled from the new control room. An illuminated diagram will be provided, giving automatic indication as to which feeders supplying substations are alive. A complete new telephone equipment will shortly be installed, giving direct communication to all substations and traffic controllers.

The old auxiliary equipment, operated at 220 V a.c., but this is being changed over to 440 V a.c., and the auxiliaries on the two latest turbo-alternators, are working at the higher voltage. The new 440 V busbars are housed in the basement, and the main switches are all remote controlled. The new "house" transformers are being erected on the engine room floor, while the 440 V "unit" transformers and the generator reactors are housed on a new floor between the basement and the engine room floor.

The original equipment consisted of 64 Babcock and Wilcox land-type boilers, each of a capacity of 16 000 lb. of steam per hour at a pressure of 200 lb. and a temperature of 500 deg. F. Eight new boilers, of the C.T.M. type, made by the same firm, have been installed, four in 1922 and four in 1925. All these have a capacity of 39 000 lb. per hour, at 290 lb. pressure and 700 deg. F. To facilitate the general reconstruction without reducing the output from the station, four new C.T.M. boilers have been erected outside the western end of the main boiler house. These have a capacity of 50 000 lb. per hour each at the higher pressure and temperature, and have been in service since 1927.

So far 16 of the old boilers have been removed and replaced by eight new ones of 50 000 lb. capacity, working under the higher steam conditions, and supplying the two latest large turbines. The remaining boilers are at present working on the low-pressure steam system. Eight further large boilers (of 50 000 lb. capacity) are at present in course of erection, replacing the second batch of 16 old boilers which have been removed. All the new boilers are equipped with balanced draught equipment, the 50 000 lb. boilers having compartment-type stokers. Each boiler has a superposed steel economiser. The thermal efficiency of the installation, as it is to-day, is 16¼%, that of the new plant being 22%.



Ash handling plant, Lots Road.

The steelwork supporting the coal bunkers is at present being overhauled and renewed where necessary. At the same time two partitions are being built in the large bunker between the four original brick stacks. This is intended to facilitate the operation of the station.

The old system of handling ashes by means of skips has been replaced by a water-sluicing system, discharging into a sump built in the yard at the west end of the power house. From this sump ashes are grabbed by a telpher crane, and can be either passed through screens for sizing, or discharged into barges in the Chelsea Creek. The water supply has been improved and new lightning conductors have been installed on the four brick chimney stacks.

A new artesian well has been sunk in the yard at the east end of the power house, and is fitted with an electrically-driven centrifugal pump.

PRICE OF ELECTRICITY.*

Load Factor—Lighting, Heating, Cooking and Power Loads—Analysis of Charges for an All-Electric House.

THE subdivision of the cost of electricity supply under the two main headings of Standing Charges and Running Costs is generally well understood by those who have the administration of such undertakings. The equity of the principle that every class of load should bear its just proportion of the Standing Charges is also accepted, but the question which must present itself to the councillor or director who has to keep a business eye on the administration is: "Where is the equity in these varying charges?"

Let it be supposed that an authorised undertaking is buying electricity in bulk upon the two-part tariff of 10s. per kW of maximum demand per month, plus 0·4d. per unit. On account of the seasonal differences in loads the monthly kW charge of 10s. will not work out in practice at the equivalent of £6 per annum, but about 20% less than this, say, £4 16s. Let us call the bulk price £5 per annum per kW of maximum demand, plus 0·4d. per unit.

There are 1 200 pence in £5, so that if a kW of load is used for 1 200 hours per annum, it will consume 1 200 units and the cost of those units will be (after adding on the running cost of 0·4d. per unit) 1·4d. per unit. There are 8 760 hours in a year, and taking that number as being 100 %, 1 200 hours use per annum only represents about 13½%. This percentage is technically spoken of as the load factor, and it is the principal factor in determining the cost and value of electricity.

Character of the Lighting Load.

The hours during which full artificial lighting is required in private houses, hotels, etc., in this country are necessarily short; they only amount to about 1 000 hours per annum since Summer Time has been introduced. In the case of shops and offices, however, due to compulsory closing hours, early closing days and no Sunday or holiday use, the hours of lighting are only about 200 per annum. These hours may be extended by advertisement use after closing hours, and in an endeavour to improve the inherently bad load factor of shop lighting, supply authorities often offer shopkeepers an attractive lower rate for such after hour use. All night public lighting runs to about 4 000 hours use per annum, and can greatly improve overall lighting load factors, but very little of such lighting is done in the smaller provincial towns.

The peak demands of all these lighting loads are bound to be simultaneous, and the result is that short and long hour lighting, taken in the aggregate only, establishes a load factor of about 10 per cent. per annum. Private houses, hotels, restaurants, etc., with public lamps, are long hour users with a load factor of about 15% overall, whilst shops and offices have a lighting load factor of only about 5 per cent. Appropriate costs at the above-named bulk tariff are as follows:—

Shops and offices	3·15d. per unit
Private houses, hotels, etc.	1·32d. „ „
Aggregate of all lighting	1·77d. „ „

These loads are not dependent upon hours of darkness, and since they are mainly used during the day-time they are spoken of as "day loads." They are not, however, entirely confined to daylight hours, and the power and heating loads are bound partially to overlap the lighting peak in the darker winter months, between about 4 p.m. and 6 p.m. Hence the advantage of a monthly kilowatt charge for bulk supply.

The aggregate overall load factor of these three classes of load is at present about 30%, and is tending to improve, particularly where the cooking load is being developed. At 30% the bulk cost is 0·86d. per unit.

Analysing these loads further we find that industrial power loads, working 46 hours per week, put up a load factor of about 20%, equal to bulk cost of 1·08d. per unit. Occasional power loads such as a chaff-cutter, circular saw, sausage-making machine, etc., have a much lower load factor than this, and therefore, a higher cost per unit. Hence the principle of quoting flat rates for small power purposes, beginning at a fairly high price for the first few units per quarter, and diminishing as consumption increases.

Since heating is only a general need in this country during the winter months, and then only for our active waking hours, it cannot have a load factor higher than about 30% if in regular daily use. Heating, however, has its complementary summer loads, such as refrigerating and ice-making, both of which are rapidly developing following recent food legislation. Electric irons are also in use all the year round, as well as certain other heat applications, apart from cooking, such as wash-boilers. The combination of heating and refrigerating, therefore, establishes a load factor of about 30% (0·86d. per unit), but this is tending to improve with the development of low temperature heating under thermostatic control, and may be expected to increase to 40% as a combined load factor (0·74d. per unit).

This is in a class of its own since it is an all-the-year-round load with such attractive features as night baking, in a large way for bakers and confectioners. Where an existing bulk supply peak now occurs between 4 and 6 p.m. in the winter, it is certain that the cooking load is scarcely represented in that peak at all. Practical tests have shown that not more than one cooker in nine is in full use at any one time and probably not more than one in thirty is represented in the peak load of a general distribution network.

The individual load factor of a cooker is not more than about 5%, but the overall load factor of all the cooking loads is likely soon to be not less than 50% (bulk cost 0·67d. per unit).

Water heating by thermal storage with thermostatic control can be definitely excluded from any desired local or system peak. It can therefore be utilised by the Supply Authority entirely for the improvement of load factor. On this account it can be rated at its base unit cost only, viz., 0·4d. per unit.

Tabulating the above named figures we have the base bulk costs as follows:—

	d. per unit.
Lighting	1·77
L.T. power supply	1·08
Heating and refrigerating	0·74
Cooking	0·67
Hot water	0·40

All the above items are represented in a certain definite ratio in the requirements of an all-electric house. These may be set out as follows:—

Units per annum.		£	s.	d.
When lighting now uses ..	200 bulk cost at 1·77d.	1	9	6
Power will call for	150 „ „ „ 1·08d.	0	13	6
Heat and refrigerating call for	6 000 „ „ „ 0·74d.	18	10	0
Cooking will call for ..	1 650 „ „ „ 0·67d.	4	12	1
Hot water will call for ..	4 000 „ „ „ 0·40d.	6	13	4
Total ..	12 000 av. „ „ 0·64d. =	31	18	5

At present retail charges (say 6d. for lighting and 2d. for other purposes) the distribution authority is only selling 400 units per annum to this consumer at an average price of 4d. per unit (including 1¼d. bulk cost):

Local charges therefore require 400 at 2¾d.	4	11	8
Add also 20 per cent. to above bulk cost	6	7	8
Charge to consumer, covering all charges	42	17	9

Average price per unit retail, equals 0·85d.

Futility of Uneconomic Tariffs.

From the foregoing it may be noted that all local charges (including profit) are met, whilst the new business represents an accession to local charges, which will be more than adequate to meet additional local costs for this already existing consumer's larger supply. The price at which such a consumer is able to buy under the above case in an economic one, having regard to the cost of less convenient but competitive alternative means. The example emphasises the futility of offering high uneconomic tariffs if this class of business is to be secured.

The example represents the electrical requirements of a four or five bedroomed house. Assuming that it has a rateable value of £27 10s., then an appropriate tariff for its electricity supply would be a fixed quarterly charge of 5 per cent. of the rateable value (£1 7s. 6d.), plus ¾d. per unit. The yield would be approximately £43 per annum for 12 000 units.

This is the class of business which offers the greatest scope for supply, and a most welcome service to the consumer.

R. W. K.

PARIS AGRICULTURAL MACHINERY SHOW.*

Electric Ploughs and Light Cultivating Gear—Farm Pumps—Cheap Electric Washing Machines—Success of French Electrical Agricultural Machinery Makers.

By THEODORE RICH.

OWING to a material extent to the co-operative instincts of many French farmers—instincts only too often absent at home to the extent that some big-wigs of the British farming world have been heard to sneer at the very idea—it has been possible to make material progress regarding electric ploughing. Where fields are comparatively large and a convenient point can be found at which a permanent h.t. line can be tapped at 11 to 16 kV, and if necessary connected by a light h.t. field branch, a 500 metre cable, at comparatively low voltage, can be used to connect the travelling transformer station used to the tractors, giving at that radius facilities for the ploughing of quite a material area. If a group of farmers will agree to the order in which the land of each of them will be ploughed to get the best results, then a contractor or co-operative group can bring his tackle on to the spot and have so many acres in sight to cultivate with a minimum of road movement of the gear. Ploughing is sometimes done at night to make up for delays due to bad weather. To-day in many walks of life transport is a material factor.

The earliest electric plough sets were rigged up by taking the boilers and engines off two steam ploughing engines and replacing them with motors. With such gear the pull which can be put on the wire rope hauling the tip-over plough is limited by the friction of the wheels of the hauling tackle on to the ground. At one metre per second one H.P. corresponds to about 165 lb. pull, and taking a co-efficient of friction of ·4 one has to have normally about 420 lb. weight per H.P. to prevent slipping, that is to say over half of the weight of the gear is required to make it stand up to its work. Where steam haulage gear is used the weight of the boiler and engine required to give the power required is usually sufficient to give the necessary adhesion; an electric motor with cable drum is not nearly so heavy as a steam tractor, and the problem has been to develop a hauling gear which will give the necessary pull without slipping sideways, while remaining much lighter in weight than steam tackle.

M. Estrade has developed a plough of 4½ tons weight which can give the same effort as one of the normal steam type weighing 14 tons, the motor for the former being 45 H.P. (with a momentary overload of 60 to 80%). He gets over the slipping difficulty by making the flanges of the wheels on the hauling gear side with a radial plate ring which will dig into the ground; these flanges are shrouded for transport. This gear is made by the Société Electro-Motoculture of Carcassonne (Fig. 4). A lever with a guide pulley at one end and a haulage drum at the pivoted end, something like a lifting crane, works vertically on an arc of a circle, the rope going over the top, the centre being connected by crank gear to a piston working against a "bottle" of nitrogen gas under high pressure. The heavier the pull the greater the pull down on the lever, and the greater the plate flanged wheels eat into the ground and form an anchorage so that a comparatively light set of hauling gear can exert a heavy pull without slipping sideways.

The Estrade gear is worked with two winches on the Fowler system backwards and forwards. There are eight of these sets at regular work in France.

One French company, "Treuils Pan," has made a speciality of heavy portable haulage winches and special land anchors and tackle for resulting draw-pulls up to 60 tons, the winches being driven either by petrol or electric motor or by belt from a portable electric motor, petrol tractor or other form of power.

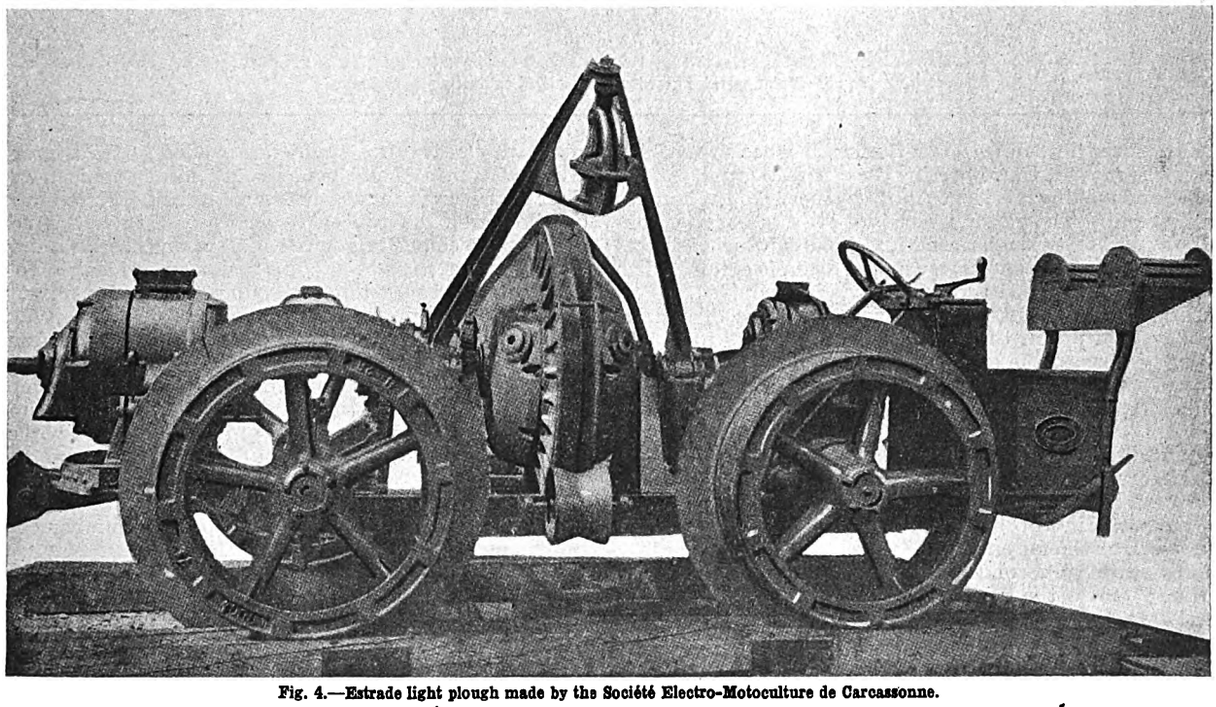

Fig. 4.—Estrade light plough made by the Société Electro-Motoculture de Carcassonne.

The land anchor consists of a number of flat plates with T crosspieces and steel pins driven in. With this gear trees and stumps can be hauled out, mole land drainage gear used and various forms of haulage heavy cultivation carried out.

There has been in France a certain amount of ploughing done on the Howard one-"engine" system with pulleys and anchors in the course of the fields, some of the ploughs used being quite small, as low as 6 H.P.; a difficulty is the amount of labour required in fixing the anchors, guide pulleys and ropes.

A material part of the land in France is cultivated in small holdings, and a great demand has arisen for miniature farming gear of all kinds within the reach of the purse and operating capacity of the small-holder. A small plough and cultivator was brought out a year or so back for a run up to about 50 yards, operated by a hand winch on the plough itself and a light wire rope, a sort of spade forming the anchor, so that various forms of ploughing, harrowing and scarifying could be carried out without animals or motor tractor.

A new development is an electric motor operated gear for hauling light cultivating tools (Fig. 5); it is designed to plough, cultivate ridge, harrow and clean land. An electric motor is mounted on an angle steel frame something like a tinker's barrow with one of the sides open. The motor and

* The first part of this article appeared in our issue of March 28th.

Digitized by Google

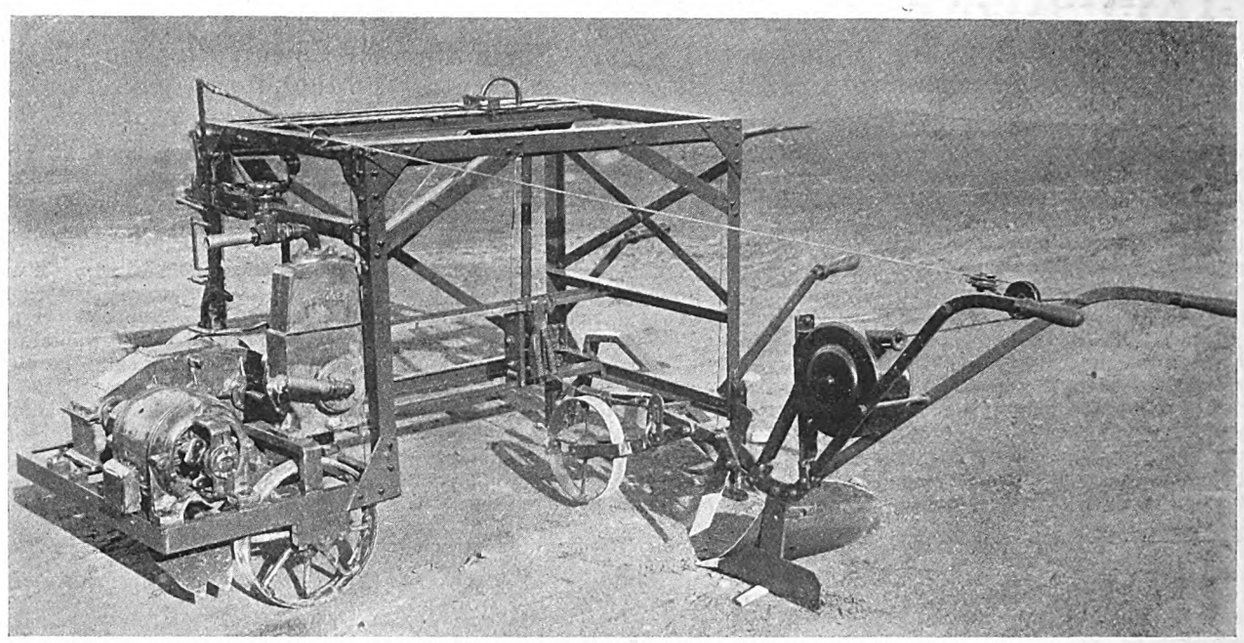

Fig. 5.—Motor operated gear for hauling light cultivating implements.

gearing is placed low down over the small wheels on which the barrow is moved, thus lowering the centre of gravity of the apparatus and making it easier to move by means of the handles at the other end. The motor, which is of ½ H.P. or 2 H.P., is connected to a gearbox through a centrifugal clutch which also acts as an overload slipping device, a winding drum is connected to the gearbox, a two-speed arrangement being included.

A light wire rope runs from the winding drum diagonally to a pulley high up on the frame, and then drops to a final guide pulley close to the ground, so that the rope pulls along the ground so as to clear the leaves or low branches of bushes or plants. The two latter pulleys work on a horizontal slide. The plough or other implement used is hauled up to the barrow and underneath it also by the wire rope, the opening in the side of the frame increasing therefore the length of the run. A cord is attached to the plough through a spring controlled auto-winding up gear. When the plough is about to start its work at the far end of the furrows, the cord is pulled, the motor starts, a second pull stops it, declutching at the same time; and if the gear is over-run a fork over the rope actuated by a disc throws the clutch out and stops the motor.

The hauling pulleys are on a horizontal slide with dog-tooth catches, so that several furrows can be made without moving the barrow. When the implement is as far to the left as it will go, the tail is lifted, the fixed spuds free themselves, two hinged anchor forks are lifted up, and the barrow is moved forward by one length, and the operation recommenced. The gearbox is arranged with projecting spindles to which belt pulleys can be attached, and a manure pump can be mounted on the frame for use around the holding.

Arrangements are made so that if desired a back haul can be obtained: in the ordinary way the plough or other implement, being light, can be hauled back by hand. The whole apparatus has been designed by M. Rigondeau and made by R. Vignaud, of Fontafie, in the department of Charente, France. The machine is a development of the wire rope cultivation system. It was originally designed to aid small holders, injured in the war, to help them to cultivate a piece of land without a horse plough; it is quite new and, if it stands up to its job, will form an interesting contribution to the stock of appliances available to aid the small holder.

Quite remarkable progress is taking place with regard to the use of various forms of electrically driven pumps for use for portable water supply, manure pumping, irrigation and general farm purposes. Special attention is being given to deep well pumps. The scarcity of labour has made the electrically operated pump a boon to the farmer. Messrs. René Volet, an undertaking with a British branch (at 242, Goswell Road, E.C.1), showed a system of drawing from a deep well by by-passing a certain proportion of the pump discharge down the well again to operate a coned injector pointing upwards, and thus bring the equivalent water level within the reach of the pump suction. No moving parts are therefore required down the well. During the last two years very heavy frosts which prevailed in the winter almost all over Europe have made many farm people nervous, as their house or farm supply service tanks, elevated in roofs or on silo-towers, have been frozen up or trouble has been had with burst connecting pipes. A system has been developed analogous to that in use for years on warships, to act as accumulators to level out the pumping duty on turret turning and other high pressure hydraulic work.

A vertical cylindrical tank is placed in a frost-free basement: it is filled against the pressure of the air in the upper part, and when the air pressure drops the electric pump starts filling the cylinder again from below, so a pressure supply can be given to the house, dairy or farm buildings without any elevated tanks and connections likely to be vulnerable to frost. If much of the air gets absorbed by the water it can be made up by means of a motor tyre pump. The progress in rural electrification can well be judged by the number of electric pumps on view at the Paris show.

In view of the fact that large areas in Algeria and Morocco are being cleared for vineyards and grain crops in areas where supplies of electricity are being made available, it is probable that material developments will take place before long regarding irrigation, pumping and wire rope hauled gear.

A feature of recent French agricultural machinery shows and of the annual Paris Fair has been the number of inexpensive electrical washing machines on view. It is now possible in France to buy a wood tub washer with electrical drive to the dolley for about £8, and with electrically-driven wringer for about £11. They are therefore sold by the hundred. If at home simple wood tub washers were fitted with motor drive and sold at about £15, they, too, would be in thousands of British homes. As it is, they cost from £25 to £36, a price that drives away thousands of potential customers and electricity users. So long as about £5 is charged for a motor for a sewing machine, so long will many people hesitate to have electricity into their homes at all. The class of machine that people in America can afford to buy is out of the question for most families in debt-stricken Europe.

France is very short of farm labour, but necessity has been the mother of invention, and quite a number of ingenious appliances were on view at the Paris winter show. Many examples were to be seen of the application of old principles formerly used on large scale plant only, to small appliances operated by electric motor or petrol engine. One cannot say that in general the quality of the appliances is quite up to British standards, but where there are many small holdings on which the number of hours of work with any particular appliances must necessarily be limited, then a farmer cannot usually afford to buy the very best.

Several firms have been founded in France to deal exclusively with electrical apparatus for agricultural use, and the success of some of them shows that electricity can be of real help to the farmer provided that sensible arrangements and regulations are made so that current can be brought to his door.

MARINE ELECTRICITY.

Future of Turbo-Electric Propulsion—Need for Compact Machinery Spaces and of High Pressure Water Tube Boilers—A New Electric Machinery Space.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ship Types.")

THERE now seems to be very little doubt that steam is occupying a more important position in marine engineering than it has for some time. Moreover, this importance is increased by the fact that steam has now something definite to offer, as a counter to the Diesel engine, in a group of tonnage which steadily is becoming the prerogative of the Diesel engine.

As far as the largest ships of all are concerned, there is very little doubt that at the moment the geared turbine is the choice of shipowners. If the rumours one hears concerning the new Cunarder are correct, and if the "Bremen" and "Europa" are to be taken as an indication of shipowners' ideas on the matter of "mammoth" ship propulsion, then it is abundantly clear that this form of power will be used on the relatively few transatlantic mammoths that will be built during the next few years. The theoretical advantages of other systems of propulsion are many, and the practical advantages of turbo-electric propulsion for such ships are inescapable, but both on the score of first cost and also due to the fact that shipowners perhaps have a somewhat understandable reluctance to make what might appear to them to be a bold step, it would seem that turbine drive with water tube boilers is likely to be paramount for some time to come. But the building of large mammoth passenger liners is, to a great extent, a matter of national prestige, and few people would contend that as far as constructional work on them is concerned, they are really attractive commercial propositions. While it is unquestionable that the electrical industry would welcome the chance of powering a mammoth ship from purely prestige reasons, it is reasonable to suppose that the most attractive commercial future is held out in the group of passenger liners of 17 000 to 20 000 H.P. which will always be built in increasing quantities. Also a large number of cargo vessels of single screw type of between 2 000 and 5 000 H.P. must undoubtedly need auxiliary turbo-electric drive in order to bring them into line on a competitive basis with the extremely economical motor vessels now building for this purpose.

Here, then, is a glimpse of the future of turbo-electricity as far as marine work is concerned, but from the mammoth all-steam ships, whose powering we have discussed above, can be learned much because any new ship of this type must have high pressure, high superheat water tube boilers. To say that the total area of tank top space occupied by boilers for a ship of 80 000 to 100 000 H.P., compared with the similar ships of 20 years ago, is nearly halved by the use of high pressure water tube boiler plant, may be a rough guess, but will be found to be very approximately correct. High pressure and high superheat is being applied to many recent turbo-electric ships, and an examination of the plans of the new turbo-electric liner now being built in this country shows that the total number of boilers for a ship of about 20 000 H.P. on two shafts is only four, the space occupied by them being very little greater than that occupied by the turbo-generators themselves.

Demand for Compactness.

The cry for compactness is very real where steam plant is concerned, and no one could criticise the most modern of turbo-electric ships on the score of excessive space occupied by machinery. It is, perhaps, too significant that at a time like this, when compactness is being developed to such an extent, there should be, in the newest turbo electric-liners building in this country, a feature which is at once a departure from, and a compromise on, recent arrangement practice. The question of arrangement of turbo-electric ships is in many ways hackneyed, and one had always thought that it had become more or less stereotyped with the motors arranged immediately abaft the turbo-alternator sets, there being then two shaft tunnels of the ordinary type with a long length of shafting leading to the screws themselves. The earliest of all electric ships had of course their motors placed aft in a special compartment, the inconvenience of reaching which caused, in later ships, the motors to be placed in the main power room.

This new ship has her two main double armature propelling motors arranged not quite aft, but well aft. There is, between the power room and the propelling motor room, a small working alleyway which, while primarily designed to carry the necessary cables, is suitable also for ready access from one compartment to another. It is probable, although there is only conjecture to prove this, that such an arrangement of motors in the end makes for a better trimmed ship than would be the case were the motors completely aft. On the other hand, there is a gain in space as far as the ship's cargo-carrying capacity is concerned by virtue of the fact that two large shaft tunnels are eliminated and only one small working alley is substituted in their place. We thus see that these ships are in every sense of the word electric ships, and that in them there is displayed an entirely new technique which all goes to prove that the electric ship is slowly evolving itself as a separate entity, and while, of course, it still has very many problems in common with power driven ships of other types, it does nevertheless at the same time bring in its train a great many questions of its own.

High Pressure Achievements.

Reverting again to the question of compactness of machinery space as a result of increase of boiler pressures, one feels that this is a point which cannot be too strongly emphasised, and it is most certainly to the advantage of electrical companies to advise, wherever possible, shipowners to go in for these high pressure units. There is perhaps a natural reluctance on the part of shipowners to go out wholeheartedly for high pressures, and also a certain nervousness. We may note, for example, the case of two recent turbo-electric ships, in one of which two small water tube boilers of high pressure are used, the pressure being 370 lb. per sq. in. with superheat and air preheaters. On the other hand, a newer ship launched recently has Scotch boilers giving steam to the turbo-generator set at 250 lb. per sq. in. only. There are five Scotch boilers on the ship with the lower pressure, compared with two water tube boilers on the ship with the higher pressure. Although the ship with the Scotch boilers is larger than the ship with the water tube boilers, in proportion the machinery space of the former is larger than that of the latter.

Perhaps the best example of what is possible with high-pressure boilers is to be shown by quoting the case of the Hamburg-Amerika liners of "Albert Ballin" class which have recently been re-engined and re-boilered. Instead of four double-ended and four single-ended Scotch boilers operating at a moderate pressure, four large water tube boilers designed for 400 lb. per sq. in. pressure have been fitted; each boiler is provided with a large superheater, a feed water heater and air heater, the air for combustion being pre-heated to 160 deg. C. and the feed water heater raising the temperature of feed from 115 deg. C. to 116 deg. C. The space required for the new boilers was less than that required by the old units owing to the adoption of higher pressures and the watertight bulkhead between the engine and boiler rooms was able to be placed three frames forward. This shows what a saving in space is possible by the two methods. Incidentally, the space so gained was used to accommodate larger turbines, but this is a matter which does not concern us here.

Since the last article in this series was written, news has come of the definite placing of a contract by Furness Withy and Co. with the General Electric Company for a large turbo-electric liner which presumably in size and in accommodation will be the repeat of a Diesel-engined liner built only a few years ago. America continues to complete electric liners for various services and in this country there seems to be a definite feeling that some Diesel-electric orders for small craft may be placed within the near future. A particularly interesting order, which, it is rumoured is now being considered is that for a Diesel-electric passenger vessel of about 8 000 H.P. to run from Australian ports to the Pacific Islands. This is one of the few cases where Diesel-electric propulsion has apparently been considered for a passenger vessel, and should the order be placed it will show that although turbo-electricity has made some strides, there is no finality and that the Diesel-electric ship may even yet prove to be a serious potential rival to the turbo-electric ship. Whatever be the case, there is no doubt that the next few months are going to witness some very real and interesting developments and that the electrical companies themselves, if they wish it, can look forward to participating in the marine sphere to no small extent.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Nickel Iron Alloys.

[To the Editor.]

Sir,—We have read with interest the article in your issue of March 14th, on the new nickel iron alloy, Permalloy C, for which, as a high permeability magnetic material, properties are claimed which have never before been obtainable. In this connection we would like to bring to your attention a material of which your correspondent is apparently unaware, that is Mumetal (the magnetic properties of which are equal to those tabulated in his article), manufactured by the Telegraph Construction and Maintenance Co., Ltd.

This metal has a wide circulation in this country in the design of electrical instruments and its application is general in the cases outlined by your correspondent as possible spheres of usefulness for Permalloy, viz., as instrument transformers, audio frequency transformers, electrical measuring instruments and magnetic shields. The advantages of Mumetal were strongly brought out at the meeting of the Instrument Section of the Institution of Electrical Engineers on February 7th, which is cited by your correspondent.

As regards magnetic stability, the advantage of Mumetal over straight nickel iron alloys is that it is not so susceptible to damage by strains. We do not claim that the material can be bent or mishandled with impunity after annealing, but we do claim that under ordinary handling conditions involved in instrument assembly, no impairment of magnetic properties results.

We note that it is also claimed by your correspondent that simpler heat treatment is required for Permalloy C than for the earlier alloys of the series. We have for some years employed a simple annealing process as the best heat treatment for Mumetal and many of our customers have carried this out on their own part for some time.

In conclusion we would mention that most British electrical firms of repute employ Mumetal as standard for precision instruments which are, and have been for some time, available in the market.—We are, etc.

For the Gutta Percha Co.,
H. J. Garnett, Manager.

March 24th.

BOOK REVIEWS.

Elettrotecnica. By Profs. Dott, L. Donati and G. Satori (Milan: Ulrico Hoepli.) Vol. 1, Pp. 406; Vol. 2, pp. 596. 120 lire (2 Vols.)

In the description of the contents of these two volumes the authors are very modest. They are described as a brief means of understanding the operation of electrical machines, transformers and motor convertors, with hints in connection with the transmission of electrical energy. They really form a complete treatise on the subjects mentioned.

Vol. 1.—The preface quotes a statement of the late Lord Kelvin:—"Nothing is more fatal to the acquirement of electrical knowledge than lack of confidence in the handling of mathematical formulæ." This statement is certainly believed by the authors since both volumes bristle with mathematical formulæ; they are, however, not too intricate and can be readily followed by students of technical schools and colleges. The first volume contains a preliminary section; this is to prepare students for the subject matter proper which begins on page 31. In this section unit quantities receive some attention. Such subjects as Force, Work, Velocity, Accelleration, etc., are dealt with; elementary vector diagrams and a discussion of various forms of energy are included in this section. The first chapter is confined to explanations of statical electricity. The fundamentals are dealt with in addition to units; considerations of the capacities of condensers in series and in parallel form a large portion of this chapter. The second chapter deals very fully with constant current values; heating units and the heating of water and instruments for measuring same are discussed. The third chapter is confined to electrolysis, the chemical action accumulators is considered to be under this heading. Chapter 4 consists of 60 pages, the whole of which are devoted to electromagnetism. This chapter may be considered as a complete text book on this subject; it is well written and the illustrations are very clear. The fifth chapter deals with induced currents, the formulæ in this chapter should be carefully studied. The sixth and seventh chapters deal with the capacities of conductors and units. Potential gradients and the distribution of voltage in various kinds of dielectrics are adequately discussed. The eighth chapter is very important from the fact that it deals with alternating current; this is done in a masterly manner. The chapter contains almost 100 pages; vectors, wave form, etc., make the arguments very clear. The ninth and the last chapters are confined to considerations of inductance; harmonic quantities are discussed to some extent.

Vol. 2.—The second volume begins with chapter 11; this is really a treatise on static transformers. The calculations are valuable. The matter dealing with electrical machinery commences with chapter 12. The characteristics of both a.c. and d.c. machines are discussed and illustrated. Chapter 13 is confined to the electro-technics of direct current machines; all types of machines are discussed, many curves are given and series and parallel connections are illustrated. Chapter 14 may be said to be a discussion on armature winding. The characteristics and connections of various types of windings, for different pole systems, are given; the magnetic circuit is adequately dealt with, as is also the general expression for the calculation of e.m.f. Chapter 15 appears to be a little out of place since it deals with the essentials of polyphase currents; it should really follow Chapter 16, which is devoted to a.c. dynamos. Both chapters are well-written and should prove useful to students. In Chapter 17 we have the essentials of static and rotating polyphase transformers. Various types of windings and connections are discussed and the outlines of design are given. Direct current motors form the subject matter of Chapter 18, while in Chapters 19 and 20 the essentials and characteristics of a.c. motors and synchronous motors are fully dealt with. The calculations in these sections should prove useful to designers. Chapter 21 is confined to speed regulation and Chapters 22 and 23 deal with various types of rotary convertors. The last chapter deals almost exhaustively with the transmission of electrical energy, this from both an a.c. and d.c. point of view. At the end of each chapter are exercises dealing with the subject matter in the chapter; this is certainly an essential of acquiring knowledge. The chapters and contents are at the beginning of the first volume and the index is at the end of the second volume. The index is extensive and very comprehensive. The volumes are to be commended to all associated with the subjects mentioned. Translated into English, this work would have a ready sale in this country.

Cyril Sylvester.

Wechselstrom-Leistungsmessungen. By Werner Skirl. (Berlin: Julius Springer.) Pp. vii+278. Bound, 14 marks.

This book is now in its third and enlarged edition. It is unique in that practically the whole field of indicating (not integrating) instruments for the measurement of a.c. power is covered by illustrations from the products of one firm, namely, Siemens and Halske. The restriction of the treatment in this way has the advantage that the whole scope of measurements is covered by a single range of instruments designed as regards rating and auxiliary equipment especially for the purpose. The underlying principles, of course, are common to all makes. The construction of various types of movement, first described, is followed by descriptive matter dealing with current, voltage, power-factor and frequency measurements as auxiliaries to power measurement. The several types of wattmeter are detailed, with particular reference to their adaptation to various ranges. Simple theoretical treatment is given in a concise form where necessary. The section on current transformers has been enlarged, to take note of the later developments which have obtained since the second edition. The author lays particular stress on methods of measurement, and to this end he employs exceptionally clear connection diagrams and drawings. The latter displace half-tone blocks and are greatly superior to them. Among various subjects dealt with, the author gives some details of no-load power losses in cables, calibration and the calculation of errors. The book should be useful in electrical laboratories and test beds, especially as there seems to be nothing quite like it in English. Though the book should be particularly useful where modern Siemens instruments are used, so much of the material is applicable to instruments of other manufacture that engineers and students will find the information invaluable both for study and reference.

S. Parker Smith.

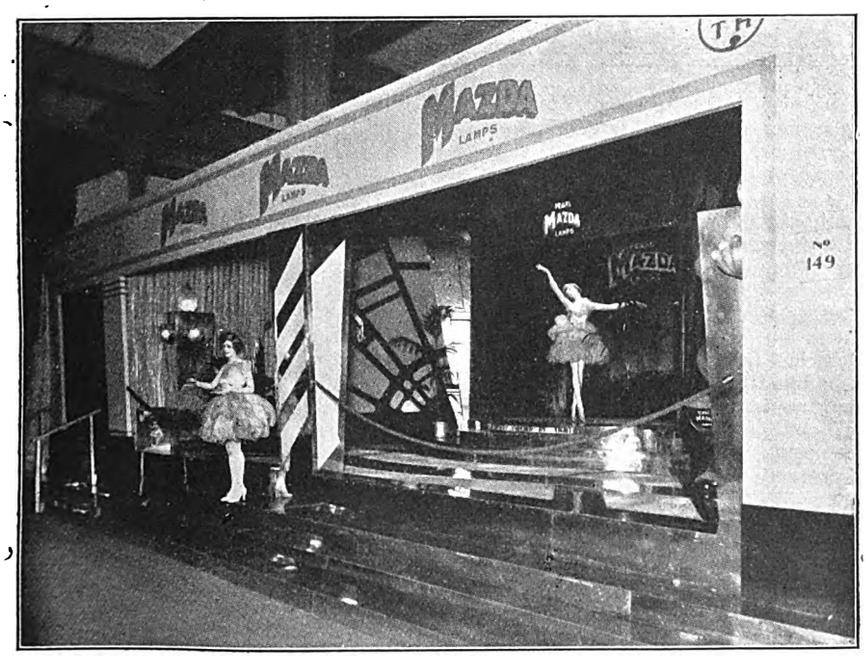
THE IDEAL HOME EXHIBITION.

Further Descriptions of Some of the Electrical Exhibits—The "Hall of Ideals"—New Domestic and Cooking Appliances.

(*Concluded from page 403.*)

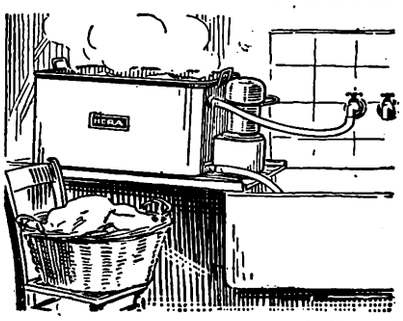
VISITORS to the exhibition will be impressed by the scenic effects in the main hall. These take the form of a large back-cloth suspended round the hall, in front of which are two foregrounds consisting of sea, mountains and trees, the whole representing a scene on the Lido. This scenery is unique, inasmuch as it is the largest that has been erected in this country. The total length of the backcloth is 800 ft. with a maximum height of 35 ft. The whole scene is floodlighted with special projectors, the total power utilised being about 100 000 W. Other features of the exhibition which are arousing public interest are the international nurseries and the ideal attic rooms. The nurseries are a series of scenes depicting nurseries in various countries throughout the world —Holland, Hungary, Lapland, Japan, Turkey—in addition to examples of modern and ultra-modern nurseries. The ideal attic rooms show how a tawdry squalid attic may be converted into living rooms. The special lighting arrangements for the Lido scene, international nurseries and the ideal attic rooms were supervised by the EDISON SWAN ELECTRIC CO., LTD. This same company also occupies three stands, namely, the Hall of Ideals in the Empire Hall, a refrigerator stand in the main hall and a radio stand in the main hall gallery. With regard to the Hall of Ideals, this is made up of seven special exhibits comprising cookers, washers, refrigerators, electrical aids to beauty, a modern lounge, vacuum cleaners and a model drawing room. Passing inside the hall one is received by a commissionaire who hands out a pamphlet describing a series of domestic ideals. Looking about us we see a number of little rooms sheltered behind large plate glass windows. Each room represents an ideal, and we turn to the first. Seated on a chair is a girl dressed in a frock of green, gold and yellow. As we approach she rises from her chair and tells us in dumb show of the first ideal, an electric washer and ironer. As she demonstrates how this machine will do the week's washing in an hour while we sit and watch it she explains by means of ingeniously arranged showcards, the advantages and the simplicity of operation.

As we continue our tour of the hall, we see under similar conditions electric polishers, cleaners, electric radio sets, artistic lighting fittings, electric fires and an electric beauty parlour, where artificial sunlight, ultra-violet rays, vibro-massage apparatus and other aids to beauty are shown by a girl sitting at an ultra modern dressing table.



A general view of the stand of the British-Thomson Co., Ltd., at the Ideal Home Exhibition.

From the electrical point of view, the "Village of Ideal Homes" is disappointing, and in only one instance did we notice an electric cooker (by the CREDENDA CONDUITS CO., LTD.). Water softeners, refrigerators, floor polishers and cleaners, mostly by ELECTROLUX, LTD., are more numerous, while in the cavity brick house SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD. show good examples of modern lighting. This section of the exhibition provides an excellent opportunity for demonstrating the possibilities of the all-electric house, and it is therefore regrettable that nothing appears to have been done with a view to making ideal houses, at least all-electric homes. With the large number of all-electric kitchens to be seen elsewhere in the exhibition, it certainly seems odd that such kitchens are absent from what pretend to be houses of comfort and convenience.



The new "Hera" washer of L. G. Hawkins and Co., Ltd.

With regard to the other exhibits it would be useless in the space available to attempt a description of each, and since most of the appliances have already been described in THE ELECTRICIAN, little purpose would be served by such a course. Mention of outstanding items, however, is another matter, and on the stand of L. G. HAWKINS is shown for the first time a "family-sized" electric washer of the name of "Hera." This machine has a tub measuring 21¾ in. by 14 in. by 16½ in. and is finished in white enamel relieved in blue. The construction is such that the washer may be placed over a heater and the water inlet and outlet connected to the tap and sink.

The "Junior" cooker, though not new, is now offered by the JACKSON ELECTRIC STOVE CO., LTD., in two ranges, namely, for 2-3 and 4-5 persons, and inspection of these two cookers is recommended. A range of new cookers by the HOTPOINT ELECTRIC APPLIANCE CO., LTD., has also been added to the Hotpoint-Falco series. These embody all the latest desirable features in connection with the design of cookers, and include mottle-grey enamelled hob, removable oven interiors and doors to grill chambers. This new series comprises cookers suitable for two to three people up to 25 to 30 people.

Another interesting appliance to be seen at the show is an electrically heated washer made by the WONDER WASHER CO. This is a new washer shown for the first time, as is also the "Tellus" vacuum cleaner illustrated in our last issue. "Canvary" electric water heaters are exhibited by BERRY'S ELECTRIC, LTD., for the first time, and a feature of the heaters which should appeal to the housewife is that the temperature of the water can be varied as it flows.

The BRITISH THOMSON-HOUSTON CO., LTD., is making a special Mazda lamp display, details of which were given in our issue of March 21st. B.T.H. refrigerators are also shown, these forming one of the exhibits of the EDISON SWAN ELECTRIC CO., LTD.

STOKES TABLE COOKER CO. (121, Woodhouse Lane, Leeds), are featuring a novelty cooker, suitable for table use. The range offered is obtainable with elements suitable from 50 V to 250 V, while the consumption is 450 W.

Among the outstanding radio exhibits may be mentioned the radio gramophone sets of the IGRANIC ELECTRIC CO., LTD., and CELESTION, LTD. All-mains receivers are featured by FERRANTI, LTD., while components form the chief exhibits of BENJAMIN ELECTRIC, LTD.

NEWS IN BRIEF.

A Substitute for Insulating Oils—Electrically Propelled Liner—Swedish Railway Electrification—A New Miners' Lamp—Appointments Vacant.

THE illumination of the church clock at Conisborough is to be effected by means of electricity taken from the overhead trackless car wires. A lamp has been so placed as to throw a light on to the clock.

The Sussex Branch of the Electrical Contractors' Association is holding a dinner and dance at the Royal Pavilion, Brighton, on May 10th, at 6.15 p.m. Tickets can be obtained from Mr. G. E. Hervey, 20, Glynde Avenue, Hampden Park, Eastbourne.

It is reported that Furness, Withy and Co., Ltd., have placed a contract with Vickers-Armstrongs, Ltd., for a new liner of about 23 000 tons, which is to be propelled electrically by means of General Electric (Fraser and Chalmers') turbo-alternators.

An electrical engineer is required for H.E.H. the Nizam's State Railway.

A mains engineer is wanted by the Mid Cheshire Electricity Supply Co., Ltd.

Brighton Corporation invites applications for the position of engineer and manager of its electricity undertaking.

Personal telephone calls to the Irish Free State are now obtainable from any place in Great Britain and Northern Ireland.

The number of hired cookers connected to Manchester Corporation's mains during January was 52, making a total of 5 945 on circuit.

Stoke Newington (London) B.C. has been recommended to accept a tender for the erection of the southern sub-station, at a cost of £2 300.

Bournemouth Corporation has placed a contract, amounting to £943, for the supply of 24 police telephone boxes, to be erected in various parts of the town.

The Budapest telephone authorities have established a special "medical exchange" which will put patients into touch with their doctors at any time of the day or night. It is said that doctors will keep the exchange informed of their movements.

The Federation of British Industries has drawn up standard fundamental clauses which appear to be suitable for inclusion in contracts for all classes of work. These include an arbitration clause, and clauses relating to damages for delay, extension of time in certain specified circumstances, insurance and the general liability of contractors.

King's Patent Agency, Ltd., 146A, Queen Victoria Street, London, E.C.4, has issued an enlarged edition of its handbook on "Patents for Inventions." Amongst new features is one relating to employees' inventions, and the book contains a mass of information on the patenting of inventions, the registration of trade marks and designs and the protection of copyrights. Copies will be sent free to applicants.

The first annual general meeting of the Bristol and District Branch of the Electrical Association for Women was held at Messrs. Fortt's Restaurant, Bristol, on March 24th. The meeting was followed by a supper, at the invitation of the Edison Swan Electric Co., Ltd., after which a lantern lecture on "Electricity in Architectural, Furnishing and Lighting Design" was given by Mr. H. Lingard.

Mr. F. Lee, M.P., who is on the Mines Department Safety Research Board, explained to the Derbyshire Miners' Association last Saturday what is being done in regard to safety research work. He said the Board had under consideration an electric safety lamp which showed a red disc in the presence of gas, and when connected up to a coal-cutting machine would cut off the current in the presence of gas. It was a British invention and was to be tested in collieries in South Yorkshire.

The Westinghouse Electric and Manufacturing Co. recently gave a demonstration of a new application of the "electric eye." It sets a bell in operation and "trains a revolver" upon a prisoner who climbs a prison wall.

The Swedish Government is considering a proposal for converting 595 miles of the State railways to electric traction, at a cost of about Kr. 71 840 000. It is calculated that direct and indirect savings of over 1¼ million kronor will be effected by the change.

Edinburgh Education Authority opens a certain number of evening continuation schools for an eleven weeks' session in the spring and early summer. The session began on Monday. The classes include one for women on the use of electrical apparatus in the home.

LOOKING BACKWARD.

FIFTY years ago, according to THE ELECTRICIAN *of April 3rd, 1880, the telephone was successfully used over a distance of about a mile at the Easter Monday Volunteer Review.*

A patent for transmitting scenes to a distance by electricity was applied for by patent agents of Pittsburgh, Pa.

The electrical heating of boilers by means of a spiral winding of platinum wire was proposed by Mr. Charles Davis, of Paris.

* * *

TWENTY-FIVE years ago, THE ELECTRICIAN *of April 7th, 1905, contained a reference to the work then in progress on the bridging of the Zambesi at the Victoria Falls. At the end of this month, a quarter of a century later, tenders are returnable for construction of the second bridge across that river, at Sena, Portuguese East Africa, of which the cost will be well over £1 000 000.*

The Swedish State Railways were about to submit to the Riksdag a proposal to purchase for 4 000 000 kr. the waterfalls near the principal railways and to utilise the water power to generate electricity for working the trains.

A tender for the erection of new electricity showrooms has been accepted by Eccles Electricity Committee.

Hastings Corporation has accepted a tender for the supply of 12 half timber framed police boxes, to cost £782.

The Post Office has begun the laying of 68 miles of underground telephone cable, containing over 100 pairs of wires, from Dundee to Aberdeen.

On March 27th over 60 members of the E.A.W. visited the Ediswan Works at Ponders End, where the party made a tour of the various departments.

The 53rd convention the of National Electric Light Association (U.S.A.) will be held from June 16th to 20th, in the Exposition Auditorium, San Francisco, Cal.

Electric cookers can now be hired from Blackpool Corporation at 7s. 6d. per quarter instead of 10s. as hitherto, and the charges per quarter for washers and boilers are 4s. 6d. and 6s. (instead of 6s. and 7s. 6d.), respectively, for 10 and 14 gallon sizes.

It is stated that a new German invention is a switch which breaks, without sparking, on a 600 000 kW circuit. This is said to be effected by replacing the usual oil by a fluid which is at present a secret.

An ingenious model, designed by Partridge's Models, Ltd., has been made in London for the Mersey Docks exhibit in the British section of the Antwerp Exhibition. It is a scale model of part of the river and docks. Eighteen-inch models of famous liners, drawn by electric magnets under the water, pass up and down the river and come to rest in the docks. Lock gates open and close automatically, and the rise and fall of the tide is reproduced. The model is entirely electrical.

The third annual general meeting and luncheon of the Cheltenham Branch of the Electrical Association for Women took place on Wednesday of last week. Amongst the guests were the Mayor of Cheltenham, Miss C. Haslett (director of the Association), Mr. E. E. Sharp (Venner Time Switches, Ltd.), and Mr. W. J. Bache (borough electrical engineer of Cheltenham). Ald. J. Moore (Cheltenham) said many modern improvements in domestic apparatus were entirely due to the efforts of the E.A.W. Mr. Sharp delivered a lecture on "Domestic Electrification Overseas."

Mr. H. Lingard addressed a meeting of the Birmingham and Midlands Branch of the Electrical Association for Women last week on "Electric Light and Eyesight Preservation." He said although the average home, factory and school was grossly under-lighted, by far the greatest defect was the general prevalence of glare. If clear electric lamps were used they should be concealed from view in well designed reflectors and fittings. The light of pearl or opal lamps was noticeably softer in effect upon the eye, and it was to be hoped these would soon entirely replace the naked filament lamps.

BUSINESS ITEMS.

THE manufacturers of, or agents for, "Calrod" heating elements are requested to communicate with the Editor.

A. C. COSSOR, LTD., announce the opening of a Liverpool branch at 42, Paradise Street, under the management of Mr. S. G. Beer.

The address of the London office of the UNITED STEEL COMPANIES, LTD., has been changed to 16, Great George Street, S.W.1.

The bronze coloured brass lighting units installed in the Glasgow University Chapel were designed and supplied by the Glasgow branch of the GENERAL ELECTRIC CO., LTD., in conjunction with the architects, Messrs. John Burnett, Son and Dick.

POWER CONTRACTS (BATWIN), LTD., 164, Southwark Bridge Road, London, S.E.1, inform us that they have acquired from Power Contracts, Ltd., the Batwin motor department, and that service and delivery of Batwin machines is now given from the above.

Amongst recent orders of an extensive character received by the UNDERFEED STOKER CO., LTD., are the complete ash sluicing plants for the London Power Co., Battersea power station; Ipswich Corporation; Shropshire, Worcestershire and Staffordshire Electric Power Co., Ltd., Severn power station, Stourport, Worcestershire. Edward Lloyd and Co., Ltd., Kemsley Paper Mills, Sittingbourne.

An interesting method of controlling present-day machinery may be seen at the Laundry Exhibition, which was opened by Miss Margaret Bondfield on March 24th, at the Agricultural Hall, London. A "Mammoth" washing machine is exhibited, controlled by speech. This machine, made by the BRITISH-AMERICAN LAUNDRY MACHINERY CO., LTD., consists of a polished steel drum 12 ft. in length and about 8 ft. in diameter, and is capable of washing about 1 000 lb. of clothes in an hour. When the word "start" is spoken into a microphone the machine commences to operate, while at the command "stop," the machine comes to a standstill. Needless to say, this type of control was only installed as an experiment, and the transverse current microphone and control gear for this operation were made and supplied by the IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, London.

The progress which is being made in the adoption of the Foster Economiser is indicated by the contracts placed during the first three months of this year. Installations ordered for Great Britain include the Yorkshire Electric Power Co., Thornhill (4); London Power Company, Deptford, West (2); Sheffield Corporation Electricity Supply (3); Shoreditch Borough Electricity Supply (1); Torquay Electricity Works (2). In addition to the foregoing, orders have been received for installations abroad as follows:—Monte Video, South America (8); Ymuiden, Holland (2); Utrecht, Holland (6); Twentsche Centrale, Holland (2); Mines de Drocourt, France (2); Raffineries F. Beghin, France (2); Rotterdam, Holland (2). An outstanding feature of the economiser is the construction of the elements, which employs cast-iron gills or rings machined and shrunk on to solid-drawn steel tubes. The apparatus is manufactured at the Wakefield works of E. GREEN AND SON, LTD., for Eco POWER, LTD., London.

A GENERAL view of the stand of Falk, Stadelmann and Co. at the Ideal Home Exhibition.

PERSONAL.

MR. Hy. Mozley, who retired last week-end as manager of Burnley Transport Department, has spent 62 years with transport undertakings.

THE Championship Cup of the Swinton and Pendlebury Ladies' Hockey League, with medals and badges, has been won this season by the Chloride Recreation Ladies "A" Team, composed of employees of the Chloride Electrical Storage Co., Ltd. Throughout the season these girls have played 21 matches without defeat, the only point lost being a drawn game in the first match of the season. The goal scoring ability of the side is shown by the record of 117 goals, while the defence has only conceded 8 goals. Miss Hilda Athorn, the centre forward, heads the list of League goal scorers with the total of 71 goals.

Estate of the gross value of £64 868, with net personalty £63 210, was left by the late Mr. Henry Alabaster, late chairman of the "Electrical Review," Ltd., who died on January 13th, aged 83 years.

We learn that Mr. H. Walkington, late works manager of S. G. Brown, Ltd., having retired, Mr. S. G. Brown, F.R.S., is taking full charge of the works. He will be assisted by Mr. H. A. Webb (radio department) and Mr. H. H. Hebden (gyro and electro-megaphone department), who have been associated with the firm for many years.

Estate of the gross value of £99 785, with net personalty £99 261, was left by the late Mr. Alan Archibald Campbell Swinton, chairman of Crompton and Co., a director of Parsons Marine Steam Turbine Co., Wallsend, and of many electrical supply companies, who died on February 19th, aged 66 years. He left scientific books to the I.E.E.

Sir Alexander Roger, finding himself in disagreement with the policy adopted by the Board of the Constantinople Telephone Company, has resigned his directorship, and on Saturday, March 29th, Mr. Frank Gill was elected to fill the vacancy. It was reported last week that the International Telephone and Telegraph Corporation had purchased a controlling interest in the stock of the Constantinople Telephone Company.

Presentations were made this week by the directors of Benn Brothers, Ltd., and by the staff of "The Hardware Trade Journal" to Mr. Edgar E. Starke and Mrs. Starke, who celebrated yesterday, Thursday, the 25th anniversary of their wedding. At a meeting of the board, the directors passed a resolution expressing their congratulations and their esteem and abiding friendship for Mr. Starke. This resolution is to be engrossed and signed by Sir Ernest Benn (chairman), the directors and senior members of the staff.

Obituary.

MR. TOM ARTHUR FLATHER, aged 62 years. He was managing director of Flather and Co., Ltd., of Beeston, and founded the firm in 1893.

MR. PERCY GEORGE CHEVERTON, on March 26th, aged 62 years. He was for about 45 years with Crompton and Co., Ltd. (now Crompton Parkinson, Ltd.), in the firm's purchasing department, and resigned about a month ago.

SIR WILLIAM SYMINGTON MCCORMICK, F.R.S., on March 23rd, chairman of the Advisory Council to the Department of Scientific and Industrial Research. Cremation having taken place in France a memorial service was held at St. Margaret's, Westminster, on Monday.

IN PARLIAMENT.

Discussion in House of Commons on Government's Empire Wireless Policy.

IN the course of the discussion on the motion for second reading of the Consolidated Fund Bill in the House of Commons on March 26th, Sir E. Hilton Young called attention to the decision of the Government and the determination of the Post Office to develop the overseas wireless telephonic system of communications without the co-operation of the Communications Co. He said the company was formed to co-ordinate and rationalise the cable and wireless system of overseas communication, and it possessed the outfit and had established wireless beam stations, which were the means of carrying the overseas wireless telegraphic communications of the Empire. It was beyond controversy that at the time of the institution of the company it was contemplated that it would carry on, on behalf of the Post Office, the overseas telephonic as well as the telegraphic communication. The Post Office, however, would not even negotiate with the company and would not give it an opportunity to make good its claims.

The Communications Company could give a service at once with the oversea Dominions. The Post Office could give nothing immediate. It was all speculative. Some statements suggested that he had not got to the bottom of the matter. One statement was that there would be an economy of £17 000 a year in the working costs, but it appeared from other statements that instead of being £17 000 a year less than that of the Communications Co. it would be £3 000 more. The strong recommendation of the Committee of Experts to the Postmaster-General was that he should co-operate with the Communications Co. If the Post Office did not co-operate with the Communications Co. they would have to rely on somebody else, and that somebody else would be, not a British interest, but the large American Cable Co. Mr. Lees-Smith (Postmaster-General) said when the late Government leased the beam wireless stations to the Communications Co., they reserved the future of wireless telephony. Economy might, no doubt, be obtained in using the beam stations for wireless telephony, but there were advantages in the concentration of all the services at Rugby. The Communications Co. relied on the efficiency of aerials with very high masts, while the Rugby engineers, using lower masts, at much less cost, believed that although there was a certain loss of power it could be compensated for by developing a very powerful transmitter. The higher masts cost roughly, £34 000, and the lower masts £3 500. It was estimated that the cost of using the Rugby system would be between £20 000 and £30 000 less than that of renting the beam stations. With regard to contracts for machinery at Rugby and Baldock, the Standard Co., although it had American capital, had works in this country where it employed 7 000 British workmen. The debate was interrupted by private business.

Finsbury Park Tube Railway.

A Select Committee of the House of Commons has had under consideration, during the past week, the London Electric Railway Co.'s Bill to authorise a tube railway extension, 7¼ miles in length, from Finsbury Park to Cockfosters.

Mr. Frank Pick, managing director of the company, said 27 250 000 passengers yearly arrived at Finsbury Park by the tube and Metropolitan District Railways, and only a small proportion of these transferred to the L. and N.E. Railway. It was proposed to build a new depot at Cockfosters, which would facilitate a speeding up on the whole line. Generally speaking, they expected the Treasury to pay interest on part of the capital for 15 years. The cost of the works, including the purchase of land, a westward extension, improvement of existing stations, etc., would be about £13 000 000.

Sir Ralph Wedgwood, general manager of the L. and N.E. Railway Co., said extension of the tube railway beyond the Manor House must result in serious diversion of traffic from the L. and N.E. Railway. He believed the proposed line would result in a drop of £110 000 in his company's receipts. The L. and N.E.R. Co. had now a scheme for electrifying their main line as far as Welwyn and the old Great Northern branch suburban lines.

The Committee approved of the Finsbury Park to Cockfosters extension, and expressed the opinion that the L. and N.E.R. should not feel discouraged from going on with their electrification.

ILLUMINATION COMMITTEE.

Annual Report of the National Illumination Committee of Great Britain.

THE principal activities of the Committee during the past year have been in connection with the carrying-out of the programme of work decided upon by the International Commission on Illumination at its Bellagio and Saranac meetings, and with making arrangements for the 1931 meeting of the Commission. As recorded in last year's annual report the National Committee has appointed a number of sub-committees to deal with the subjects of which the Commission is making a special study, for five of which the British Committee has accepted the secretariat responsibility. Responsibility for the other subjects is divided among the other countries which are members of the Commission. In connection with most of these subjects the British sub-committees are in fairly close touch with their corresponding sub-committees abroad. In a few cases the contact is not so good, but conditions are improving.

The British sub-committees are at work, and it is hoped that fuller co-operation will now be secured and that the imminence of the 1931 meeting will result in more intensive efforts in all countries.

Preparations and details for the 1931 meeting of the International Commission on Illumination, which is being held in Great Britain at the invitation of the British Committee, were begun early in the year. It was decided that the meeting of the Commission should be associated with an International Illumination Congress, which would visit a number of places of interest to illuminating engineers where papers would be presented and discussions held. The Illuminating Engineering Society has agreed to co-operate with the National Committee in the organisation of the Congress, and an executive committee consisting of members of the two organisations has been set up to deal with all matters relative to the Congress as well as the non-technical portion of the meeting of the Commission at Cambridge. The technical aspects of this meeting will, of course, be directly under the control of the Central Bureau and the Executive Committee of the Illumination Commission.

THE JOHN BENN HOSTEL.

East End Boys' Ready Response to Educational Opportunities.

THE John Benn Hostel, Stepney, London, E., has another successful year of work behind it, and the report of the Warden for 1929 makes good reading. The document brings to the reader a sharp realisation of the immense value of the work done in this little community of boys. Here is salvaged part of the immense amount of valuable, but too often wasted, material among the youths of the East End. With 75 boys the Hostel now has its full complement. Employment among the lads is satisfactory, and with hardly an exception they are placed in positions that offer the prospect of future development. Their jobs are not merely blind alleys with the inevitable outcome in unemployment after a year or two. Many boys are apprenticed to various crafts and trades, but still more interesting is the exceptional talent to which the Hostel life offers scope. At the present time two of the boys are studying for matriculation. One hopes to take Orders and the other to distinguish himself as a chemist. Another boy is learning advertising photography, while studies for the Chartered Institute of Secretaries and for proficiency in commercial art are occupying two clever youngsters. Meanwhile, the work of social recreation, carried out in the Milner Hall, goes on daily and successfully and commands the steady support of large numbers of Stepney people. The East End Hostels Association (of which Sir Ernest Benn is the President) is emphatically an organisation deserving the support, on the highest patriotic as well as compassionate grounds, of the charitably-minded.

The annual meeting was held last week.

"THE CURSE OF GOVERNMENT."

In connection with the Individualist Bookshop series of Monday lectures on Present Day Problems, Sir Ernest Benn will speak on "The Curse of Government" at Caxton Hall, S.W.1, on Monday next at 5.45 p.m. The full programme of these lectures is obtainable from the Secretary, Individualist Bookshops, 53, Victoria Street, London, S.W.1.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

NANTWICH RURAL DISTRICT COUNCIL.—Electric wiring of houses. Particulars from the Surveyor.

GREAT WESTERN RAILWAY CO., April 4th-24th.—Supply of electrical cables and wires (list 20) and telegraph ironwork (list 21). Specifications with forms of tender from the Office of the Stores Superintendent, Swindon (form of tender for list 20 on and after April 14th). Tenders for list 21 by April 4th and for list 20 by April 24th.

PRESTWICK CORPORATION, April 4th.—One year's supply of electric lamps, fittings, etc. Schedules, etc., from the Burgh Engineer, Town Hall, Prestwick.

SHEFFIELD CORPORATION, April 4th.—Supply of one wheel press, with electric motor, for the tramways and motors department. Forms of tender from Mr. A. R. Fearnley, general manager, Division Street, Sheffield.

CENTRAL ELECTRICITY BOARD, April 7th.—Supply and erection of 66 kV and lower voltage transformers, in connection with Mid-East England Electricity Scheme. Specification (No. M.E.E.-G.T.1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

GLASGOW EDUCATION AUTHORITY, April 7th.—Supply of electric lamps, etc. Specification from the Education Offices (Supplies Department), 129, Bath Street, Glasgow; deposit 10s.

STANDING JOINT COMMITTEE OF GLAMORGAN QUARTER SESSIONS AND COUNTY COUNCIL, April 7th.—Electric light installation at Barry Dock Police Station, Court, etc. Specifications from Barry Dock Police Station or Glamorgan County Hall, Cardiff.

PERTH CORPORATION, April 9th.—Electric lighting installation work in 104 houses at Darnhall Drive and 46 houses at Florence Place, Perth. Schedules, etc., from Mr. Thomas McLaren, burgh surveyor, City Chambers, 16, Fay Street, Perth; deposit £1.

STOKE-ON-TRENT CORPORATION, April 9th.—Supply and erection of e.h.t. and l.t. overhead transmission lines. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

DUNDEE CORPORATION, April 10th.—Supply of e.h.t and l.t. paper insulated, lead-covered and double steel tape armoured cable. Specifications, etc., from Mr. D. H. Bishop, Electricity Department, Dudhope Crescent Road, Dundee.

DUNDEE CORPORATION, April 10th.—Supply of (1) d.c. and a.c. house service meters; and (2) 35 000 pairs of 8 mm. and 9 mm. × 15 in. long arc lamp carbons, for Angold magazine flame arc lamps. Specification, etc., from Mr. D. H. Bishop, general manager and engineer, Electricity Supply Department, Dudhope Crescent Road, Dundee.

GALASHIELS CORPORATION, April 10th.—Electrical work of five blocks of three-apartment houses (20 houses in all) at Wood Street, Galashiels. Specifications, etc., from Messrs. J. and J. Hall, architects, Galashiels.

MORECAMBE AND HEYSHAM EDUCATION COMMITTEE, April 11th.—Electric light installation at West End Council School, Westminster Road. Particulars from the Borough Engineer deposit £1 1s.

ATHERTON URBAN DISTRICT COUNCIL, April 14th.—Supply of five miles of 0·06 h.t., concentric, paper insulated, lead sheathed, served, steel tape armoured and compounded cable manufactured in accordance with latest B.E.S.A. specification.

Overhead Line Work.

BEDFORD CORPORATION, April 14th–May 5th.—Supply and erection of 11 000 V overhead lines, and auxiliary apparatus, other than transformers, for supplying an area of 100 sq. miles, under the Corporation's rural demonstration scheme. Only British labour and material may be employed. Specification, etc., from the Borough Electrical Engineer, until April 14th; deposit £3 3s. Tenders by May 5th.

COVENTRY CORPORATION, April 14th.—Electrically-driven pumping machinery, for Whitley pumping station. Specification (£10) from Sir Alexander Binnie, Son and Deacon, Artillery House, Artillery Row, London, S.W.1.

EDINBURGH EDUCATION AUTHORITY, April 14th.—Electrical installation in proposed new primary school at Wardie. Specifications, etc., from Mr. J. M. Johnston, 47, Charlotte Street, Leith.

LONDON COUNTY COUNCIL, April 14th.—Manufacture and supply of h.t. and l.t. cables; and reconstruction of existing l.t. cables. Specification, etc., from the General Manager of Tramways, 23, Belvedere Road, London, S.E.1; deposit £2.

MANCHESTER CORPORATION, April 14th.—Twelve months' supply of electricity meters (specification No. 264); potential and current transformers (No. 265); cables (No. 266); time switches (No. 268); auto-transformers and auto-balancers (No. 270); a.c. industrial electric motors (No. 271); and electric kettles (No. 274). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s. for each.

Supply of Stores.

MANCHESTER CORPORATION, April 14th.—Twelve months' supply of stores, etc., to the electricity department, including dry batteries for flashlight lamps, cable troughing, conduit for wiring, dynamo and copper tape brushes, fuse boxes, lamp columns, service boxes, wire, etc. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

BIRKENHEAD CORPORATION, April 15th.—Twelve month's supply of c.i. house service boxes, mains joint boxes, insulating and rubber tapes, and electrical sundries. Specifications from the Borough Electrical Engineer.

BATTLE URBAN DISTRICT COUNCIL, April 16th.—Electrically driven borehole pump, at Powdermill Lane pumping station, and two sets of electrically-driven boosting pumps at Starr's Green booster station. Plant to be of British manufacture and complete with electrical equipment and cable connections. Specification, etc., from Messrs. J. Taylor and Sons, Caxton House, Westminster, S.W.1; deposit £5.

CENTRAL ELECTRICITY BOARD, April 16th.—Construction of site works and foundation works for the transforming stations at Ribble (Preston) and Lancaster. Specification (N.W.E.—P.F.1) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

FIFE EDUCATION AUTHORITY, April 16th.—Electrical work in new elementary school, Sinclairtown, Kirkcaldy. Schedules, etc., from Mr. George Sandilands, Education Offices, Wemyssfield, Kirkcaldy; deposit £1 1s.

DUNDEE CORPORATION, April 23rd.—One year's supply of stores and materials to the tramways department. Specifications, etc., from the General Manager, Transport Office, Dundee.

NEWTOWNARDS (CO. DOWN) GUARDIANS, April 26th.—Electrical plant and wiring, etc., in connection with conversion of workhouse into a district hospital. Specification from Mr. John Warden, clerk to the Guardians; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, April 28th.—Supply and erection of 33 kV, 11 kV and 6·6 kV switchgear, for connecting Board's supply to electricity supply undertakings, under N.W. England and North Wales scheme. Specification (No. N.W.E.-G.S. 4) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 5th.—Supply and erection of 33 kV transmission line crossing of the river Witham, Boston, under Mid-East England scheme. Specification (No. M.E.E.-S.L. 3) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

DUNDEE CORPORATION, May 10th.—Supply and erection of two electrically-driven, vertical spindle main circulating water pumps, in pump room, in connection with Carolport generating station. Specification, etc., from Mr. D. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.-G.S. 1) from Mr. R. H. Fox, secretary and

Digitized by Google

solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2 ; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.-S.L. 2) from Mr. R. H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2 ; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice essential.*

PALERMO (SICILY).—Supply of five electric coal elevators, of 80 tons capacity, and 20 (or more) electric cranes, from two to five tons capacity, for new pier at Palermo. (Reference A.X. 9 302.)

SYNDICAT INTERCOMMUNAL D'ELECTRICITÉ DES DEUX SEVRES, TOURS.—Erection of transmission lines, under project, for supplying electricity to 195 villages.

ST. GILLES (BRUSSELS) MUNICIPALITY, April 5th.—Supply of 1 000 5 A and 400 3 A meters and 204 of various capacities, all for 220 V d.c. circuits. Further information (Fr. 5) from Service de l'Electricité, 40, Rue de Bethléem, St. Gilles.

WEST MEATH COUNTY BOARD OF HEALTH, April 7th.—Electric wiring and supply of lamps, etc., at District Hospital and Dispensary, Athlone. Form of tender from Board of Health Offices, Mullingar.

INDIAN STORES DEPARTMENT, April 8th.—Supply of oil engine driven d.c. generating sets, for Manzai power station (Military Engineering Service). (Specification B.X. 6 270.)

PORT ELIZABETH MUNICIPALITY, April 10th.—Supply of electric cable and overhead line material (specification No. 40). (Reference B.X. 6 282.)

ANTWERP MUNICIPALITY, April 11th.—Supply and erection of two mercury rectifiers at transformer station, Quai 232. Further information (Fr. 6) from Hotel de Ville.

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African Iron and Steel Industrial Corporation, Ltd., c/o International Construction Co., Ltd., 56, Kingsway, London W.C.2.

INDIAN STORES DEPARTMENT, April 14th.—Supply, erection, etc., of three oil engine-driven d.c. generating sets. (Reference B.X. 6 231.)

VICTORIAN ELECTRICITY COMMISSION, April 14th.—Supply of 22 000 V switchgear and accessories, for sub-station "C" at Brunswick (specification No. 30/17). (Reference B.X. 6 182.)

NEW ZEALAND POSTS AND TELEGRAPHS, April 15th.—Supply of 4-conductor cords (P. and T. 151/2 218). (Reference B.X. 6 303.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Supply of lead-covered switchboard cable (schedule C.574). (Reference B.X. 6 202.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

Underground Cables.

ORADEA MARE (TRANSYLVANIA) MUNICIPALITY, April 24th.—Supply of lead-covered, double steel tape-armoured, underground cables. (Reference B.X. 6 298.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, April 28th.—Supply and erection of electrically driven high lift and low lift pumping plants, etc., for South-West Tablelands Water Supply (tender No. 51, 1929/1930). (Reference A.X. 9 219.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

VICTORIAN ELECTRICITY COMMISSION, May 5th.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000 V circuit (specification No. 30/19). (Reference B.X. 6 226.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

CAPE TOWN MUNICIPALITY, May 7th.—Supply of l.t. iron-clad switchgear. (Specification No. 492/1930.) Reference B.X. 6 293.)

COPENHAGEN MUNICIPALITY, May 10th.—Supply of switchgear and rectifier plant for Eskildsgade sub-station (Reference B.X. 6 271.)

COPENHAGEN MUNICIPALITY, May 12th.—Supply and erection of two turbo-generators. (Reference B.X. 6 297.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13th.—Supply of terminal strips (P. and T. 151/2 200). (Reference B.X. 6 209.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of cable clamps, for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

Tenders Accepted.

CROYDON CORPORATION.—A. Reyrolle and Co., Ltd., supply of switchgear, £1 380 12s. (Recommended).

ADMIRALTY.—Siemens Electric Lamps and Supplies, Ltd., supply of Siemens special battery signalling lamps.

TORQUAY CORPORATION.—Vanstone and Sons, encasing electric wiring at Torre Abbey Sands café in steel tubing, £85.

GLASGOW CORPORATION.—Darroch and Espir, further electrical installation at Shieldhall Hospital, £264 19s. 1d. (Recommended.)

SYDNEY (N.S.W.) CIVIC COMMISSIONERS.—A. Reyrolle and Co., Ltd., supply of 11 000 V metal clad switchgear, for sub-stations, £65 677.

SHEFFIELD EDUCATION COMMITTEE.—Corporation Electric Supply Department, installation of electric wiring and fittings at Earldom Road Council school, £516.

BRENTFORD GUARDIANS.—Electrical Installations, Ltd., provision of central switchboard and laying of electric mains at West Middlesex Hospital, Isleworth, £2 504.

GENERAL POST OFFICE.—Telephone exchange equipment, Post Office Stores Department (Studd Street, London, N.), Standard Telephones and Cables, Ltd. Telephonic repeater equipment, Birmingham, General Electric Co., Ltd. ; Leeds, Standard Telephones and Cables, Ltd.

LONDON AND NORTH EASTERN RAILWAY.—Edison Swan Electric Co., Ltd., 12 months' supply of electric lamps (contract No. 194) ; Metro-Vick Supplies, 12 months' supply of electric lamps ; Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens gasfilled, vacuum and carbon filament lamps.

LOWESTOFT CORPORATION.—Ferguson, Pailin Ltd., supply and erection at Oulton Broad of e.h.t. sub-station switchgear, l.t. distribution switchgear and switch kiosks, £1 308 (recommended). Also tendered : Switchgear and Cowans, Ltd. £2 034 ; Metropolitan-Vickers Electrical Co., Ltd., £1 838 ; A. Reyrolle and Co., Ltd., £1 804 ; General Electric Co., Ltd., £1 797 ; Crompton Parkinson, Ltd., £1 578 ; English Electric Co., Ltd., £1 509 ; J. G. Statter, Ltd., £1 420 ; British Thomson-Houston Co., Ltd., £1 366. Foster Engineering Co., Ltd., supply and erection of two transformer kiosks at Kessingland, £544 (recommended). Also tendered : A. Reyrolle and Co., Ltd., £1 538 ; British Thomson-Houston Co., £850 ; English Electric Co., Ltd., £819 ; General Electric Co., Ltd., £814 ; British Thomson-Houston Co., Ltd., £777 ; Johnson and Phillips, Ltd., £775 ; Yorkshire Switchgear Co., Ltd., £751 ; Switchgear and Cowans, Ltd., £708 ; Yorkshire Transformer Co., Ltd., £679 ; Crompton Parkinson, Ltd., £654 ; W. Lucy, Ltd., £603 ; Metropolitan-Vickers Electrical Co., Ltd., £552 ; Ferguson, Pailin Ltd., £552.

WORK IN PROSPECT.

COSHAM.—Extensions, Portsdown School, to cost £13 757. Particulars from the contractors, Green and Foley, Eastleigh.

EYEMOUTH.—School to cost £36 000. Particulars from the architects, John Scotland and Sons, Airdrie.

GLASTONBURY.—Houses (26), for the Town Council. Particulars from the Borough Surveyor.

KINGSTON-ON-THAMES.—Houses (140), for the Town Council. Particulars from the Borough Surveyor.

LEYLAND.—Houses (22), for the Urban Council. Particulars from the Surveyor.

MAIDENHEAD.—Houses (16), for the Town Council. Particulars from the Borough Surveyor.

MALTBY.—Houses (40), for the Urban Council. Particulars from the Surveyor.

MANSFIELD WOODHOUSE.—Additional 54 houses, for the Urban Council. Particulars from the Surveyor.

MOTHERWELL.—Houses (60), for the Town Council. Particulars from the Burgh Surveyor.

NELSON.—Four schools to cost £94 248, for the Borough Education Committee. Particulars from the Director of Education.

NEWCASTLE (STAFFS).—Church hall to seat 500. Particulars from the rector, Rev. L. J. Baggott.

OLD FLETTON.—Houses (72), for the Urban Council. Particulars from the Surveyor.

ROTHERHAM.—Houses (440), for the Town Council. Particulars from the contractors, H. E. Pitt, Ltd., Sunderland.

SAFFRON WALDEN.—Houses (24), for the Town Council. Particulars, from the Borough Surveyor.

SOUTHPORT.—Skin diseases hospital and clinic, for the Town Council. Particulars from the Borough Engineer.

SPALDING.—Houses (27), for the Urban Council. Particulars from the architect, Mr. A. E. Palmer, IA, Pinchbeck Road.

STAFFORD.—County offices for Staffs County Council. Particulars from the Clerk.

STOCKPORT.—Houses (180), and 40 flats, for the Town Council. Particulars from the Borough Surveyor.—Senior school (720 places), for the Borough Education Committee. Particulars from the Secretary, Mr. A. Lawton.

STOCKTON-ON-TEES.—Extensions, Portrack Schools, to cost £7 749. Particulars, Mr. J. C. Watson.

STOWMARKET.—Housing scheme. Particulars, the Surveyor.

STROUD.—Houses (31), for the Urban Council. Particulars from the contractors, Wheatley and Sons.

TAUNTON.—Schools and extensions to cost £19 435, for the Borough Education Committee. Particulars from the Director of Education.

TEDDINGTON.—Church to cost £18 000, for St. Mark's Parish. Particulars from the Incumbent.

THORNE.—100 new houses, for R.D.C. Particulars, H. Plewes, surveyor, Thorne, near Doncaster.

TWICKENHAM.—Houses (72), for the Town Council. Particulars from the Borough Surveyor.

WAKEFIELD.—Wiring 1 000 houses, to cost £10 000. Particulars, L. Ives, borough surveyor, Town Hall, Wakefield.

WARRINGTON.—Bakery for the Co-operative Society. Particulars, the Architect, Balloon Street, Manchester.

WARWICK.—County offices to cost £13 500, for Warwickshire County Council. Particulars from the County Architect.

WELLS (SOMERSET).—Extensions, District Hospital. Particulars, the Secretary.

BOARD OF TRADE ANNOUNCEMENT.

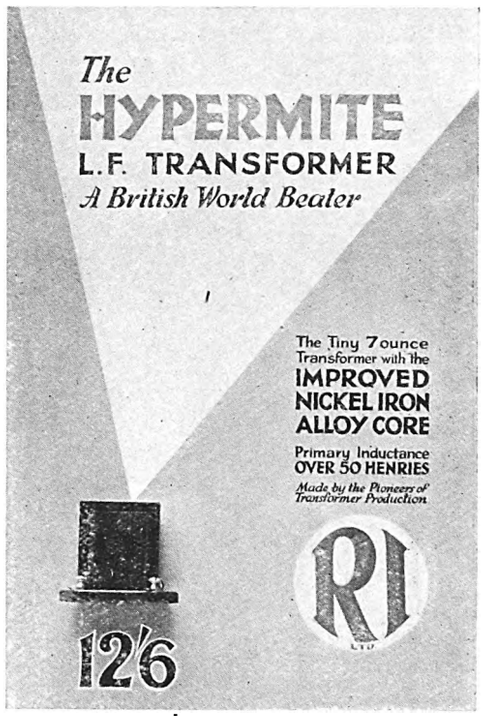
The Lord Chancellor and the President of the Board of Trade have appointed a Committee to consider present trade practices which result in withholding from particular retail traders supplies of goods in which they wish to deal or which prevent the resale of such supplies except upon conditions imposed by the suppliers, and to report whether in their opinion all or any of such practices are detrimental to the public interest, and, if so, what alterations in the existing law are necessary to prevent the continuance of such practices. The membership of the committee is as follows:—Messrs. W. A. Greene (chairman), Alexander Johnston, D. H. Macgregor, W. E. Mortimer, J. E. Singleton, A. G. Walkden. The Secretary to the Committee, to whom all correspondence should be addressed, is Mr. C. K. Hobson, Board of Trade, Great George Street, London, S.W.1.

TRADE PUBLICATIONS.

AMONG the latest publications of the BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester, is a booklet devoted to voltage regulators for tapped transformers.

GENT AND CO., LTD., Faraday Works, Leicester, have published Book 7, section 26, relative to electro-motor syrens and far-reaching fog signals, and Book 1, section 16, dealing with electric bells and indicators.

RADIO INSTRUMENTS, LTD., 12, Hyde Street, London, W.C.1, have issued a novelty showcard relative to the "Hypermite" transformer. As will be seen from the accompanying illustration, the transformer forms an accessory to the showcard, making altogether an arresting sales aid for window or counter display.



A new showcard issued by Radio Instruments, Ltd.

The range of d.c. motors and generators falling under class "F" and manufactured by CROMPTON PARKINSON, LTD., Guiseley, Leeds, is dealt with in Specification A 302, the second edition of which has just been issued.

The report of a test carried out by Mr. W. A. Tookey on the "Petter Atomic" Diesel engine is the subject of publication No. 2 007, by PETTERS, LTD., Yeovil.

A new issue of "Aluminium Foundry Data" bearing No. 328 and superseding No. 213 has been published by the BRITISH ALUMINIUM CO., LTD., Adelaide House, King William Street, London, E.C.4.

The NORRIS WARMING CO., LTD., 11-12, St. Andrew's Hill, London, E.C.4, has sent us an artistically coloured calendar entitled "What Can I Do For You?" The subject is a charming girl artist sitting before an easel, armed with paint brushes and colours.

The latest publications of SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E., include a new catalogue No. 641 dealing with batteries and price list No. 648 concerning radio batteries for portable sets. The latter publication indicates which batteries are the most suitable for various well-known radio receivers.

CROMPTON PARKINSON, LTD., Bush House, Aldwych, London, W.C.2, have issued two new booklets, D903 and D904 dealing with the installation and maintenance of Parkinson a.c. and d.c. motors respectively. Both booklets are well illustrated with explanatory diagrams and adequate descriptive matter is provided.

MAVOR AND COULSON, LTD., 47, Broad Street, Glasgow, S.E. have issued a special brochure introducing their new driving gear for electric shaker conveyors.

The REVO ELECTRIC CO., LTD., has sent us a copy of a new catalogue which is a most comprehensive and interesting list. It contains very many new and scientifically designed fittings and should prove a very great assistance to street lighting engineers. The company believes that it is the most comprehensive list issued by any firm in the class of material covered by the issue and will be a useful addition to the bookshelves of most electrical people. The reference is No. 14. We have also received a leaflet dealing with the new "Matchless" fire fitted with a switching arrangement which gives even distribution of heat over the reflector even when the whole of the element is not switched on full. The reference of this leaflet is No. 161.

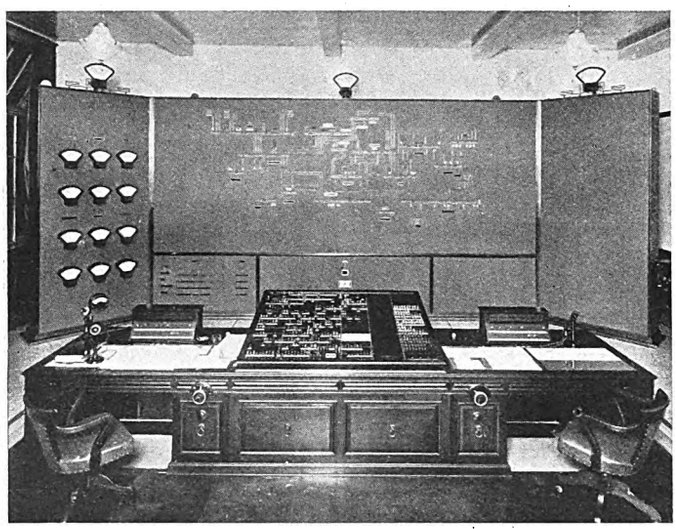
ELECTRICITY SUPPLY.

Withdrawal of Coventry Extension Scheme—Eston and Easy Purchase—Stirling and Bulk Supply—Hydro-Electric Development in India.

COVENTRY Corporation's scheme for the extension of the Longford generating station at a cost of £162 000 has been withdrawn in deference to the wishes of the Electricity Commissioners.

Sanction has been obtained by Bexhill Electricity Committee to borrow £6 117 for plant extensions at the northern sub-station. The committee has decided upon the provision of plant, etc., and replacement of distributor cables, at a cost of £7 420.



COMPLETE operating control and protection of the entire system of the London Power Company is maintained from Ergon House, Westminster, by means of control cables and pilot telephones which connect with main generating plants and the numerous sub-stations. Our illustration shows the interior of Horseferry Road sub-station, where a central control box is seen mounted on the desk. Lever settings indicate the bus bars to which various circuits are connected, while the Monel metal covering ensures a durable, non-corrosive surface of good appearance. Beyond the desk is situated the control panel consisting of slate slabs mounted in a Monel metal framework. The complete circuit diagram on the panel is of inlaid Monel metal strip, as are also the "label-frames," which appear as black slots in the board. The mountings for ammeters and voltmeters are likewise made from Monel metal, the whole lay-out being indicative of the work carried out by A. Reyrolle and Co., Ltd., of Hebburn-on-Tyne.

The Electrical Engineer has submitted to Eston Electricity Committee particulars of an easy purchase scheme which has been successfully operated by the Newcastle Electric Supply Co. in the north-east area. The system applies to all kinds of domestic apparatus and fittings, and can also include installations if desired. The Committee decided to adopt a similar scheme.

Lowestoft Electricity Committee has obtained all requisite wayleaves in connection with the proposed supply of current to Kessingland, and the Electricity Commission has sanctioned the borrowing of £414 for buildings, etc., in connection with the supply.—The Minister of Transport has consented to overhead lines at Oulton Broad for the transmission of electric energy at a pressure of 460/230 V.

Marylebone (London) Electricity Committee has decided to provide 61 circuit breakers for the d.c. feeders at the generating station, in place of existing fuse equipment, the positions of which will have to be altered to allow sufficient space for the erection of new e.h.t. switchgear, at a cost of £1 970, and to lay ducts for the diversion of d.c. and e.h.t. feeder cables incidental to the erection of new switchgear, at a cost of £4 600.

A party of motorists visited Lewisham, London, last week, to see a demonstration of systems of street lighting on the main road through the borough. The South Metropolitan Gas Co. have fixed a series of high-power gas lamps suspended over the middle of a mile of the road, and the South Metropolitan Electric Light and Power Co. has fixed electric lamps on high standards with brackets at points on the side of a second mile of road. The experiments are being made with a view to adopting the system which is considered most likely to minimise the number of road accidents.

The Shawinigan Water and Power Co. will shortly begin work on the development of the first six sites available for water power development on the Upper St. Maurice River. The site chosen for initial development is that of Rapide Blanc, where 160 000 H.P. can be obtained. There has been placed in operation a new transmission line connecting Thetford asbestos mines with the company's Quebec terminal station, which receives its power from the Ile Maligne plant of the Duke-Price Power Co. on the Saguenay River. This line is 55 miles long and is designed to transmit 20 000 kW.

Mr. F. Gordon Tucker, on behalf of the Ministry of Transport, held an inquiry recently into Liverpool Corporation's scheme to erect overhead cables in the Whiston district. For Huyton-with-Roby U.D.C., which opposed the granting of the powers, Mr. J. H. Peters, clerk of the Council, said the wires would spoil the countryside and be a source of danger. The inspector said the margin of safety in this country was largely in excess of that adopted anywhere else. Mr. D. Seymour, for the Corporation, said the cost of an underground line would exceed that of the overhead line by 200%.

The completion of the first stage of the scheme for the generation of electricity by utilising the waters of the Uhl river, in Mandi State, India, is expected to be achieved by the autumn of 1932. The first stage comprises plant to produce 36 000 kW, and it is estimated to cost from £4 000 000 to £4 500 000, compared with the original estimate of £3 200 000, the increase being due to unexpected weakness having been discovered in the mountain strata through which a tunnel is being driven, which also accounts for the extension of the estimated time of completion from 1930 to 1932. Ultimately the extension of the scheme so as to supply 120 000 kW is contemplated.

Stirling T.C. has been informed by the Central Electricity Board that it is not economically possible for the Board to give a supply of 250 kW to the Council, in view of the relatively large capital expenditure involved in the erection of transmission lines from the nearest grid point at Bonnybridge. Mr. M'Coll, on behalf of the Board, has suggested that the Council consider the closing down of its present power station and the taking of a bulk supply for the whole of its requirements. The Electricity Committee recommends that the Council should not agree to the closing-down of the power station, but should take a supplementary supply from the Scottish Central Electric Power Co., provided suitable terms can be arranged. The Council has decided to have a report prepared on the cost of generating the additional supply themselves, as against the cost of taking the supply from the Scottish Central Co.

At the meeting of Birmingham Corporation, on Tuesday, the Electric Supply Committee reported that in connection with the change of frequency, and so that the undertaking might be in a position to meet the demand for 50 cycle supplies as and when the change-over programme progressed, it had been found necessary, after conferring with the Central Electricity Board and the Electricity Commissioners, to provide new generating plant, switch-gear, buildings and cables. The estimated cost of the extension at generating stations and sub-stations was £519 050, and of mains £176 825, making a total of £695 875. The whole of this expenditure was necessary at this stage for the purpose of enabling the frequency-change programme to be proceeded with effectively; consequently the Central Electricity Board would provide the whole of the capital required. The Board would also bear the interest and sinking fund charges thereon until such time as the equipment, or portions of it, would have been required to meet the normal growth of the load on the undertaking. So far as could be seen at the moment, it would appear likely that the transfer of liability from the Board to the Corporation would commence in about five years and become complete in seven years. The Committee recommended the Council to give its approval of the scheme.

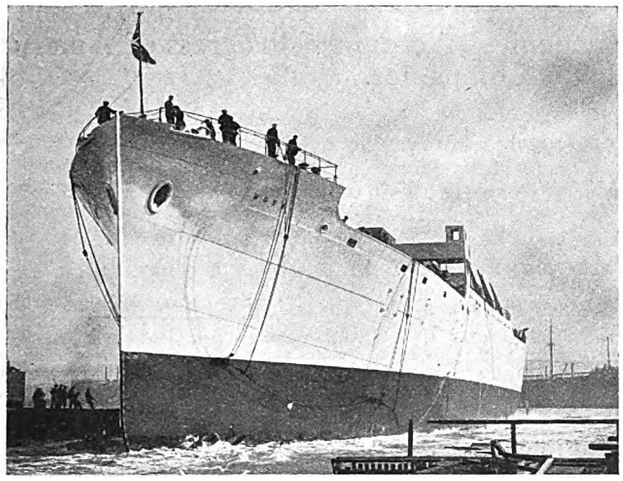
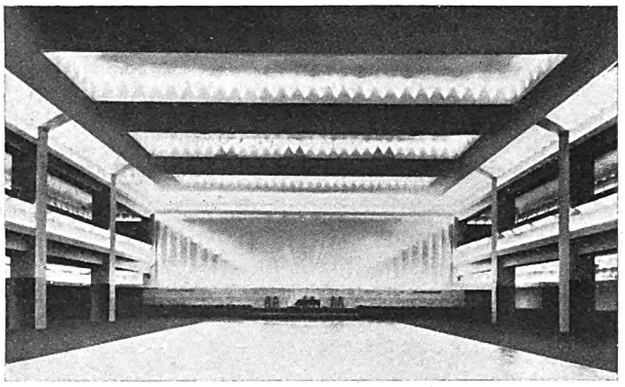
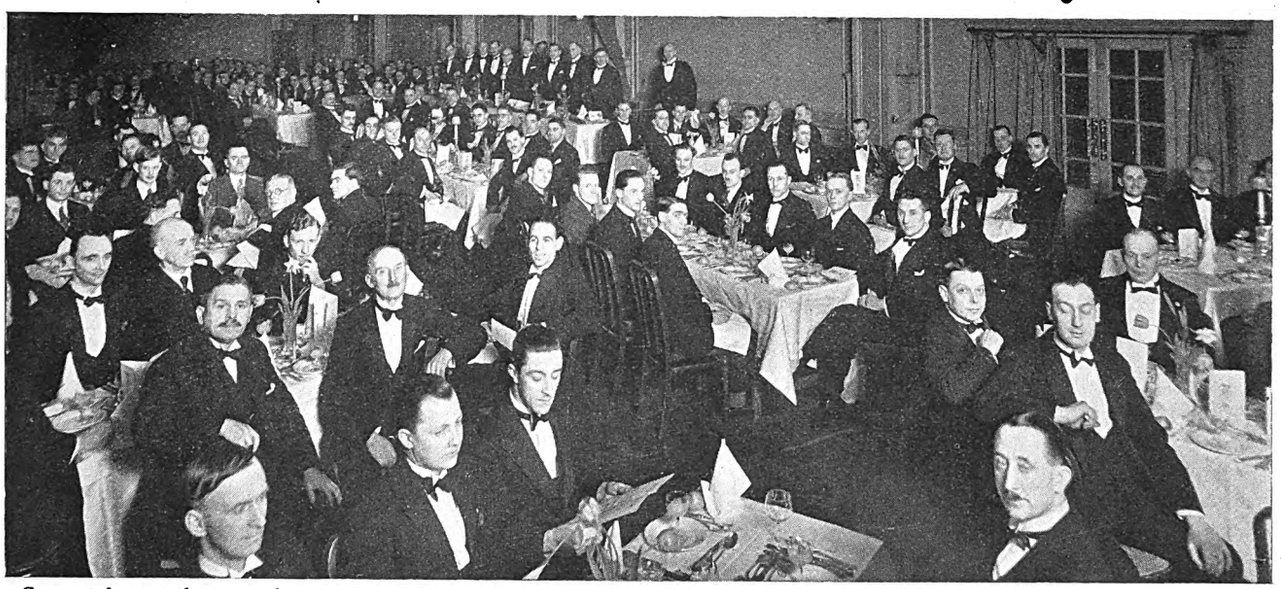
ELECTRICAL NEWS IN PICTURES.



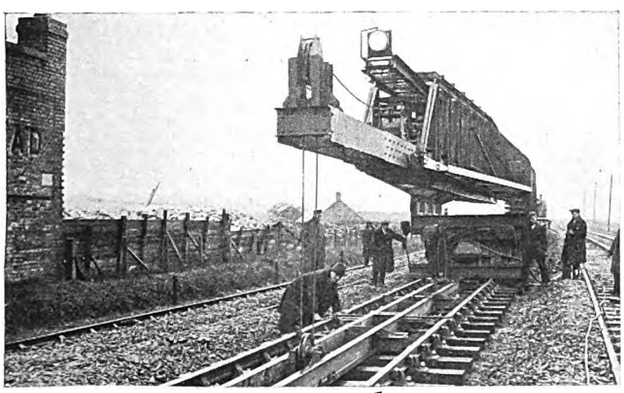
The new turbo-electric ship "Musa" was launched at Belfast on Saturday last, and here she is seen leaving the slipway. She is a 6 000-ton vessel built by Workman Clark (1928), Ltd., for Elders and Fyffes, Ltd., and is fitted with B.T.H. propulsion equipment. The "San Benito," the first turbo-electric vessel built in Great Britain, was also built by Workman, Clark, Ltd.

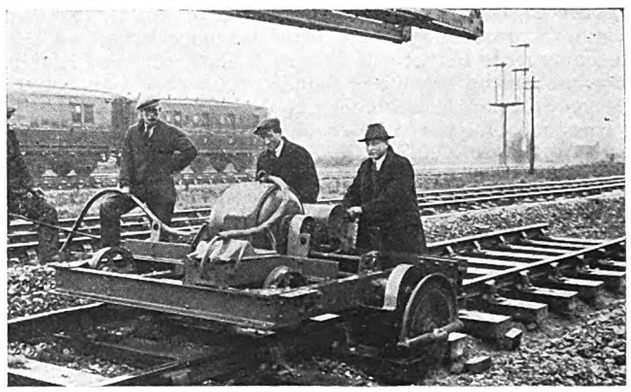


What is claimed to be the largest hotel ballroom in the world is found in the new Hotel St. George, in Brooklyn, N.Y., where the lighting arrangements can also claim to something out of the ordinary. Modernistic effects are obtained in the manner shown in the illustration above, while changing shadow and colour schemes in the form of laylights are also introduced.



Group taken at the seventh annual staff dinner of the Automatic Telephone Manufacturing Co., Ltd., held on March 21st in the Banqueting Hall of the Exchange Hotel, Liverpool. Covers were laid for some 160 members and guests and the function proved highly successful. The chairman of the company, Sir Alexander Roger, presided, other directors present being Mr. H. L. Harris, Mr. G. W. Moore, and Mr. Eric Taylor. "The Company" was proposed jointly by Mr. G. Male and Mr. T. R. Rayner, the Chairman responding. "Our Associates," proposed by Mr. G. W. Moore, was responded to by Mr. H. L. Harris, whilst "Guests" were toasted by Mr. H. H. Harrison and acknowledged by Mr. E. A. Ward, of Siemens Electric Lamps and Supplies, Ltd. Following the dinner appropriate entertainment was provided by Miss Gladys Sweeney, Miss Gladys Simcoe, Mr. Foden Williams, and Mr. Walter Jones and Partner, whilst Mr. John Pennington's Quartet rendered selections during dinner.





The L.N.E.R. has put into operation new equipment for the quick changing of rails. The plant consists of a special electrically operated cantilever truck, which lifts part of the old track and transfers it to a wagon. An electric winch is used in conjunction with the truck, and this pulls the new length of track into position ready for bolting up. The cantilever truck in actual operation at Cambridge may be seen in the left-hand picture, while an electrically-driven saw, used for cutting the sleepers into 8 ft. 6 in. lengths to facilitate their lifting by the cantilever, is shown on the right.

PARA ELECTRIC RAILWAYS AND LIGHTING CO., LTD.

The accounts of this company, which was registered in 1905 to acquire the tramway and electric lighting undertakings of the Compania de Estrada de Ferro Paraense, of Para, Brazil, show that during the year ended November 30th last, passengers carried amounted to 2½% more, and at £182 071, the gross receipts were £2 925 higher. Operating expenses showed no material increase and amounted to £107 958, and after taking credit for interest, transfer fees, and miscellaneous receipts, the net revenue for the year is shown at £74 305—an increase of £2 295. In 1928 nothing was deducted from the book value of the company's investments, but last year the sum of £3 189 was written off, consequently the net profit has suffered a reduction of about £700, the figure being £28 103. This amount has been allocated as under, after adding £5 002 brought in from the previous accounts :—

Brought forward from 1927-28 accounts		£5 002
Net profit for 1928-29		28 103
		33 105
Dividend of 6% on £325 000 cum. pref. shares		£19 500
Transferred to Depreciation and Renewals Reserve		10 000
Carried forward to 1929-30 Appropriation		3 605
		33 105

During the year £5 935 was debited to depreciation and renewals.

UNDERGROUND RAILWAYS GROUP.

The following are the sums placed to reserve, and the amounts carried forward in the 1929 accounts of the Common Fund Companies of the Underground Electric Railways of London :—

	To Reserve. £	Carried Forward. £
Metro. District	90 000	44 768
London Electric	157 198	177 152
City and South London	25 000	36 179
Central London	40 000	105 053
London. Gen. Omnibus	390 000	97 356
Assoc. Equipment	—	201 261
Underground Elec.	—	262 504

MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD.

Principal features of results for the last two years are compared below :—

	Dec. 31, 1929. £	Dec. 31, 1928. £
Gross Receipts	921 528	905 816
Net Profit	203 111	193 420
Ordinary Dividend	178 909	178 909
5% War Loan	381 952	515 120
Investments in Subsidiary Co.'s	273 178	291 949
Shares in Associated Co.'s	109 606	97 666
Cash	12 603	38 672
Carried forward	17 405	36 689
Dividend	15%	15%

At 43s., the shares yield about 7%.

COMPANY NEWS.

Relapse in Cables and Wireless Stocks—Progress of Scottish Power Co.'s Works—Shropshire, Worcestershire and Staffordshire Co.'s Expansion—Directors' Reports, etc.

THE recent reply in the House of Commons by the Postmaster-General to the critics of his decision not to make use of the Marconi beam stations for his overseas telephone service, led to a relapse in the stocks of the Cables and Wireless company, and, although a recovery has set in, prices are lower than when we last wrote. American Telephone and Telegraph capital stock, on the other hand, has jumped up 15 points, and is now quoted at 270. Radio Corporation of America shares, though not closing at the best, show a rise of several points compared with a week ago. Hydro-Electrics and International Holdings have both been bought freely during the past week, and both show a considerable further advance in price.

Equipment favourites show irregularity. Enfield Cable Works ordinary at 92s. 6d. are 5s. down, and Callender's at 75s. have lost half-a-crown. General Electrics at 47s. 6d. and Siemens at 25s. have each gained 1s. 3d., while Ever-Readies have jumped from 18s. to 19s. 6d. Associateds have shed a shilling. Crompton Parkinson preference issues have changed hands at higher figures, and the quotation for 9% second preference is 2s. up.

The electricity supply section continues to show a cheerful appearance. City of London shares at about 34s. 6d. are 1s. 3d. up, Chelsea's have advanced from 25s. to 25s. 6d., and St. James's from 26s. 6d. to 27s. Yorkshire Electric Power ordinary shares are 1s. 3d. higher at 33s. 9d., and Shropshire, Worcestershire and Staffordshire preference are up from 22s. to 22s. 6d. Newcastle-upon-Tyne Supply shares have put on another 7½d., bringing them to 25s. Scottish Power shares have moved up 1s. from 30s. to 31s., and Clyde Valley 6% preference are 6d. better at 28s. Central Electric Supply and Folkestone debentures are both a point higher. Calcutta Supply shares have risen half-a-crown to over £2 10s., and an advance of 1s. 3d. brings the price of Victoria Falls Power shares over £3. London Power Co.'s debentures have gained a point, being now quoted at par.

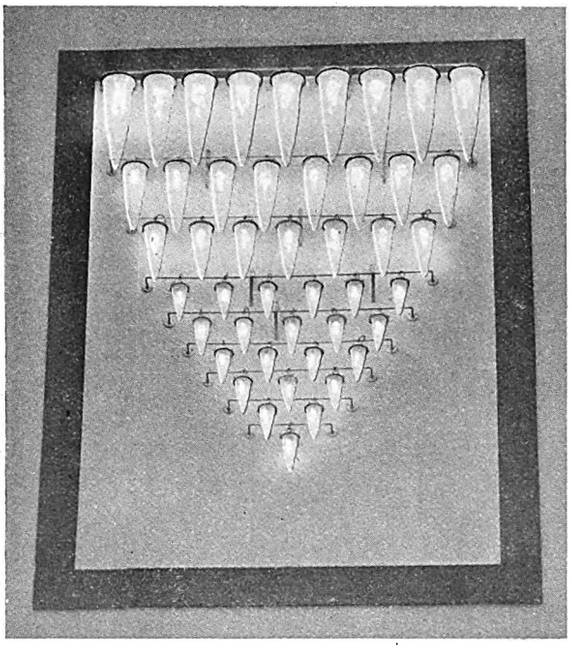
Directors' Reports, etc.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—£150 000 of 5½% con. deb. stk. was placed in the market last week at the price of 96½.

WEST GLOUCESTERSHIRE POWER CO.—Gross rev. for 1929, £80 307, agst. £60 321. Electy. sold, 13 263 745 kWh, agst. 10 947 341.



ONE of the four "Icicle" panels, by H. G. Ascher, Ltd., which may be seen each side of the archway at the west end of the main hall at Olympia, London, during the Ideal Home Exhibition.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON, LTD.—It is reported that company has placed privately £750 000 of 5% 1st mtge. debs.

BOURNEMOUTH AND POOLE ELECTRICITY SUPPLY CO., LTD.—Fin. div. of 9%, less tax, makg. 15% for year (same as last year) is announced.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Qrtrly. div. of 60 cents p. sh. on common (same as last year) will be payable on April 30.

SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD.—Fin. div. of 6%, less tax, on ord. shs., makg. 9% for year, agst. 8½%, is announced.

ABITIBI POWER AND PAPER CO.—Operatg. profits for past year, $8 377 246, against $7 380 963; net surplus $4 111 804, against $2 846 041, plus $59 145 391 brt. in.

RICHMOND (SURREY) ELECTRIC LIGHT AND POWER CO., LTD.—Fin. div. 7% on ord. shs. for year 1929 is announced, subject to audit, makg. 11% for year (same as previous year).

BRITISH ENGINE, BOILER AND GENERAL INSURANCE CO., LTD.—After placing £20 000 to pensn. fund, £15 000 to a contingency fund and £1 334 to res., blce. to pft. and loss acct. is £20 139. Fin. div. 15s. p. sh., less tax, makg. 30s. for year.

SHAWINIGAN WATER AND POWER CO.—Gross earngs. for 1929, $13 475 863, agst. $11 562 331, net earngs. $5 907 979, agst. $4 848 524. After provision for divs. on common shs. ($2.12½ agst. $2.00) and other appropriatns., carry fwd is $1 314 027, agst. $1 928 344.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—Net pft. for 1929, £45 820, agst. £54 909. Standard div. on ord. shs. for year, 8·833%, agst. 8⅞%. To res. for ord. shhldrs. proportn. of consumers' benefit, £7 947; co-partners. sh. of consumers' benefit, £2 565. Fwd. £21 818, agst. £24 039.

AMERICAN CITIES POWER AND LIGHT CORPORATION.—Net income for 1929, $9 899 172. Net income equal to $4.24 p. sh. on average amt. of class "B" common stk. outstandg. It is stated that since Dec. 31, 1921, market value of investmts. has increased by over $5 000 000.

OXFORD ELECTRIC CO., LTD.—Net rev. for 1929, £80 803, includg. £6 449 brt. in., agst. £51 548 and £6 166. Ord. div. 7%, agst. 8½%; to res. and renewals, £15 000, agst. £25 000; fwd. £42 803, agst. £6 449. Appeal by company in regard to judgment obtained by Oxford Corporation will probably come before the Court at an early date.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY CO., LTD.—Blce. from net rev. acct. for 1929, £35 639, plus £16 579 brt. in. After paying fin. div. on 7% pref. shs. to Dec. 31, 1929, a div. of 10·477d. p. sh. on ord. shs. is recommended makg., with the intm. div. of 10d. p. sh. already paid, the standard div. for the year; to specl. res. for ord. shhldrs.' proportion. of consumers' benefit £10 610; fwd. £6 485. Electy. sold 10 392 914, increase 20·21%.

Company Meetings.

BATH ELECTRIC TRAMWAYS, LTD.—Mr. E. H. R. Trenow, presiding at the meeting on Monday, said the decrease in traffic and other receipts of £2 782 was more than offset by economies in costs of £3 168. Much of the traffic was to and from the railway stations. The new areas were served by the omnibus company, which acted in the closest co-operation with the tramways company, and, as the latter was interested in the omnibus company, it would be seen that the situation was one in which the tramways company reaped some advantage as a set-off to the loss of traffic. A dividend of 3½% was recommended on the preferred ordinary shares, leaving £703 to carry forward. The report was adopted and the dividend approved.

TORQUAY TRAMWAYS CO., LTD.—Mr. H. T. Barnett, presiding at the meeting on March 26th said, in reference to the company's Bill in Parliament, owing to the rapid growth of traffic in Torquay, due to its popularity, the congestion in the main streets had become acute, and the corporation had approached the company with various suggestions to relieve congestion. Finally, both parties had agreed that the substitution of the trolley vehicle system for the tramways was the most desirable solution. An agreement had been arrived at with the Corporation of Torquay, negotiations with Paignton U.D.C. pointed to an early settlement, and in all probability an unopposed Bill would be the result. The report was adopted, and the company's Bill was unanimously approved.

SCOTTISH POWER CO., LTD.—Mr. George Balfour, M.P., presiding at the meeting last week, said during the last 10 years their investments in subsidiary companies had increased from £353 858 to £3 440 173. Rapid progress was being made with the construction of the hydro-electric works at Loch Rannoch. The generating station would have an initial capacity of 32 000 kW, and would be available for supply towards the end of the current year. The generating plant in their various power stations, with the addition of the hydro-electric plant of the Grampian Co., gave them a total plant installed of about 80 000 kW, the load connected at December 31st, 1929, was 63 790 kW, and the maximum load during 1929 was 22 207 kW. Electricity sold was about 70 000 000 kWh, an increase of nearly 50% compared with five years ago. The report and accounts were adopted and the dividend of 8%, less tax, on the ordinary shares was approved.

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.—Mr. J. B. Braithwaite, presiding at the meeting last week, said their sales of current in 1926 increased 4 000 000 kWh; in 1927 5 000 000; in 1928 8 400 000; and for 1929 the increase was just over 9 000 000, in spite of the reductions which they had made in prices. The profit showed a small increase, that for 1929 being £473 972, compared with £451 587 in 1928. For 1929 the average price paid by their consumers was 2·1d. The reduction in price led, of course, to an increase in the so-called consumers' benefit. In 1928 that was £275 937, and in 1929 it was £348 253. During the four years in which that arrangement had been in force their consumers had benefited to the extent of £930 000 compared with what they would have paid had they been charged the standard price. The increase in the consumers' benefit led to an increase in the one-sixth share which the company was allowed to retain and add to the reserve fund. They were able to retain for the past year £58 052, and the reserve fund now stood at £243 137. The report and accounts were adopted.

TILLING-STEVENS MOTORS, LTD.—At the meeting last week, Mr. H. E. Carter, chairman, said, in reference to the order for petrol-electric vehicles which he had told the shareholders last year they had every hope of obtaining, they designed and built trial vehicles for test purposes, and they understood the vehicles gave satisfaction. Later on the question of

Digitized by Google

fitting four-wheel brakes was raised and of additional luxury in upholstery. They found themselves confronted with a great difficulty, as the weight of the petrol-electric vehicle was greater than that of a gear-driven vehicle by just a sufficient amount to prevent them from constructing a satisfactory vehicle with the additional weight of four-wheel brakes and the extra weight of luxurious upholstery. Finally their friends were compelled to place a trial order for 100 gear-driven vehicles elsewhere, but the Minister of Transport had since stated that he would increase the weight forthwith by 10 cwt. This was ample to make up the margin required for the items he had referred to. Now that the difficulty of the weight question had been removed, they would do their best to obtain orders for the balance of the renewal of the fleet. Other old friends who had used petrol-electric vehicles for many years had recently placed other orders with them for the new type.

SHROPSHIRE, WORCESTERSHIRE AND STAFFORDSHIRE ELECTRIC POWER CO.—At the meeting last week, Mr. E. Garcke, chairman, said, in May last year, soon after the last annual meeting, the majority of the "A" and "B" ordinary shares were acquired by the Greater London and Counties Trusts, a British company representing American industrialists and financiers who understood the position of the company and the potentialities which it is the purpose of the company to develop. He was authorised by the chairman of the Trust to make a statement to the effect that the Trust had the intention of making a large issue of its capital to British investors as soon as the arrangements were completed and the time was opportune; that such issue would include the whole of their American electrical interests in this country, and that the British investing public would be afforded an opportunity to participate to the extent to which they might wish to avail themselves. The Shropshire, Worcestershire and Staffordshire Co. had acquired the electricity undertaking of the Corporation of the City of Hereford as from March 31st last year. They had also acquired the undertakings supplying electricity in Hook Norton, Bromyard and Blockley situated in their existing statutory area; and also those in Builth Wells, Presteign, Talgarth, Hay and Knighton. They were applying for a Special Order to enable them to supply electricity generally throughout the counties of Radnor and Brecknock, and also in the rural district of Newent, in Gloucestershire. Over £816 000 had been spent during the year on new capital works and the acquisition of undertakings. It was proposed to pay dividend for the year on the 6% cumulative preference shares, dividend of 8% for the year on the "A" ordinary shares, and dividend of 7½% for the year on the "B" ordinary shares, and to place to reserve appropriation account £57 895. The report and accounts were adopted.

BRITISH ALUMINIUM CO., LTD.—Lt.-Col. S. H. Pollen, presiding at the meeting last week, said net profit for the year was £443 102, compared with £441 383. The trading profit amounted to £407 977, against £399 498. The electrical industry, like the transport and chemical industries, consumed an ever-increasing quantity of aluminium. Their metal was being adopted as a substitute for non-magnetic iron in many instances, such as in the large casings for metal-clad switchgear, and the metal was also used for transformer radiators, shields for turbo-alternators, controller frames, junction boxes, bedplates, gear-cases, quick break switchgear parts, fans and innumerable other applications in economic substitution for other metals. Steel-cored aluminium cable was the standard cable employed on the British "grid" system, and it was in demand throughout the world. The most important event in the period under review was the completion of the first stage of the Lochaber works, which was effected before the close of the year, subject only to the finishing off of a few minor items. The Lochaber Power Co. was set up by the 1921 Act to carry out these works and to be responsible for the statutory obligations attaching thereto. Later they found it necessary to form an intermediate company—the North British Aluminium Co., Ltd.—to facilitate the hydro-electric development and to establish and operate the aluminium producing factory. The undertaking, when completed, would develop 120 000 H.P. and would be by far the largest hydro-electric installation in the British Isles. The period granted by the 1921 Act for the construction of the whole scheme was ten years, and it was necessary that they should obtain an extension of time in order that they might proceed with the remainder of the works, which had not yet been begun. The Lochaber Power Co. had therefore promoted a private Bill for obtaining an extension of time for the construction of the remaining works. During the year they disposed of the Orsières Power Co., a partly developed water power undertaking in Switzerland which was acquired prior to the reconstruction of their company. The report and accounts were adopted, and a final dividend of 6% on the ordinary shares, less tax, making 10% for the year, was approved.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO., LTD.—The Earl of Selborne, presiding at the meeting on March 27th, said the net profit declared for 1929 amounted to £77 801, and, adding £114 122 brought forward, there was a total of £191 923. An interim dividend of 2½% had been paid, and the directors now proposed to distribute a further dividend of 7½%, free of income-tax, carrying forward £102 283. The declaration of a profit and the payment of the usual dividend for the year had only been made possible by a transfer from reserves, and it was not proposed on this occasion to add any further sum to the present reserve fund of £365 000. Although they had succeeded in securing most of the orders given for submarine cable during the past year, the volume of work had been so small and at such competitive prices that the result was an actual trading loss. During the past two or three years there had been considerable consolidation in the varied interests of telegraphic intercommunication, involving both submarine cables and wireless. Naturally, the altering conditions would take some time to adjust themselves, but it was encouraging to note that among those best qualified to judge there was no lack or even lessening of faith in the future of submarine telegraphy. The coming of the so-called loaded cable was a great advance in transoceanic telegraphy, especially as it could be duplexed, and they were now considering a still further advance inasmuch as they anticipated the manufacture of super high-speed telegraph cables which would provide not only a far higher capacity for ordinary telegraphic traffic, but which should also, if required, be capable of being used for telephonic speech and facsimile reproduction. He was glad to report that the year 1930 had opened with better prospects, and they had already in hand a substantial order for the Italcable Co. of Rome to manufacture and lay a loaded cable between La Panne, in Belgium, and Lisbon, a distance of about 1 100 miles. This cable would be similar in type to the one they laid in 1928 for the Western Union Telegraph Co., which was capable of being duplexed at a speed of 1 400 letters a minute in each direction. The directors were not prepared to take a gloomy view of the prospects of the company. They were constantly effecting economies and improving the organisation. They were in a position to carry out submarine cable work of any magnitude; there were already signs of improvement in the outlook, and they did not lack confidence in the future. The report and accounts were adopted.

METAL AND CHEMICAL PRICES.

		Price.	TUESDAY, April 1st. Inc.	Dec.
Copper—				
Best Selected	per ton	£75 10 0	—	15s. 0d.
Electro Wirebars	,,	£84 5 0	—	—
H.C. Wire, basis	per lb.	11⅛d.	—	—
Sheet	,,	11⅛d.	—	—

Cleveland Warrants	per ton	£3 10 0	—	—
Galvanised Steel Wire, basis 8 S.W.G.	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£20 10 0	10.s. 0d.	—
Foreign or Colonial	,,	£18 17 6	2s. 6d.	—
Tin—				
Ingot	per ton	£170 15 0	£1 0s. 0d.	—
Wire, basis	per lb.	2s. 4d.	⅛d.	—
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£18 10 0	—	12s. 6d.
Mercury	per bottle	£22 15 0	—	2s. 6d.

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate* .. Ton £25 to £25 10s.
,, Roll, ,, £10 10 0 *Boric Acid* (Crystals) ,, £32 0 0
Sulphuric Acid (168° Tw.) Ton £6 15 0 *Sodium Chlorate*—per lb., 2⅛d.
Sodium Bichromate—Per lb., 3⅛d.
Rubber—Para fine, 8⅛d.; plantation, 1st latex, 7 11/16d.

∴ The metal prices are supplied by British Insulated Cables Ltd.

THE LEAD MARKET.

The market opened last week with an active tone, and according to James Forster and Co. a considerable business was transacted chiefly for forward delivery. Demand has since declined and prices slipped back. A better demand has been experienced in America, which resulted in the official price being raised 25 points to 5.75 cents per lb. Closing prices on March 28th were £18 16s. 3d. for all positions, 3s. 9d. to 1s. 3d. per ton up on the week.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BONAS, L. M., and WESTCOTT, K. A., 178A, High Road, Kilburn (trading as SAVOY RADIO CO), wireless dealers. £39 16s. 5d. January 27th.

BROOKS, Francis Edward, 9, Castle Street, Rugby, dealer in wireless parts. £25 7s. 6d. February 6th.

ELECTRAMONIC CO., LTD., 1, Budge Row, E.C., wireless manufacturers. £20 13s. 3d. February 11th.

JENCO LIGHT CO., 33, Garstang Avenue, Breightmet, Bolton, electric lamp dealers. £15 16s. 11d. February 26th.

NORTH SURREY ELECTRICAL FACTORS, LTD., 77, Sedge Street, Croydon, electrical factors. £18 11s. 3d. February 18th.

NUTTER, G. M., 246, Yorkshire Street, Rochdale, electrical dealer. £16 5s. 5d. January 31st.

PHILLIPS, Mr. W. W., 5, Station Road, Burry Port, wireless dealer. £10 2s. 7d. January 22nd.

SOLDERING FLUIDS, LTD., 2, Wells Street, Jermyn Street, S.W., wireless dealers. £22 16s. January 16th.

THOMAS AND STINCHCOMBE, LTD., Narrow Wine Street, Bristol, electrical engineers. £15 3s. 2d. February 25th.

WEINBAUM, Philip, 9, Old North Street, W. (trading as BLOOMSBURY WIRELESS SUPPLIES). £52 8s. 3d. January 27th.

YELDON, Gerald, 58B, London Road, Portsmouth, wireless dealer. £21 11s. 8d. January 30th.

Deeds of Arrangement.

JEFFERY, Albert Leslie, 180, Charnwood Street, Leicester, electric and wireless expert. Dated March 21st, filed March 27th. Trustee, F. Simkin, 16, New Street, Leicester. Secured creditors, £3; liabilities unsecured, £330; assets, less secured claims, £233.

WHITE, Herbert Daniel, trading as H. D. WHITE, Roden Street, Ilford, electrical engineer. Dated March 26th, filed March 31st. Trustee, W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C. Liabilities unsecured, £1 128; assets, less secured claims, £685.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HALCYON WIRELESS CO., LTD., 313, Regent Street, London, W., radio manufacturers. At a further meeting of the creditors held on March 27th, Mr. Gisborne, solicitor, representing the Six Sixty Radio Co., the largest trade creditors, who presided, said it had been hoped that the same group of gentlemen who were interested in the matter before might be able to put forward some offer, but the only definite offer that had been received was one of £10 000, out of which £5 000 would have been required to pay off the bank and there might have been a net balance of about £3 000 left to be dealt with in regard to the trade creditors' claims. Naturally they could not seriously consider such an offer as that. Other negotiations had been proceeding, but it was found that those with whom they negotiated were cognisant of the position and this, of course, handicapped them considerably. The committee thought that they might have had to come before the creditors that day and be compelled to recommend liquidation as the only alternative before them, but Mr. Emby had, in the meantime, been very active in trying to get friends and relatives to rally round him and come to the rescue in a difficult situation, and was prepared to make an offer to the creditors which was equivalent to 5s. in the £ to all the unsecured creditors. If the company were closed down on the figures as they stood, it did not look as if there could be more than 3s. 6d., or at the outside 4s. in the £. Mr. Emby said the committee had done everything that was at all possible to protect the interests of the trade creditors and to-day they had an offer which he submitted was a very generous offer in all the circumstances. If the company did go into liquidation, they would most likely get no more than 2s. 6d. in the £. Mr. Emby said that the Halcyon Company had had a good name in the past and while it was not ntended to manufacture in future, it was simply desired to keep the name and perform certain repair work, etc., which would be done at Pembridge Villas. The meeting discussed the matter for a considerable time, one or two creditors taking up a somewhat hostile attitude because printed particulars had not been supplied them. Eventually, a resolution was put to the meeting and carried, with three dissentients, in favour of accepting from Mr. J. H. Torring a sum equivalent to 5s., payable within twenty-one days and conditional on acceptance by all creditors within fourteen days.

VANDER-DE-VLIES, Charles Frederick, radio engineer, trading as RADIO HOUSE, 510, Stockport Road, Longsight, Lancs. Creditors were called together recently, when a statement of affairs was submitted which showed liabilities of £409 (£306 due to the trade and £103 to loan creditors), and net assets estimated to realise £143, or a deficiency of £266. It was pointed out that the assets in the statement of affairs were at estimated values, and in the event of a forced realisation would probably not realise the amounts shown. It was explained that owing to pressure by creditors, it was deemed advisable for the debtor to execute a deed of assignment in order to protect the assets for the general body of creditors, and that had been done, Mr. A. T. Eaves, of Harry L. Price and Co., 47, Mosley Street, Manchester, being appointed to act as trustee. After discussing the position, the creditors resolved that the deed of assignment already executed should be confirmed, and that the trustee should endeavour to sell the estate as a going concern.

London Gazette, etc.

Winding-up Petition.

ELECTRAMONIC CO., LTD. A creditor's petition for winding-up has been presented and is to be heard at the Royal Courts of Justice, Strand, London, W.C., on April 7th.

Companies Winding-up Voluntarily.

MERSEY RADIO AND GRAMOPHONE CO., LTD., Liverpool. Statutory meeting of creditors, Common Hall, Hackins Hey, Liverpool, Thursday, April 3rd, for the purpose, if thought fit, of nominating a liquidator and appointing a Committee of Inspection.

MORTLOCK (C.), LTD. Statutory meeting of creditors at the office of C. Eastlake Smith, chartered accountant, 29-30, King Street, Cheapside, E.C.2, Tuesday, April 8th, at 4 p.m.

Bankruptcy Information.

GOODRICK, John, Terrington Offerton Lane, Stockport, Chester, electrician. Receiving order, March 26th. Debtor's petition. First meeting, April 8th, 2.30 p.m., Official Receiver's Offices, Byrom Street, Manchester. Public examination, April 25th, 10.30 a.m., Court House, Vernon Street, Stockport.

MELVILLE, Ernest James, lately trading as JAMES MELVILLE AND CO., Dudley Chambers, Angel Row, Nottingham, electrical contractor. Receiving order, March 26th. Creditor's petition.

Notice of Dividend.

HUDSON, Rex Chadwick, 1 and 2, Bridge Road, Chatburn, Lancashire, electrical contractor. First and final dividend, 10d. per £, payable April 4th, Official Receiver's Office, District Bank Chambers, Blackburn.

Bankruptcy Proceedings.

BENJAMIN, Ernest Emanuel (trading with another as JOHNSTONE, BENJAMIN AND CO.), 10, Ascham Street, Leverton Street, Kentish Town, London, N.W. The affairs of this firm who had carried on business as wire and metal merchants and as electrical wire and cable manufacturers and was adjudged bankrupt in February, 1901, came before Mr. Registrar Warmington in the London Bankruptcy Court on March 26th on the hearing of an application for discharge by Ernest Benjamin. The Official Receiver said that the proofs of debt lodged against the debtors' joint estate amounted to £7 833, those withdrawn to £257 and the probable claims not yet admitted were £11 making a total of £8 101. The available assets of the joint estate were estimated at £5 912 and mainly consisted of shares in Johnstone, Benjamin and Co., Ltd. The trustees in bankruptcy afterwards filed a notice of motion for a declaration that the transfer by the debtors of their business and other assets to a company shortly before their bankruptcy was fraudulent and void and should be set aside and the Court made an order sanctioning a compromise submitted by the company whereby a sum sufficient to pay all preferential debts and 10s. in the £ on all provable debts owing to the unsecured creditors of the joint and separate estates was to be paid to the trustees, and dividends amounting to 10s. in the £ were in fact paid. In evidence the debtors had stated that the applicant began business as a wire merchant in 1890 and two years later added to the business that of manufacturer of electrical wires and cables and that of metal merchant. He was afterwards joined by his cousin Lewis Benjamin and they traded together as above. In August, 1900, the business was removed to the Crown Electric Works, 10, Ascham Street, and in the following year the debtors transferred the lease and goodwill of the business, etc., to the before-mentioned limited company in consideration of their appointment as managing directors and the payment to them of £9 200 payable in cash and shares although the cash (£500) never came into their hands. When they sold their business they were in financial difficulties and insolvent and unable to pay their debts as and when they became due, and although their trade debts exceeded £7 000, none of the trade creditors was consulted before the sale and no provision was made for the payment of their claims. The debtors attributed their insolvency to pressure by creditors, to loss in trading in consequence of the disturbance to their business through its removal in August, 1900, to lack of capital, to additional expenses occasioned by the removal, to bad debts and to inability to realise their shares. The Official Receiver opposed the application on the ground that the applicant had given an undue preference in favour of a creditor and having heard a solicitor on his behalf his Honour suspended the discharge for three months.

EXPIRING PATENTS.

Below is a list of patents of interest to electrical engineers and which, unless extended, expire during 1930 :—

No.	Date (1914).	Name of Patentee.	Subject of Patent.
85	Jan. 1 ..	British Thomson-Houston Co. (General Electric Co., New York).	Centrifugal compressors.
252	Jan. 5 ..	Arco and Meissner ..	Relay arrangements for wireless telegraphy and telephony.
641	Jan. 9 ..	Buenos Ayres and Pacific Railway Co. (Jas. P. Harte, Argentina).	Signalling apparatus.
1 556	Jan. 20 ..	Hammond, jun.	Control of moving bodies by radiant energy.
1 969	Jan. 24 ..	Automatic Telephone Mfg. Co., and Newforth, jun.	Telephone systems.
2 323	Jan. 28 ..	Gimingham	Electric lamps.
2 713	Feb. 2 ..	Shaw	Globe holders for electric and other lamps.
2 827	Feb. 3 ..	Stone and Co., and Darker	Electric train lighting, etc., systems.
3 358, 3 359	Feb. 9 ..	Western Electric Co. (Franklin, Tuthill and Woodward, Belgium).	Machine telephone switching systems.
3 360	Feb. 9 ..	Western Electric Co. (Franklin, Tuthill and Woodward, Belgium).	Impulse control systems.
3 385	Feb. 9 ..	British Thomson-Houston Co., Young and Garton.	Motor control switches.
3 405	Feb. 10 ..	Gardner	Signalling devices.
3 596	Feb. 11 ..	British Thomson-Houston Co., and Whitaker.	Current collecting devices for electrical machines.
3 696	Feb. 12 ..	Schweitzer and Conrad ..	Fuse device for electrical circuits.
3 699	Feb. 12 ..	Western Electric Co. (Franklin, Tuthill and Woodward, Belgium).	Electromagnetic relays.
3 756	Feb. 13 ..	Peck	Ignition devices for engines.
4 235	Feb. 18 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electric conductors.
4 873	Feb. 25 ..	Kershaw, Haywood, and Saxby and Farmer.	Interlocking apparatus for railway signalling.
4 953	Feb. 25 ..	Möller	Rotary h.t. rectifiers.
5 455	March 3	British Thomson-Houston Co., and Wedmore.	Protective devices for a.c. generators.
5 513	March 4 ..	Hall and Co., and Nield ..	Electromagnets and their application.
6 088	March 10..	British Thomson-Houston Co. (General Electric Co., New York).	Power generating plant.
6 210	March 11..	Gotthilf Ansgarins Betulander.	Automatic or semi-automatic telephone systems.
6 439	March 13..	British Thomson-Houston Co. (General Electric Co., New York).	Filaments for incandescent lamps.
6 443	March 13..	Maley and Cadbury ..	Brakes for tramway rolling stock.
7 336	March 23..	Maitre and Martin ..	Electromagnetic means for vibrating piano strings, etc.
7 692	March 26..	Maitre and Martin ..	Contact breaker for electromagnetic vibrating members.
7 766	March 27..	Hochstaedter	Electrical conductors.
7 820	March 27..	British Thomson-Houston Co. (General Electric Co., New York).	Centrifugal compressors, pumps, etc.
8 118	March 31..	Hatfield and Hookham ..	Electrolytic meters.
8 173	March 31..	British Thomson-Houston Co., Clough and Whitcher	Protection of a.c. generators, rotary convertors, etc.
8 327	April 2 ..	Payne, and Bristol Tramways and Carriage Co.	Control apparatus for multiple speed gear.
8 473	April 3 ..	Siemens Bros. and Co., and Grinsted.	Indicating device for electrical installations.
9 367	April 15 ..	British Thomson-Houston Co. (General Electric Co., New York).	Coating metals, and apparatus therefor.
9 666	April 18 ..	Dickson	Synchronising systems.
9 840	April 21 ..	Betulander	Automatic or semi-automatic telephone systems.
10 172	April 24 ..	Parsons and Bennett ..	Reflectors for searchlights, etc.
10 415	April 27 ..	Davies, and Gallenkamp and Co.	Resistance furnaces.
10 532, 10 533	April 28 ..	Peter	Alternating current track signalling.
11 116	May 5 ..	Torchio	Electrical reactors.
11 355	May 8 ..	Edgar Allen and Co., and E. Larmuth.	Points for tramways, railways, etc.
11 801	May 13 ..	Salman and Dodgson ..	Absolute permissive automatic block signal system.
12 361	May 19 ..	Withers (K. C. Cox, Norfolk Is.).	Selenium cells.
12 555	May 21 ..	Wise	Mountings or fittings for incandescent lamps.
12 573	May 21 ..	British Thomson-Houston Co. (General Electric Co., New York).	Governing mechanism.
12 926	May 25 ..	Hamilton and Ferranti ..	Mercury motor meters.
13 076	May 27 ..	British Thomson-Houston Co. (General Electric Co., New York).	Manufacture of tungsten.
13 248	May 29 ..	Marconi's Wireless Telegraph Co., and Round.	Production of continuous electrical oscillations and their utilisation for wireless telegraphy and telephony.
13 348	May 30 ..	W. T. Henley's Telegraph Works Co., and Savage.	Electrically heated vulcanising apparatus.
13 538	June 3 ..	Strohmenger	Electric welding and fusian deposition of metals.
13 549	June 3 ..	British Thomson-Houston Co. (General Electric Co., New York).	Manufacture of metal wire.
13 933	June 9 ..	Waters, and Callender's Cable and Construction Co.	Electric cables.
14 108	June 11 ..	British Thomson-Houston Co. (General Electric Co., New York).	Compressors.
14 119	June 11 ..	Dinin	Accumulators.
14 229	June 12 ..	British Thomson-Houston Co. (General Electric Co., New York).	Manufacturing metallic bodies.
14 294	June 13 ..	West	Electric controllers.

(*To be continued.*)

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

322 526 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline Impulse generators for use in telephone or like systems. (7/9/28.)
299 360 Associated Telephone and Telegraph Co. Electromagnetic relays. (24/10/27.)
322 533 Automatic Telephone Manufacturing Co., Ltd., and T. Blashill. Use of rectifier couples in telephone or like systems. (8/9/28.)
322 534 J. B. Hansell and Associated Electrical Industries, Ltd. Oil tanks for oil-immersed electrical apparatus, such as transformers. (8/9/28.)
297 039 Akt.-Ges Brown, Boveri, et Cie. Polyphase protective or regulating apparatus. (12/9/27.)
297 091 International General Electric Co., Inc. Over-load protective arrangements. (14/9/27.)
322 554 Edison Swan Electric Co., Ltd., and T. F. Stent. Formers for inductance coils and the like. (14/9/28.)
322 555 Callender's Cable and Construction Co., Ltd., L. G. Brazier and J. Urmston. Cores for electric induction coils. (14/9/28.)
298 603 Siemens-Schuckertwerke Akt.-Ges. Continuously-working absorption refrigerating-machines. (12/10/27.)
322 558 F. S. S. Wates. Electric meters. (20/9/28.)
322 559 State Railways Radio Co., Ltd., and L. Zoltan. Radio receiving-sets with a number of sets of headphones. (21/9/28.)
322 565 T. Bailey. Fuse insulators. (27/9/28.)
322 568 R. C. Graseby. Electric switches. (29/9/28.)
322 569 Igranic Electric Co., Ltd., and A. D'A. Hodgson. Intervalve transformers employed in radio apparatus. (29/9/28.)
322 578 J. G. H. Budd and British Automatic Totalisator, Ltd. Totalisators and like machines. (4/10/28.)
322 579 D. S. B. Shannon. Telephonic loud-speakers. (5/10/28.)
322 581 G. Simonis. Interrupters for electric ignition apparatus. (8/10/28.)
322 584 T. A. Biddington and R. Field. Wireless receiving-apparatus. (11/10/28.)
322 585 G. Pailin and Ferguson, Pailin, Ltd. Circuit-breakers. (11/10/28.)
322 592 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Means for regulating the phase displacement in an electric system. (18/10/28.)
322 595 Siemens Bros. and Co., Ltd., and J. R. Thorpe. Electrical condensers. (23/10/28.)
299 463 Anode Rubber Co., Ltd. Insulated joints for electric conductors. (28/10/27.)
322 600 British Insulated Cables, Ltd., and L. B. Wilson. Electrically heating rivets and other articles. (27/10/28.)
305 526 Condit Electrical Manufacturing Corporation. High-tension electric distributing and switching apparatus. (6/2/28.)
322 603 General Electric Co., Ltd., E. H. Croft, W. J. Paddock, and W. Wilson. Electric switches. (1/11/28.)
322 610 Siemens Bros. and Co., Ltd., F. Turner, and H. J. Hadlow. Recording-apparatus for measuring-instruments. (5/11/28.)
322 611 W. J. Pitt. Means for electroplating. (6/11/28.)
322 614 W. R. Everett. Radio or wireless aerials (antenna) for emission or reception. (8/11/28.)
322 615 T. Bailey. Fuse insulator. (8/11/28.)
322 622 R. A. Rothermel. Loud-speakers. (13/11/28.)
301 461 Associated Electrical Industries, Ltd. Contacts for circuit interrupters. (30/11/27.)
322 627 Whipp and Bourne, Ltd., and F. Whipp. Fusible-cut-outs. (20/11/28.)
322 634 D. R. Davies and Associated Electrical Industries, Ltd. Electrical switch gear. (26/11/28.)
301 839 Suddeutsche Telefon-Apparate Kabel und Drahtwerke Akt.-Ges. Electrical alternating-current rectifiers. (6/12/27.)
302 177 Suddeutsche Telefon-Apparate Kabel und Drahtwerke Akt.-Ges. Method of manufacturing alternating-current rectifiers. (10/12/27.)
302 184 Kalle and Co. Akt.-Ges. Production of light-sensitive layers by means of diazo compounds. (10/12/27.)
322 652 Siemens Bros. and Co., Ltd., and E. A. Forceville. Automatic telephone selector banks and selectors. (14/12/28.)
302 913 British Thomson-Houston Co., Ltd. Electric switch mechanisms. (22/12/27.)
322 662 British Thomson-Houston Co., Ltd. (W. D. Coolidge). Electrical discharge devices. (22/12/28.)
322 667 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Arrangements for modulating the frequency of electric oscillations. (1/1/29.)
322 670 Revo Electric Co., Ltd., and F. H. Reeves. Electric lamp fittings. (3/1/29.)
322 680 Radiologie Akt.-Ges. and F. Bennemann. Röntgen tubes. (19/1/29.)
322 682 Bullers, Ltd., and J. G. Miller. Insulators. (21/1/29.)
322 688 H. H. Berry. Electric imitation fires. (24/1/29.)

36 210 E. D'E. Moss. Electric lighters for cigarettes, etc.
36 229 M. A. Rowe. Thermal control for electric circuits
36 149 N. Simpson. Electric cutting knife.
36 163 F. Smith. Electric lamps for advertising signs, etc.
36 182 U. C. Tainton. Electrodeposition of zinc.
36 248 Telefunken Ges. fur Drahtlose Telegraphie. Direction finding apparatus. (16/1/29, Germany.)

COMING EVENTS.

Friday, April 4th (To-day).

Institution of Electrical Engineers (Meter and Instrument Section).—Victoria Embankment, London. Paper by Messrs. E. H. Rayner, W. G. Standring, R. Davis and G. W. Bowdler on "Studies in Low-Power-Factor Measurements at High Voltages." 7 *p.m.*

Monday, April 7th.

Society of Engineers (Inc.).—Geological Society, Burlington House, Piccadilly, London, W. Paper by Mr. R. Borlase Matthews on "Rural Electrification and Electro-Farming in Great Britain." 5.30 *p.m.*

Tuesday, April 8th.

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. Ordinary meeting. 2.30 *p.m.*

Institution of Electrical Engineers (Students' Section of the North-Western Centre).—Engineers' Club, Albert Square, Manchester. Annual general meeting. 7.15 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, George Street, Glasgow. Annual general meeting. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansal, on "The Imperial Chemical Industries' (Limited) Steam and Electrical Power Plant at Billingham." 7.30 *p.m.*

Television Society.—Engineers' Club, Coventry Street, Piccadilly, London, W. Lecture by Dr. T. H. Harrison on "Photo-electric Cells and their Applications." 8 *p.m.*

Wednesday, April 9th.

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting.

Electrical Contractors' Association (Eastbourne Branch).—Ordinary meeting.

General Electric Co.—Magnet House, Kingsway, London. Entertainment by the G.E.C. Dramatic Society. 7 *p.m.*

Television Society.—University College, Gower St., London, W.C. Second annual exhibition. 3 to 9 *p.m.*

Thursday, April 10th.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Electrical Contractors' Association (East Yorks. Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Paper by Messrs. S. W. Melsom, A. N. Arman, and W. Bibby on "Surge Investigations on Overhead Line and Cable Systems." 6 *p.m.*

Institute of Metals (Swansea Branch).—Thomas's Café, High Street, Swansea. Annual general meeting. 7 *p.m.*

Friday, April 11th.

Physical Society.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington. Fifteenth Guthrie Lecture, by Prof. P. Debye, on "The Scattering of X-rays in Gases in Relation to Molecular Structure." 5 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Savoy Place, Victoria Embankment, London. Address by Col. Sir T. F. Purves. 6.15 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-upon-Tyne. Annual general meeting, 7.15 *p.m.*

Saturday, April 12th.

Institution of Electrical Engineers (London Students' Section).—Visit to the Deptford Power Station of the London Power Co. 2.30 *p.m.*

Example of a C.G.S. Frequency-graph. Scale 39-44 cycles. High accuracy. Independent up to 20% of voltage variations. Made for any frequency and any useful scale amplitude.

Used by leading Supply Authorities.

THE ARISTOCRATS——AMONG RECORDERS

"C.G.S." RELAY-GRAPHERS

STANDARD RANGE: Voltgraph, Ampergraph, Wattgraph, kVA Graph, Frequency Graph, Power Factor Graph, Summation Wattgraph for any number of independent circuits. Distant Repeating Recorders and Indicators. Microampergraph for anode current, for Wireless and Photo-electric Cells, etc. Also Automatic Integrator and Switching Device operated by a Relay-grapher

STANDARD FEATURES: Motor-operated, therefore, though the instrument and the torque are exceptionally strong, the burden on the Instrument Transformers is small. Degree of Reliability and Accuracy unobtainable with other types. Straight co-ordinate chart 6 in. wide and 120 ft. long. Two-speed 8-day Clock. Easily adaptable to special requirements. Fully guaranteed.

ISTRUMENTI DI MISURA "C.G.S."

Manufacturers of Motor-operated Recorders for over 30 years

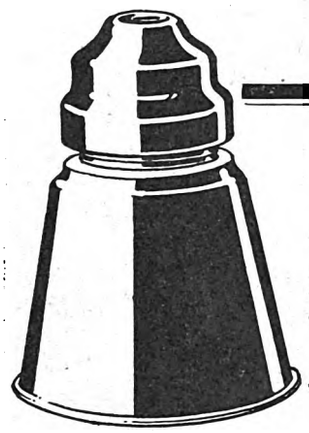
MONZA ITALY

For particulars and prices please write to the British Representative:—

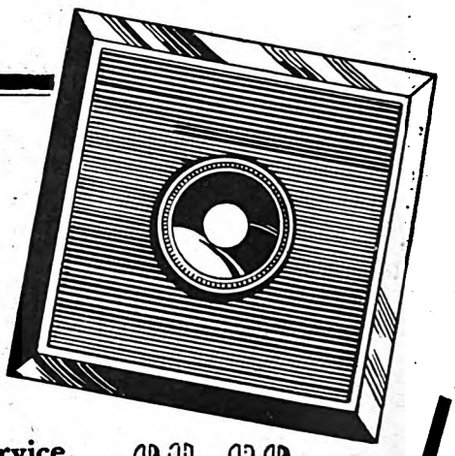
O. E. MALINVERNO

37, WALBROOK, LONDON, E.C.4

Cables: Wattografo, London. 'Phone: Mansion House 6918

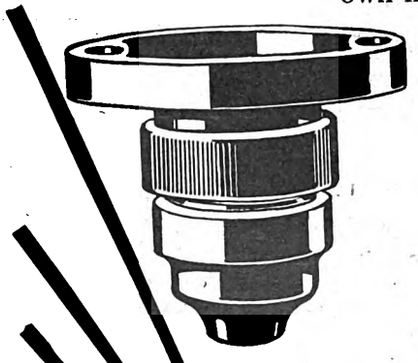


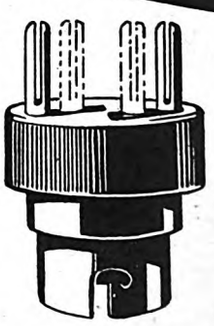
ASHDOWN



MOULDED Bakelite Accessories

Superior in design – finish – and sound value, to anything yet attempted. British made to the last detail in the Ashdown Works, and consistently specified and recommended on their own merits.





Ashdown Bakelite Moulding Service

Saves you trouble—it makes the dies and tools for you at less than cost, makes and fits the metal parts, and delivers the completed component dead to time.

N.B. Manufacturers of wireless accessories and electrical instruments are invited to prove for themselves the unfailing accuracy and high quality ensured by Ashdown Moulding Service.

EASTER HOLIDAYS.

The editorial, publishing and advertising offices of "The Electrician" will be closed for the Easter holidays from 6 p.m. on Thursday, April 17th, to 9 a.m. on Tuesday, April 22nd.

Russia.

BETWEEN the vast region which lies to the east of Poland and the Baltic States, stretching across Asia to the Pacific, and the Western world, a thick curtain has been drawn for more than fifteen years. The outbreak of war in 1914 severed the principal channels of communication on the European side and intercourse except between diplomats and military leaders was reduced almost to vanishing point. Three years later the Bolshevik revolution cut even these slender strands. Since then, Russia and Russian affairs have afforded an opportunity for the dissemination of a mass of fantastic statement and discussion in which facts are usually entirely subordinated to ideas. Hypnotised by the vast size and large population of the Soviet Union, and in spite of abundant evidence to the contrary, there are numbers of people in this country who believe that the Russian market is a Golconda for British industry, to tap which they are prepared to go to almost any length in condoning the most dishonourable and treacherous conduct. Repudiation of debts, amounting with accrued interest in the case of Great Britain alone to a sum that would almost liquidate our debt to the United States, brutal savagery, and an avowed determination to upset other forms of government leave these admirers of the Russian mirage unshaken in their views. The small extent of our pre-war exports to Russia, which then included Poland and the Baltic States—the most developed part of the old Russian Empire—is brushed aside with vague talk of "immense potentialities" regardless of the wholesale destruction of the never large purchasing power of this market which took place during the war and has been further reduced by the policy of the Soviet administration.

We print this week two views of Russia from different angles. One is an outline of the impressions gathered by Sir ERNEST BENN during his recent visit to the Baltic. The other is an American business man's account of the electrification programme that is being carried out under the Five Years' Plan. Sir ERNEST BENN did not enter Russia and his book, apart from its searching general criticism of Soviet economic policy, is particularly interesting as an indication of the views about Russia held by that country's nearest neighbours. That Soviet Russia is a most unpleasant and dangerous neighbour is very evident. It is also clear that the more money she has at her disposal the more dangerous and unpleasant she will become. Let us assume that the electrification programme described by Mr. DIBNER is completed and that extensive industrial production is thereby achieved. A new manufacturing area operating at starvation wages will then be competing with the industrial countries of Europe, and Russia, far from being a market, will be endeavouring to export manufactured products as well as foodstuffs and raw materials.

Mr. DIBNER points out that the great bulk of finance for the Five Years' Plan is derived from a population staggering under an enormous tax load. "To finance a total capital investment of nearly £7 000 000 000 under the Five Years' Plan from a population whose average monthly wage is only £7, with a purchasing power of only 59 per cent. of pre-war value requires a reinvestment of national income varying from 36 to 48 per cent. . . . The standards of living imposed by such heavy taxing allows only the most fundamental necessities." Yet it is an operation of this kind that the advocates of extensive credits to Russia are asking us to further. Sir ERNEST BENN'S book will, we hope, do something towards destroying popular illusions about Russia. One can, indeed, sell unlimited quantities of goods to purchasers if one is prepared to lend them the money without regard to eventual repayment, but trade so obtained is not worth having, especially if it is to be instrumental in helping the other party to the transaction in its plans to overthrow all who do not subscribe to its perverted doctrines.

Current Topics.

Burden of Taxation.

IN answer to a question in the House of Commons on March 25th Mr. SNOWDEN gave figures relating to the burden of taxation in Great Britain, Germany and the United States which indicated that the amount payable per head of population in this country is about 60 per cent. greater than in Germany and 75 per cent. more than in the United States. The per capita figures given are: United Kingdom, £15 1s. 5d.; Germany, £9 12s. 8d.; United States, £8 14s. 3d. It is not surprising that our manufacturers find it difficult to compete for export trade and even to retain their home market. We are about to learn what Mr. SNOWDEN has in store for us but in view of these figures he will have a difficult task to justify any increase in the present burden on British industry and trade.

North London Railway Services.

HAVING had the electrification of its London suburban lines under consideration for a number of years the L.N.E.R. has produced a plan for the conversion of the Great Northern section as far as Welwyn and Hertford. In view of the facts that the scheme was not put forward until the Underground project for an extension of the Piccadilly tube from Finsbury Park to Cockfosters was well on the way to receiving Parliamentary sanction and that the L.N.E.R. is vigorously opposing the tube extension the attitude of the railway company has rather a dog-in-the-manger appearance. This impression is fortified by the intimation that a final decision by the L.N.E.R. as to its own electrification programme is likely to be delayed until the fate of the tube Bill is known, and possibly, if the latter is passed, until the effect of the tube extension on traffic has been ascertained. We believe that there is ample justification for both projects but in any event the L.N.E.R. has only its own timidity and dilatoriness to blame for the prospective competition in an area which has been very badly served for many years.

B.E.A.M.A. and the National Scheme.

MR. HUGH QUIGLEY, in the course of an article published by the "Financial Times" on Tuesday, of which we give an abstract on page 466, charges the Electricity Commissioners with undue delay in sanctioning extensions to generating plant, and suggests that another 500 000 kW should have been ordered last year to keep pace with the growth of demand for current. It is hardly possible to challenge Mr. QUIGLEY'S figures, though it may be pointed out that the percentage of 4·4 relating to the small increase in new plant in 1929, which adds greatly to the impressiveness of his case, is perhaps too isolated to form the basis of an indictment. It must be remembered that the present generating capacity is some 70% in excess of the maximum demand. A primary object of the grid is to secure a better utilisation of plant and therefore to reduce this excess capacity. Given a really marked industrial revival it is possible that a shortage of current might be experienced in three years' time, in spite of the existence of this surplus capacity, but the fact that such a large margin does exist must impose a certain caution in sanctioning extensions.

Effect of the Grid.

FURTHER, as the grid grows towards completion the linking up of stations must tend towards a slowing down in the provision of new plant. It can indeed be said that had the South-East England grid been six months or a year further forward an extension such as that which was opened at Kingston on Wednesday would hardly have been authorised. Taking the long view it would not be in the interests of manufacturers to discount the future too freely, for in that case a larger number of orders at the moment would probably result in a very dull patch in the near future. Some attempt to even out the rate of provision of new plant would therefore appear to be in the general interest. It is possible that the Commissioners were ultra-cautious last year, but whether they are right or wrong can only be definitely proved by experience. We hope that a trade revival will show them to have underestimated the actual needs. In any case Mr. QUIGLEY has done good service in drawing attention to the subject, and the figures which he has collected will doubtless lead to a re-examination of the position by the Commissioners.

Progress in Portugal.

UNDER the dictatorship Portugal, like Italy and Spain, has made a notable advance in the direction of modernising the mechanical equipment of the country. Several years of stable government have transformed the financial situation, and have paved the way for the execution of a vigorous reconstruction programme of which Portugal stood in great need. An excellent system of roads is replacing the dreadful tracks of a few years ago, and the Government is now able to raise internal loans at under 7%. In the electrical sphere progress is also to be recorded. Most of the important areas are now linked by trunk telephone lines with one another and with Great Britain and Continental countries. At the general meeting of the Anglo-Portuguese Telephone Co., Ltd., last week, the chairman, Sir Alexander Roger, said that in 1929 there were 3 665 new stations connected to the company's exchanges, an increase of 16% in the year. By September the Lisbon Trindade Exchange will have been converted to automatic working. Given a continuance of sound government, Portugal should offer a growing market for electrical goods, particularly if it should be found possible to put in hand the long-discussed Douro hydro-electric project.

Inter-planetary Television.

A CONTRIBUTOR to the April issue of the "Telegraph and Telephone Journal" humorously discusses past failures to achieve wireless communication with the Martians and makes a fantastic suggestion of a combination of telescopes and valves which would enable confirmation or refutation of scientific conjecture in regard to conditions on Mars to be attained. Although we have no great faith in the possibility of establishing communication with inhabitants of other planets—should there be any of sufficient intelligence and mechanical skill within the solar system—it is an interesting thought that television apparatus would be of much greater practical use for the purpose than either Morse signals or telephony. Assuming that waves could be induced to penetrate the Heaviside layers of the earth and Mars and travel in a beam between the two worlds, the transmission and reception of pictures would provide a method of establishing comprehension which would be almost impossible by any audio system. But we fear that the prospects of finding planetary neighbours equipped with the necessary apparatus are remote.

EXTENSIONS AT KINGSTON-UPON-THAMES.

Opening by Sir John Brooke.—3 750 Brush Turbo-generator and 50 000 lb. Stirling Boiler Added—Output of 8 000 000 Units.

EXTENSIONS to the Royal Borough of Kingston-upon-Thames Central Electricity Station were opened by Sir John Brooke, K.B.E., C.B., on Wednesday, the new 3 750 kW turbo-generator being started up by Lady Brooke.

The company was subsequently entertained to luncheon at Nuthall's Restaurant by the chairman, Councillor A. A. Gregory, and members of the Borough Electricity and Lighting Committee. The Mayor, Councillor W. H. Bowskin, presided.

Proposing the toast of "The Kingston Electricity Undertaking," Sir John Brooke said that the Kingston Electricity Committee had been ready to co-operate with the London and Home Counties Joint Authority and was assisting neighbouring undertakings. It was already supplying Walton, and he understood that it was going to assist Twickenham and Teddington, and there might be further schemes maturing in which Kingston would be concerned. In the course of time the whole of the generation of the country would be worked substantially as one unit. This development would be no good unless we were able to use it to the full and rapidly increase consumption. Industrial success and civilised comfort in the future would depend on the cheapness and availability of electricity. He congratulated Mr. Kingham, the Borough Electrical Engineer, on the aggressive vigour of the administration of the Kingston station. Mr. Kingham was one of the band of progressive engineers in the area around London who were determined to keep their undertakings in the front rank. He suggested the formation of a branch of the Electrical Association for Women in Kingston.

Originally designed by Sir William Preece, the Kingston station was opened in 1893, and contained Belliss Siemens reciprocating sets with a total capacity of 225 kW, generating at 2 100 V, single phase, 77 cycles. The total output for the first 15 months of the undertaking was 128 267 units. It is estimated that sales in the year ended March 31st, 1930, reached 8 000 000 units. The maximum load has grown since 1894 from 100 kW to 4 630 kW, and the number of consumers has increased from 77 to 6 500. Belliss Siemens reciprocating sets were added, but no individual set was above 200 kW.

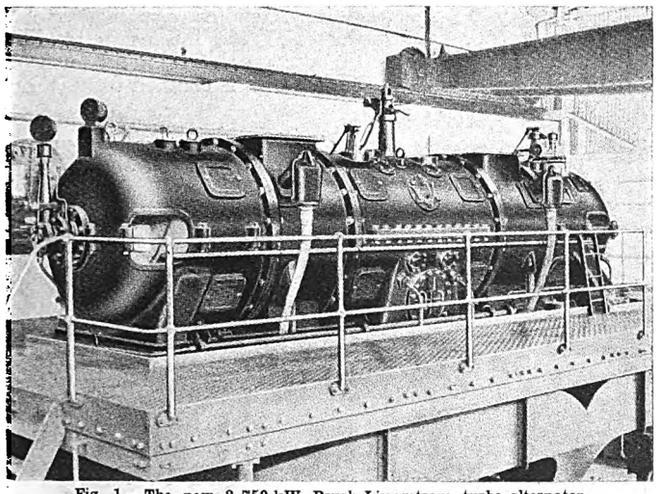

Fig. 1.—The new 3 750 kW Brush-Ljungstrom turbo-alternator, Kingston-upon-Thames.

In 1913 it was decided to instal two Diesel engines, one of 500 H.P. and one of 400 H.P., manufactured by the Maschinenfabrik Augsburg Nurnberg A.G., each of these direct coupled to a 270 kW alternator manufactured by Siemens Bros. of Woolwich. These were the first slow speed horizontal Diesel engines erected by this firm in England.

In 1918 the first two 1 000 kW turbo alternators were installed; these were of Brush-Ljungström make, manufactured by the Brush Electrical Engineering Co., Ltd., Loughborough, generating at 3 300 V, three phase, 50 cycles. In conjunction with this plant two five-drum Stirling boilers, each with an evaporative capacity of 21 000 lb. per hour, were installed.

It now became necessary to change over the supply in Kingston to 240 V for lighting, and 415 V, three phase, 50 cycles and 240 V, single phase, 50 cycles, for power. As it was anticipated that this work would take some years, it was necessary to instal temporarily two 1 000 kW frequency changing motor generating sets, manufactured by the Brush Company, the first of that type to be made in this country.

Owing to the greatly increased load in 1923 it was necessary to instal a further 2 000 kW Brush-Ljungström turbo alternator, and in the boiler house one 30 000 lb. horizontal tube Vickers boiler. This Vickers boiler was fitted with the first Illinois mechanical stoker to be erected in England.

The growth in output was so great that within a short time a further 3 000 kW set, also of Brush manufacture, had to be installed. During the time this set was being erected negotiations were begun with the London and Home Counties Joint Electricity Authority for a supply in bulk to Walton-upon-Thames, and on April 1st, 1929, that area first began to take current. A sub-station was erected at the electricity works, complete with transformers and switchgear, by the General Electric Co. In this sub-station were three 800 kVA transformers stepping up from 3 300 to 11 000 V.

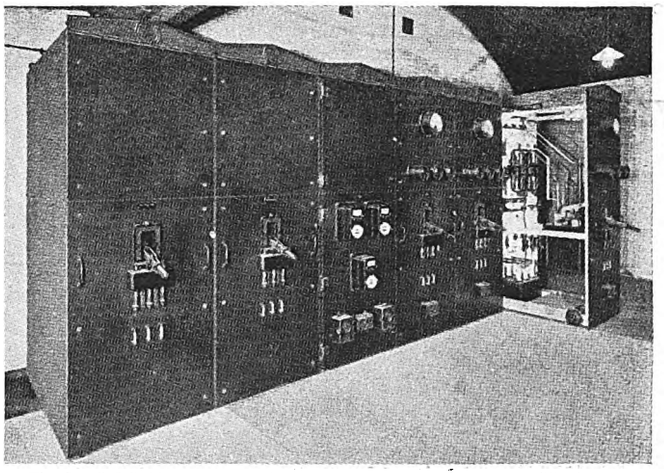

Fig. 2.—G.E.C. 11 000 V truck type switchgear showing one truck withdrawn.

The maximum demand from Walton in the initial stages far exceeded the original estimated requirements, and it was found necessary to instal the additional plant now running.

The Hackbridge Construction Co., of Walton-upon-Thames, are receiving from this station a supply of current for testing the 132 000 V transformers which they are manufacturing in connection with the National Grid Scheme, and this supply is given to them without interference with the network of either Kingston or Walton.

The present extension comprises additions to the boiler house; foundations, etc., by W. H. Gaze and Sons, Ltd., of Kingston; boiler by the Stirling Boiler Co., Ltd.; turbo-alternator by the Brush Electrical Engineering Co., Ltd.; e.h.t. switchgear and l.t. switchgear by the General Electric Co.; and cables by the Union Cable Co., Dagenham Dock.

The foundations for the boiler, owing to the nature of the ground, presented some difficulties, and the entire boiler and boiler sub-structure are carried upon a concrete raft having in places a total thickness of 9 ft. The boiler plant is of the Stirling five-drum type, with patent integral superheater and a Green's tri-tube economiser. The boiler is capable of producing 50 000 lb. of steam per hour, with an extremely large overload capacity. Under the boiler are two Babcock and Wilcox stokers of the enclosed type.

The turbo alternator of the Brush Ljungström type is most economical at an output of 3 000 kW when supplied with steam at a pressure of 225 lb.

The l.t. switchgear is enclosed in a cubicle of the steel plate type, and operated from a marble control panel on the switchboard above. The alternator cubicle is equipped with an oil immersed circuit breaker of 50 000 kVA maximum breaking capacity with the necessary instruments.

Additions to the coal conveyer were by W. J. Jenkins and Co., of Retford, who supplied the original coal conveyor.

The feed water system is driven by one Weir steam turbo-feed pump, and the centrifugal pump for the condensing water is manufactured by Messrs. Mather and Platt.

VULCANISED FIBRE.

A Misnamed Product—Method of Manufacture—Physical Properties—Mechanical Strength—Electrical Applications—Working Recommendations.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

THE use of the term "vulcanised" in the common name of vulcanised fibre is a strange anomaly, for no process in any way connected with, or even resembling, vulcanising is employed in its manufacture. Whatever its origin, the designation is of long standing, and appears firmly established both in common use and in technical specifications.

In its composition and processes of manufacture the material is closely associated with high-grade paper, and even more closely with pressboard, for it is a product of cotton rags which are first converted into absorbent paper. After further chemical treatment the material is rolled up on cylinders to the required thickness and put through finishing processes.. The processes of manufacture, unlike those of paper and

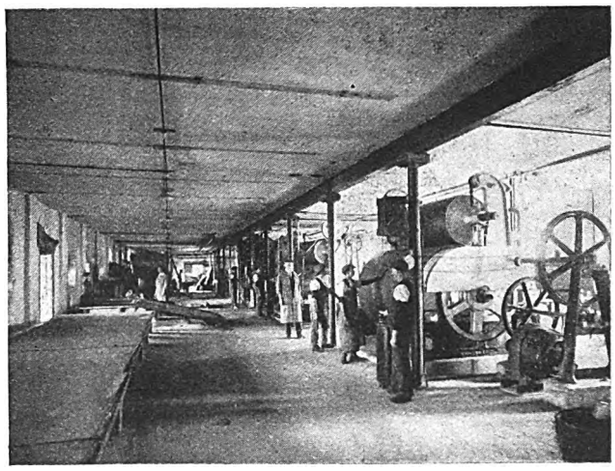

Fig. 1.—Fibre Making Machines, Maidstone Works of the Diamond Fibre Co. (see also Figs. 2 and 3).

pressboard, include what is termed an "acid" treatment actually a process using zinc chloride, and require a long soaking process for final cleansing.

Fibre had its origin in the United States, where the earliest patents on it were granted in 1859 to Thomas Taylor, whose successor, Edward Mendinall Taylor, founded at Wilmington, Delaware, the Diamond State Fibre Company. This was the first, and is still to-day, probably the largest firm of fibre manufacturers. The source of supply has remained chiefly in America. Independent British manufacture has not been developed to any great extent, but important manufacturing and development work is being done at Maidstone, in Kent, by the Diamond Fibre Company, which is associated with the American firm. Continental products are, generally speaking, of inferior grade.

The output of fibre finds extensive use in many directions. It is used extensively for electrical work, though probably not so extensively as before the development of bakelite and pressboard. In electrical manufacture, as will be seen later, its use is limited to mechanical service and low voltage insulation. Fibre boards are made from about $\frac{1}{32}$ in. to about $1\frac{1}{2}$ in. in thickness. In sheets thinner than $\frac{1}{32}$ in. the same material is known as leatheroid.

The pulp is produced from selected and cleansed rags, which are put through rotary cutting machines and rotary boilers. From the boilers the rags are delivered to washing machines, in which they are further macerated, and thence to beaters which draw out the fibres and form the pulp. From the beaters the pulp passes through continuous paper-making machines, where it is formed into flat wet sheets which travel over large drums for drying. In this stage the material is soft and velvety, resembling high-grade blotting paper. The sheets are wrapped into rolls and then delivered to the fibre-making machines (Fig. 1), where they are unwound, run through a zinc chloride bath for parchmentising, and rewound on drums or mandrels to the required thickness for the sheets or tubes.

The material, still soft and pliable, though now more dense and tough, is taken from the machines, the large cylinders for sheets being slit longitudinally and straightened out. The final treatment consists of a succession of soakings in solutions of zinc chloride, gradually diminishing in strength to pure water (Fig. 2). This process is a long one, the thin sheets taking about a week and the greater thicknesses requiring as much as a year or more to complete. Hurrying the process leads to the formation of blisters, which are usually relieved by pricking. Sheets which show evidence of having been pricked should be avoided by electrical manufacturers. The B.E.S.A. specification requires that the finished material should not contain more than 0·02 per cent. by weight of chloride.

In the final air drying the sheets shrink about 50 per cent. in thickness, 10 per cent. in length, and 15 per cent. in width. Drying warps the sheets so that it is necessary to flatten them in steam-heated hydraulic presses, after which it is put aside for several months in a dry, ventilated room to season. Before shipping the sheets are calendered to exact thickness (Fig. 3).

Fibre is ordinary supplied in natural (grey) colour, red or black. The red and black colourings are obtained to some extent by the use of selected coloured rags and to some extent by the addition of colouring matter. In general, material of the natural colour is preferable for electrical purposes, though red fibre is also used to a large extent. Research observations extending over fifteen years on machine slot wdeges of red and grey fibre in alternate slots in the same machines and examined after varying periods of service, have clearly demonstrated the superiority of the grey material. Regarding the varieties of fibre manufactured, it should be mentioned that two distinct kinds, designated respectively "hard" and "flexible," are made, the latter in two varieties, glycerine fibre and calcium fibre. Flexible fibre often contains a large proportion of jute. It is extremely hygroscopic, and is quite unsuitable for insulation. Consideration is therefore given here to hard fibre, only of high quality and high density.

Fibre rods are produced by turning up square sections cut from sheet. Wherever possible tube material should be used in preference to rod, since the concentric lamination gives less tendency to splitting and to warping. It is interesting to note that there has recently been placed on the market a form of fibre, in rod and special sections, which is claimed to have no

Fig. 2.—Fibre Washing Plant.

laminated structure, and therefore does not burr across lamination planes in threading. Specimens of the material certainly show very fine thread cutting. The new material also appears to have a lower moisture absorption characteristic than the usual material, and also to have exceptionally low shrinkage. It may prove to be an important development.

The physical properties of fibre are mostly good. It is unaffected by oil, grease and most solvents, including spirits, turpentine and acetone. Moderate dry heat does not affect it, and it does not melt under any conditions. At high temperatures it becomes brittle, but retains its other mechanical pro-

Digitized by Google

perties and electrical strength until it chars at about 180 deg. C. The weakness of the material lies in the effect water has upon it. It absorbs moisture readily, as shown in Fig. 4, which, with Fig. 5, is reproduced from "Electrical Insulating Materials," by Monkhouse. Under the influence of moisture the fibre swells, warps and loses much of its mechanical strength and practically all its electrical strength. For this reason it should be given a varnish or other protective coating, and even with this protection should not be used as insulation beyond the recommended limit of 20 V per mil, as mentioned in the notes on electrical strength.

The mechanical strength of fibre is probably its most remarkable feature. No other material, it is claimed, can favourably compare with high-grade fibre in the relation of its tensile strength to its weight. The mechanical strength characteristics of fibre are indicated by the curves reproduced in Fig. 5. The makers' claims approximate to the values shown as do also the minimum permissible values recommended in B.E.S.A. Spec. 216, the latter values being in general a little lower. It will be noted that somewhat sharp irregularities occur in the curves at a thickness of about ·25 in. These are due to the fact that about this thickness a change is usually made in the paper used in the manufacture of the fibre.

The electrical strength of fibre for boards of different thicknesses is indicated by the lower curve in Fig. 4. The makers' claim in this respect is 200 to 400 V per mil. It should be noted, however, that the values given are those obtained on thin specimens which have been subjected to a 24 hours' conditioning treatment of drying at a temperature of about 80 degs. C.

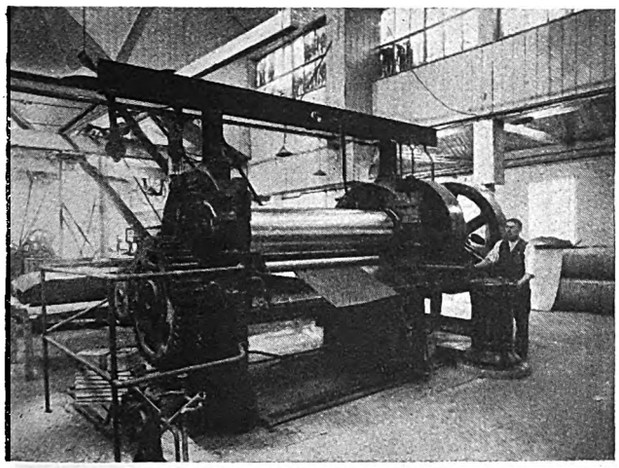

Fig. 3.—Fibre Calendering Machine.

The admitted tendency of fibre to absorb moisture causes great reduction of electric strength under humid conditions, and for this reason the British and Continental standard specifications recommend a limiting service stress of 20 and 15 V per mil respectively.

Some of the more important applications of fibre in electrical work are indicated in the following notes, together with some recommendations based on research work and manufacturing experience with regard to special methods of treatment and testing.

Washers for Supporting the Windings of Field Coils, Solenoids, etc.—Though some electric strength is desired, the mechanical strength consideration predominates. The material, after being cut to shape, is often given a treatment of varnish.

Spacing Blocks and Radial Segments for Supporting the Stator Windings of Turbo-alternators.—This is one of the principal uses of thick fibre board. Exceptional care should be taken to ensure the use of well-matured material, so that no shrinkage may take place in service. There is a tendency to use synthetic resin boards for this purpose, but experience has shown that fibre can be used satisfactorily.

Slot Wedges for Machines.—This is one of the most common uses of fibre, and it is one in which only the highest grade material should be accepted. The B.E.S.A. specification emphasises the importance of strength for this work by including a special test. In this test measurement is made of the pressure required to dislodge a slot wedge specimen from a slot. The types of specimen and the test apparatus used are such as to reproduce as far as possible the service conditions. Two sizes of wedge are suggested, both of round-edge section, one specimen ·66 in. wide and $\frac{1}{8}$ in. thick, and the other ·88 in. wide and $\frac{1}{4}$ in. thick. The minimum permissible pressures required to displace the wedge from the slot in a compression testing machine are given as 3 000 lb. per in. length for the smaller specimen, and 5 000 lb. per in. length for the larger. Since, however, there must be a relation between the results of this test and those of the shearing test, and test results have confirmed that this relation exists, the

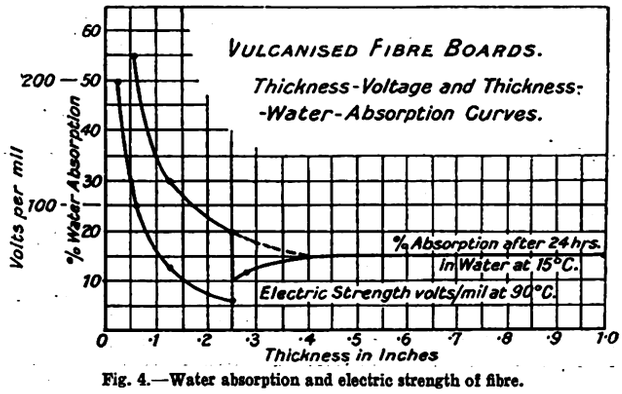

Fig. 4.—Water absorption and electric strength of fibre.

use of the special apparatus advocated can be dispensed with, provided that the shearing strength is not below 14 000 lb. per sq. in. for material of $\frac{1}{8}$ in. thickness, and 12 000 lb. per sq. in. for material of $\frac{1}{4}$ in. thickness.

The question of shrinkage is of vital importance where slot wedges are concerned, and, therefore, not only should the material be specially selected, but in almost all cases it should be shrunk by a curing heat-treatment prior to service, and treated with varnish immediately after the curing. It is interesting to note here that observation of the amount of shrinkage in the curing process will give a direct indication of the quality of the material; the poorer the quality the higher the percentage of shrinking.

Fuses, Bases and Tubes.—The suitability of fibre for this service is due to its remarkably good behaviour under fuse-wire charring tests. It withstands repeated explosions without appreciable carbonisation "tracking." Its excellent properties in this respect are indicated by Fig. 6, which shows comparative specimens of fibre, bakelite paper board and micanite subjected to the standard E.R.A. test. It should be noted that the fibre specimen has been subjected to ten explosions, the micanite to three, and the bakelite only to one.

The following recommendations given by the makers regarding methods of working the material are helpful, since in general the material is hard on cutting tools, and has a resilience which renders some operations difficult if too light a cut is attempted. Another important point is that, owing to the low heat conductivity of fibre, a tool which tends to bind will rapidly overheat.

Punching.—A plain punch and die may be used on sheets up to $\frac{3}{8}$ in. thick, but a smooth edge cannot be obtained on

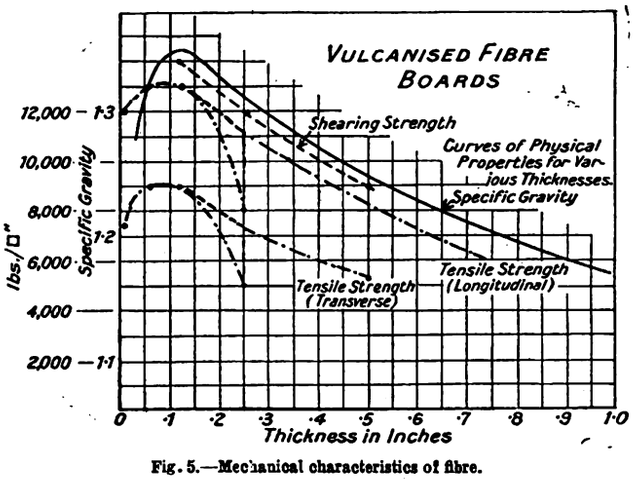

Fig. 5.—Mechanical characteristics of fibre.

sheets over $\frac{1}{8}$ in. thick. Sheets thicker than $\frac{3}{16}$ in. should be warmed to about 55 deg. C. A plain die will cut about 100,000 pieces before re-grinding is necessary.

Turning.—The peripheral speed should be 30 per cent. faster than for cast iron. The tool should be wide-nosed, with

Digitized by Google

a large clearance but no rake. The cut should remove at least $\frac{1}{8}$ in., as a light cut will not give uniform diameter. The tool is dulled quickly. No lubricant is needed.

DRILLING.—Fibre should be drilled dry, using a fast feed. The hole will be about ·003 in. undersize, hence, to prevent excessive heating, the drill should be removed from the hole as soon as possible. To make a hole the exact drill size or a little larger, the drill should be ground with one lip a little

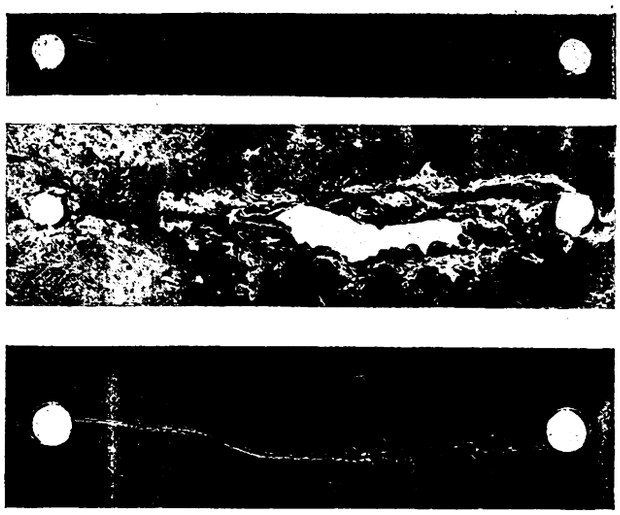

Fig. 6.—Comparative results of fuse wire tests. Top—Fibre, 10 explosions; Micanite, 3 explosions; bottom—Bakelite, 1 explosion.

longer than the other. A drill will last about three-quarters of an hour before re-grinding is necessary.

REAMING.—Fibre cannot be reamed. Two or three operations will dull the reamer and the hole will not be to size.

THREADING.—Ordinary taps and dies give good results. A very little oil should be used.

MILLING.—Use a high-speed and coarse feed, so that the cutter throws the chips away. If possible mill in one operation.

PLANING.—Use a high speed and take a deep cut, which should never be less than $\frac{1}{16}$ in.

SAWING.—Band and smooth saws of wide pitch, made specially for fibre, can be obtained from most manufacturers. A smooth saw will last $\frac{1}{2}$ hour on $\frac{1}{4}$ in. fibre, 20 min. on $\frac{1}{2}$ in., and 15 min. on 1 in. before being re-sharpened. A band saw will last 1 to $1\frac{1}{2}$ hours on $\frac{1}{8}$ in. fibre, and $\frac{1}{2}$ hour on $\frac{3}{4}$ in.

BENDING.—Sheet fibre can be bent if it is first immersed for 5 to 10 min. in a steam bath at atmospheric pressure. When cool and dry, it will re-harden and retain the given shape.

The authors' acknowledgements are made to the Diamond Fibre Company for information on manufacture and machining and for Figs. 1, 2 and 3; to Sir Isaac Pitman and Sons, Ltd., for Figs. 4 and 5; and to the Metropolitan-Vickers Electrical Company for permission to publish information gained in research work.

RIVERSIDE "B" STATION, SHANGHAI.

THE new Riverside "B" station of the Shanghai Power Co. has a capacity of 40 000 kW, raising the total capacity of the company's plant to 161 000 kW. Riverside "B" comprises two Metropolitan-Vickers turbo-alternator sets, each of 20 000 kW maximum continuous rating, twin cylinder, 3 000 r.p.m., arranged for stage bleeding; two Babcock and Wilcox Stirling boilers with normal evaporation of 140 000 lb. per hour and maximum of 185 000 lb. per hour, fitted with steel tube economisers, air preheaters and Lopulco pulverised fuel firing equipment, supplied by the International Combustion Co., England.

Records covering the four weeks ended December 25th show that during this period over 26 000 000 units were generated in the new station, representing 49% of the combined output of the Shanghai Power Co.'s stations. The fuel consumption was 14 498 B.Th.U.'s per kWh generated, giving an overall thermal efficiency of 23·55%. The fuel used has a calorific value considerably below 11 000 B.Th.U's. This is the first pulverised fuel plant to be installed in North China.

TELEPRINTING.

Teleprinter Service for Subscribers through Telegraph Exchanges.

WE learn that the Post Office is making preparations, which have reached an advanced stage, for the introduction of an entirely new development in telegraphic service. This will take the form of a public telegraph exchange, operated on the same lines as a telephone exchange, by means of which subscribers will be able to telegraph typewritten messages direct to one another. This innovation should revolutionise the telegraph service since it will eliminate all delay other than that which occurs through a desired connection being temporarily engaged, obviate the necessity for sending telegrams to a public telegraph office for despatch and enables a typewritten reply to be received almost immediately.

At the outset it is proposed to confine the new service to the London area but it will eventually be extended to all the larger centres if it proves sufficiently popular.

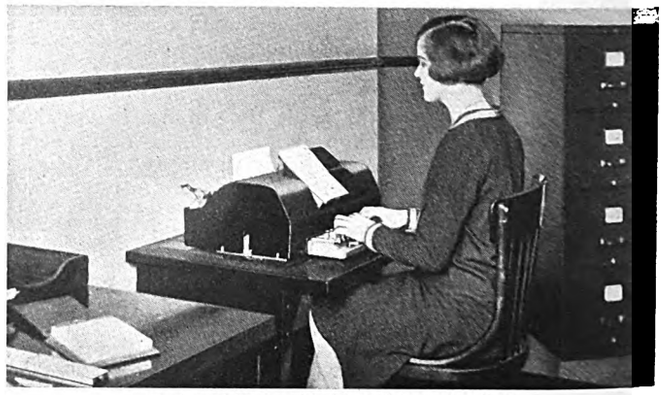
The London exchange switchboard will be installed in the Central Telegraph Office. Each subscriber will be provided with a teleprinter of the column-printer (not tape-printer) type, which any typist can use after a little preliminary instruction. The machines will be modifications of the Creed 3A machines now used in large numbers by the Post Office for high speed telegraphy. These machines receive on tape instead of in column, but otherwise are much the same as those to be supplied to subscribers.

Each subscriber will be allotted a number, and by depressing a button on the teleprinter will call the exchange operator. The number of the required subscriber will then be dialled, as in the case of automatic telephony. When the required connection has been made by the exchange operator, the indication "THRO" will be typed on the subscriber's teleprinter. The two subscribers may then proceed to typewrite to each other, and when they have finished, the depression of another button will notify the exchange operator of the fact and the connection will then be severed.

There will be automatic means for ensuring that subscribers are connected with the correct number asked for, i.e., when the two lines are connected, the exchange number of the called subscriber will be automatically printed at the receiving point of the calling subscriber's instrument.

Subscribers will be able to forward telegrams to the C.T.O., and, it is hoped, to all telegraph companies, without fee beyond the normal charges for the telegraph service. They will also be able to receive their incoming telegrams on their teleprinter instruments.

The subscription to the exchange contemplated at the outset is a flat rate of about £70 per annum where the subscriber's premises are within a two-miles radius of the C.T.O., and £75 per annum if the premises are beyond the two-miles radius but within a four-miles radius of the C.T.O. There will be an additional payment where the premises are beyond the four-miles radius.



Typing a telegram direct to a distant subscriber.

This subscription will cover the installation and maintenance of the lines and instruments and all communications with other subscribers on the Exchange. Additional instruments in the same premises will be obtainable for a further subscription of about £50 each per annum.

Owing to the amount of work involved, it is not likely that the Exchange will be in working order in much less than twelve months.

THE B.T.H. LABORATORIES.

Works Testing and Development—The Engineering Laboratory (Rugby)—General Electrical and Physical Work—Insulations and General Work—Chemical and Metallurgical Research—Million Volt Testing Equipment—Radio Development.

By H. WARREN and A. E. SMITH

THE multifarious activities of the B.T.H. Company necessitate very comprehensive investigation and testing arrangements. The design and construction of machinery and apparatus ranging from the largest steam turbines, generators, motors and switchgear, to talking film equipments, fractional horse-power motors, magnetos, radio and domestic appliances, and electric lamps call for an exact knowledge and control of all the materials used and principles involved, the march of progress demands daily improvement, and a continual striving after new things. Only by maintaining an efficient works testing corps and a separate expeditionary investigational force can advance be ensured, and these services entail the establishment of personnel and equipment of special interest and importance.

Fig. 1.—Experimental laboratory for synthetic resins, varnishes, etc.

The materials with which the manufacturing organisation is fed are specified to conform to the standards necessary for the service to which they are to be applied, these standards having been previously established by investigation and experience. The conformation to the critical standard is proved by constant acceptance tests on the raw materials, and successive tests in various stages of manufacture confirm the initial examination. These tests in the B.T.H. factories are, generally speaking, carried out in the works' chemical and electrical testing laboratories. The former undertakes all routine tests—physical, mechanical and chemical, and the latter takes care of routine electrical and magnetic testing.

These arrangements apply particularly to the main Rugby works; but the other factories specialising in specific lines of apparatus have, to some extent, developed testing and experimental arrangements appropriate to their main products; such a condition being the logical outcome of considerations of expediency and geography. The Coventry Works, for example, manufacture magnetos, radio sets and components, fractional horse-power motors, and moulded insulations; and the peculiar problems and materials associated with this combination require electrical, physical and chemical tests and experiments on the spot, augmenting the general information and service available from the central Rugby laboratories.

The Birmingham works, specialising in motors, uses metals proved in the Rugby laboratories, but tests its own insulating materials as delivered. The Willesden switchgear factory, with its special high voltage problems, requires its own high tension facilities, and so, logically, the million volt laboratory is there.

These works' testing laboratories take care of all the routine material testing required by the company, and certain of them also, as indicated, do a proportion of experimental and development work necessary in connection with problems of factory production and design. The general investigational and fundamental work on electrical, physical, insulation, chemical and metallurgical matters is carried out in the engineering laboratory at Rugby. No routine testing of any kind is done in this laboratory. It is wholly devoted to the investigation of problems connected with present and future electrical and allied manufacture, and constitutes a self-contained entity drawing its problems from the various departments and factories, and pursuing original lines of experimenting to the point where they become of manufacturing importance.

The engineering laboratory occupies two floors of a steel frame and brick building. There are 39 rooms of various sizes, and of these five are used for administration and offices, one is a library and records department, another is an experimental workshop, and the remainder are laboratories. The floor area is 20 000 sq. ft. There is also a large separate acoustical laboratory especially designed for work in connection with talking film equipment.

The insulation and chemical and metallurgical laboratories in which the chemical processes are carried out are provided with fume chambers connected to shafts extending to the roof of the building, and the radio laboratories are connected to a multiple 180 ft. aerial on the roof, as well as to other experimental aerials of various lengths and heights.

When these laboratories were established, the equipment was undertaken on rather unique lines; no attempt was made to acquire a collection of the usual testing and academical apparatus, but the current problems were specially considered and appropriate apparatus for grappling with them was designed and constructed, for the most part in the laboratories themselves. The vacuum physics laboratories have a complete manufacturing equipment exactly the same as that upon which radio valves are regularly produced in the factories. The insulation laboratories, in addition to special experimental machines, have small replicas of the regular works' plant, and as examples of special apparatus, constructed in the laboratory, a high frequency and high voltage oscillator, special high temperature measuring apparatus, loud speaker output, characteristic plotting gear, and carborundum squirting apparatus may be mentioned.

The special work undertaken in the engineering laboratory naturally necessitates very careful choosing of the staff, which is drawn mainly from the Universities and from the company's apprentices.

Work is constantly being carried out in connection with many special and diverse matters, such as batteries, carborundum resistances, fabrication, the development and improvement of factory products such as wire and coreplate insulation, vitreous enamelling, synthetic resins, textolite gears, radio valves, transformers, analysers, rectifiers, talking film apparatus and radio circuits. The instructions issued to the various factories give fundamental data upon which certain engineering designs are based. Manufacturing processes developed in the laboratory are covered by works' instructions, and these new manufactures are controlled in consultation with the works' authorities.

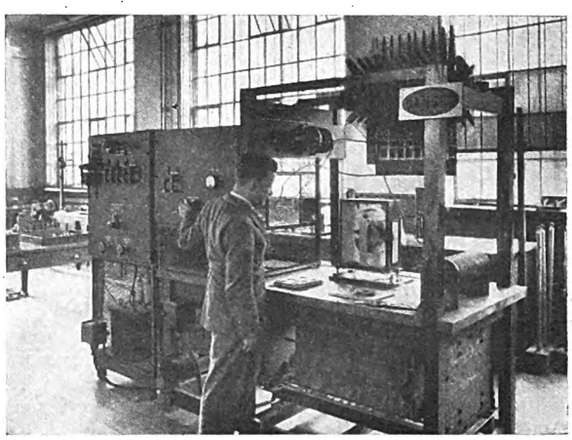

Fig. 2.—H.F. and H.V. apparatus in Insulations Laboratory.

Taking Laboratory No. 118 as an example, it may be mentioned that this room is used generally for electrical work involving specially accurate measurements. In addition to

Digitized by Google

a potentiometer and Wheatstone bridge for the calibration of special instruments, the room is equipped with apparatus such as standard condensers, inductances and resistances, which can be set up to form circuits for the accurate measurement of capacity, inductance, magnetic properties of iron, small phase angles in transformers, reactors, etc., and various other electrical quantities. The determination of the amplification characteristics of intervalve transformers and amplifiers, the measurement of the permeability of iron at flux densities of only a few lines per sq. cm., and also at extremely high flux densities, and the measurement of the phase displacement between high and low tension circuits of potential transformers, are among the more difficult observations made

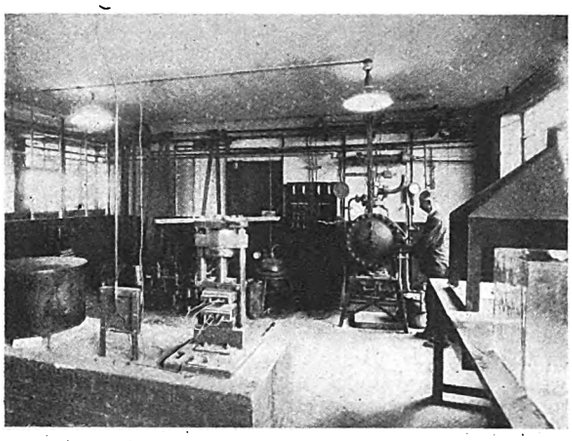

Fig. 3.—Insulation Process Laboratory.

in this room. In this laboratory, a sound-proof room is provided for the investigation of small motors, loud speakers, amplifiers, etc., and apparatus has recently been installed which enables the "frequency-output" characteristics of any amplifier or loud speaker to be projected upon a screen.

In Laboratory No. 124, the work is principally in connection with sound recording and reproducing apparatus. A range of power amplifiers capable of delivering from 1 to 50 W of undistorted power has been developed for the reproduction of sound from gramophone records, and up to 160 watts in the case of talking films. Special work has also been done on the theory of loud speakers, including large moving coil apparatus. A considerable amount of attention has been devoted to the reproduction of sound from photographic films, and this has resulted in the development of the "B.T.H. Reproducer," a 40 W talking film equipment which has been installed in many theatres. Such work as recording the sound on films is also in hand, and the characteristics of selenium and photo-electric cells are being closely studied. Telephotographic reception from America is also conducted.

In another laboratory work associated with small thermionic valves and rectifiers is carried out. Investigations in connection with new types, and special work in regard to the modification of existing types, as well as special life tests on valves are also undertaken. Certain special investigations are conducted such as those arising from difficulties with standard lines of vacuum devices; and observations of their characteristics are constantly being made.

The principal work carried out in Laboratory No. 117 is in connection with the production of new rectifiers, etc.; such devices are constructed on a small scale basis, and preliminary measurements of their characteristics are made, the work culminating (in collaboration with the works) in the issuing of the necessary data. Problems of general vacuum physics are also investigated as they arise.

In Laboratory No. 125 experimental reception and measurements on short wavelengths from America are periodically carried out by arrangement with the I.G.E. Company. The laboratory includes a special draped audition room for acoustical work, an optical laboratory, the equipment of which includes an optical bench and a quartz spectrograph, and adjacent photographic dark rooms. There is also a large acoustical laboratory provided with means of projecting and playing talking films.

Laboratory No. 111 is used generally for the experimental development of synthetic resins, varnishes, moulding powders, etc., and, in addition to this, experimental spirit and oil varnishes, lacquers, paints, filling compounds and cements are produced here. All the requisite testing gear to ascertain the chemical and physical properties and to aid the development of these new products is provided. Laboratory No. 11 is specially equipped with hydraulic steam and vacuum plant for the small scale synthesis and moulding of synthetic resinous compounds. Laboratory No. 21 is a process laboratory provided with electrical presses, experimental wire enamelling and cotton sleeving machines, a fabric treating tower, controlled atmosphere chambers and ovens, and experimental impregnation plant.

Laboratories Nos. 17 and 19 are respectively completely equipped for the high tension testing and the mechanical testing of experimental insulations.

Laboratory No. 16 is an e.h.t. testing laboratory in which sustained tests are carried out for protracted periods, and special apparatus is also set up for battery and electrical resistivity testing. Laboratory No. 12 contains special equipment for the experimental production of ceramic and refractory materials. In this laboratory a complete investigation of the production and properties of carborundum products is in progress, and new ideas in connection with electric fires are being pursued.

Many unclassified investigations are undertaken in the Insulation section of the laboratory such as the production and general applications of new resins; the improvement and development of sound producing records, and investigations of new processes and new non-metallic materials. Improved manufacturing processes relating to insulation and insulating methods are being constantly worked upon and an engineering sub-section of the insulation group deals specifically with troubles associated with manufacture and design as well as the conducting of new factory processes.

The work of the Chemical and Metallurgical section is conducted in the following laboratories:—

Analytical (Inorganic and Metallurgical).
Analytical (Organic).
Mechanical Investigational.
Microphotographic.
Physico-Chemical.

In addition there is an external laboratory equipped with plant for large and small scale melting, casting, annealing and other metallurgical processes requiring high temperatures. This laboratory is also equipped for pyrometric work. The work undertaken includes investigation into the causes and prevention of chemical and metallurgical difficulties, corrosion troubles, etc., either in the B.T.H. Company's works or in connection with outside installations. There is also a continual demand from the engineers for experimental investigation of the mechanical, physical and chemical properties of materials required to meet the new and ever increasing demands of the industry, and for other pure or applied researches.

The experimental investigation of metals (ferrous and non-ferrous) involves chemical analysis, mechanical testing, and

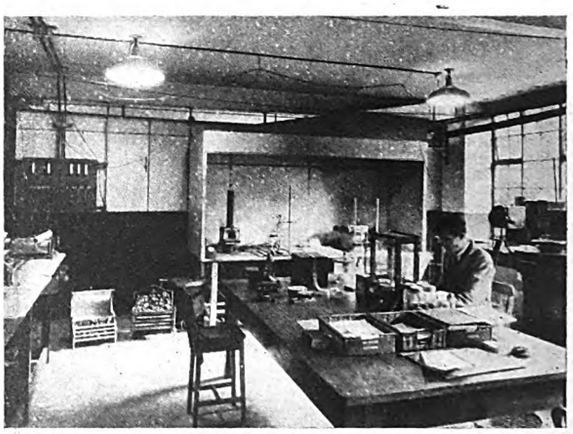

Fig. 4.—Experimental laboratory for Ceramics, Refractories, etc.

examination under the microscope, and a room possessing two special fume chambers and necessary equipment is devoted to such matters as organic and metallurgical chemical analyses. In other rooms testing machines are available for the mechanical examination of materials in tension and compression at normal and at elevated temperatures, for resistance to shock and vibratory stresses, also for examining hardness.

The microphotographic laboratory is provided with the necessary metallographic and petrological microscopes and optical bench, together with camera for recording observations

Digitized by Google

on the structure of metals, rocks and minerals, and apparatus for polishing the surfaces to be examined and a dark room suitably fitted up for developing and printing are available.

A considerable amount of work comes into the Chemical and Metallurgical section in regard to boiler problems, and this involves water analysis. A special room is devoted to this and to other research work of a miscellaneous character. The section possesses an up-to-date refractometer, a spectrometer, and other special apparatus.

The organic analytical laboratory deals with a variety of problems arising out of the use of oils for insulation in switchgear and transformers, also for the lubrication of turbines and other machinery. Other organic investigations are carried out in this laboratory in co-operation with the insulation laboratories.

Every investigation undertaken in the laboratory is allocated a number. A job sheet is made out carrying at its head the title of the investigation ; it is filed in the worker's note book in front of his notes relating to the work. As the work proceeds the changes in the position of the job are noted on the sheet, and at intervals every sheet is reviewed by the section leaders or chief of the laboratory. Every job sheet has a duplicate, kept up to date, in the library, and thus at any time the jobs in hand in the laboratory, and the position of each man's work, can be ascertained in the library.

Instructions are issued to the works on the following forms :—

(1) Material Process Specifications.—These cover such things as the manufacture of all kinds of compounds, enamelling of wire, vitreous enamelling, etc.

(2) Material Inspection and Test Sheets.—These relate to the inspection and tests of materials. (These tests are carried out by the works' testing departments.)

(3) Treatment Specifications.—These cover treatments of insulations and machines.

(4) Engineering Laboratory Instructions.—These record certain fundamental design data.

The common practice of having permanent clerical or general abstractors has not been followed. The men engaged in the ordinary work of the laboratory are best qualified to do the abstracting, and the whole staff has been organised for this important work, every man being encouraged also to follow the general current technical literature in the library. Each man on the staff has allocated to him the duty of abstracting from one or two specific journals, and he is responsible for supplying to the Librarian the necessary references and abstracts, the Librarian filing and indexing all the material that he collects. This same routine applies to scientific papers and patent specifications, and a master index of abstracts is available in the library, under the following three headings :—(1) authors, (2) subjects and (3) patents.

The library was purposely started with empty book shelves. No attempt was made to acquire a collection of ordinary textbooks, as the Works' Data Department already had such a library. Any books required by the staff and bearing on current problems or modern scientific advance are purchased on request and in this way a collection of books of real live interest to the men using them has been established.

The Engineering Laboratory co-operates with all the various national research and standardising associations. It also operates in collaboration with the laboratories of associated concerns, and is in intimate touch with scientific and development work going on in America and on the Continent.

The Electrical Laboratory at Rugby has a total floor area of 4 161 square feet. This laboratory carries out the routine electrical and magnetic testing of metals, the mechanical and electrical testing of insulations, etc., and the repairing and standardising of all classes of instruments and meters used in the factories.

The Chemical Testing Laboratory at Rugby has a total floor area of 3 120 sq. ft. It is divided into three sections :—

(1) Mechanical testing section.
(2) Inorganic section.
(3) Organic section.

The mechanical testing section is equipped for carrying out mechanical tests on the various materials such as cast iron, steel, non-ferrous alloys and other metals used in the factory. The inorganic section is equipped for conducting analyses of all the non-ferrous materials and alloys used in the brass foundry, bearing metals, raw materials such as pig iron, coke, sand, etc., used in the iron foundry, steels, boiler water, etc. The organic section tests materials such as solvents, gums, filling compounds as well as transformer and lubricating oils.

The Rugby Measuring Room deals with the standards of measurement, and is responsible for checking and setting all works mechanical measuring devices. It is regarded as a department for the standardisation and maintenance of gauges, and so on, but it also functions occasionally in settling dimensional questions of an investigational character.

Gauges for large and important work are made in this department and are checked every time they are drawn from stores for a job. Screw gauges are also examined and checked. and a Cussens projector is provided. Standard profile gauges are finished with the aid of the projector, and it is now regular practice to make bucket blade drawings for turbines on millboard so that the drawings may be used as templates.

At the Willesden works, where switchgear is manufactured there is a high voltage laboratory used for routine production,

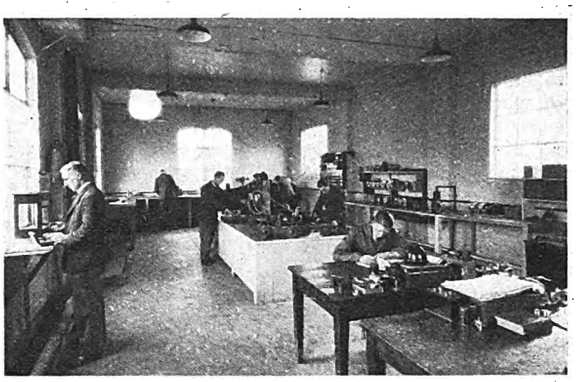

Fig. 5.—Magneto Development Laboratory—first floor.

testing of switchgear and component parts, as well as for experimental work at high voltages, especially where voltages above 100 kV are involved. The equipment in this laboratory includes a 300 kV testing transformer with the necessary control gear and oil testing tanks, for tests both in air and in oil, and if necessary for tests in hot oil, e.g. at 90° C. Provision is also made for testing insulators in the " wet " condition by means of artificial rain. A 1 000 000 V transformer has recently been installed to enable testing to be carried out at voltages up to this limit. A special motor alternator set is provided for supplying the transformer, and a sphere gap peak voltmeter is included in the permanent equipment to ensure accurate measurements of voltages during tests.

The Coventry organisation is concerned mainly with (1) magnetos and ignition devises for use with internal combustion engines, (2) lighting sets for motor vehicles, and the manufacture of fractional H.P. motors, (3) radio apparatus, and (4) the manufacture of moulded insulations.

The magneto development laboratory comprises a two storey building. The upper storey is provided with the usual modern laboratory equipment, and here the staff carries out all tests and investigational work appertaining to ignition apparatus. Provision is also made for the testing of motor cycle lighting sets, starting and lighting equipment for cars and fractional H.P. motors.

A room on the ground floor is equipped for the performance of endurance tests over extended periods on all these types of apparatus. A " moist " chamber is provided in which the temperatures and humidity can be controlled to give almost every atmospheric condition. An arrangement is also provided whereby ignition apparatus can be tested on engines, a Heenan and Froude dynamometer being direct coupled to the engine to give all working conditions of load and speed.

The radio development laboratory consists of four rooms, two of these rooms being devoted to testing and investigational work ; a third room is set apart for the construction of special experimental apparatus, and the remaining room consists of a conference room and library. Various pieces of apparatus which have been developed in the Engineering Laboratory at Rugby are utilised in this laboratory for testing, an instance of this being the apparatus for determining the frequency output characteristics of amplifiers and loud speakers.

The Moulded Insulation Laboratory, which is adjacent to the moulding shop, exists primarily for the purpose of assisting the manufacturing organisation to maintain proper control of the manufacturing processes in this department.

RUSSIA'S ELECTRIFICATION EFFORT.

American Business Man's Impressions—£40 000 000 Spent Last Year—330 000 h.p. Dnieprostroy Hydro Electric Station—Difficulties of Finance.

MR. A. B. DIBNER, vice-president of the Burndy Engineering Company (United States), contributes an interesting article on "Russia as an Electrical Market" to the "Electrical World" of March 8th. Mr. Dibner visited Russia recently to study Russia as a market for American equipment. In the course of his survey he gives details of the extensive electrification work that is in progress under the Five Year Plan which was initiated on October 1st, 1928.

The total expenditure for electrification for 1929 was over £40 000 000, financed by the Soviet Union, the individual states and the communities, according to the relative national or local importance of the work. New plants already constructed and operating on a national basis generate 250 000 kW, of which 73 000 kW is by hydro, 140 000 kW by peat, and only 38 000 kW by coal and coal dust. At the termination of the "Five Year Plan" the value for peat and coal will be raised to 393 000 kW and 324 000 kW, respectively.

The reason for the predomination of peat as a source of energy is due to the fact that the rich anthracite beds are located in south-eastern Russia in the Donetz Basin, some 400 miles from Moscow, and similar large points of consumption. The rail haul over these long distances is, in the present condition of the railways, unwarranted, particularly in view of the presence of large peat beds comparatively near both Leningrad and Moscow. This peat is mined by a number of methods, varying from the primitive pick and shovel to the most modern hydraulic mining.

Plants under construction today are, however, largely coal-burning or hydro. This is made possible by developing the Dnieper River at Kichkas and concentrating many new industries close to the coal regions, as at Rostof and Stalingrad. The generating capacity of the group at present under construction totals 796 000 kW (initial output), with plans for ultimate extension to 1 285 000 kW. Of the present group, 473 000 kW will be hydro generated, 110 000 kW will burn peat, 170 000 kW coal and coal dust, and 43 000 kW will use petroleum from the extensive sources of supply in the Baku oil fields.

Plants still included under the "Five Year Plan," on which construction has not yet begun, but for which money has been appropriated, cover a total capacity of 1 021 000 kW, distributed among 22 stations.

There is an increasing list of concessions available for entire power plants of first-line capacity, totalling at present some 512 000 kW of national importance alone. This includes an 80 000 kW hydro and a 60 000 kW coal-burning station. These are among the 22 stations totalling 1 021 000 kW of plants forming part of the national scheme for immediate construction, but the financing of which has not yet been fully determined, although preliminary negotiations have been started.

Pre-eminent in this group is the Dnieprostroy hydro station, rising out of the wilderness on both banks of the Dnieper. Design and supervision of construction are under the direction of Col. Hugh L. Cooper. The river is dammed by a concrete structure that will raise the river level 160 ft. above the rock foundation. The immediate capacity of the four turbines will be 330 000 H.P. with an ultimate installation of 750 000 H.P. generated by nine units. Each of the four initial units is an American General Electric 77 500 kVA, 13 800 V 3-phase, 50 cycle vertical shaft waterwheel generator.

Large Area to be Served.

The energy generated will in all probability be distributed chiefly to vast local electrochemical works for the manufacture of aluminium, ferro-manganese, and electrical steel. The plant will also serve an area of some 300 miles radius, equivalent to that of the six New England States. A portion of the energy will also be sent at 220 kV to the Don Basin and to Ekaterinoslav, an industrial centre 60 miles north. It is contemplated that this plant will be completed by 1934 at a cost of about £22 500 000 for power and navigation facilities.

At the Krassny Oktiabre plant, which is being erected near Leningrad, the steam equipment is being installed under the supervision of the Metropolitan-Vickers Company, this organisation having received the major contracts for supplying this equipment. It is being equipped with the very latest construction in peat-burning equipment. Some 5 000 men and women are engaged in the work.

German and Swedish high-tension transformers and oil-circuit breakers are being installed in a well-laid-out outdoor yard. The outdoor high-tension buses are supported by Thomas-Hewlett insulators.

The magnitude of the entire Russian electrical programme is made greater by the dearth of technical materials and trained labour, the poor condition of transport facilities, and particularly the out-of-way locations of power plant sites. To this must be added the background of a national purchasing organisation with a future that is suspect abroad, where the bulk of the required equipment is to be purchased. The situation is one in which credit is limited and the great bulk of finance is derived from a population staggering under an enormous tax load. To finance a total capital investment of nearly £7 000 000 000 under the "Five Year Plan" for industrial development from a population whose average monthly wage is only £7, with a purchasing power of only 59 per cent. of pre-war value, requires a reinvestment of national income varying from 36% to 48%, graduated over the five years. The standard of living imposed by such heavy taxing allows only the most fundamental necessities.

One phase of the programme, according to Mr. Dibner, is the general interest of the citizens in electric power stations. It is in these embodiments of the technical ideals of the Soviets that the labourer and peasant see emancipation from the earthly labour that has been their lot through the long, dark years of Russian history. It is no uncommon holiday that finds 500 or 600 labourers and peasants being guided through the larger steam stations.

DIRECTION-FINDING APPARATUS.

Result of Tests at Slough—Superiority of Modified Adcock System.

AT the Institution of Electrical Engineers on Wednesday, a paper by Mr. R. H. Barfield, M.Sc. (Eng.), A.M.I.E.E., on "Recent Developments in Direction-Finding Apparatus" was read.

Part (1) describes a four-aerial direction-finding system erected at a site near the Radio Research Station, Slough, and gives details of the tests carried out on this apparatus at wavelengths of 300 to 600 m. The system is based on the Adcock principle, but a modification has been introduced to correct for the asymmetry of the aerial system with respect to its upper and lower portions which is unavoidable if the operating hut is at ground level.

The results of the tests show the new system to be considerably superior to the closed-loop system for conditions of "night effect." They indicate, however, a residual instrumental error of the system in the presence of downcoming waves. Finally, a further modification of the system by which it is hoped this will be eliminated is described.

Part (2) describes two distinct types of portable short-wave direction-finding apparatus and gives details of the methods by which they were tested and compared under working conditions at wavelengths of 12 to 60 m.

The first instrument is of the totally-screened closed-loop type. The second instrument is of the rotating Adcock type consisting of a single pair of spaced vertical aerials pivoted about a vertical axis.

The tests described are divided into four sections :—

Test (*a*) showed the Adcock to be much superior to the loop in the presence of downcoming horizontally polarised waves, while (*b*), (*c*) and (*d*) show that for observations on the ground ray both instruments are equally satisfactory and that with due precaution in the choice of a site their performance is much the same as that of longer-wave apparatus. For observations just outside the range of the ground ray both systems are equally useless, while at greater ranges (beyond the "skip distance") the results again demonstrate the superiority of the Adcock to the loop.

It is shown that the results generally confirm the conclusions with respect to the nature of the propagation of the waves arrived at by Eckersley* from somewhat similar experiments.

SOME FACTS ABOUT RUSSIA.*

Sir Ernest Benn's Critical Survey of the Five Year Plan—Finland's Experience of Soviet Economic Policy—The Question of Credits—A Warning.

MANY British merchants and manufacturers have long hoped for a sharp increase in business following the resumption of diplomatic relations with Russia. Those hopes have not been fully justified as yet, and the unsettlement of Russia itself due to Government attacks on religion and the surviving landed peasantry seems to put off their justification to a future still more remote.

It is opportune, at a time when a British Government well disposed to the present Russian rulers is quite sincerely pinning much faith to the industrial capacity of the Soviet régime as a solvent for some of our unemployment, that a business man should publish his opinions on the subject. Sir Ernest Benn's new book will at once commend itself to those who heard gladly the confessions of a capitalist, marking with satisfaction a break in the traditional and too self-effacing silence of the British business man.

Communist Claptrap.

Sir Ernest Benn makes a close survey of the Five Year Plan of Industrial reconstruction, to which the Soviet Government is now devoting much energy. As his information is provided by Communist documents, his criticism is the more effective. A Communist pamphlet on the plan, quoted by the author, declares that "The productivity of labour, thanks particularly to the great development of mechanical energy of all kinds, will increase by 110 per cent., and the costs of production will decrease by 35 per cent., under the Plan. *But this will not prevent a further increase in real wages.*"

But how, asks Sir Ernest, "can we argue about the first two sentences of the above quotation? Production will increase by 110 per cent., costs of production will decrease by 35 per cent. Those are the premises, and then italics are used to emphasise the monumental truth discovered apparently in Moscow and in Moscow alone: '. . . this will not prevent a further increase in real wages.'

"If it were again possible, as it has often been possible in the past in industrial countries properly managed by industrial methods properly understood, to increase production by 110 per cent., costs of production would decrease certainly by 35 per cent., probably by a great deal more, and no power on earth has ever been able or would be able to prevent a doubling or trebling of real wages."

The assertion by the Soviet rulers of their desire for the welfare of the world's workers comes under the author's eye. He doesn't believe it. And the following reason (provided by Sir Ernest's recent tour of the Baltic States) presents a pretty problem for the theoretician who is apt to think of trade with Russia in terms of sentiment, not business:

"The liking of the Finnish workman for Bolshevism and its ways is not enhanced by the obvious fact that the Russian workers are keeping their fellows in Finland in a condition of very dire poverty. The Enso [timber] works to which I have referred have managed for some years to scrape out a 6 per cent. dividend on their capital, not an extravagant return from an industry which is conducted with great efficiency, but this figure is accompanied by wages to the women of about 15 shillings and the men of about 30 shillings a week, respectively. These figures, it is true, mean more than they seem, because life at Enso is very simple, rents are not worth mentioning, fuel is free, supplies (such as they are) cheap. Nevertheless women are working a twelve-hour day at strenuous tasks for 15 shillings a week, and even so, are threatened with unemployment because the Russians are supplying our and their markets at prices much lower than the Finns can accept. It is not pretended, even by the Bolsheviks, that the Finns could go lower. It is not suggested that there is any waste or lack of efficiency in the Finnish method or the Finnish equipment. It is universally agreed that with the marvellous system of water transport through the 36 000 lakes of Finland, with mills on the water's edge, with machinery of the most up-to-date description, the Finns are able to deliver timber to the world in competition with anybody who wants to live. They therefore argue, not without justice, but with considerable fervour, that the Russians do not want to live; that the Bolsheviks do not care whether the Russians live or not. They have one object, and one object only, in delivering timber to London or to any other market. That object is to get cash, not to pay Russian wages, but to conduct Communist propaganda."

Again, on the argument that Russian trade depends on "credits," Sir Ernest is particularly trenchant:

"The Bolsheviks have for years past, with and without recognition, sent to this country vast quantities of timber, oil, and other commodities, quantities which are well below the pre-war figures, but vast nevertheless. On the other side of the account, the Bolsheviks have made sundry purchases from us, very sundry and very few. In the year 1928 they shipped here £21 548 237 worth of materials, in respect of which (and this simple fact does require careful note by people who talk of credits) no less a sum than £21 548 237 sterling was placed to their credit in English banks. In the same year they bought from us £2 715 987 of English-made goods, and £2 084 762 of foreign and colonial goods purchased through London. In respect, therefore, of these purchases the sum of £4 800 749 was placed to their debit in their English bank accounts. There arose in this way, in this one year, a credit balance in favour of the Bolsheviks of nearly £17 000 000, available for any purposes they decide, but most easily available for the purchase of British goods and the provision of employment in this country. Seventeen million pounds in one year. The Bolsheviks have been going for ten years. The balance varies from year to year, but on the whole there has been nearly £150 000 000 in their favour which, during that period, has actually been in the hands of British bankers on their account. . . . We have freely and of our own will bought the timber and the oil from the Russian, the money belongs to him and, being lovers of freedom, we cannot reasonably complain if he spends it on any form of propaganda which appeals to him. But when he asks us to lend him more then we are in duty bound to take these facts into consideration."

Sir Ernest Benn as a business man, is contemptuous rather than fearful of the economic muddle of Communism. But as an Englishman and a patriot he is gravely concerned at the unwearying assault of Communist materialism upon our culture. "About Russia" is a hard-hitting, fearless book, which will flutter a good many dovecotes—and none too soon, as many will affirm.

CENTRAL ELECTRICITY BOARD.

Report for 1929—Position of the Area Schemes—Temporary Arrangements.

THE second annual report of the Central Electricity Board (for 1929) has been published, and is obtainable (price 5s. net) from the publishers, Messrs. Whitehead, Morris, Ltd., Tower House, Holland Street, S.E.1, or through any bookseller.

During 1929 testing of towers has been carried out to ensure compliance with the regulations of the Electricity Commissioners. The Board's policy regarding types of discriminative protective gear to be used on transmission lines has been definitely settled. The switchgear required for the transforming stations is being manufactured on mass-production lines. The special instruments required for metering the Board's supplies have now been fully developed by British meter manufacturers.

During the year the Board placed contracts amounting to £8 004 705, making a grand total, at December 31st, 1929, of £10 899 692. They have been able to place all their contracts with British firms.

CENTRAL SCOTLAND.—Four sections of the 132 kV transmission lines and five transforming stations are now in service. The first lines were put into commission on May 9th, 1929.

On December 31st last 244 circuit miles of lines were under construction and 47·8 circuit miles were in operation.

SOUTH-EAST ENGLAND.—In the spring of 1929 a 10-mile section of 132 kV line between Bedford and Little Barford was completed and put into temporary use at 33 kV for a supply to the Bedfordshire, Cambridgeshire and Huntingdonshire Company. This was the first of the Board's lines in any area to be put into commercial service.

During last December the first section of the cable system in the London area (between St. Pancras and Hornsey) was put into service.

On December 31st last 81 circuit miles of primary lines, 27 circuit miles of secondary lines and 105 circuit miles of underground cable were under construction, and 10¼, 1¾ and 16 circuit miles, respectively, were in operation. During the year construction work has been proceeding on 14 transforming stations.

CENTRAL ENGLAND.—All the main contracts have been placed, and construction work has been begun on the primary line between the two Birmingham stations (Hams Hall and Nechells) and Ocker Hill. A secondary line, 14 miles in length, between Northampton and Kettering, was put into service in February of this year.

NORTH-WEST ENGLAND AND NORTH WALES.—The main contracts have been placed. A secondary line between Stockport and Macclesfield was put into commission on September 30th last.

MID-EAST ENGLAND.—Contracts have been placed for the overhead lines, and satisfactory progress has been made on the layout of the sub-stations and the manufacture of equipment.

WAYLEAVES AND SUB-STATION SITES.—During the year the Board obtained wayleaves for 2 099 tower sites on primary lines and 1 206 on secondary lines, making a total of 3 305.

The position at the end of the year was as follows :—

	Mileage Surveyed	No. of Towers to be Erected	No. of Wayleaves Obtained
Primary Lines—			
Central Scotland	246·6	1 472	1 472
South-East England ..	268·5	1 700	1 133
Central England	227·95	1 335	594
North-West England and North Wales	100·85	622	244
Mid-East England ..	72·0	452	242
Secondary Lines—			
South-East England ..	33·6	340	326
Central England	18·76	250	184
North-West England and North Wales	120·25	959	676
Mid-East England ..	28·3	317	143

The Board refer to the helpful and public spirit in which the majority of landowners are recognising the need of facilitating the Board's work, and also the help and co-operation they have received from the National Trust and other Societies interested in the preservation of public amenities.

The arrangements made, or under discussion, during the year include the giving of supplies to the following : Greenock Corporation, Ayrshire Electricity Board, Falkirk, Kirkcaldy and Paisley Corporations, North Metropolitan Electric Power Supply Co., the London and Home Counties J.E.A., Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co., Central Sussex Electricity Limited, Hastings Corporation, Aldershot Gas, Water and District Lighting Company, Kettering Urban District Council, Alderley Edge and Wilmslow Electricity Board, Lancashire Electric Power Co., Fleetwood Urban District Council, Bridlington Corporation and the undertakers for the Lincolnshire Special Order.

CHANGE OF FREQUENCY.—The standardisation of frequency necessary for the carrying out of the Board's schemes is proceeding in Central Scotland, Central England and North-West England. Motors aggregating 29 509 H.P. and rotary convertors of 21 405 kW capacity have already been changed.

In May, 1929, the Board made an issue of £3 000 000 Central Electricity 4% stock at the price of £83 per cent. In January, 1930, they issued £7 000 000 Central Electricity 5% stock at the price of £97 10s. per cent.

THE NATIONAL SCHEME.

B.E.A.M.A. Criticism of the Electricity Commissioners' Policy.

MR. Hugh Quigley, of the B.E.A.M.A. Economic and Statistical Department, in an article contributed by him to the "Financial Times" on Tuesday, charges the Electricity Commissioners with ultra-conservatism in the sanctioning of new generating plant. He gives figures which indicate that since 1926 there has been a steady fall in the amount of new plant sanctioned, and contends that if the new plant ordered had kept pace with the output of electricity in 1929, the electrical industry would have had an addition of at least 500 000 kW passing through its workshops, which would have given employment to 30 000 more workers, including subsidiary and auxiliary industries.

Mr. Quigley also claims that the expected closing down of private industrial plant has not taken place, but that industry has shown a greater tendency to meet its own requirements and develop apart from the national scheme. The orders placed by the private industrial firms in 1929 amounted to 170 000 kW, a post-war record.

Actually, therefore, the national scheme, so far as generating plant is concerned, is not adding to employment in the electrical and subsidiary industries, and is not promoting the conversion of the private plant to the policy of purchasing electricity in bulk from the public system. Mr. Quigley adds that the first essential of rationalisation is the provision of power at a low price so that the process of electrification can be accelerated and completely carried out.

We give below tables from Mr. Quigley's article :—

TABLE I.

ELECTRICAL POWER PRODUCTION IN FIVE COUNTRIES (from all sources). (Millions of Units).

COUNTRY.	1928.	1929.	Production per head of population in 1929. (Units.)
Great Britain	14 960	16 455	374
U.S.A.	114 000	126 000	1 050
Germany	28 100	33 000	525
Italy	10 100	10 850	272
Canada	15 936	17 628	1 820

TABLE II.

CAPACITY OF GENERATING PLANT IN GREAT BRITAIN.

YEAR.	Public supply stations, including non-statutory undertakings. Kilowatts.	New Plant sanctioned by Electricity Commission. Kilowatts.	Percentage of installed capacity.
1925–26 (March 31st)	4 415 000	585 700	13·2
1926–27	4 883 000	775 604	15·9
1927–28	5 535 000	668 357	12·1
1928–29	5 881 000	602 818	10·2
1929–30	6 450 000*a*	280 000*b*	4·4

a Estimated. *b* Ordered.

TABLE III.

INCREASE IN ELECTRICAL POWER PRODUCTION AND PLANT ORDERED.

YEAR.	(Percentages). Increase in production of electricity (over previous year).	New plant sanctioned or ordered as percentage of installed capacity.
1925–26	10·0	13·2
1926–27	4·0	15·9
1927–28	19·5	12·1
1928–29	10·5	10·2
1929–30	13·0	4·4
1925–30	71·0	66·0

WORLD POWER CONFERENCE.

Provisional Time Table of Meetings—44 British Papers—Programme of Excursions—Addresses by Professors Einstein and Eddington.

WE give below particulars of the provisional time table that has been arranged for the second Plenary Meeting of the World Power Conference to be held in Berlin from June 16th to 25th, together with the titles of the British papers of electrical and allied interest which are to be read during the Conference.

On Sunday, June 15th, members of the Conference will be received in the Reichstag at 9 p.m. by the Honorary President and Chairman. The opening meeting will be held in the auditorium of the Kroll Opera House, Platz der Republik, Berlin, on Monday, June 16th, from 10 a.m. to noon. The technical meetings will be held as shown in the following table, I, II and III signifying the numbers of the reception halls in the Opera House in which the meetings are to take place :—

Day.	10 a.m.-Noon.	2.30 to 4.45 p.m.
June 16th	Opening Meeting	Electricity in the Household and in Agriculture—I Problems Relating to Water Rights—III
June 17th	Electricity in Crafts and Industry—I Heat, Fuel and Power Economies—II Research Work—III	World Problems of Power Supply—I Standardisation Problems and Rationalisation of Statistics—II Education—III
June 18th	Three Dimensional Load Models and Current Tariffs—I Power Supply on Ships—III	Individual Problems of Power Supply in Different Countries—II Power Transmission in Factories and on Machines and Vehicles—III
June 19th	Construction and Operation of Large Power Plants—I	Construction of Large Generators and Transformers, etc. Legislative and Political Economic Problems relative to Power Supply—II
June 20th	Cooperation of Different Power-producing Plants—I	—
	Steam and Electrically Operated Railways—II	—
June 21st	Transmission and Flow of Energy in Single and Multiple Connected Networks—I Stationary Internal Combustion Engines—II Dams—III	—
June 23rd	Rationalisation and the Technical and Economic Problems of Water Power Utilisation—II	Economic Problems relative to Power Storage on a Large Scale—I Earthing, Lightning Protection and the Effects of Power Lines on Telephone and Telegraph Lines—II
June 24th	Costs and Comparative Efficiency of Different Types of Energy from the Consumer's Point of View—I Water Power Industry in Individual Countries—III	—
June 25th	Combined Heat and Power Supply Plants—I Switchgear, including Automatic Control Apparatus and Remote Metering and Signalling Apparatus—II	Closing Meeting
June 26th	Beginning of official tours in connection with the Conference	

General addresses will also be given on June 16th (5-6 p.m.), June 17 (12.30 to 1.15 p.m.), June 19th (12.30-1.15 p.m.), June 23rd (5-6 p.m.) and June 24th (12.30-1.15 p.m.). Professor Einstein, Professor A. S. Eddington, Mr. Dunlop, M. Surruys and Dr. Oliven (who will deal with the problem of a European Grid), will be the speakers on these occasions.

On June 17th, at 8 p.m., there will be informal meetings of experts to discuss solid fuels, liquid fuels and electricity. At 10 p.m. on June 18th the official World Power Conference Festival and Banquet, with entertainment and dancing, will be held. Informal meetings of experts on gaseous fuels, steam power, I.C. engines, water power, education and legislative problems will take place on June 23rd, at 8 p.m.

The excursions planned include visits to various points of interest in and around Berlin during the Conference, especially during the week-end of June 21st-23rd, and six provincial tours to begin on June 26th. These are : (1) To the West and the industrial regions of the Rhine and Westphalia ; (2) through Central Germany to the South-West and Baden ; (3) to the South through the Central German lignite district to Bavaria ; (4) to the South-East, via Saxony and Lower Silesia to Upper Silesia ; (5) to the North-east via Pomerania and East Prussia, and (6) to the North—Hansa Towns (Bremen, Hamburg, Lübeck).

The British papers number 44, those of electrical or allied interest being :—

SECTION 1. ELECTRICITY IN THE HOUSEHOLD AND IN AGRICULTURE. "The Most Recent Applications of Electricity to Agriculture" (C. A. Cameron Brown) ; "Illumination as a Factor in the Sale of Electricity" (C. W. Sully).

SECTION 6. COSTS AND COMPARATIVE EFFICIENCY OF DIFFERENT TYPES OF ENERGY FROM THE CONSUMERS' POINT OF VIEW.—"Relative Places of Gas and Electricity in Industrial Heating" (Sir Robert A. Hadfield and R. J. Sarjant) ; "Comparison Between Compressed Air and Electricity for Use in Collieries" (Prof. D. Hay and N. E. Webster).

SECTION 7. CONSTRUCTION AND OPERATION OF LARGE POWER PLANTS.—"Mains and Cables in Highways" (S. Lacey) ; "Treatment of Flue Gases from Modern Power Stations" (Dr. S. L. Pearce).

SECTION 10.—STEAM TURBINES, GAS TURBINES AND RECIPROCATING STEAM ENGINES.—"Use in Power Stations of Steam Turbines having, with their Auxiliaries, Large Overhead Capacities" (Sir Charles Parsons).

SECTION 11. BOILERS AND FURNACES.—"Boilers to Meet Peak Load Conditions and the Application of Heat Storage" (A. Spyer).

SECTION 13. RATIONALISATION AND THE TECHNICAL AND ECONOMIC PROBLEMS OF WATER POWER UTILISATION.—"Automatic Hydro-electric Stations in Australia" (H. D. Cook).

SECTION 19. SWITCHGEAR, INCLUDING AUTOMATIC CONTROL APPARATUS FOR POWER STATIONS AND REMOTE METERING AND SIGNALLING APPARATUS.—"Remote Metering" (F. H. Clough) ; "Modern High Power Switching Stations" (R. W. Gregory and F. C. Winfield).

SECTION 20. TRANSMISSION OF FLOW OF ENERGY IN SINGLE AND MULTIPLE CONNECTED NETWORKS.—"The British Grid System" (Sir A. Page and C. W. Marshall).

SECTION 22. INDIVIDUAL PROBLEMS OF POWER SUPPLY IN DIFFERENT COUNTRIES.—"Some Economic Problems of the Electrical Industry" (H. Quigley).

SECTION 26. STEAM AND ELECTRICALLY-OPERATED RAILWAYS.—"The Economic Operation of Electrified Railways" (C. H. Merz and F. Lydall).

SECTION 33. STANDARDISATION PROBLEMS AND THE RATIONALISATION OF STATISTICS.—"The British Standardisation Movement and its Public Significance" (C. le Maistre).

SECTION 34. EDUCATION.—"Training of Engineers in the L.C.C. Scheme of Technical Education with Special Reference to the Instruction in Generation, Transmission and Economics of Power" (G. H. Gayer).

Copies of the provisional time-table, programme of excursions and a descriptive pamphlet are obtainable from the British National Committee, World Power Conference, 63, Lincoln's Inn Fields, W.C.2.

SHIPS' ELECTRIC DECK AUXILIARIES.

Mr. A. Read, Associate Member of the North-East Coast Institution of Engineers and Shipbuilders, read a paper on "Ships' Electric Deck Auxiliaries" at a general meeting of the Institution at Newcastle-upon-Tyne on April 4th.

The paper gave a short outline of the reasons for the introduction of electricity to the drive of deck auxiliaries. Reference was made to the good qualities of steam auxiliaries and the difficulty of reproducing some of these qualities electrically. The control of the various auxiliaries was made the principal feature of the paper.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Transport for Contractors."

[To the Editor.]

Sir,—For some years past The Electrician has courageously upheld the claims of the electric battery-propelled vehicle for use by traders for delivery purposes, and has, quite rightly, emphasised the point that progress will best be initiated by the industry itself making the greatest possible use of electric vehicles for its own purposes. A few firms, like the G.E.C., have long seen the value of using electrically-propelled vans for public deliveries of "Everything Electrical," and many others could derive similar advantage from such an obvious outward expression of confidence in the medicine which they regularly prescribe for others.

Noticing an article on "Transport for Contractors" in your issue of March 28th, I naturally expected to find therein some commendation of the various cheap and light types of battery-driven vans which are now available. Much to my surprise, however, I found that the article was devoted solely to the i.c. engine van!

Can it be, Sir, that your enthusiasm has waned, or that you have now concluded that there is no practical application for the light-weight, low-priced electric battery-driven delivery van?—I am, etc.,

Stockwell, S.W.9, April 1st. "Elevan."

[*We fully appreciate the virtues and capacities of the electric battery vehicle, and are convinced that it will find an increasing favour, particularly in the larger towns, as time goes on. But it is impossible to ignore the i.c.-engined vehicle—also to a not inconsiderable extent electrical in its mechanism and equipment. We shall be publishing other articles dealing with transport matters and costs, and can promise "Elevan" that the merits of the electric-battery vehicle will not be overlooked.*—Ed.]

Safety in Domestic Electrification.

[To the Editor.]

Sir,—Let me say at once that I agree with any campaign to improve the insulation of domestic apparatus. Were it possible to have no exposed conductors and nothing but good insulation enclosing every conductor, the maximum degree of safety would, doubtless, be assured, but in my article of March 18th, 1927, I had to deal with electrical apparatus as it then existed, and as it is much the same to-day, I think the points I made then are still applicable.

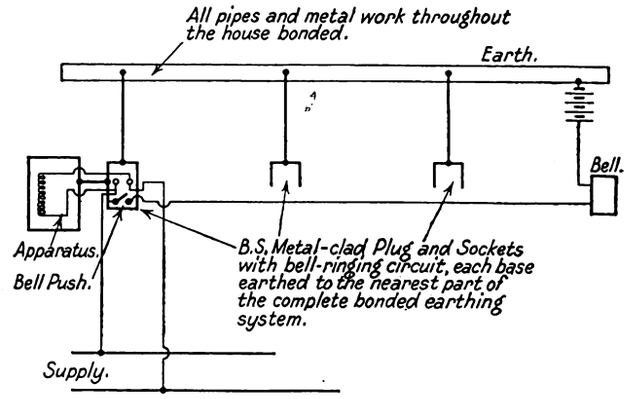
Mr. Gilbert quotes out of a paragraph in that article without giving the essential context. I may be allowed to quote what precedes Mr. Gilbert's quotation, namely:—

> A bad earth connection is worse than none at all, because it gives a false sense of security. In addition to this, two metallic parts of the earth circuit exposed in a house might have a difference of potential between them sufficient to cause arcing, and possibly even a fire; and, obviously, a shock could be felt by a person touching both of these points, even though he was quite remote from the electrical apparatus. Effective bonding of the metalwork in the earth circuit is, therefore, essential, and the best way of securing it is to use a bare copper wire leading from the sockets of the wall plugs to the nearest good "earth," such as a cold-water pipe, and to clamp it to any cable cleating or other metalwork that it may pass in its course. If the earth circuit is reasonably well made at the beginning, there is little fear that an open circuit will develop in it.

Then follows the part quoted by Mr. Gilbert, referring to a means of checking, particularly when being installed, the continuity of the earth wire, a break in which, if it is installed in the way described, is scarcely even remotely likely. The earth wire would bond all metal pipes, bath frames, gas pipes, central heating or hot water pipes and radiators, so that there is no metalwork in the neighbourhood of electrical conductors which would not be earthed. In the system I have tried, the press-button for the bell-push is itself metal-clad and earthed, and forms part of the base carrying a British standard (Specification 196) earthed plug and socket. This is shown in outline in my accompanying diagram, and I am sending you separately an experimental sample of the plug and press-button I have referred to.

With the bell-pushes shown in Mr. Gilbert's Fig. 2, and with the circuit of his diagram, it is clear that two simultaneous faults have to occur before there is any chance of personal danger. If one of these breakdowns occurs, namely, that in the earth wire, it would be discovered by the failure of the bell to ring, and the fact that the simultaneous occurrence of the second fault is highly unlikely, means that the system ought to give as practically certain safety as anything can.

Mr. Gilbert says that continuity of the earth circuit cannot be guaranteed; but I venture to say that a sound earthing circuit, plus the bell-system test, or something like it, gives



practically 100% safety in comparison with the danger of accident when there is no earth circuit.

In switchgear practice we learn that all metalwork in the neighbourhood of, or containing, live conductors must be earthed. Also, all metal framework of portable apparatus must similarly be earthed. If nothing but earthed metal is accessible, we have safety.—I am, etc.,

Hebburn-on-Tyne, March 31st. H. W. Clothier.

[*We have received several other letters on this subject and these will be printed in subsequent issues.*—Ed.]

Empire Radio Telephony.

[To the Editor.]

Sir,—In a comment on "Empire Radio Telephony" in your issue of March 28th you say:—

"There still remains grave doubt as to the wisdom or equity of separate control of long-distance telephony and telegraphy, and it is to be feared that such a division cannot fail to bring about a lot of friction that would be much better avoided."

The reference is to international communications, such as Anglo-Australian or Anglo-American services, and I think that you have scarcely given full weight to the essential differences between a telegram and a telephone message. The former is a concrete thing—a piece of paper—which can be physically dealt with at each point in its transmission, and which can be handed over from one operating authority to another, in the course of its transmission, without much delay or loss of efficiency, even though these authorities may employ systems fundamentally different in type.

A telephone message, on the other hand, requires the previous setting up of a complete chain of circuits which must function as a whole between the premises of the two parties to the conversation.

A long distance international call involves the use of many repeater stations connected together by sections of wire line, supplemented in certain cases by intermediate radio links. The complete chain must operate as one system, and the operating administrations have continuously to strive for the utmost possible uniformity of speech transmission characteristics and of maintenance procedure.

It is common ground among telephone engineers that the best results are obtained when the administrations of two intercommunicating nations can connect their systems directly one to another, and much capital has been spent in many lands with the object of providing direct routes which will avoid the intervention of an intermediate authority not concerned with the two local networks which obtain their mutual service over one international circuit.

To provide for the wedging in of a third authority, whose function it will be to connect the two local systems together when required, would not, therefore, be a step towards simplicity and smooth working, but would have an opposite tendency.—I am, etc.,

London, April 3rd. "Telen."

[*We appreciate the force of the technical argument put forward by "Telen," but our previous remarks, to which he refers, were based more on the financial aspect of dual control with its traffic diverting possibilities.*—Ed.]

NEWS IN BRIEF.

Electric Ship-Welding — Rotherham School Lighting — Effects of Australian Tariff — Telephony between England and Brazil — Societies' Arrangements.

A FOREMAN is wanted in Malvern Urban District Council's electricity department.

A revised edition of the sixpenny leaflet "Facilities for Training Women as Engineers" has been issued by the Women's Engineering Society.

The annual report of the North Area Committee of the E.D.A. shows that during the year 78 lectures, apart from conferences, were given with a total attendance of 4 300.

Electric welding has been adopted in the construction of Germany's new cruiser, the "Koenigsberg." It is reported that, in view of this vessel's successful performance, electric welding is also to be used in two other cruisers, a battleship and a fleet of destroyers.

Hull Telephones Committee has decided that continuous lighting of kiosks be adopted.

Colchester Electricity Committee is to provide coal siding accommodation at a cost of £1 650.

The first telephone conversation between England and Brazil, nearly 6 000 miles, took place last week.

Guildford electricity department is now hiring electric cookers, water boilers, radiators, kettles and irons.

The Chief Constable of York says since the police call box system was adopted at York 68 operative public calls have been made.

The American Telephone and Telegraph Co. and the International Telephone and Telegraph Corporation opened a telephone service between North and South America last week.

Dr. Page, leader of the Australian Federal Country Party, speaking at Melbourne recently, said the Australian customs tariff should be scientifically adjusted so as to allow machinery not manufactured in Australia to enter free. The high duties on electrical machinery prevented the full exploitation of electric power.

The Australian Government has issued a proclamation prohibiting the import of electric heating and cooking appliances, wireless receiving sets, wireless headphones, batteries (including dry cells and accumulators), electric smoothing irons, and certain other goods, except with the written consent of the Ministry of Trade and Customs.

Contracts placed with Messrs. Richardsons, Westgarth and Co., Ltd., for electricity generating plant at Hartley Main Colliery, South Shields, and at Brighton have been cancelled at the request of the Central Electricity Board, on the ground that the contracts will be unnecessary in view of the expediting of the grid supply. The contracts referred to are said to amount to about £100 000.

Although three-quarters of the water power resources of the United States are located west of the Mississippi River, only one-quarter of the country's power requirements are situated in this area, according to the N.E.L.A. A review of the production of electricity in 1929 shows, further, that the output of power in the East and South is growing at a faster rate than in the North and West and that the proportion east of the Mississippi is increasing.

The summer meeting of the Meter and Instrument Section of the I.E.E. will be held at Leamington Spa on Saturday, May 24th. There will be a luncheon at the Crown Hotel, High Street, Leamington Spa, at 12.30 p.m. Other items of the programme will be a motor coach excursion, and tea at the Cadena Café, Leamington Spa. Members travelling by the 9.10 a.m. train (from Paddington) down and the 8.18 p.m. up can obtain railway tickets at the reduced charge of 11s. (to be sent to the Secretary of the Institution). Payments for lunch, tea and motor coach trip can be made to the stewards on the day of the meeting.

Heston and Isleworth U.D.C. requires a draughtsman for the electricity department.

The annual report for 1929 of the Television Society shows that membership increased during the year from 325 to 577. Steps have been taken for the society's incorporation.

The G.E.C. eleventh annual sports and gala will be held at the G.E.C. London Sports Ground, Preston Road, Wembley, on Saturday, July 5th. Full details will be published later.

The first annual dinner of the West Yorkshire branch of the E.C.A. was held at Leeds on April 4th, with Mr. Kenneth Shaw in the chair. Speakers included Messrs. H. Willoughby-Ellis, W. B. Woodhouse, A. Innes, C. F. Partridge, C. V. Walker, and J. D. Green.

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of April 10th, 1880, contained an account of three months' experience of electric lighting at Blackpool, with some now amusing details of the frequent interruptions due to the jamming of the racks holding the carbons, which had to be remedied by jerking a line attached to the lamp. The man detailed to do this was ultimately saved the trouble by "the passing public and youths pulling the line as they went by."*

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of April 14th, 1905, it was reported that the second great pyramid of Ghizeh was struck by lightning on March 31st, several large stones being dislodged—this being the first occasion of the kind on record.*

It was announced that 28 German firms belonging to the Union of Electrical Manufacturers had organised a co-operative society to purchase raw materials.

Rotherham Education Committee proposes to continue the scheme of installing electric lighting in one school each year.

The architect is to report to Manchester Town Hall Extension Committee on the question of adopting electric thermal heating in the town hall.

Arc lamps at the Grand Union Canal Company's Regent's Canal Dock ship lock at Limehouse, enable work to proceed as efficiently by night as by day.

The manager of Hull Corporation telephones department reports that, to meet anticipated demands, automatic exchanges should be extended by 2 000 lines.

In Doncaster's new £70 000 Sanatorium and Infectious Diseases Hospital, which was opened last week, electrically-driven washing, drying, and cleaning machines are used.

The fifth annual conference of the Electrical Association for Women will be held in London on May 15th and 16th. The first day's programme includes a luncheon at the Park Lane Hotel; a visit to the H.O. Industrial Museum; reception by the Executive Committee, followed by a talk by Mr. Ll. B. Atkinson. The second day will include a visit to the Greenford factory of J. Lyons and Co., and a cabaret ball will be held at the Park Lane Hotel in the evening.

The March issue of "The Henley Telegraph" continues from the September issue the "Henley History," and contains many historical facts which are published for the first time. On page 117 is a note of the presentation of Long Service Certificates. "The Old Brigade," featured on pages 122–127, commenced with the September issue, and will be continued; and "Welfare—Woolwich," on page 130, gives an idea of the good work being done by a seldom-heard-of part of the Henley organisation.

Mr. Basil A. Pilkington, F.R.S.E., addressed the members of the Edinburgh Rotary Club last week on "Electrical Energy from Scotland's Natural Resources." He hesitated to say that hydro-electric power undertakings in the Western Highlands were a commercial proposition. It was probably only where the electrical energy available could be consumed within a short distance of the source of supply, and in those areas where coal might cost anything from £2 per ton upwards that its advantage was beyond cavil.

The Institute of Patentees (Inc.), in co-operation with the polytechnics and the Association of Principals of Technical Institutions, has decided to found a series of presentation courses at one or more of the recognised technical schools and polytechnics which exist throughout the country. The subjects taken will include physics, electrical and mechanical engineering, metallurgy, etc. The scholarships are open to candidates of both sexes, of all nationalities, and of any age over 16. They entail about three evenings' work a week, in addition to home work. Successful candidates will have the necessary fees paid for them and will be given Associate Membership of the Institute of Patentees and £1 for books.

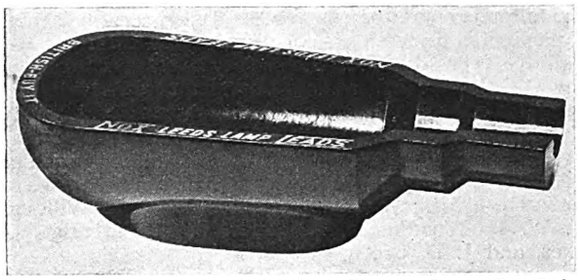
BUSINESS ITEMS.

THE new address of the Leeds office of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., is Permanent House, The Headrow.



THE latest novelty of the Nox Electric Lamp Co., Ltd. A lamp half-section made of bakelite and intended for use as an ashtray.

The BRITISH RESISTOR CO., LTD., announces that all communications should henceforth be addressed to the company's new premises at Trafford Park, Manchester.

The London address of HENRY WELLS CO., LTD., has been changed to 736-7, Salisbury House, Finsbury Circus, E.C.2. The address of the works remains, as hitherto, Salford, Manchester.

NEW DISTRIBUTORS OF EDISON STORAGE BATTERIES, LTD., Victoria House, Southampton Row, London, W.C.1, wish to inform our readers that their offices will be closed from 12 noon on Thursday, April 17th, until Tuesday morning, April 22nd.

The METROPOLITAN-VICKERS ELECTRICAL CO., LTD., advise us that all correspondence formerly addressed to the London office, concerned with meters, instruments and relays should now be addressed to the company at Gorst Road, Park Royal Road, London, N.W.10.

A West Indian firm desires to communicate with British manufacturers of electric washing appliances, drying and ironing machines, overhead line fittings, galvanised iron bolts, brace and insulators for wooden pole work. The Department of Overseas Trade has all particulars. Reference A.X. 9 284.

SHIMWELL, ALEXANDER AND CO., 82, Fenchurch Street, London, E.C.3, have been appointed by the ALPHA ELECTRICAL APPARATUS CO., of Premier Works, Percy Road, Greet, Birmingham, sole distributing agents for domestic appliances for the counties of Kent, Sussex, Surrey, Hampshire and Dorset. Stocks will be held at 110, High Street, Southampton.

BRITISH INSULATED CABLES, LTD., of Prescot, have obtained the contract for the supplying and laying of the Post Office trunk cable from Liverpool to Colwyn Bay. About 54 miles of cable will be required for this contract, the value of which is approximately £60 000. Another order secured is for 150 000 rail bonds for the Southern Railway, the value being about £20 000.

The CRESSALL MANUFACTURING CO., of 31-32, Tower Street, Birmingham, informs us of the appointment of Mr. A. J. Taylor, 6, Colney Hatch Lane, London, N.10, as agent for the Eastern Counties—Lincolnshire, Norfolk, Suffolk, Cambridgeshire, Bedfordshire, Buckinghamshire, Huntingdon, Peterborough—and also Essex, Middlesex and Hertfordshire, outside the Metropolitan Postal District.

Radio telephone service over the first two-way circuit, linking the continents of South and North America, was established on April 3rd by the COMPANIA INTERNACIONAL DE RADIO (Argentina) and the AMERICAN TELEPHONE AND TELEGRAPH COMPANY, when more than 277 000 telephones in Argentina, Chile and Uruguay were connected with 21 600 000 telephones in Mexico, Cuba, the United States and Canada.

A beam telephone service has been opened to the public between Madrid and Rio de Janeiro. The stations conducting the service in Spain are of the short-wave beam type and were erected by MARCONI'S WIRELESS TELEGRAPH CO., LTD., at Aranjuez, near Madrid. In addition to the telephone service, a commercial telegraph service is in operation. For use in these circuits special receivers have been constructed by the Marconi engineers on behalf of Transradio Espanola, the Spanish Company to which these stations belong and which carries out the wireless services between Spain and other countries. The South American end of the service is controlled by the Companhia Radiotelegraphica Brasileira.

PERSONAL.

MR. S. A. Williams has now joined the engineering staff of the Bastian Meter, Co., Ltd.

Dr. R. S. Clay, principal of the Northern Polytechnic, has resigned, and will finish his duties in December.

Mr. Ian Scott Dalgleish, electrical engineer, of St. John's Hill, has been elected a member of the Woking Urban Council.

Hazel Grove and Bramhall Urban Council has appointed Mr. B. Lomax to the temporary position of electrical engineer and manager.

Bromley Town Council has appointed Miss Beatrice M. Goodchild as saleswoman demonstrator in connection with the electricity undertaking.

The Relay Automatic Telephone Co., Ltd., announce the appointment of Mr. H. K. Piggott as manager for the South-Western area, having his district office at Cardiff.

Mr. R. Auchterlonie, electrical engineer, Galashiels, has been elected to the committee of the newly formed Galashiels Merchants Association as the representative of the town's electrical engineers.

Mr. Alexander Brown, chief of the electricity department of the Stirling District Mental Hospital, Larbert, has retired after thirty-two years service and has been presented with a gold watch and albert.

Mr. Robert Aitken, superintending engineer for the West of Scotland District, has retired from the Post Office telephone service and was presented by his staff with a powerful wireless receiver and loud speaker.

Mr. William B. Woodhouse, the engineer and manager of the Yorkshire Electric Power Co. has been appointed a director of Electrical Distribution of Yorkshire, Ltd., to fill the vacancy caused by the death of Mr. Arthur Greenhow Lupton. See page 477.

The Chairman of the Electricity Commission, with the concurrence of the Minister of Transport and the other Commissioners, has appointed Sir John Reeve Brooke to be vice-chairman of the Commission on the retirement of Sir Harry Haward from that position on March 31st. See page 477.

Testimony to the personality and popularity of Mr. D. Maxwell Buist, late chief electrical engineer of the Synthetic Ammonia and Nitrates, Ltd., was reflected in a pleasant ceremony at Stockton on March 28th, when his colleagues and friends presented him with a grandfather clock and easy chair on the occasion of his appointment as engineer to the North-East England Electricity Scheme.

In pursuance of its policy of establishing Area Committees in various parts of the country, the E.D.A. last year organised two Committees in Scotland, one in the West, of which Bailie A. G. Logan of Falkirk is Chairman, and one in the East, the Chairman being Councillor J. Couston, of Edinburgh. In order to assist these two Committees, the E.D.A. have now appointed Mr. E. M. Hood as Officer to the two Committees, and he is established temporarily at 18, Quentin Street, Glasgow, S.1. Mr. Hood, who is an Edinburgh man, has been connected with the manufacturing and wholesale sides of the electrical industry in Glasgow for many years, and his appointment should lead to a great increase in E.D.A. activities throughout Scotland.

In connection with the death of Thorsten Von Zweigbergk, we are informed that he first made his mark in the electric traction world when with the Walker Electric Co. Under Prof. Sidney Short this company supplied traction equipment which was very successful in service and was well known in England. The company was absorbed eventually by the Westinghouse Company and Prof. Short brought his staff to England where they assisted in building up the Preston works of Dick Kerr and Co. in 1900. On Prof. Short's death in 1904 Zweigbergk became responsible for all the traction work of Dick Kerr and Co. His name will always be associated with the invention of the metallic shield blow-out and its application to tramway and railway controllers. This device is too well known to require description but it is interesting to know that controllers on this system gave excellent results in service even for currents up to 4 000 amps. Perhaps the best known of the earlier railway electrification schemes for which Zweigbergk was responsible were the Liverpool to Southport line of the Lancashire and Yorkshire Railway and the Liverpool Overhead Railway. Later he designed the first electrification of the Bury-Holcombe Brook line of the L. and Y. which was carried out at 3 000 V d.c. the traction motors being wound for 1 500 V and connected two in series. This, it is believed, was one of the first 3 000 V systems put into practical operation.

ELECTRICAL PUBLICITY.

Annual Luncheon and Meeting of the North West Area of the E.D.A.

ALDERMAN W. WALKER occupied the chair at the annual luncheon of the British Electrical Development Association (North West Area), held at the Midland Hotel, Manchester, on March 31st. In proposing the toast of the E.D.A., coupled with the names of Mr. H. Marryat, chairman, Executive Committee, and Lt.-Col. W. A. Vignoles, director, the Chairman emphasised the necessity of publicity, and pointed out the benefit of doing it through one organisation rather than each unit doing it for itself. For a long time the manufacturers had borne the burden of E.D.A.'s work, but it was important that all sections should combine. He therefore appealed to the representatives of the various undertakings present to do all they could in this direction. A great deal had already been done, but as yet they had only touched the border of the possibilities, the advantages of which were apparent to all concerned. The Chairman also mentioned the usefulness of the E.D.A. conferences, which were a medium for spreading the experience of experts all over the country.

Mr. Marryat, in replying, showed a graph demonstrating the changes in the profits earned by the electrical and gas industries during the period since the formation of E.D.A. The gas profits were seen to have fluctuated somewhat but not increased to any marked extent, while the electrical profits had shown a steady expansion. This latter he attributed to the exertions of E.D.A. He extended upon the chairman's words about the activities of the Association, and said that the E.D.A. had come in for some criticism in regard to its methods of press advertising, on account of its extensive use of small 2-in. advertisements. He did not agree that these were inferior to more substantial ones. On the contrary, they represented maximum efficiency in this type of publicity. They were judiciously placed in a wide variety of journals, and thus reached all classes of readers. On the question of publicity, however, he did not believe that anything like enough was being spent.

Colonel Vignoles supported Mr. Marryat and was optimistic about the future. He gave an example of the industrial use of electricity in connection with a pottery furnace, and it had been proved that it was both cheaper and better than the old type heated by means of coal. It was therefore important to emphasise, when advocating electricity, that it was not only cheaper but better. The campaign carried out by the Electrical Association for Women last winter had been very successful.

After the luncheon, the annual meeting was held at the Demonstration Bureau, 4, Fountain Street, Manchester.

ELECTROTECHNICAL COMMISSION.

Preparations Well in Hand for British Participation in International Meetings.

THE British National Committee of the I.E.C., i.e., the Electrical Industry Committee of the British Engineering Standards Association, is now actively engaged in preparations for British participation in the forthcoming important meetings of the International Electrotechnical Commission. The Technical meetings will be held in Stockholm during the first week in July, after an opening meeting in Copenhagen. The closing Plenary Session, together with a meeting of Council, will take place in Oslo. There will be meetings of 15 Advisory Committees dealing with nomenclature; rating of electrical machinery; symbols; steam turbines; aluminium; voltages, including tests on high-voltage insulators; electric traction equipment; insulating oils; overhead lines; radio valves; measuring instruments; rating of rivers; tests for shellac; rating of oil switches; internal combustion engines.

A very influential delegation, consisting of representatives of Government Departments, the Institution of Electrical Engineers, the Institution of Civil Engineers, the Electricity Commissioners, the Central Electricity Board, and manufacturing, research, and supply organisations interested in the work of international standardisation in the electrical field, will be present from Great Britain, and delegates from the Dominions will also attend.

The Scandinavian National Committee of the I.E.C. is making arrangements for the visiting delegates to see some up-to-date hydro-electric and other plant, while for those who care to stay after the meetings, an interesting trip to view the Midnight Sun is being organised.

MILL LIGHTING.

Problems Connected with Artificial Lighting in the Textile Industry.

IN a paper read before the Illuminating Engineering Society on March 25th, Mr. S. Anderson said there were few industries for which the provision of suitable artificial lighting offered more varied problems that those associated with the manfacture of textiles. From investigation it was evident that the majority of mill executives were interested in their lighting, and while it was not difficult to convince them that the glare so universally found is objectionable it was extremely hard to make them feel the need for using higher intensities than at present employed. On the other hand, any suggestion that current consumption might be cut down and lamp breakages minimised by a modernised installation in certain cases arouse intense interest. The question of maintenance was rarely dealt with adequately, and many mills were visited where clear gasfilled lamps were so obscured by fluff and dust as to resemble pearl lamps in their diffusion of the light. In general, intensities at present prevalent were far below what could be considered good practice, and the majority of lighting installations were put up with little or no regard for the principles of good lighting. Quite 90 % of the mills employed electric light, and the standard of illumination in those employing gas was considerably below the average standard of those with electric light.

SUMMARY OF FINDINGS AND RECOMMENDATIONS.

Average intensity in foot-candles on work.

COTTON MILLS.	Mill A	B	C	D	E	F	G	Recommended Minima
Bale breaking, opening and scutchers	1·5	—	0·5	—	3	—	0·8	3

* NOTE.—The lower value is for light and the higher for dark material.

STAFF PENSION SCHEME.

Pension and Life Assurance Plans for the Lancashire Electric Power Co.

PARTICULARS are announced of a scheme for pensions and life assurance for the benefit of the employees of the Lancashire Electric Power Co. which has been secured by a contract with the Legal and General Assurance Society.

The plan is a contributory one, and membership is open to employees on the permanent staff over 18 and under 65 years of age, irrespective of their state of health, provided that not less than 75% join the scheme. It will be a condition of employment for all those entering the service of the company after the inception of the scheme, from April 1st, that they must join at the expiration of three months after their entry into the company and attainment of the age of 18.

The contributions of the staff will cover only a portion of the annual cost, the balance being payable by the company, which will also pay all the premiums for providing pension benefits in respect of past services. This arrangement will be applicable only to those employees in the company's service on March 31st, 1929, who joined the scheme on or before March 31st, 1930. Besides ensuring a pension from the age of 65, based on the annual salary or wage for each year of contributing service, life assurance, also based on the salary earned, will be provided to cover the risk of the death of an employee while in the service of the company or after he has retired on pension. The annual pension payable from the age of 65 for each year of contributing service rises from £1 in the case of employees earning £130 and less to £20 in the case of those earning £951 and more, while the life assurance similarly ranges from £100 to £800, and the employees' weekly contribution from 1s. to 20s.

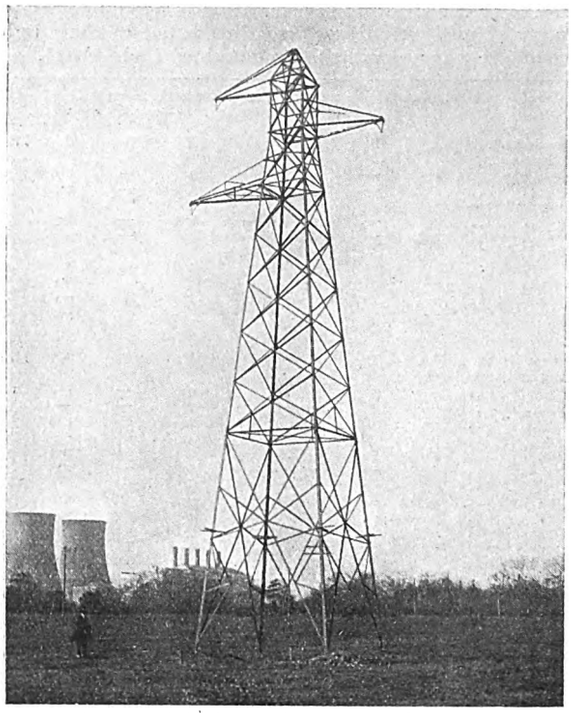
COPPER STEELS.

Non-Corrosive Transmission Towers.

IT is now fairly well established that the use of steel containing small percentages of copper (of the order of 0·2%) results in a metal offering considerable resistance against atmospheric corrosion. In tests carried out in Germany upon



A copper-steel transmission tower in the Central England electricity area.

steel sleepers for railway use, it was found that the loss of weight by corrosion of copper-bearing steels after a seven-years' period of test was very appreciably less than with corresponding steels having no copper. In shipbuilding, too, the use of copper-steel is expanding, especially for masts and funnels exposed to severe atmospheric corrosion.

One observer (Daeves, "Schiffbau," September, 1928, p. 423), estimates that the unpainted copper-steel has from two and a half to two times the life of ordinary steel, and his tests showed that where copper-free steel had lost 70% to 90% of its thickness, copper-steel, under identical conditions, had only 4% wastage.

In view of the high cost per mile of electrical transmission lines, and the necessity for prolonging their life and reducing upkeep, it is noteworthy that for the Central England electricity scheme transmission towers have been constructed of copper-bearing steel. The towers are manufactured by the Horseley Bridge and Engineering Co., Ltd., Tipton, from copper-bearing steel supplied by the Frodingham Iron and Steel Co., Ltd., Lincolnshire.

THE "MECHANICALS" BENEVOLENT FUND.

The report of the Committee of Management of the Benevolent Fund of the Institution of Mechanical Engineers, for the year 1929, states that during the year the names of 212 ordinary members and 30 life members were added. The decease of 14 members is reported, including three life members. Eleven resignations were received, and 24 memberships lapsed. The total membership on December 31st, 1929, was 1 420, 168 being life members. In addition to subscriptions from members of the fund, contributions have been received from about 306 other members of the institution during the year. The accounts for 1929 show that the total of the fund on December 31st amounted to £14 722 17s. 7d. The income was £1 636 15s. 5d., and grants to 40 applicants amounted to £1 995 10s. The committee reports an excess of payments over receipts of £431 2s. 1d. The amount of £1 300 (including a legacy of £200 from the late Mrs. M. Hill, widow of Mr. A. J. Hill) was invested in £1 663 16s. 3d. 3½% conversion loan. The special appeal issued to all members of the institution in November 1928 resulted in the receipt of donations amounting to £1 342 and annual subscriptions of £187 18s.

LEGAL INTELLIGENCE.

The Fencing of Electrical Machinery—Derby and Notts E.P. Co. and Factory Acts.

A KING'S Bench Divisional Court consisting of the Lord Chief Justice, Justices Avory and Branson on April 3rd heard an appeal by Mr. J. H. Warren, an inspector under the Factory Acts, against the refusal of the Derby magistrates to convict the Derbyshire and Nottinghamshire Electric Power Co., of the alleged offence of neglecting to fence, or make them in such a condition that they would equally be as safe as if they were securely fenced, certain high voltage conductors.

The Attorney-General (Sir William Jowitt, K.C.), in support of the appeal, said that at the respondents' generating station at Spondon, Derby, there was a trifurcating box which was usually covered by a cage, but in May, 1929, a workman named George James House was engaged in brushing down with a brush that contained a certain amount of metal. A portion of it and part of the front of the cage was removed. He was working within a foot of one of the leads that was insulated with empire tape. Touching one of the cables with the brush House received an electric shock and died. It was stated that the cage was only removed from the centre part of the apparatus and that part was "dead," but current ran through the conductors on each side. House was a man with technical knowledge and knew the dangerous nature of the work, and moreover had been warned. The justices declined to convict, holding that the conductor was protected. The contention for the inspector was that the "live" conductors were not sufficiently insulated, and that sufficient safeguards had not been taken to protect a workman even though he was careless.

Sir Henry Maddocks, K.C. (for the respondents) said House was employed by contractors who were adding to the plant for the Power Co. He received no instructions from respondents. The set of "live" cables next those which House was brushing supplied the works of the British Celanese Co., and it was not practicable to render those cables "dead." The empire tape used to insulate the leads was admitted to be an adequate insulator, and no fewer than six layers had been used.

The Lord Chief Justice said the question turned upon a tolerably clear point. The Act said that conductors should either be covered with insulating material and be sufficiently protected when necessary to prevent danger, or they should be placed and safeguarded so as to prevent danger so far as was reasonably practicable. The Derby justices in this case found that both those provisions had been carried out. But no transverse screens protected the workmen from the "live" cables, although that precaution could have been carried out so that on both sides House could touch live conductors. How exactly the man met his death was not known, but it seemed obvious that transverse screens might have prevented the accident. That fact was fatal to the respondents' case. Consequently there were no materials on which the justices could refuse to convict the respondents of an offence, and the case would go back for conviction.

Justices Avory and Branson concurred.

"HOW TO SEND AND SAVE."

A Useful Publication of Interest to Electrical Manufacturers.

THE Great Western Railway Company has published a particularly useful book dealing with the despatching and transporting of goods over the company's system. A feature of the publication is that times of delivery at the various stations are given together with the latest times of acceptance. Goods accepted at Birmingham any day between Monday and Friday up to 5 p.m., for instance, could be delivered at Trowbridge the next day, at York during the second morning, and so on.

Other subjects dealt with in the publication include: American Traffic; Bulking for Carriage Charges Purposes; Channel Islands Traffic; Container System of Transport; Continental Traffic; Country Lorry Services; Cranes; Freight Train Names; Freight Train Services; Irish Traffic; Overseas Traffic; Private Siding Connections; Railhead Distribution; Railway Classification; Rates and Charges; Rebates Allowed for Use of 20-ton Wagons; Registered Transits; Road Transport Facilities; Scottish Traffic, etc.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

ASHBY WOULDS URBAN DISTRICT COUNCIL.—Electric light wiring of eight houses at Albert Village. Particulars from the clerk, Mr. C. E. Crane, South Street, Ashby-de-la-Zouch.

MORECAMBE AND HEYSHAM EDUCATION COMMITTEE, April 11th.—Electric light installation at West End Council School Westminster Road. Particulars from the Borough Engineer; deposit £1 1s.

ATHERTON URBAN DISTRICT COUNCIL, April 14th.—Supply of five miles of 0·06 h.t. concentric, paper insulated, lead sheathed, served, steel tape armoured, and compounded cable manufactured in accordance with latest B.E.S.A. specification.

Rural Electrification.

BEDFORD CORPORATION, April 14th–May 5th.—Supply and erection of 11 000 V overhead lines, and auxiliary apparatus, other than transformers, for supplying an area of 100 sq. miles, under the Corporation's rural demonstration scheme. Only British labour and material may be employed. Specification, etc., from the Borough Electrical Engineer, until April 14th; deposit £3 3s. Tenders by May 5th.

COVENTRY CORPORATION, April 14th.—Electrically driven pumping machinery, for Whitley pumping station. Specification (£10) from Sir Alexander Binnie, Son and Deacon, Artillery House, Artillery Row, London, S.W.1.

EDINBURGH EDUCATION AUTHORITY, April 14th.—Electrical installation in proposed new primary school at Wardie. Specifications, etc., from Mr. J. M. Johnston, 47, Charlotte Street, Leith.

GLASGOW EDUCATION AUTHORITY, April 14th.—Electric lighting and electric heating installations in Ruchill Temporary School, Huxley Street, Ruchill. Specifications from Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s. each.

HASTINGS CORPORATION, April 14th.—Supply, erection, etc., of two-gallon ice cream freezer and cold storage cabinet. Specification, etc., from Mr. J. Norman Gray, White Rock Pavilion, Hastings.

HULL CORPORATION, April 14th.—Supply and drawing in of 600 V cable for tramway feeders, for the tramways department. Specification from the General Manager, Tramway Offices, Albion Street, Hull.

LONDON COUNTY COUNCIL April 14th.—Manufacture and supply of h.t. and l.t. cables; and reconstruction of existing l.t. cables. Specification, etc., from the General Manager of Tramways, 23, Belvedere Road, London, S.E.1; deposit £2.

MANCHESTER CORPORATION, April 14th.—Twelve months' supply of electricity meters (specification No. 264); potential and current transformers (No. 265); cables (No. 266); time switches (No. 268); auto-transformers and auto-balancers (No. 270); a.c. industrial electric motors (No. 271); and electric kettles (No. 274). Specifications from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; desposit £1 1s. for each.

MANCHESTER CORPORATION, April 14th.—Twelve months' supply of stores, etc., to the electricity department, including dry batteries for flashlight lamps, cable troughing, conduit for wiring, dynamo and copper tape brushes, fuse boxes, lamp columns, service boxes, wire, etc. Forms of tender, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester.

BIRKENHEAD CORPORATION, April 15th.—Twelve months' supply of c.i. house service boxes, mains joint boxes, insulating and rubber tapes, and electrical sundries. Specifications from the Borough Electrical Engineer.

GLASGOW CORPORATION, April 15th.—Supply of electric fittings and cables, etc., to the Housing Department, for 12 months. Form of tender (No. 3), etc., from the Director of Housing, 20, Trongate, Glasgow.

BATTLE URBAN DISTRICT COUNCIL, April 16th.—Electrically driven borehole pump, at Powdermill Lane pumping station, and two sets of electrically driven boosting pumps at Starr's Green booster station. Plant to be of British manufacture and complete with electrical equipment and cable connections. Specification, etc., from Messrs. J. Taylor and Sons, Caxton House, Westminster, S.W.1; deposit £5.

CENTRAL ELECTRICITY BOARD, April 16th.—Construction of site works and foundation works for the transforming stations at Ribble (Preston) and Lancaster. Specification (N.W.E.—P.F.1) and form of tender from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

FIFE EDUCATION AUTHORITY, April 16th.—Electrical work in new elementary school, Sinclairtown, Kirkcaldy. Schedules, etc., from Mr. George Sandilands, Education Offices, Wemyssfield, Kirkcaldy; deposit £1 1s.

BELFAST MUNICIPAL COLLEGE OF TECHNOLOGY, April 17th.—Supply and erection of a large, ironclad, three-wire, 440 V distribution board. Specification from the General Office, at the College.

ROMSEY CORPORATION, April 17th.—Electric lighting of town hall. Specification, etc., can be seen at the office of the Borough Surveyor.

WORTHING CORPORATION, April 21st.—One borehole pump, coupled to an electric motor. Specification, etc., from Borough Water Engineer, Chapel Road, Worthing.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC, April 22nd.—Supply of incandescent lamps. Forms of tender, etc., from the Controller of Supplies, His Majesty's Office of Works, etc., King Charles Street, Westminster, S.W.1.

DUNDEE EDUCATION AUTHORITY, April 22nd.—Electric lighting and central heating installations in new Central School at Rockwell, Lawton Road, Dundee. Specifications, etc., from Messrs. Allan and Friskin, architects, 26, Castle Street, Dundee.

DUNDEE CORPORATION, April 23rd.—One year's supply of stores and materials to the tramways department. Specifications, etc., from the General Manager, Transport Office, Dundee.

CENTRAL ELECTRICITY BOARD, April 28th.—Supply and erection of 33 kV, 11 kV and 6·6 kV switchgear, for connecting Board's supply to electricity supply undertakings, under N.W. England and North Wales scheme. Specification (No. N.W.E.–G.S. 4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

ILFORD CORPORATION, April 28th.—Supply and erection of (*a*) rotary convertor plant of 500 kW capacity, with automatic control; or (*b*) rectifier plant. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

CENTRAL ELECTRICITY BOARD, May 5th.—Supply and erection of 33 kV transmission line crossing of the river Witham, Boston, under Mid-East England scheme. Specification (No. M.E.E.–S.L. 3) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.–G.S. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.–S.L. 2) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice essential.*

ANTWERP MUNICIPALITY, April 11th.—Supply and erection of two mercury rectifiers at transformer station, Quai 232. Further information (Fr. 6) from Hotel de Ville.

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., April 12th.—Electrical and other equipment for the various departments of the company's iron and steel works to be erected at Pretoria. Further information from the Committee of Consulting Engineers of the South African

Digitized by Google

Iron and Steel Industrial Corporation, Ltd., c/o International Construction Co., Ltd., 56, Kingsway, London, W.C.2.

INDIAN STORES DEPARTMENT, April 14th.—Supply, erection etc., of three oil engine-driven d.c. generating sets. (Reference B.X. 6 231.)

VICTORIAN ELECTRICITY COMMISSION, April 14th.—Supply of 22 000 V switchgear and accessories, for sub-station "C" at Brunswick (specification No. 30/17). (Reference B.X. 6 182.)

NEW ZEALAND POSTS AND TELEGRAPHS, April 15th.—Supply, of 4-conductor cords (P. and T. 151/2 218). (Reference B.X. 6 303.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Supply of lead-covered switchboard cable (schedule C.574). (Reference B.X. 6 202.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 15th.—Cord type switchboards. (Reference B.X. 6 135.)

BELGIAN STATE RAILWAYS, April 16th.—Supply of armoured cables. Cahier des Charges Special No. 20 257 (fr. 2½) from Service du Materiel des Chemins de Fer Belges, 21, Rue Louvain, Brussels.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

ORADEA MARE (RUMANIA) MUNICIPALITY, April 24th.—Lead covered, double steel tape armoured underground cables. (Reference B.X. 6 298.)

CHRISTCHURCH (N.Z.) MUNICIPALITY, April 25th.—Supply of electricity meters. (Reference B.X. 6 309.)

ST. GILLES (BRUSSELS) MUNICIPALITY, April 26th.—Supply of 6 000 metres of 10 sq. mm. armoured cable, 100 metres of 35 sq. mm. and 1 000 metres of 70 sq. mm. Cahier des Charges (fr. 5) from Service de l'Electricité, 40, Rue de Bethléem, St. Gilles, Brussels.

ANTWERP MUNICIPALITY, April 28th.—Supply of cables and junction boxes. (Reference B.X. 6 312.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, April 28th.—Supply and erection of electrically driven high lift and low lift pumping plants, etc., for South-West Tableland Water Supply (tender No. 51, 1929/1930). Reference A.X. 9 219.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

COPENHAGEN MUNICIPALITY, May 10th.—Supply of switchgear and rectifier plant for Eskildsgade sub-station (Reference B.X. 6 271.)

COPENHAGEN MUNICIPALITY, May 12th.—Supply and erection of two turbo-generators. (Reference B.X. 6 297.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed, self-cooled transformers, suitable for outdoor service. (Reference B.X. 6 096.)

NEW ZEALAND POSTS AND TELEGRAPHS, May 13th.—Supply of terminal strips (P. and T. 151/2 000). (Reference B.X. 6 209.)

CHILEAN MINISTRY OF MARINE, May 15th.—Supply of three metric ton travelling electric crane and four-metric ton stationary electric revolving crane. (Reference No. A.X. 9 186.

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 20th.—Supply and erection of one 25 kVA, three-phase, 400/230 V, 50 cycle generator. (Reference B.X. 6 307.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of telegraph instruments (schedule C. 579). (Reference B.X. 6 248.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators, for Mangahao powe scheme, section 215B. (Reference B.X. 6 300.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of cable clamps, for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14th.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24th.—Supply of 110 kV outdoor steelwork and switchgear, for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25th.—Supply of condensers (P. and T. 151/2 240). (Reference B.X. 6 308.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8th.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15th.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1. (£10 5s., not returnable.)

Tenders Accepted.

BINGLEY URBAN DISTRICT COUNCIL.—D. Greenwood, electrician's work in 92 houses on Ryshworth Hall estate.

GLASGOW CORPORATION.—English Electric Co., Ltd., supply of 450 hand-operated camshaft tramcar controllers, £26 000.

UNION CONSTRUCTION CO. (FOR LONDON UNITED TRAMWAYS).—English Electric Co., Ltd., supply of 94 maximum traction tramcar trucks, £14 000.

GENERAL POST OFFICE.—British Insulated Cables, Ltd., supply and laying of trunk cable from Liverpool to Colwyn Bay (about 54 miles), £60 000. (Approximate).

DUNDEE CORPORATION.—A. Fyall, electrical work in connection with erection of 54 three-apartment and 30 two-apartment houses in Corso Street, Dundee, £492.

GENERAL POST OFFICE.—Batteries: Douglas (Glasgow) Telephone Exchange, Alton Battery Co., Ltd.; telephonic repeater equipment: Aberdeen, General Electric Co., Ltd.

IRISH FREE STATE LOCAL GOVERNMENT AND PUBLIC HEALTH DEPARTMENT.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens electric lamps and batteries.

GLASGOW CORPORATION.—T. Bolton and Son, Ltd., copper bands; British Insulated Cables, Ltd., insulated bolts; P. R. Jackson and Co., Ltd., commutators for G.E.58 motors.

BOURNEMOUTH CORPORATION.—Bournemouth and Poole Electricity Supply Co., Ltd., lighting and heating equipment for police boxes, £341 10s., with maintenance charge, 9s. 6d. per box per quarter.

MAIDENHEAD CORPORATION.—Hewittic Electric Co., Ltd., rectifier plant for sub-station, £1 295; W. Lucy and Co., four transformer kiosks, £885; Drake and Gorham Wholesale, Ltd., sub-station switchgear, £268.

MANCHESTER CORPORATION.—Crypto Electrical Co., Ltd. (associated with Lancashire Dynamo and Motor Co., Ltd.), constant potential battery charging equipment; Nesta, Ltd., 100 sets of upholstered seats for tramcars.

BEXHILL CORPORATION.—Chamberlain and Hookham, Ltd., supply of meters, £1 030; Hewittic Electric Co., Ltd., supply of rectifier equipment, £1 492; A. Reyrolle and Co., Ltd., ring main switchgear, etc., £457 1s.; Bertram Thomas, feeder switchgear, £220 (all recommended).

CENTRAL ELECTRICITY BOARD.—Enfield Cable Works, Ltd., certain 132 kV overhead transmission lines in connection with North-West England and North Wales Electricity Scheme, 1928; Watsham's. Ltd., and W. T. Henley's Telegraph Works Co., Ltd., 33 kV overhead transmission lines in connection with South-East England Electricity Scheme, 1927. Approximate total value of the contracts, £320 000.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—Twelve months' supply of stores and materials to the electricity department: General Electric Co., Ltd., electrical goods; Chamberlain and Hookham, Ltd., ordinary and two-rate meters; Metropolitan-Vickers Electrical Co., Ltd., prepayment meters; W. T. Henley's Telegraph Works Co., Ltd., meter boards; Dussek Bitumen Co., Ltd., insulating compound.

Digitized by Google

TORQUAY CORPORATION.—Stirling Boiler Co., Ltd., supply and erection of two water-tube boilers, economisers, air pre-heaters, induced and forced draught fans, grit arresters, chimneys, etc., for the electricity department, £34 540. Also tendered: J. Thompson Water Tube Boilers, Ltd., £34 989; Yarrow and Co., Ltd., £36 315; Babcock and Wilcox, Ltd., £36 811; Spearing and Co., Ltd., £37 840; Simon Carves, Ltd., £38 000; Vickers Boiler Co., Ltd., £38 645.

LONDON COUNTY COUNCIL.—H. J. Cash and Co., Ltd., wiring and fittings for electric lighting, power, bells and telephones at new Homestall Road, Peckham, Secondary School, £1 354. (Recommended.) Also tendered: Smethurst and Co. (London), Ltd., £1 380; Electrical Installations, Ltd., £1 545; J. Briggs (Electrical Contractors), Ltd., £1 561; Ellis and Ward, Ltd., £1 759; T. W. Berkeley Electrical Engineering Co., Ltd., £1 786; Malcolm and Allan (London), Ltd., £1 793; Barlow Bros. and Co., £2 140; Heath, Pritchard, Ltd., £2 534.

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—W. Lucy and Co., Ltd., one 5-way feeder pillar, £44; one 10-way, £59 10s.; one 6-way, £46; one 8-way, £48; one 8-way, £58 15s.; and one 6-way, £53, less 5%; W. T. Henley's Telegraph Works Co., Ltd., three 3-way disconnecting boxes, £20 19s. 3d.; two 3-way, £13 19s. 6d.; two 3-way, £13 19s.; one 3-way, £15 1s. 7d.; and one 3-way, £6 2s. 4d., all less 2½%; Callenders Cable and Construction Co., Ltd., three 3-way disconnecting boxes, £28 19s.; one 4-way box, £19 5s. Enfield Cable Works, Ltd., 5 000 yds. cable, £565; 500 yds., £102 10s.; 500 yds., £82 10s.; 980 yds., £1 185 16s.; 1 760 yds., £290; 880 yds., £102; and one 3-way disconnecting box, £8 15s., less 2½% (all recommended).

"THE LEGION BOOK."
A Remarkable Guinea's Worth in Aid of a Splendid Cause.

ONE of the first matters to claim the interest of the Prince of Wales when he returns from his visit to Africa will undoubtedly be the progress of "The Legion Book." This unique book, written and illustrated, at the Prince's personal invitation, by fifty of the most famous novelists, poets and artists in this country, was published in aid of the British Legion, and the King expressly desired that the money resulting from its sale should be regarded as a thanks-offering for his recovery.

In one of the last public speeches he made before sailing for Africa at the beginning of this year, the Prince warmly commended "The Legion Book" to the public. He declared it to be "a remarkable book," and added, "I would appeal to everyone who can afford to do so to buy a copy." It is strongly hoped that a particularly wide response to the Prince's appeal will be made during his absence. If his expectations are to be realised, at least 100 000 copies of the book must be sold. It is certain that nothing would be more gratifying to him on his home-coming than the knowledge that this mark had been reached.

The price of the book is one guinea—and it is well worth it. This royally-inspired composite work includes some of the finest things ever penned by Mr. Rudyard Kipling, Mr. John Galsworthy, Mr. G. K. Chesterton, Mr. Hilaire Belloc, Mr. Arnold Bennett, Mr. Aldous Huxley, Mr. Edgar Wallace, Mr. Hugh Walpole and Mr. Robert Bridges, the Poet Laureate, to name but a few of its universally known authors. Its illustrators include Sir William Llewellyn, President of the Royal Academy; Sir Arthur Cope, R.A., Professor William Rothenstein (who contribute, respectively, portraits of the Queen, the King and the Prince of Wales), Mr. Augustus John, A.R.A., and Mr. Max Beerbohm.

"The Legion Book" is in itself a most covetable treasure, but its worth is more than doubled by its added virtue of being a means of helping a splendid cause—the welfare of the men who fought and faced death, and who, having survived the fight, are now finding it an even greater test of courage to face life; and it is, too, the succouring of the widows and children of those who have died after serving their country. The proceeds go to the Prince's personal fund for the British Legion—a fund with the administration of which he is personally associated. Not only private persons but also public bodies, municipal libraries, schools, colleges, clubs and other institutions will, no doubt, be anxious to ensure the complete success of the Prince's appeal.

All letters in regard to "The Legion Book" should be addressed to Admiral Sir Lionel Halsey, G.C.M.G., St. James's Palace, London, S.W.1, and the envelopes marked "L." Cheques should be made payable to the Legion Book Fund.

TRADE PUBLICATIONS.

GENT AND CO., LTD., Faraday Works, Leicester, has published Book 7, Section 8, dealing with bell signals, relays-keys, etc.

Benjamin Reflector Fittings Catalogue No. 427 (superseding 190) has been issued by SIEMENS ELECTRIC LAMPS AND SUPPLIES LTD., 38-39, Upper Thames Street, London, E.C.4.

This year's calendar of the Metropolitan-Vickers Electrical Co., Ltd., has just been issued. The subject is Miss Helen Gilliland, whose charms are rivalled only by her fifteen predecessors.

The ELECTRIC CONTROLLER AND MANUFACTURING CO., of Cleveland, Ohio, has sent us a new leaflet dealing with magnetic controllers for crane operation.

The "Non-Fayl" electric operated coffee mill is the subject of a new list published by the MORECAMBE ELECTRICAL EQUIPMENT CO., LTD., Fahy's Buildings, Easton Road, Morecambe.

We have received from the UNDERFEED STOKER CO., LTD., Africa House, Kingsway, London, W.C.2, a copy of a new pamphlet giving brief particulars of the "Duo-Mass" vibro conveyor.

We have received from SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E.18, a copy of price list No. 649, entitled "The Big Stride Forward in Wireless Battery Performance."

"Take Care of the Seconds and the Hours will take Care of Themselves" is the title given to a new leaflet of the RELAY AUTOMATIC TELEPHONE CO., LTD., Marconi House, Strand, London, W.C.2.

A number of new items are illustrated and described in the l.t. fuse and switchgear catalogue, No. 2 130, just issued by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38/39, Upper Thames Street, London, E.C.4.

INDIVIDUALIST LUNCHEONS.

Owing to the closing of the Hotel Cecil, new arrangements have been made for the last two luncheons of this season, to be held at the King Edward VII Rooms, Hotel Victoria, Northumberland Avenue, London, W.C.2, on May 14th and June 18th. The speaker on May 14th will be Dr. E. Graham Little, and on June 18th the Rt. Rev. the Bishop of Durham will give an address.

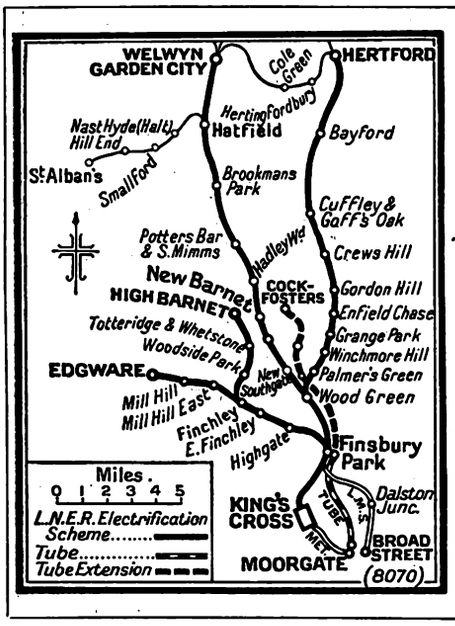
ELECTRICITY SUPPLY.

Bulk Supply in East Cornwall—Colchester Corporation to Purchase Walton Undertaking—Bexhill Extensions—Fixed Price System at Beckenham.

MAIDSTONE T.C. has received sanction to a loan of £3 500 for the erection of electricity showrooms in Middle Row.

Cheadle and Gatley U.D.C. is to supply electricity under a Fringe Order to premises in Northern Etchells.



THIS route-map reproduced from "The Times" indicates the electrification scheme of the L.N.E.R., and the Tube extensions referred to in our last issue. Though the L.N.E.R. scheme is now complete and has been laid before the Developments Act Committee, its carrying out is understood to be dependent to some extent upon the fate of the Bill for the Tube extension now before Parliament.

It is proposed by Halifax Electricity Committee to carry out work in connection with mains, etc., at an estimated cost of £30 564.

Great Ayton (Yorkshire) ratepayers have decided by a large majority to substitute electric lighting for the present gas lighting in the village.

Sanction to a loan of £9 092, for h.t. mains, and £1 633 for switchgear, transformer and kiosks has been received by Birkenhead Corporation.

Tamworth T.C. has decided, subject to the sanction of the Commissioners, to acquire the undertaking of the Tamworth Electrical Supply Co. for £1 500.

York Electricity Committee recommends application for loans of £4 000 for assisted wiring and £12 000 for the purchase of domestic apparatus to be let on hire.

Terms have been agreed between Plymouth T.C. and the Cornwall Power Co. for a bulk supply of electricity by the Corporation to the East Cornwall area, including the towns of Saltash and Torpoint.

Colchester Corporation has decided, conditionally, to purchase the electricity undertaking of Walton-on-the-Naze U.D.C. for £10 546, plus a sum not exceeding £450, representing unborrowed capital expenditure.

St. Pancras (London) electricity department has fitted special types of reflectors to a number of lamp standards in Camden Road and Crowndale Road for experimental purposes, in order that the effect upon the street lighting may be considered.

For the purposes of the national "grid" it is necessary for the Central Electricity Board to erect sub-stations in the vicinity of Birmingham Corporation's power stations at Hams Hall and Nechells. The Electricity Committee has arranged to provide the requisite sites.

The sum of £47 075 is to be spent by Burnley Electricity Committee in changing over from d.c. to a.c. the supply of electricity in certain parts of the town. It will be necessary at a later date for remaining districts to be changed over, the estimated cost being £90 000.

The electricity supply for the village of Longsdon provided by Leek U.D.C. was inaugurated on March 27th. The scheme has cost between £2 000 and £3 000, and the sub-station has been designed so that it may at a later date be able to provide supplies for Cheddleton and other neighbouring areas.

Sanction to a loan of £6 117 for plant extensions and for the Northern sub-station has been received by Bexhill T.C. Sanction is to be sought for loans for additional plant at the Little Common sub-station, estimated to cost £1 831, and an additional sub-station in Terminus Road, estimated to cost £2 613.

Beckenham U.D.C. is to proceed with a re-distribution scheme in the area of Church Road, Shortlands, including a new sub-station in Scotts Lane, at an estimated cost of £5 602. The "fixed price light" system of supply is to be extended to all houses in the district having a rateable value not exceeding £25.

Sheffield electricity department has received an application from Beighton P.C. for a supply of electricity throughout the parish, and the Committee has agreed to supply electricity on terms to be hereafter arranged.—The Committee is seeking an Order authorising the extension of the existing area of supply so as to include Dronfield urban district.

The Ballymoney Light and Power Co. has informed Ballymoney R.D.C. that the company has applied to the Electricity Commissioners for a Statutory Order to enable it to continue to supply electricity in Ballymoney and the district round about the Balnamore side of the town. The company desires to get a supply of electricity in bulk from Larne, from the Antrim Electricity Supply Co.

Mr. Borlase Matthews has informed Sleaford U.D.C. that the Electricity Commissioners have granted the Lincolnshire Electricity Special Order, though it has yet to be formally approved by Sleaford. He has asked whether the Council would be prepared to transfer its undertaking to the public utility company which it has been arranged to form to operate the Order. He predicts a lower price for electricity as one of the immediate advantages of the transfer.

A new transformer of 1 000 kVA has been put into service at Minffordd by the North Wales Power Co. to meet the increased demand of Bangor Corporation. This transformer is intended to take the place of one of the two existing transformers of 500 kVA. It is anticipated that there will be a substantial increase in the output, in consequence of the revised terms of the Power Co. for bulk supply, and especially in view of the reduced rates to domestic users under the two-part tariff.

Hull electricity department is eliminating the domestic prepayment system, which was a combination of the domestic tariff and a prepayment meter, involving the standing charge payment by a quarterly account and payment per kWh through a prepayment meter. Under that system the reduction of meter rents could not be applied, and the consumers concerned were prevented from taking full advantage of the ½d. per kWh rate.—The Electricity Committee has obtained sanction to borrow £68 386 in connection with the supply to the added area.

Southwark (London) Electricity Committee reports that a complete change-over from d.c. to a.c. throughout the whole area of supply would cost about £121 000, involving annual repayments of approximately £12 000 if no assistance was forthcoming from the Commissioners or any other source. The Committee considers therefore, that this course is not to be contemplated at present. It appears, however, that there is every justification when laying new mains for the provision of four-core cable, which could be used for three-phase current later. It is therefore recommended that in future alternative prices for three- and four-core cable be obtained.

The Borough Electrical Engineer has reported to Electricity Committee that extensions of mains in the Barking side, Seven Kings and Chadwell Heath districts are necessary and negotiations for kiosk sites have been. Engineer has submitted a scheme which he thinks will attract potential consumers who cannot avail themselves of the facilities already offered, and will result in securing sufficient consumers in practically every road in the borough where the mains are not laid at present, to warrant the capital expenditure in laying the mains. Under the scheme it is proposed to provide in existing houses a complete installation, including shades and lamps, the charges to be for six lighting points, 6s. per quarter, and for each additional lighting point, 9d. per quarter, the maximum number of lighting points to be 12. The Committee recommends that the scheme be put into operation in respect of roads along which the Council's electricity cables have already been laid.

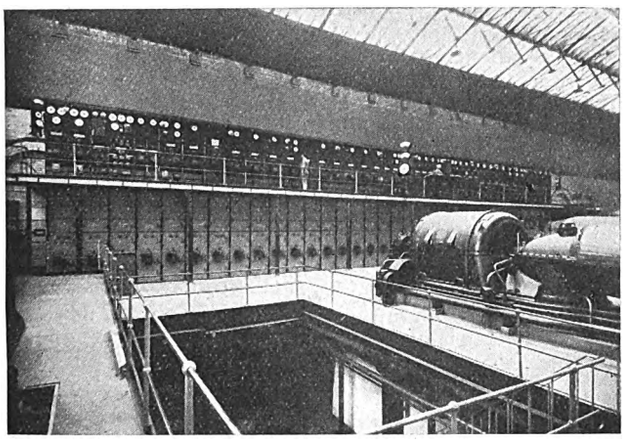
ELECTRICAL PICTURES.

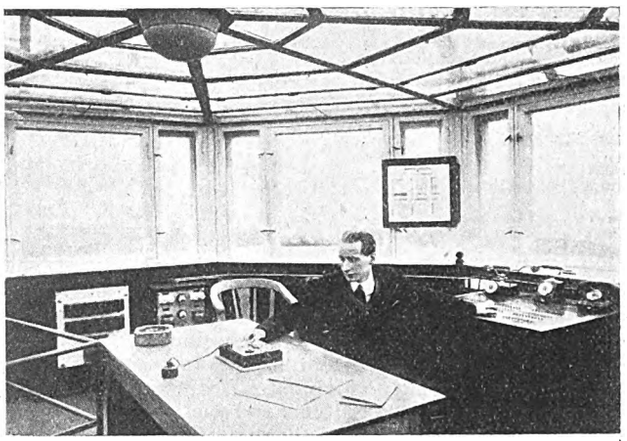
Sir John Brooke, whose appointment as vice-chairman of the Electricity Commission is referred to on page 470.

A new electrically operated rammer, which has made its appearance on the London streets.

Mr. W. B. Woodhouse, who has joined the Board of the Electrical Distribution of Yorkshire, Ltd. See page 470.



The control board at the Derby power station. The original and all the extension switchgear was manufactured by the British Thomson-Houston Co., Ltd., and the board illustrated is located in the turbine house, mounted on a gallery above the original bank of switchgear cubicles.



A "lighthouse" has been erected in Berlin whence an official, by means of press button switches, can illuminate all the thoroughfares of the city. From the lighthouse high above the buildings, the controlling officer has a comprehensive view of the whole city area.

On Thursday, April 3rd, over 400 members of the Electrical Association for Women visited the Ideal Home Exhibition, London, as the guests of the General Electric Co., and were afterwards entertained at luncheon at the Clarendon Restaurant, Hammersmith, London, where this photograph was taken. The London members of the Association were joined by contingents from Birmingham, Cheltenham, Cardiff, Ashford, Rugby, Gloucester and Bath. During the afternoon members were the guests of the Edison Swan Electric Co.

The activity created by the placing of large orders on the part of the Central Electricity Board during 1929, in conjunction with the many developments in domestic electrification, is reflected to some extent in the accounts of several electrical manufacturing and equipment companies. In spite of difficult international conditions and the general industrial depression, both the home and the export trade in electrical goods and apparatus has shown an improvement in relation to 1928, although in many instances the net profits of the companies have declined.

In the telephone world important arrangements for mutual help and collaboration have been made between telephone manufacturing and operating companies. As one of the results of this policy the International Automatic Telephone Co. now forms a prominent link in an important chain of companies covering the U.S.A., Great Britain, Germany, etc.

The results of the International Automatic Telephone Co., Ltd., for the last two financial years are compared below:—

INTERNATIONAL AUTOMATIC TELEPHONE CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Net Profit	£133 517	£130 816
7% Preference Dividend	11 924	11 924
12½% Ordinary Dividend (less tax)	53 750	53 750
12½% Deferred Dividend (less tax)	45 000	45 000
To Reserve, etc.	10 000	10 000
Patent Rights and Goodwill	360 000	360 000
Investments (at cost) and Loans	905 235	930 647
Debtors	101 545	123 627
Cash	4 509	3 629
Creditors (including provision for contingencies)	112 347	150 506
Ordinary Share Capital	430 000	430 000
Deferred Share Capital	360 000	360 000
7% Preference Share Capital	170 338	170 338
Carried forward	82 579	69 736
Dividend	12½%	12½%

The ordinary shares rank for 6% non-cumulative dividend and also for capital in priority to the deferred shares, and *pari-passu* with the deferred in the surplus profits after a dividend of 6% on the deferred. At the recent price of 21s. 3d., the preference yield £6 11s. 9d. per cent., and at 37s., the return on investments in the ordinary shares amounts to about 6¾.

AMERICAN TELEPHONE AND TELEGRAPH CO.

The expansion of the American Telephone and Telegraph Company during the past three years is indicated in the following table:—

	1927. $	1928. $	1929. $
Net Revenue	128 614 910	143 170 491	166 189 758
Dividends	97 379 934	103 821 440	116 378 771
Added to Surplus	79 173 841	19 349 051	49 810 987

In the London Stock Exchange Official List the common stock of this company is quoted at 250.

NEW YORK TELEPHONE CO.

The 1929 accounts show a net profit of $29 655 543, the dividend being maintained at 8%, and $5 582 543 added to the surplus.

BELL TELEPHONE OF CANADA.

The net income of this undertaking is shown at $5 528 069 in the 1929 accounts, the dividend of $8 per share being maintained, and the sum of $668 126 added to the surplus.

When comparing the principal features of the Accounts of Enfield Cable Works, Ltd., for the two last accounting periods, it should be remembered that the 1928 profit figure relates to the 18 months ended Dec. 31, 1928:—

ENFIELD CABLE WORKS, LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Net profit	£129 408	£143 067
7½% Preference Dividend	15 000	22 500
Ordinary Dividend	87 500	72 500
To Reserve	25 000	40 000
Share Premium Account	155 035	160 690
Creditors	60 804	33 179
Cash	148 685	44 594
Debtors	352 096	210 218
Stock	113 357	160 837
Reserve	160 000	140 000
7½% Preference Share Capital	200 000	200 000
Ordinary Share Capital	350 000	350 000
Carried forward	33 559	31 650
Dividend	25%	30%

At 26s., the preference shares yield 5¾%, and at 92 the ordinary return about 5 1/16%.

Some of the principal items shown in the final Accounts of the British Aluminium Co., Ltd., covering the last two accounting periods are compared below:—

BRITISH ALUMINIUM CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Net Profit	£279 793	£284 063
Preference Dividend	17 974	17 974
Ordinary Dividend	100 103	100 103
To General Reserve	100 000	100 000
To Depreciation Reserve	50 000	50 000
Property	2 871 423	2 737 079
Debenture Redemption Funds	482 911	445 056
5% Prior Lien Debenture (£100)	745 600	768 100
6% Non-Cum. Pref. Capital	299 570	299 570
Debenture Stock, 5½%	507 215	521 770
Ordinary Capital (£1)	1 001 034	1 001 034

COMPANY NEWS.

Rise of American Telephone and Telegraph Stock—Anglo-Portuguese Telephone Co.'s Capital Programme—Clyde Valley Co.'s Increased Profit—Directors' Reports.

AMERICAN Telephone and Telegraph stock is approaching the 300 mark, a further rise of 10 points during the past week bringing the quotation up to 280. Radio Corporation of America shares are over 60, a 5-point rise in the week, on talk of a deal with the General Electric and Westinghouse companies. General Electric shares have, for the same reason, jumped up a matter of 7s. 6d., to 55s. Hydro Electrics are 3 points higher at 54¼, the present quotation being 10 points above that ruling in the middle of last month. Since then, of course, the corporation's report has been made known, showing a net income of nearly £1 380 000 in 1929, compared with not quite £1 150 000 in 1928. International Telephone and Telegraph Stock has advanced to above $70 a share. Cables and Wireless stocks are much about the same as a week ago. Marconi International Marine shares at 45s. are down 1s. 3d.

In the manufacturing department, the feature has been the rise in General Electrics, already referred to. Associated Electrics have jumped from 28s. to 31s. 6d., and Ever Ready ordinary, with a rise of 1s., are once more over par, while the participating preference shares are 6d. better at 29s. 6d. Henley's ordinary shares are 3s. 9d. higher at 131s. 3d.; Enfield Cable Works shares are quoted at 90s. ex dividend and bonus. International Automatic Telephone shares are also ex dividend and bonus, the price being 35s. Automatic Telephone Manufacturing ordinary shares at 37s. 6d. are 1s. 3d. down.

A number of electricity supply companies' shares are at a slightly higher level. Charing Cross shares are 1s. 6d. up at 27s., and Brompton and Kensington, Chelsea, St. James' and Pall Mall, and Westminster are all 6d. to the good. Electric Supply Corporation shares are 1s. 3d. higher, at nearly 47s. South Metropolitan 7% preference have moved up from 25s. to 26s. 9d., but South Londons at 26s. 9d. are down 9d., and City of London 1s. 3d. lower at just over 33s. Calcutta Supply shares have given way 1s. 3d., to below 49s. 6d.

Metropolitan and District Railway shares are slightly firmer. London and Suburban Traction debentures are 2 points down

To 5% deb. stk. redemptn. acct., £4 863, agst. £4 648 ; to res. and renewals accts., £15 000, agst. £19 000 ; pref. sh. div., £12 600. It is proposed to resume divs. on ord. shs., after lapse of three years, with a paymt. of 2½%. Fwd., £3 122, agst. £3 327.

NOTTING HILL ELECTRIC LIGHTING CO., LTD.—Pft. for 1929, includg. £28 977 brt. fwd., £91 873, agst. £91 734, includg. £27 744 brt. in, deb. and other int., £2 794, agst. £2 911, sinkg. fund "A" and int., £11 288, agst. £7 420, sinkg. fund "B" and int., £7 226, agst. £5 646 ; to contingency fund, £1 019 (same), joint undertakg. int., £2 172, agst. £2 334, and income tax, £11 526, agst. £12 887. Div. on 6% pref., £9 600. Fin. div. on def. at 11s. 7·817d. p. sh., less tax, makes 16s. 7·817d. (agst. 14s. 0·006d. ; fwd. £28 229, agst. £28.977.

A. REYROLLE AND CO., LTD.—Pft. for 1929, £98 021, agst. £90 615, plus £77 892 brt. in, after deductg. £1 000 for distribution among charitable and other funds. Divs. of 7% p.a. on pref. shs., and 12½% p.a. on ord. shs. are recommended. To res. for gen. purposes, includg. equalisatn. of divs., £100 233. Fwd. £75 681, agst. £78 892. Attentn. has been given to reorganisatn. and developmt. of J. H. Holmes and Co., Ltd., a subsidiary in which the company holds a controlling int. There was a loss in the first year's tradg. of that company, which was charged to res. in that company's accts., and has not been taken into acct. in arriving at the pfts. of A. Reyrolle and Co.

WINDERMERE AND DISTRICT ELECTRICITY SUPPLY CO., LTD.—Rev. for 1929 £15 016, decrease £174 ; workg. exes., £6 461, agst. £6 449. Blce. of rev. acct., £8 555, plus £803 brt. in ; deb. int. and divs., Keswick Elect. Light Co., £924 ; loan and bank int., £134, and redemptn. of debs., £493, making total of £10 909, less deb. int. and bank commissn., £849. Deducting amts. placed to depreciatn. res., £2 000 ; res. fund, £1 250 ; income tax acct., £500 ; cap. acct., free wiring, £250, and to writing off investmts., £493, left £5 567, out of which intm. divs. of 5% on 6% cum. pref. and 2½% on 7½% pref. shs. have been paid. Divs of 6% on 6% cum. pref. shs., making 11% for year, 5% on 7½% pref. shs., making 7½% for year and 4% for year on ord. shs. are recommended.

CONSTANTINOPLE TELEPHONE CO.—The International Telephone and Telegraph Corporation has purchased a controllg. int. in the stk. of the Constantinople Telephone Co. It is announced that the transactn. has been approved by the Turkish Govt. and that a new rotary automatic equipt. will be installed in Turkey. The International Corporation already operates in Spain, Cuba, Mexico, Porto Rica, Peru, Chile, Argentine, Uruguay and Brazil. The rept. of the Constantinople Telephone Co. for 1929 shows, after debiting int. on obligatns and debt certificates and usual allocatn. to res. for amortisatn., balce. of £T10 187 (agst. £T9 934, plus amt. brt. fwd. £T14 412, less distributn. made in April last on sh. cap. £T10 621, making £T13 978. Directors again recommend div. of 3½%.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.—Rev. for 1929, £1 874 049, agst. £1 859 159 ; blce. to net rev. acct., £1 180 944, agst. £1 207 130. Blce. from last acct. was £681 089, agst. £441 388. Int. in deb. stk. and tempy. loans absorbed £288 342 ; 7 % deb. stk. sinkg. fund instalmt., £5 000 ; and provision for diffce. between issue and redemptn. price of deb. stk., £4 600. Placed to contingency fund, £28 975 ; to res. for taxatn., £10 000 ; to res. for depreciatn. £284 953 ; to investmt. res. acct., £15 000. Fin. div. on 6 % pref. shs. at 3 % required £99 646. Fin. div. on ord. shs. at rate of 8 % (makg. 11 % for year) recommended. Electy. sold, 374 910 784 kWh, agst. 323 462 637. Consumers increased by over 40 000, makg. a total of over 162 000. Applicatn. has been made to the Commissioners for consent to extend Barking power house.

Company Meetings.

PINCHIN, JOHNSON AND CO., LTD.—At the recent general meeting, Mr. Edward Robson, chairman, moved the adoption of the directors' report and the declaration of a final dividend on the ordinary shares for the year 1929 of 20%, less tax, making 30%, less tax, for the year. He said while the company's total assets amounted to some £3 520 000, no less than £2 700 000 was represented by liquid, or easily realisable assets. Reserves and carry forward at January 1st amounted to £1 002 859. The report and accounts were adopted, and a resolution was passed authorising the capitalisation of £143 953 from the reserve and its application in paying up in full 287 906 ordinary shares, to be allotted to the ordinary shareholders in proportion to the number of such shares held by them.

Digitized by Google

PARA ELECTRIC RAILWAYS AND LIGHTING CO., LTD.—Sir Francis M. Voules, presiding at the meeting on Monday, said the gross earnings of the tramways department had increased from 4 827 contos in 1928 to 4 940 in 1929, and those of the light and power department from 2 341 to 2 417 contos. If the recommendation to pay a final six months' dividend at the rate of 6% per annum on the preference shares was approved, there would remain £3 604 to be carried forward. The Board had decided that additions to the generating plant be provided. By the installation of two turbo-generators of 1 500 kW each they hoped to be in a position, in about a year, to satisfy any demand for some time to come, and to realise substantial economies. To provide for the expenditure, which would amount to about £30 000, the directors proposed setting aside from month to month sufficient portions of the ordinary revenue to meet payments for this power plant extension as and when due. The report was adopted, and the appointment of a committee of shareholders to co-operate with the Board in a scheme of capital reorganisation was approved.

BAIRD TELEVISION DEVELOPMENT AND BAIRD INTERNATIONAL TELEPHONE COMPANIES.—A scheme of amalgamation of interests was considered at a series of meetings of shareholders of these companies on Monday. Sir Edward Manville, chairman, said since the last annual meeting the energies of the companies had been chiefly concentrated on the perfection of television. They started regular vision transmission on September 30th last. The chairman explained the capitalisation proposed for the new company and the contemplated allocation of the shares respectively to the shareholders of the combining companies. The fusion of interests, he said, automatically gave the shareholders of the Development company a proportional use of the cash resources of the International company, and the "B" shareholders were to relinquish their rights of control. It was stated that the result of the voting would be announced later. At an extraordinary meeting of Baird International Television, Ltd. (presided over by Lord Ampthill), and also at a meeting of the holders of "A" shares, the scheme was approved. The adjourned annual general meeting followed, at which the report and accounts were adopted.

CLYDE VALLEY ELECTRICAL POWER CO., LTD.—At the meeting on April 2nd, Mr. Charles Ker (who presided in the absence of Sir Frederick C. Gardiner, chairman) said receipts from the sale of current had increased by approximately £43 000. Rates and taxes were equivalent to over 11% of the receipts. The net result was a profit of £355 000, an increase of £50 000. The output for the year, 258 000 000 kWh, was 18 000 000 kWh higher than for 1928, and additional connections to mains were 25 110 H.P., 9·38% increase. So far this year the output showed an increase of 8% over the corresponding period of 1929. The average rate per kWh sold last year was 0·736d., and the combined average received by the company and its subsidiaries 0·811d. The 20 000 kW, 50 cycle turbo alternator had been installed at Yoker power station, and had delivered power to the Central Scotland "grid" lines and to consumers since September. It was hoped to complete the standardisation of frequency in the whole of the company's area by the autumn of 1932. The estimated total cost was about £2 500 000. Another 20 000 kW turbo-alternator was due to be put in commission for the coming winter. The report and accounts were adopted.

LLANELLY AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Mr. M. A. Edwards, presiding at the meeting last week, said the conditions during the past year had not been inducive to industrial activity. In spite of this, 608 new consumers were added and 23 675 600 kWh sold, compared with 21 843 400. This increase was due largely to the growth of domestic consumption. A new super station for South Wales was contemplated in connection with the South West England and South Wales scheme, but its locality was not yet indicated. Their company had the rights to the best site available for the purpose. Negotiations of considerable importance had been conducted for several months which might result in considerably changing the scope and ramifications of the business. The company's Bill in Parliament under which it sought authority to run trolley vehicles and omnibuses in the place of, and in extension of, the light railways was proceeding normally. The first two months' trading this year showed a satisfactory increase over the corresponding period of last year. In the course of discussion it was suggested that a larger dividend than 2½% might be paid on the ordinary shares. The board's proposal to pay 2½% was, however, unanimously adopted.

ANGLO-PORTUGUESE TELEPHONE CO., LTD.—Sir Alexander Roger, addressing the meeting on March 31st, said the gross operating revenue, £189 437, showed an increase of £19 418. Expenses, including £30 000 for plant depreciation, increased by £6 749, giving a gross profit of £71 287, compared with £58 618. Net profit was £50 941, an increase of £8 054. A final dividend of 5%, less tax, on the ordinary shares was recommended, making 8% for the year. To provide for the further expansion of the systems in Lisbon and Oporto, the company had expended additional large sums on capital account. The tariff rates which came into force on September 1st, 1928, had been a stimulus to new business. The basis of the tariff for all new subscribers consisted of an annuity which included a number of free calls, all calls above the number of free calls being paid extra for by the user. During the year 3 665 stations were added, approximately 16% above the total at the end of 1928. The rate of progress in England was less than 10%. The number of stations at the end of 1919 was approximately 13 000, whereas at the close of 1929 it was 26 681. The company had embarked upon a particularly heavy capital programme for 1930, involving over £200 000. It would be necessary soon to raise fresh capital. Summing up the past year, he thought there was every reason to be gratified at the results, and that the company might look forward to the future with equanimity. The report and accounts were adopted and the dividends approved.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO., LTD.—Mr. F. G. Kellaway, presiding at the meeting last week, said from the 1928 accounts, the amount brought forward was £36 689, from which was to be deducted the £1 500 additional remuneration voted to the directors at the last annual general meeting, leaving a net carry forward of £35 189. Adding to this the net profit for 1929, they arrived at a total of £238 300, of which £59 636 was distributed as an interim dividend on October 29th last. The directors recommended that there should be appropriated an amount sufficient to raise the general reserve account from £158,014 to £200 000, and that a final dividend for 1929 of 10% be paid, leaving a carry-forward of £17 405. There was a fair increase in the volume of business offering in 1929, and they had to face efficient competition. As a result of regulations passed at the Washington Convention of 1927, December 31st, 1929, saw the beginning of the end on board ship of spark transmitters of more than ¼ kW power. By the end of 1929 the company held maintenance and rental contracts in respect of 2 758 British ships, a large proportion of which carried direction-finders and auto-alarm apparatus in addition to the main installations. During 1929 the company created a new department, carrying the title "Marine Electrical Equipments," to deal with such matters as band repeaters, automatic telephones, broadcast reception on board ship, and sounding devices. They believed that the principles of Beam radiation which they were employing could give the shipowner the most satisfactory and economical form of sounding device. They had already rental and sales contracts in respect of over 70 marine wireless telephone equipments. Taking everything into account, the directors inclined to a feeling of restrained optimism for 1930.

New Companies.

ARROW ELECTRIC SWITCHES, LTD.—Cap., £2 000. Designers and manufacturers of and dealers in electrical wiring devices, switches, plugs, sockets, lampholders, etc. Solicitors: Ranger, Burton and Frost, 179, Queen Victoria Street, London, E.C.

HARLIE (EQUIPMENTS), LTD.—Cap., £100. Manufacturers and repairers of wireless apparatus, telegraphic and telephonic apparatus, electrical, magnetic and radioatic instruments, etc. Reg. Office: 5, Chiswick Road, Lower Edmonton, London, N.9.

RELIABLE BATTERY CO., LTD.—Cap., £1 000. Electricians, accumulator manufacturers, chargers, repairers and assemblers, manufacturers of wireless, telephone and telegraph apparatus and appliances, etc. Solicitors: Kerly, Sons and Karuth, 10 and 11, Austin Friars, London, E.C.2.

A. F. BULGIN AND CO., LTD.—Cap., £2 000. To acquire business of a merchant of radio wireless instruments, etc., carried on by A. F. Bulgin at 9, 10 and 11, Cursitor Street, Chancery Lane, London, W.C., as A. F. Bulgin and Co., and to carry on same and business of wireless engineers, manufacturers of telephones, X-ray and sound amplifying and reproducing instruments, etc. Solicitors: Rexworthy, Barnard and Bonser, 83, Cannon Street, London, E.C.4.

SENTINEL INSTRUMENTS, LTD.—Cap., £100. To acquire business of engineer and scientific instrument maker carried on by R. L. Granville-Johnston at Newcastle-upon-Tyne, and to carry on business of telephone, engineers, makers and repairers of and dealers in electrical and other fittings, telephones, indicators, fire alarms, lightning conductors, etc. Solicitors:—Hannay and Hannay, South Shields.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BIGGS, GEORGE AND SON, 5, Clayponds Lane, Brentford, wireless dealers. £27 6s. 1d. February 5th.

BRADFORD, Oliver Hubert, 2A, Hill Street, Griffithstown, wireless dealer. £11 14s. 6d. January 23rd.

BRADLEY, Mr. P. (trading as GRANTHAM ELECTRICAL CO.), 14, Grantham Avenue, Manchester Road, Warrington, electrical engineer. £24 10s. 11d. March 4th.

GRAY, H. C., AND SON, 6, Sutherland Avenue, Maida Hill, W., wireless dealers. £13 11s. 4d. January 21st.

JONES, Mr. A. S., 9, Newborough Street, Carnarvon, wireless dealer. £11 17s. 4d. February 20th.

ORMSKIRK WIRELESS CO., 44, Burscough Street, Ormskirk, dealers. £16 2s. 6d. February 25th.

Deed of Arrangement.

BULLOCK, Harold Alfred, Premier Buildings, Barbourne Road, Worcester, electrician. Dated March 26th, filed April 1st. Trustee, F. E. Bendall, 3, Warwick Passage, Birmingham. Secured creditors, £114; liabilities unsecured £3 139; assets, less secured claims, £1 111.

Receivership.

ELECTRICAL NAME AND NUMERICAL SIGN CO., LTD.—E. G. F. Cartwright, C.A., of 4, Heathcote Street, W.C.1, was appointed Receiver and Manager on March 19th, 1930, under powers contained in debenture dated January 22nd, 1913.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ELECTRAMONIC CO., LTD., 1, Budge Row, E.C.4. The creditors were called together on April 2nd at the above address, when one of the directors, Mr. Gerrald-Nathan, stated that he was chairman of the committee of investigation which was elected at the last meeting of the shareholders. The present position was that there was a liability to the bank of £536, preferential creditors claimed £315, and there were creditors under £10 amounting to £397. The creditors over that amount were for £4 750, and in addition there were directors' fees of £957. The solicitors' costs were scheduled at £2 000, and there was money advanced to the company by Mr. Sayers of £3 985. The total assets were in the neighbourhood of £24 000 and it was proposed that a scheme of arrangement should be entered into with the creditors. The company proposed that all the creditors under £10 should be paid in full, and that creditors over that amount should receive 10s. in the £ in cash, and should take notes for the balance to be spread over a period of 24 months with an option to redeem at earlier dates if necessary. The Chairman added that all claims against the Celestion Company had been wiped out and there was a great hope of the company doing big business in the future. The creditors decided to accept the theme of arrangement, and it was intimated that the company would go into voluntary liquidation and a new company would be formed.

"M. P. A." WIRELESS, LTD., 62, Conduit Street, London, W.1. A largely attended meeting of the creditors of the above was held on April 4th at the Holborn Restaurant, London, W.C., when a statement of affairs was submitted as at January 8th last, which disclosed unsecured liabilities of £20 357, in addition to first mortgage debentures of £29 060, and £71 653 issued share capital. The assets, after allowing £1 041 for preferential claims, amounted to £8 002 10s. 6d., showing a deficiency of £21 058, as regards the debentures, and consequently there are no assets available for distribution amongst the creditors or shareholders. The assets include book debts £4 427, estimated to realise £3 000, and stock in trade £10 295, valued at £5 000. Mr. Hodgson, the chairman, said that the shareholders held a meeting the previous day, when resolutions were passed for voluntary liquidation. The Brookmans Park station had "hung fire," for quite a long time, and after the manufacturers had got ready for the season, there was a great dislocation not only for their company but for many other firms in the trade. It affected them very severely. They had also been planning to resell the company to a larger concern. The outside capital which had been brought into the company was less than £30,000. The rest of the capital had been provided by Mr. Hodgson and a few friends. The creditors might ask what the directors had got out of the business, but he could assure them that they had received no benefits whatever, with the exception of three of the creditors who were working their whole time and their salaries had been small. For himself, he had received nothing in any shape or form, but, on the other hand, he had backed the company with thousands of pounds of his own money. After some discussion it was decided to appoint Mr. James Ure, the receiver for the debenture holders, as liquidator of the company.

London Gazette, etc.

Companies Winding-up Voluntarily.

KNIGHTON ELECTRIC SUPPLY CO., LTD. By special resolutions, March 31st. W. Lloyd, A.S.A.A., of Priory Street, Dudley, incorporated accountant, and P. Parker, of Council Offices, Knighton, solicitor, appointed as liquidators.

STRATFORD AUTO AND WIRELESS CO., LTD. By resolution, March 18th. E. H. Hawkins, incorporated accountant, 4, Charterhouse Square, London, E.C.1, nominated as liquidator.

Bankruptcy Information.

LAYTON, H. B., 35-39, Maddox Street, London. Receiving order, April 2nd. Creditor's petition. First meeting, April 16th, 11 a.m., and public examination, May 30th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

MELVILLE, Ernest James, lately trading as JAMES MELVILLE AND CO., Dudley Chambers, Angel Row, Nottingham, electrical contractor. First meeting, April 15, 11 a.m., Official Receiver's Offices, 22, Regent Street, Park Row, Nottingham. Public examination, May 1st, 10 a.m., County Court House, St. Peter's Gate, Nottingham.

Notice of Intended Dividend.

AUSTIN, Clifford, 97, Domestic Street, Leeds, trading as C. AUSTIN AND SON and AUSTINS ACCUMULATOR AND RADIO SERVICE, wireless accessories dealer. Last day for receiving proofs, April 26th. Trustee, H. C. Bowling, 24, Lower Bond Street, Leeds, Official Receiver.

Partnerships Dissolved.

DRIVER AND PETERSON (Thomas Lashlie PETERSON and Shiavux Cawasji DRIVER), plumbers, heating, sanitary and electrical contractors, 398, Stanhope Road, Back Westoe Parade and Albany Street, South Shields, Durham, by mutual consent, as from June 21st, 1929.

TAYLOR AND EDMONDS (John Robert TAYLOR and Frank EDMONDS), wireless dealers, 17, Abbey Street, Accrington, as from March 8th, 1930, by mutual consent. Debts received and paid by F. Edmonds, who will continue the business.

TURNER AND BOOTH (Ernest TURNER and William BOOTH, electrical engineers, 51, Church Street, Radcliffe, Lancashire, as from March 31st, 1930, so far as concerns W. Booth, who retires from the firm. Debts received and paid by E. Turner.

EXPIRING PATENTS.

BELOW is a further list of patents of interest to electrical engineers and which, unless extended, expire during 1930 :—

No.	Date (1914).	Name of Patentee.	Subject of Patent.
14 817	June 20 ..	British Insulated and Helsby Cables, Bayles and Higham.	Electrical condensers.
15 194	June 24 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electric meters.
15 329	June 26 ..	Siemens Bros. and Co., and Marechal.	Metal filament lamps.
15 585	June 29 ..	Parsons	Dynamo-electric machinery.
15 788	July 1 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electrical vacuum discharge devices.
15 868	July 2 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electric meters.
16 619	July 11 ..	Betulander and Palmoren	Selectors for automatic telephone systems.
16 869	July 15 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electric meters.
16 986	July 17 ..	Parsons	Dynamo-electric machinery.
17 317	July 21 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electrical measuring instruments.
17 426	July 22 ..	Evans (Elektrochemische Werke G.m.b.H., Germany).	Producing flows in molten masses of electrical furnaces.
18 443	Aug. 8 ..	Thompson	Actuating signals on and communicating with trains.
18 497	Aug. 10 ..	British Thomson-Houston Co., Young and Watson.	Relays for voltage regulators.
18 758	Aug. 17 ..	Peckham, Thomas and Andrews.	Suspension of trucks of tramway vehicles, etc.
18 761	Aug. 17 ..	Woodhouse, and Callender's Cable and Construction Co.	Cable terminal boxes.
18 809	Aug. 18 ..	Mellersh-Jackson (S. I. Posen, U.S.).	Pocket flash lights.
19 057	Aug. 25 ..	British Thomson-Houston Co. (General Electric Co., New York).	Speed controlling device for motors.
19 237	Aug. 29 ..	Marks (Morkrum Co., U.S.)	Mechanism for printing telegraph systems.
19 882	Sept. 17 .	Beaver and Claremont ..	Electric cable.
20 176	Sept. 25 ..	Knipe and Read	Electric welding, and article produced thereby.
20 196	Sept. 25 ..	Railway Signal Co., and Roberts.	Locking mechanism for use with railway signals, etc.
20 549	Oct. 5 ..	Beaver and Claremont ..	High voltage insulated cable.
20 557	Oct. 5 ..	British Thomson-Houston Co. (General Electric Co., New York).	Electric transmission systems.
20 805	Oct. 10 ..	Clarke, and Chadburns (Ship) Telegraph Co.	Ship's telegraphic apparatus.
20 908	Oct. 13 ..	Thompson (Soc. Anon. des Telegraphes Ed. Belin, France).	Arrangements for synchronising apparatus having similar periodic movements.
21 388	Oct. 22 ..	British Thomson-Houston Co. (General Electric Co., New York).	Wireless signalling systems.
21 794	Oct. 30 ..	Siemens Bros. and Co. (Siemens and Halske A.G., Germany).	Circuit arrangements for telephone installations.
21 825	Oct. 31 ..	British Thomson-Houston Co. (General Electric Co., New York).	Dynamo-electric machines.
21 906	Nov. 3 ..	W. A. S. Benson and Co., and Ellwood.	Reversible connector for electrical apparatus.
22 062	Nov. 5 ..	Smyth	Electric generators for lighting mechanically propelled vehicles.
22 383	Nov. 11 ..	Kuyser	Dynamo-electric machines.
22 437	Nov. 12 ..	Gimingham	Arc incandescent lamps.
22 897	Nov. 23 ..	Anderson and Atchley (F. G. Warburton, Canada).	System of control for maintaining relative speeds of a number of electric motors.
22 940	Nov. 23 ..	Fessenden	Measurement by the use of sound waves.
23 122	Nov. 26 ..	British Thomson-Houston Co. (General Electric Co., New York).	Vapour electric devices.

GOVERNMENT PUBLICATIONS.

The following publications have been issued and can be obtained at H.M Stationery Office, London, etc. (The titles of the publications are given in the order in which they were issued) :—

Mines Department.—New edition of Handbook of Explanatory Notes by H.M. Electrical Inspector of Mines on the General Regulations Governing the Installation and Use of Electricity at Mines. 6d.

Ministry of Transport.—Electricity Commission : Rural Electrification. Description of Bedford Demonstration Scheme. 6d.

Ministry of Transport.—Electricity (Supply) Acts, 1882 to 1928 :—Draft Special Orders, 1930. West Lancashire Rural, 9d. Haverfordwest Rural, 9d. Ipswich (Extension), 1s. Swindon (Extension), 6d. Hythe, 6d. Exmouth, 4d.

War Office.—Government Department Electrical Specifications. No. 1, 1929, Electric Cables, J, K and L. Classes (Rubber Covered for Electric Power and Light.) 6d.

Statutory Rules and Orders, 1930 : Tramway. Increase of Charges, Bristol Tramways (Temporary Increase of Charges) Order. 1d.

General Post Office : Engineering Department : Technical Instructions : XXV. Automatic Telephone Exchange Systems : Part 8. P.B.X. Final Selectors—Diagrams, January, 1930. 1s.

Statutory Rules and Orders, 1930 : Electricity, Applications for Special Orders, etc. Electricity Commissioners Special Orders, etc. ; Rules, dated Feb. 19, 1930, 4d.

Ministry of Transport : Certified Electricity Supply Special Orders, 1929 : Hornsea and Skirlaugh District, 9d. Pontardawe Rural District, 1s. Torquay (Extension, etc.), 6d. Great Yarmouth (Extension), 6d.

General Post Office—Engineering Department : Technical Instructions : XXV. Automatic Telephone Exchange Systems : Part 4, the Non-Director System (Letterpress), 6s. Diagrams, 6d.

Ministry of Transport.—Light Railways Acts, 1896 and 1912. Railways Act, 1921 : Report of Proceedings of Ministry of Transport up to December 31, 1929. 6d.

Mines Department : Daily Log Book required to be kept at mines where electricity is used ; alternative edition ; with double space for reporting (M. and Q. Form 10A). 2s. 6d.

Wireless Telephony Committee. Copy of Correspondence between the Secretary, Cabinet Committee on Overseas Wireless Telephony, and Dr. F. E. Smith, Prof. G. W. O. Howe. 3d.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

322 882 Albion Clay Co., Ltd., and R. Lawton. Electrical conduits and means of manufacture of same. (29/11/28.)
322 884 D. S. Burleigh. Electric drives for gramophones. (30/11/28.)
322 888 G. A. Betulander. Arrangement in cross-bar switches. (6/12/28.)
322 891 Pirelli General Cable Works, Ltd., and J. R. Harding. Means for supporting overhead electric lines or conductors. (10/12/28.)
322 892 W. Row. Electric dimmer switches. (10/12/28.)
322 897 C. G. M. Bennett and C. A. Ely. Electric incandescent lamp holders. (13/12/28.)
302 294 Sprague Specialities Co. Electrical condensers. (13/12/27.)
302 589 Telefonaktiebolaget L. M. Ericsson. Circuit arrangements for the generation of simple harmonic oscillations. (17/12/27.)
322 907 E. J. Lever (Trix), Ltd., and D. A. Lyons. Portable wireless receiving sets. (19/12/28.)
322 920 A. W. G. Tucker and Ferranti, Ltd. Oil-filled electric transformers. (3/1/29.)
322 933 F. Mousley. Methods of constructing and carrying antiseptic or perfumed appliances for use in telephones or speaking apparatus. (18/1/29.)
305 102 British Thomson-Houston Co., Ltd. Electromagnetic separation of complex ores. (30/1/28.)
322 944 Switchgear and Cowans, Ltd., and G. H. Neep. Electric switchgear. (2/1/29.)
322 946 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Transformers. (4/2/29.)
306 944 General Railway Signal Co. Train dispatching systems. (28/2/28.)
306 538 Telefunken Ges. fur Drahtlose Telegraphie. Aerial systems for wireless signalling. (24/2/28.)
322 966 G. Ellison and J. Anderson. Alternating electric current interrupters. (4/3/29.)
307 424 C. J. R. H. Von Wedel. Electric discharge tubes. (7/3/28.)
322 975 L. W. Wild and Wild-Barfield Electric Furnaces, Ltd. Electric furnaces. (20/3/29.)
309 138 Associated Electrical Industries, Ltd. Deoxidising apparatus for use with oil-immersed electrical apparatus. (5/4/28.)
309 550 British Thomson-Houston Co., Ltd. Electrically wound clocks. (12/4/28.)
322 822 J. L. Baird and Television, Ltd. Television apparatus and the like. (11/7/28.)
322 823 J. L. Baird and Television, Ltd. Television apparatus and the like. (11/7/28.)
314 759 J. Dieux. Electromagnetic pick-ups for disc gramophone or like records. (10/5/28.)
322 775 J. E. Pollak (Ganz-Fele Villamossagi Reszvenytarsasag). Apparatus for regulating voltage in alternating current distribution systems. (1/6/28.)
322 825 S. O. Bowker. Electric junction boxes. (12/9/28.)
323,032 A. Rosenberg. Lamps and therapeutical buildings and structures for use in ultra-violet ray therapy. (17/8/28.)
306 521 M. I. Pupin. Artificial lines for telegraphy and like purposes. (24/2/28.)
323 022 C. E. Foster and H. C. Oughton. Sensitive electrical regulating, indicating, or recording devices. (7/9/28.)
323 034 S. O. Bowker. Electric junction boxes. (12/9/28.)
323 037 Standard Telephones and Cables, Ltd., and A. D. Blumlein. Alternating-current bridge circuits. (13/9/28.)
323 038 Standard Telephones and Cables, Ltd., and M. C. Field. Dielectric material for submarine cables. (14/9/28.)
298 630 Eisenwerk Weserhutte Akt.-Ges. Method and machine for laying cable. (14/10/27.)
323 014 W. E. Beatty (Bell Telephone Laboratories, Inc.). Volume control for sound recording and reproducing. (17/9/28.)
322 995 S. Z. de Ferranti and Ferranti, Ltd. Magnetic suspension devices. (15/6/28.)
322 996 S. Z. de Ferranti and Ferranti, Ltd. Electromagneto. (15/6/28.)
292 979 Ganz-Fele Villamossage Reszvenytarsasag. Alternating current supply systems. (28/6/27.)
297 328 Suddeutsche Telefonapparate-Kabel-Und Drahtwerke Akt.-Ges. and K. Kohl. Generation of electric oscillations. (17/9/27.)
297 427 Associated Telephone and Telegraph Co. Telephone systems. (21/9/27.)
323 017 B. B. Fenn. Incandescent electric lamps. (18/9/28.) (Cognate Applications, 29461/28 and 34789/28.)
297 462 British Thomson-Houston Co., Ltd. Electromagnetic compasses of the earth-inductor type. (22/9/27.)
323 041 F. A. Lindemann. Apparatus for producing electric current corresponding to light incident thereon. (19/9/28.)
323 027 A. Graham and Co., Ltd., W. J. Rickets, and W. Stott. Telephonic systems. (19/9/28.) (Cognate Application, 14342/29.)
323 043 W. E. Beatty. (Bell Telephone Laboratories, Inc.) Sound recording or reproducing devices. (20/9/28.)
323 044 A. Egger. Apparatus for connecting instruments, meters, and the like to alternating-current systems carrying heavy currents. (20/9/28.)
297 682 Electrical Research Products, Inc. Manufacture of loaded conductors. (24/9/27.)
323 049 L. Burn. Ovens and hoods of electric, gas, and oil cookers. (24/9/28.)
322 999 C. J. Owen and Automatic Coil Winder and Electrical Equipment Co., Ltd. Coil winding machines, etc. (12/7/28.)
294 114 Telefunken Ges. fur Drahtlose Telegraphie. Apparatus for denoting and ascertaining position, type, etc., of ships. (15/7/27.)
311 755 Soc. Des Ateliers De Montage et D'Ebenisterie. Thermionic valve amplifiers. (16/5/28.)
289 157 A. Soulier. Means or systems permitting of the transformation of a distribution at variable electric tension into a distribution at constant tension. (4/10/27.)
323 071 D. Danielsson, and Allmannasvenska Elektriska Aktiebolaget. High-tension switch-fuses. (23/10/28.)
323 077 Holophane, Ltd., and H. S. Allpress. Spot-light projectors. (27/10/27).
323 079 J. B. Meiklejohn, and J. B. Meiklejohn, Ltd. Insulating switches. (31/10/28.)
323 090 Burovox, Ltd., and J. K. Haynes. Telephone systems. (15/11/28.)
301 431 British Thomson-Houston Co., Ltd. Furnaces. (29/11/27.)
323 098 F. Warburton. Telegraph printers. (30/11/28.)
301 914 Westinghouse Brake and Saxby Signal Co., Ltd. Railway traffic controlling apparatus. (8/12/27.)
307 008 Luth and Rosens Elektriska Aktiebolag. Electric driving arrangements. (1/3/28.)
323 108 Wilkins and Wright, Ltd., and J. H. Hewitt. Mechanism for rotating the spindles of electric condensers or other instruments. (19/12/28.)
323 109 J. W. Record and Record Electrical Co., Ltd. Means for retarding the action of electrical apparatus. (19/12/28.)
323 119 H. H. Berry. Electric imitation fires. (1/1/29.)
323 123 A. W. G. Tucker and Ferranti, Ltd. Alternating-current load-transferring switches. (3/1/29.)
323 124 S. G. S. Dicker (N. V. Philips' Gloeilampenfabriken.) Transformers. (7/1/29.)
304 287 O. Ekman (trading as Nordisk Elektricitets Selskab, J. P. Jakobsen, O. Ekman.) Lamp shades. (18/1/28.)
323 131 Baron Marks (A.C. Spark Plug Co.). Magnetic speedometer. (21/1/29.)
323 136 M. H. Goldstone. Insulated electric lamp-holders. (26/1/29.)

Digitized by Google

305 538 A. Daniker. Quick-acting thermal electric switches. (6/2/28.)
306 091 C. Lorenz Akt.-Ges. Apparatus for picture telegraphy. (15/2/28).
307 059 Telefunken Ges fur Drahtlose Telegraphie. Aerials. (3/3/28.)
323 158 L. T. Dixon and W. J. Silvester. Electric lamp-holders for vehicles. (1/3/29.)
309 079 International General Electric Co., Inc. Process for the manufacture of electrical condensers. (4/4/28.)
323 168 F. A. Schroeder. Electrostatic telephones. (8/4/29.)
309 494 Osnabrucker Kupfer-und Drahtwerk. Apparatus for the crossing of quadruple-core cables during stranding. (11/4/28.)
309 506 International General Electric Co., Inc. Manufacture of electrically insulating materials. (11/4/28.)
309 917 K. Lenzkes. Device for stopping electrically-driven looms by a weft-guard. (17/4/28.)
310 806 Siemens-Reiniger-Veifa Ges. fur Medizinische Technik. Cathode-ray sterilisation. (30/4/28.)
315 351 Akt.-Ges der Maschinenfabriken Escher, Wyss, et Cie. Steam or gas turbines. (12/7/28.)
315 864 Electrolux, Ltd. Nozzles for suction cleaners. (21/7/28.)
315 725 International General Electric Co., Inc. Multiple-stage rotary compressors. (16/7/28.)

Applications for Patents.

November 27th.

36 315 Akt.-Ges. Brown, Boveri et Cie. Trolley wire support for electric railways. (27/5/29, Germany.)
36 283 British Electrical and Allied Industries Research Association and P. D. Morgan. Fusible cut-outs.
36 305 S. Darby, W. B. Lancaster, T. E. Riddle and M. H. Weston. Devices for protecting ends of electric cables.
36 394 W. H. Dearden, G. Lawton, and Standard Telephones and Cables, Ltd. Manufacture of loading material for cells.
36 395 W. H. Dearden, G. Lawton, and Standard Telephones and Cables, Ltd Magnetic materials and loading.
36 405 Dubilier Condenser Co. (1925), Ltd. Radio receiver, etc. (27/11/28 Germany.)
36 365 Electrical Research Products, Inc. Transmission systems. (27/11/28 U.S.)
36 331 E. A. Forceville, and Siemens Bros. and Co., Ltd. Electromagnetic systems.
36 310 C. C. Garrard, General Electric Co., Ltd., and F. J. Keeley. Oil-immersed electrical apparatus.
36 312 C. C. Garrard, General Electric Co., Ltd., and F. B. Willis. Electrical apparatus responsive to synchronisation of alternating voltages.
36 309 General Electric Co., Ltd. Manufacture of incandescent lamps. (30/11/28, Germany.)
36 398 L. B. Haigh, Standard Telephones and Cables, Ltd., and E. P. G. Wright. Semi-automatic telephone exchange systems.
36 323 W. T. Henley's Telegraph Works Co., Ltd., E. Moor, and H. S. Wheeler. Electric switch mechanisms.
36 322 Igranic Electric Co., Ltd., and H. S. Payman. Variable resistance devices.
36 385 B. Krol, and Mullard Radio Valve Co., Ltd. Thermionic valves, etc.
36 291 H. G. Nicholson. Static transformers.
36 329, 36 330 C. L. Peters, and Siemens Bros. and Co., Ltd. Automatic telephone systems.
36 396 E. K. Sandeman and Standard Telephones and Cables, Ltd. Distributor for use in telegraphy, etc.
36 386 L. Silberstein. Manufacture of electric resistances. (18/12/28, Germany.)
36 397 Standard Telephones and Cables, Ltd. (L. J. J. Schreiber and K. M. Sano). Step-by-step selectors for telephone systems, etc.
36 356 Westinghouse Brake and Saxby Signal Co., Ltd. Operating railway signals. (15/2/29, India.)

November 28th.

36 485 Associated Electrical Industries, Ltd. Ventilation of electrical machines. (7/12/28, U.S.)
36 479 British Thomson-Houston Co., Ltd. Transformers. (28/11/28, U.S.)
36 480 British Thomson-Houston Co., Ltd. Synchronous motor drives. (28/11/28, U.S.)
36 481 British Thomson-Houston Co., Ltd. Leads for incandescent lamps, etc. (30/11/28, U.S.)
36 541 A. W. Coker and R. H. Wadeson. Electric fires, etc.
36 425 S. O. Cowper-Coles. Electrodeposition of metals.
36 426 S. O. Cowper-Coles. Electroplating.
36 543, 36 544 C. R. Cook. Electric couplings, etc.
36 521 W. S. Eaton. Electrical commutators. (28/11[28, U.S.)
36 433 A. J. Fyfe. Fixing flat electric cables into junction boxes, etc.
36 565 Gramophone Co., Ltd., and A. G. D. West. Adjusting means for rotatably mounted electrical components.
36 564 E. V. Mackintosh. Electromagnetic vibratory devices.
36 503 J. M. Ortega. Devices for use with thermionic valves.
36 536, 36 537 J. Robinson. Wireless receiving systems.
36 538 J. Robinson. High frequency electrical apparatus.
36 539 J. Robinson. Wireless receiving apparatus.
36 469 Standard Telephones and Cables, Ltd. (Bell Telephone Manufacturing Co., Inc.) Telephone switchboards.
36 462 W. W. Triggs (National Carbon Co.). Galvanic cells.
36 546 W. W. Triggs (Weston Electrical Instrument Corporation). Electric cell.
36 418 A. E. Watson. Plugs for electric switches, etc.
36 460 Western Union Telegraph Co. Synchronous telegraph system. (5/11/29. U.S.)

November 29th.

36 680 Benjamin Electric, Ltd. Holders for thermionic valves. (30/11/28, U.S.)
36 675 W. Binder. Television, etc. (29/11/29, Hungary.)
36 590 G. G. Blake. Electrotherapeutic electrodes.
36 619 British Power Railway Signal Co., Ltd., Park Royal Engineering Co., Ltd., and C. W. Somersgale. Electric lighting systems for vehicles, etc.
36 656 British Thomson-Houston Co., Ltd., C. J. Morton and L. Griffith. Ignition devices for engines.
36 657 British Thomson-Houston Co., Ltd., and F. P. Whitaker. Electric arc rectifiers.
36 673 M. W. Clarke and Spencer (Melksham), Ltd. Magnetic separators.
36 635 C. Contal and E. Davidson. Rheostats, etc. (3/12/28, France.)
36 720 A. F. Cornock and General Electric Co., Ltd. Holders for thermionic valves, etc.
36 585 J. A. Crabtree. Manufacture of covers for electric switches, etc.
36 692 R. E. Ellis (Adams Sibley Development Corporation). Electric motors.
36 718 General Electric Co., Ltd., and N. F. T. Saunders. Alternating current motors.
36 579 R. M. Hamilton. Totalisators, etc.
36 703 W. O. Hayne and Plessey Co., Ltd. Variable condensers.
36 648 Igranic Electric Co., Ltd. (Cutler-Hammer Manufacturing Co.). Circuit controllers for lifting magnets, etc.
36 626, 36 627 Lodge-Cottrell, Ltd., and L. Lodge. Apparatus for electrical precipitation of solid, etc., particles from gases.
36 674 A. W. Roschdestwin. Electric signal transmitter.
36 649 Soc. des Etablissements Pericaud. Devices for supplying radio apparatus from mains. (30/11/28, France.)
36 618 C. P. Stanworth. Electrically controlled apparatus.
36 643 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Machines for pre-shaping tapes for application of cores.
36 644 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Annealing continuously loaded submarine cables.
36 645 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Manufacture of magnetic materials.

November 30th.

36 803 Associated Electrical Industries, Ltd., and I. N. Whitesmith Manufacture of electrical coils.
36 772 Automatic Telephone Manufacturing Co., Ltd., and P. N. Roseby. Magnetic cores for loading coils, etc.
36 758 D. F. Cautley. Light sensitive cells.
36 747 A. O. Hinchliff, Watliff Co., and S. J. Watson. Electrical commutators.
36 507 International General Electric Co., Inc. Transformers. (30/11/28, Germany.)
36 762 G. E. Marr. Electric switches.
36 782 J. N. Morris and M. D. Scott. Electric pumps.
36 779 Siemens-Reiniger-Veifa Ges. fur Medizinische Technik. Apparatus for generating Röntgen rays. (4/1/29, Germany.)

December 2nd.

36 923 J. L. Baird and Television, Ltd. Television, etc., apparatus.
36 835 A. S. Bean, J. Brown and Technico Electrical Co. Illuminating apparatus fittings.
36 836 A. S. Bean, J. Brown and Technico Electrical Co. Electric shades, etc.
36 840 R. W. Biles and A. Reyrolle and Co., Ltd. Electric fuses.
36 819 G. G. Blake. Electric switches.
36 865 T. E. Bradford. Cut-outs.
36 860 British Electrical and Allied Industries Research Association and E. B. Wedmore. Circuit breakers.
36 867 British Thomson Houston Co., Ltd. Current transformers. (1/12/28, U.S.)
36 869 British Thomson-Houston Co., Ltd. Electron discharge devices. (15/12/28, U.S.)
36 870 British Thomson-Houston Co., Ltd., and H. C. Wheat. Electric lighting fixtures.
36 918 W. J. Brown and Gramophone Co., Ltd. Wireless receivers.
36 837 A. Campbell. Alternating current potentiometers.
36 852 F. D. Carrington and Carrington Mfg. Co., Ltd. Cabinets for wireless sets.
36 907 Electric Scaling Hammers, Ltd., and A. E. Hernandez. Scaling tools.
36 908 Electric Scaling Hammers, Ltd., and A. E. Hernandez. Scraping tools.
36 909 Electric Scaling Hammers, Ltd., and A. E. Hernandez. Shaft couplings.
36 910 Electric Scaling Hammers, Ltd., and A. E. Hernandez. Electric motors.
36 919 Gramophone Co., Ltd. Electrical connecting devices.
36 901 Hecla Electrics Pty., Ltd. Vessels equipped with electric immersion heaters.
36 887 W. Kaatzer. Telephone transmission.
36 896 C. D. Lightfoot. Electric heating or cooking apparatus.
36 897 C. D. Lightfoot. Wireless receivers, etc.
36 898 C. D. Lightfoot. Electric switches.
36 832 L. M. McLeod. Electric water heaters.
36 931 Marconi's Wireless Telegraph Co., Ltd. Synchronising systems for television, etc. (30/11/28, U.S.)
36 927 Siemens and Halske Akt.-Ges. High vacuum discharge vessels. (3/12/28, Germany.)
36 932 Telefunken Ges. für Drahtlose Telegraphie. Aerial arrangements. (19/2/29, Germany).
36 893 Westinghouse Brake and Saxby Signal Co., Ltd. Multiple control apparatus. (3/12/28, U.S.)

COMING EVENTS.

Friday, April 11th (To-day).

Physical Society.—Imperial College of Science and Technology, Imperial Institute Road, London, W. Fifteenth Guthrie Lecture, by Prof. P. Debye, on "The Scattering of X-rays in Gases in Relation to Molecular Structure." 5 *p.m.*
Institution of Electrical Engineers (London Students' Section).—Savoy Place, Victoria Embankment, London. Address by Col. Sir T. F. Purves. 6.15 *p.m.*
Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-upon-Tyne. Annual general meeting. 7.15 *p.m.*

Saturday, April 12th.

Institution of Electrical Engineers (London Students' Section).—Visit to the Deptford Power Station of the London Power Co. 2.30 *p.m.*
Association of Mining Electrical Engineers.—South Wales Institute of Engineers. Paper by Mr. S. T. Richards on "Some Considerations Governing Power Costs at Collieries." 6 *p.m.*

Monday, April 14th.

Institution of Electrical Engineers (Western Centre).—Town Hall, Cheltenham. Paper by Lt.-Col. S. E. Monkhouse and Mr. L. C. Grant on "The Heating of Buildings Electrically by Means of Thermal Storage." 6 *p.m.*
Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting.
Electrical Contractors' Association (Hastings Branch).—Lewcock's Restaurant. Ordinary meeting.
Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Telephone Exchange Practice in Germany and Scandinavia." (Opened by Mr. A. B. Eason.) 7 *p.m.*
Institution of Electrical Engineers (Mersey and North Wales Branch).—The University, Liverpool. Annual general meeting. 7 *p.m.*
Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Annual general meeting. 7 *p.m.*
Institution of Electrical Engineers (South Midland Centre).—The University, Birmingham. Paper by Messrs. H. A. Humphrey, D. M. Buist and J. W. Bansall on "The Imperial Chemical Industries Limited's Steam and Electric Power Plant at Billingham." Illustrated by a Cinematograph Film. 7 *p.m.*
Electrical Association for Women (Bristol and District Branch).—Rotary House, Colston Street. Lecture demonstration on stage lighting. 8 *p.m.*

Tuesday, April 15th.

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Annual general meeting. 7 *p.m.*
Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Lecture by Mr. J. R. Harding on "Present-Day Practice in Overhead Line Construction." 7.15 *p.m.*

Wednesday, April 16th.

Electrical Contractors' Association (Sussex Branch).—Ordinary meeting.
Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel. Paper by Mr. H. S. Carnegie on "The Selection of Electric Drive for Heavy Industrial Use." 7.30 *p.m.*

Thursday, April 17th.

Institution of Electrical Engineers (Hampshire Sub-Centre).—Municipal College, Portsmouth. Paper by Dr. C. V. Drysdale on "Alternating-Current Potentiometers and Their Applications." 7.30 *p.m.*

THE ELECTRICIAN

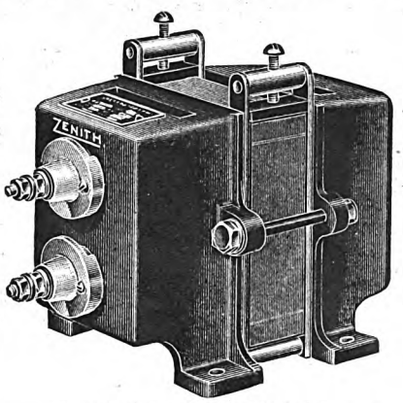
Vol. CIV.—No. 2707. Friday, April 18, 1930. [Registered at the General Post Office.] Sixpence

Digitized by Google

ZENITH

(REGISTERED TRADE MARK)

INDUCTANCES and CHOKE COILS for FILTER CIRCUITS



Quotations on receipt of detailed inquiry.

THE ZENITH ELECTRIC CO., LTD.

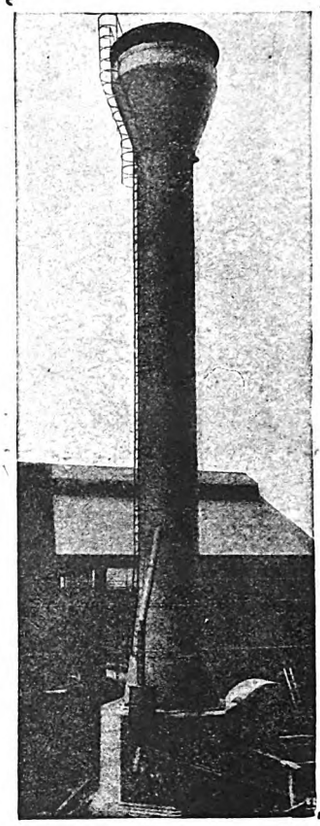
Sole Makers of the well-known "Zenith" Electrical Products

Contractors to the Admiralty, War Office, Air Ministry, Post Office, L.C.C., &c.

Zenith Works, Villiers Road, Willesden Green, London, N.W.2

Phone: Willesden 4087-8. Telegrams: Voltaohm, Willroad, London

PARKER'S PATENT "CENTRIFLOVANE" GRIT CATCHER



Automatic in its action.

Best scientific principles incorporated in design.

Durability and Efficiency combined.

No working parts.

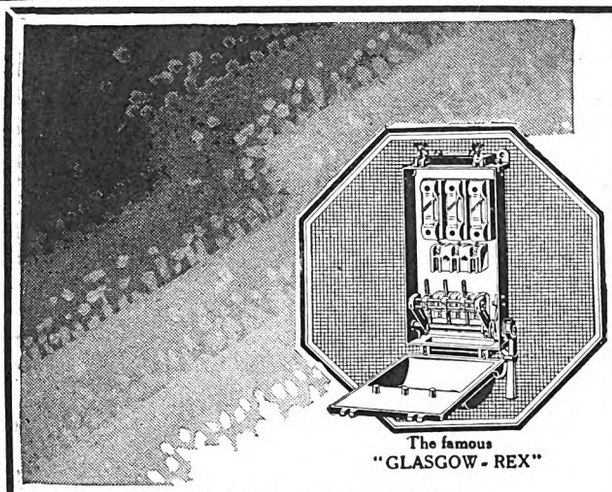
No water used.

Is working satisfactorily on chain grate stoker and pulverised fuel plants.

Electricity and Gas Works have ordered over 200.

TIPTON TUB & TUBE CO., LTD.
TIPTON, STAFFS. ENGLAND

Phone: Tipton 11.



The famous "GLASGOW-REX"

The M.E.M. "Glasgow" was the first switch to be sold at commercial prices to comply with the exacting demands of the City of Glasgow.

The new "Glasgow-Rex" pattern embodies every recent improvement.

There is no better switch for important installations.

Send for List No. 155.

MIDLAND ELECTRIC MFG. CO. LIMITED,
BARFORD ST., BIRMINGHAM.

The Budget.

THERE may be sound Socialist strategy in the Budget, but if that be so, it is quite beyond my comprehension." These are the words of Mr. JAMES MAXTON, in an interview with the "Daily Herald," and they give the key to the Budget as a whole. The fact is that Mr. SNOWDEN has done no more and no less than any Chancellor in circumstances as they are to-day would have found it necessary to do. Those who see some hope in the national financial position, and think they know the way out of the present mass of difficulty, will, therefore, find little to worry about in Mr. SNOWDEN'S speech on Monday. Those, on the other hand, who regard an annual public expenditure of £1 400 000 000 of rates and taxes as a slow and steady process of national suicide, will be more despondent than ever at this, the twelfth post-war Budget, which takes us further than ever from sane ideas of economy. Such minor alterations in taxation as are actually made are, as might be expected, mostly in the wrong direction. Another £48 000 000 is to be extracted from estate duty, income tax and surtax, while at the same time three-quarters of the bearers of these imposts are to be charged rather less than before. This is the easy road. It is straightforward vote-catching. The bulk of the unthinking mass will applaud. Students of industry know all too well that the extra money will come straight out of the fund on which prosperity and employment depend. Mr. SNOWDEN'S clever bid for the support of the middle classes, his recognition of the growth of sentimental Socialism among them, is, perhaps, the most serious feature of the Budget as a whole. There are far too many people under the delusion that they are free from personal responsibility for public expenditure. Now, as the "Daily Herald" most significantly points out on its front page, the man earning £700 a year, with two children, will actually pay less in 1931-32 than he pays to-day. The demand note which he has just satisfied was for £30 2s. Next January he will be asked for £27 18s. 6d., and, it is to be assumed, will accordingly bless the Socialist Government. All of which helps to hide the fact that the huge burden of local and national public expense, now amounting to £4 10s. per week per family, is in itself the chief cause of the price level in this country, which enhances the cost of everything we buy and make, and ruins our position in the markets of the world.

The Budget wipes out the last remnants of the pretence at helping industry from the derating proposals of a year ago. The sum of £30 000 000 has been added to the Whitehall account on the supposition that there is some corresponding relief of local rates. Ratepayers do not share the enthusiasm of politicians in this matter. There has been in some cases a welcome readjustment by derating. In most cases, however, the benefits have been more than balanced by new assessments. These new assessments were put upon us accompanied by the most specific of political pledges that they were for purposes of rating, and had no connection with Schedule A. Mr. SNOWDEN now announces a new assessment for Schedule A which will, of course, be followed in a year or two by a corresponding levelling up of rating figures. Water companies here and there and certain electricity supply undertakings, in the respect of domestic two part tariff service charges, will profit by these devices, but in the end the rating burden will be heavier, notwithstanding the £30 000 000 addition to the national Budget. All these charges go straight into the costs of manufacture. The motor industry and the trades that are subject to the operation of Safeguarding Acts are granted some respite from disturbance of the present arrangements, though in the case of several of these trades the blow will fall this year. The building trade, however, just beginning to see signs of hope after years of political handicap, will despair at the thought that land taxes, which, when first introduced by Mr. LLOYD GEORGE, began all the trouble and developed the housing shortage, are, notwithstanding

Digitized by Google

their author's recantation and everybody else's protest, to be tried again.

Still, Mr. SNOWDEN, so far as he has refrained from spectacular schemes and the temptation to satisfy his own backbenchers, has justified to the full the widespread confidence in him as a financier. Our position as a trading nation is probably safer in his hands than in those of any of the practical alternatives which present themselves. The pity is that he will be subject to no criticism that sound economists will be able to regard as effective or useful. He has to meet the onslaughts, such as they are, of the inventor and author of most of our present expenditure, Mr. LLOYD GEORGE, and from the Opposition proper of Mr. WINSTON CHURCHILL, who, as a Conservative Chancellor actually added to the expenses of the nation.

Current Topics.

Contraction of External Trade.

MR. SNOWDEN has imposed fresh burdens on British industry and trade at a time when the external commerce of the country is shrinking at a disquieting rate. For the first quarter of this year there was a contraction of £45 million in our overseas trade as compared with the first three months of 1929, divided evenly between imports on the one hand and exports and re-exports on the other, the only satisfactory feature being that there was no increase in the visible adverse balance of trade. For March the position was still worse, with a decline of £7 million in exports and re-exports, and £5·2 million in imports; March, 1929, was a shorter working month as it included the first part of the Easter holiday. In contrast with the general trade figures, it is pleasing to find that exports of electrical goods are still increasing, the total for the first quarter of this year being £554 071 greater than in the corresponding period of last year, and last month £230 302 above March, 1929. But imports are also continuing to rise, the total for the quarter just ended being £2 501 335, a rise of £822 400 over the first quarter of 1929, and the fall in purchasing power all over the world caused by declining commodity prices is not a happy augury for the immediate future of our export trade, even in electrical goods.

Fortunate France.

IN strong contrast with the unpleasant gift of Easter eggs from the Chancellor of the Exchequer to the British nation is the position of our neighbours across the Channel. The French Budget, which was read a second time a few days ago, shows a surplus of £30 000 000. This week a Bill will be passed giving further taxation relief of £12 000 000—a total of £42 000 000 in a year. In these painful circumstances, we must content ourselves for the moment with the hope that the Clerk of the Weather will be kind and give us of his best during the holiday period, so that we may return to work next week braced for the stern task of fighting our way back to prosperity against the tide of adverse world conditions and the additional obstacles which our Governments place in the way.

British Industries Fair.

THE Electrical Advisory Committee of the Birmingham Section has submitted a memorandum to Lord CHELMSFORD'S Committee on the future of the British Industries Fair. It is considered that the present date is altogether unsuitable for Dominion, Indian and American visitors, who have attended the fair in negligible numbers hitherto; an important section of the electrical industry and many individual electrical exhibitors have ceased their participation on this account. The end of May and/or early June would, it is considered, be the most desirable period in which to hold the fair. The present duration is regarded as satisfactory, and the Birmingham Committee sees no advantage in or necessity for a second fair. It does not favour the holding of a similar fair abroad or regard a travelling exhibition of British goods as a practical proposition. In the matter of improving the present utility of the fair it is suggested that trade associations might be invited to undertake the organisation of sections dealing with their own industries, and the great importance attaching to classification and grouping of exhibits is emphasised. We believe that these views are fairly generally held in the electrical industry, but the difficult problem of the date will certainly give Lord CHELMSFORD'S Committee a lot of trouble.

Another Council!

WE have no great love for committees and advisory councils so that we do not feel any surge of enthusiasm at the announcement that yet another of these bodies has been set up under the chairmanship of Mr. G. M. GILLETT, M.P., Secretary of the Department of Overseas Trade, to study problems connected with export trade. Most aggregations of the kind, however able their members may be individually, are apt to display collective folly or timidity. This is almost inevitable and the abler the members the more likely is it that they will stultify one another when they combine as a council. Committees, Commissions, Councils and Boards breed like rabbits in these days, and we do not seem to gain anything worth having from their labours. The country might indeed make better progresss toward setting its house in order if it were not deluded into looking to bodies, such as that which Mr. GILLETT has just set up, to find a road which can only be discovered by the individual exertions of its business men.

Rural Amenities.

IN the circular which has been issued by the Electricity Commissioners at the request of the Minister of Transport regarding the preservation of the beauty and character of the countryside three points are mentioned upon which it is suggested that particular stress should be raised. These points relate to careful consideration of alternative routes for overhead lines in areas of notable beauty, and the erection of such lines in depressions instead of on sky lines, the replanting of glades cut through afforested land with indigenous shrubs or coppice, and the colour of insulators. The design of stations and sub-stations is also mentioned, and it is recommended that the services of a professional architect should be utilised in a consultative capacity from the outset to ensure the harmonising of such buildings with their surroundings. No exception can be taken to these suggestions, which are based on consultations with the Councils for the Preservation of Rural England and Rural Wales and other interested bodies which have displayed a reasonable and conciliatory attitude towards electrification. With due respect on both sides for the spirit of these recommendations there should be little to fear from responsible bodies in the way of obstruction of electrical distribution in rural areas and individual fanatics will find it less easy to stir up difficulties.

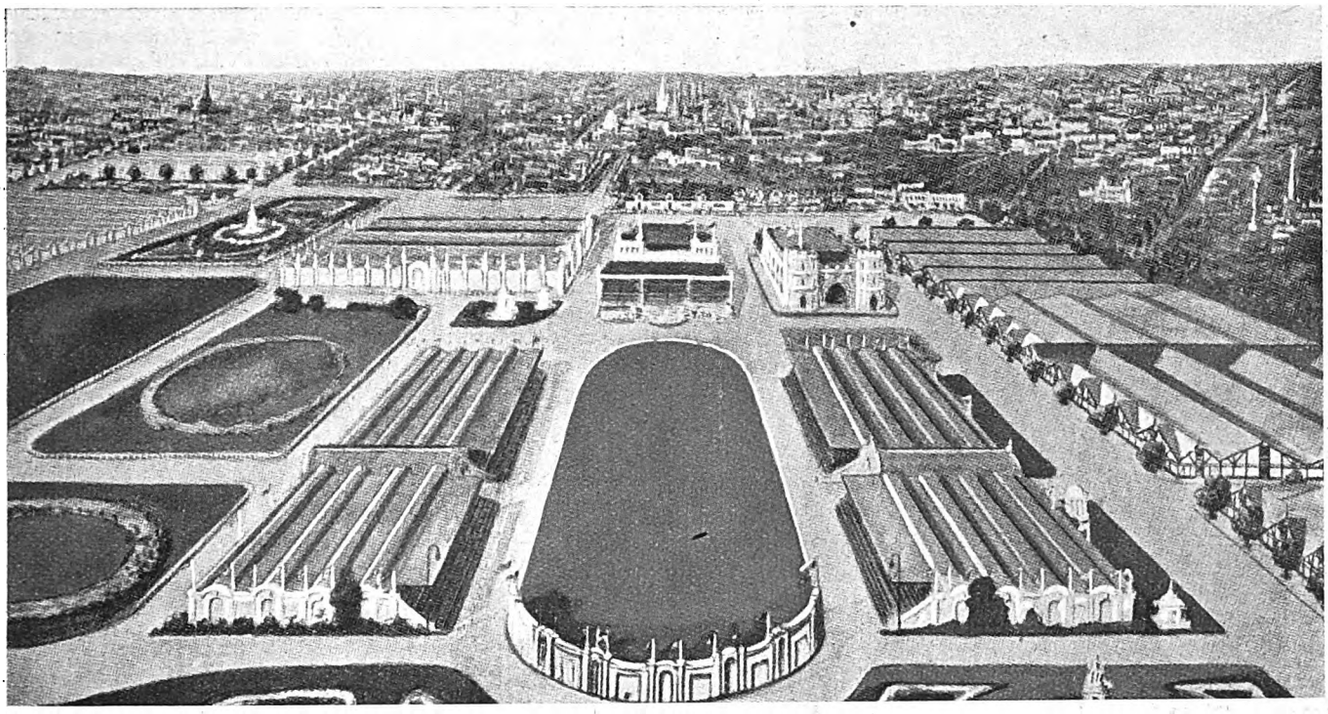
BUENOS AYRES EXHIBITION.

Organisation of British Electrical Section well in Hand—B.E.A.M.A. Working Out Plans for a Co-operative Exhibit—Importance of the Argentine Market.

NOW that the opening and closing dates of the British Empire Trade Exhibition to be held in the Palermo grounds of the Argentine Rural Society, at Buenos Ayres next year, have been definitely fixed it has become possible for intending exhibitors to go forward with their arrangements for this important effort to increase the demand for British goods in Argentina and neighbouring South American States.

It was originally intended that the exhibition should open on February 18th and close on April 2nd, but the dates finally arranged are March 14th to April 27th, and the alteration is generally regarded as an improvement. Already some 85 per cent. of the space available in the exhibition buildings has been booked, and plans are being prepared for additional buildings which it is expected will be required to provide accommodation for intending exhibitors. Major A. L. Abbott has been appointed architect to the exhibition, and Mr. Alfred Burr and Mr. Vincent Burr are working with him as consulting architects. We give on this page a reproduction of the architects' drawing of the exhibition grounds as they will appear when the work of adaptation has been completed.



Reproduction of the architect's sketch of the layout of grounds and buildings, British Empire Trade Exhibition, Buenos Ayres, 1931. The electrical section will be housed in one of the buildings on the right of the picture.

The exhibition is intended to be thoroughly representative of the British Empire, and only articles of Empire manufacture will be admitted. The British Chamber of Commerce in Argentina, which is organising the exhibition, is not seeking any financial profit, but any surplus will be handed to the Chamber to be used in the furtherance of Anglo-Argentine interests. Although no steps have been taken to that end, it may be suggested that while the exhibits are in South America the possibility should be explored of arranging for their subsequent display at Rio de Janeiro and/or Valparaiso.

Electrical exhibits will be housed in part of the Mechanical Engineering and Engineering Accessories Buildings (which includes pavilions 3, 4, 4*b*, 5 and 6). About a dozen electrical firms in Great Britain have already booked space. The British Electrical and Allied Manufacturers' Association is working out plans to ensure that there shall be a representative collective exhibit worthy of the British electrical manufacturing industry. It is recognised that Argentina, after India and the Dominions, ought to be the most valuable market in the world for British manufactures, owing to the strength and variety of our financial interests in that country. The extent of British investments in Argentina is estimated at £450 000 000 to £500 000 000. The uneasiness of the Argentine Government and people regarding American financial penetration is also a valuable psychological factor in operating in our favour. In 1928, out of total imports of electrical goods amounting to £4 366 000, Great Britain supplied £1 453 000, the United States £1 432 000 and Germany £1 329 000. In that year we supplied nearly half the imports of electrical machinery. It should be possible for us to secure as much electrical business in Argentina as the United States and Germany combined, and the exhibition of 1931, following on the activities of Lord d'Abernon's mission last year, should, if properly used, go far towards raising our exports to Argentina towards the attainable level.

In view of the aim of the Argentine Government to stimulate industrialisation there are prospects of important railway extensions, power schemes on a large scale, and a wider and more effective distribution of agricultural activity, which should provide excellent openings for British electrical manufacturers.

Coming to the details of the electrical pavilion it is suggested that this should include models, illustrated drawings and diagrams and special decorative schemes showing the productive capacity of the British electrical manufacturing industry, its achievements and its participation in world trade, photographs of complete schemes connected with the generation, transmission and distribution of electricity, use of water power resources, industrial equipment, electrification of transport services, interior and exterior illumination and commercial and domestic applications of electricity. The ordinary type of manufacturers' catalogue will be quite inadequate for this occasion, and each participating firm should aim at producing, in English and Spanish, something similar to the publication which was issued with the balance sheet by the A.E.G. this year. B.E.A.M.A. will doubtless produce a special publication dealing with the industry and its achievements as a whole, suitable for circulation in all Spanish-speaking countries, which will serve as a nexus for the publicity matter issued by individual firms and might be usefully reinforced by a special issue of "World Power," containing an account of the relation of the British electrical industry to the economic development of Argentina and a buyers' guide, which could be distributed throughout the Republic and neighbouring States.

ELECTRICAL EQUIPMENT OF CINEMA THEATRES—II.

Generator Sets—Projector and Spot Lantern Switchboard—Auditorium and Stage Dimmers—Balanced Auditorium Lighting.

By CLEMENT D. BOND.

[*Mr. C. D. Bond is the amusement engineering specialist for Messrs. W. J. Furse and Co., Ltd., Nottingham, the well-known firm of electrical engineers and lift manufacturers, who specialise in electrical equipment and lifts for theatres, cinemas, race tracks, skating rinks and dance halls. The first article of this series appeared in our issue dated March 21st.*]

THE general distribution having been decided the next thing to arrange was the various electrical apparatus. Referring back to the single line diagrams (Figs. 2 and 3 in the first article) it will be seen that mains are being run to four motor generators—two for projectors, one for battery charging and one for sound reproduction—as the latter generally forms part of a contract separate to the electrical work I shall not discuss it, the other three, however, will be built to the following specification :—

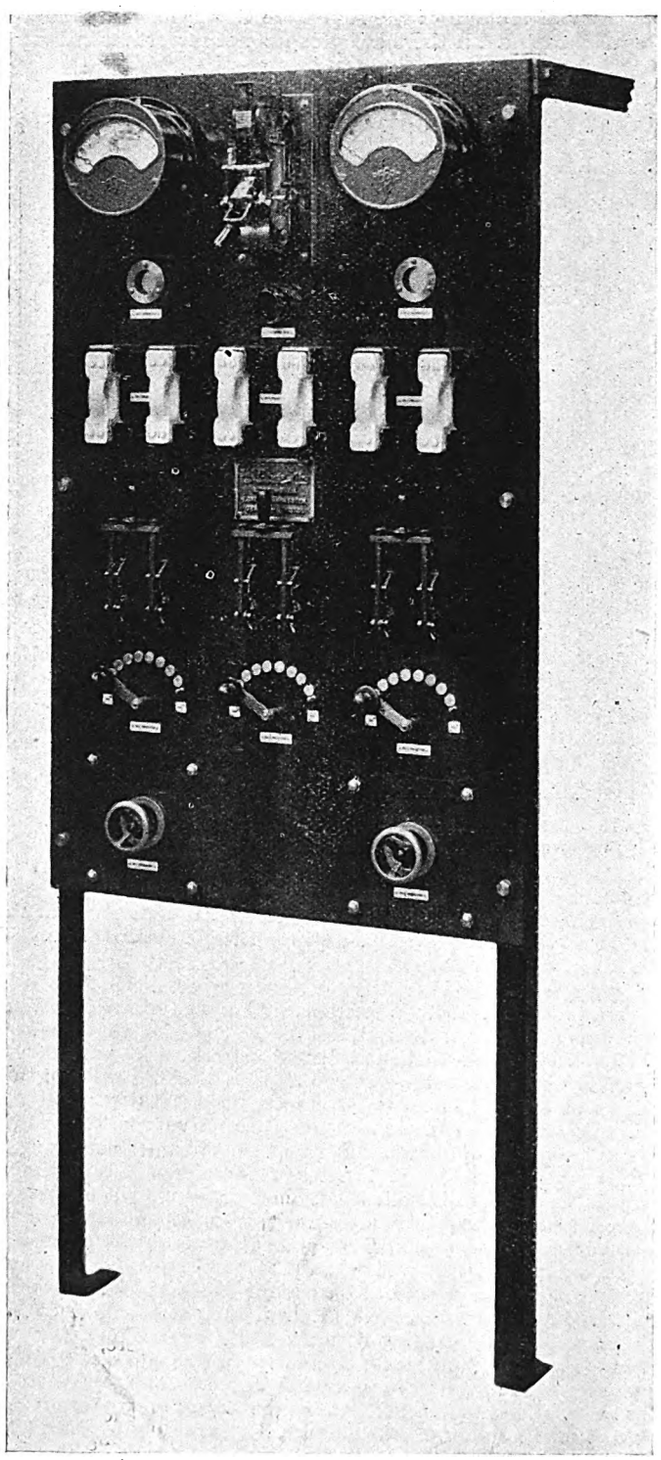

Fig. 4.—Projector room switchboard, W. J. Furse and Co.

Each set will consist of a motor and a generator coupled together with flexible coupling, both machines being mounted on one common cast iron bedplate, complete with sound proof packing. They will be totally enclosed, ball bearing type with terminal boxes suitable for screwed conduit connections. They will comply with B.E.S.A. specification, be compound wound, run at a speed of 800 r.p.m. and suitable for incoming supply of 460 V.

In the case of the sets for projectors they will be built suitable for cinema arcs and capable of a continuous output of 150 A at 80 V with voltage regulation of 20 V.

The battery set, however, will be built for battery charging having an output of 60 A at 100/145 V. This machine will be shunt wound.

When designing the electrical equipment of a new cinema the exact output of the generators should not be decided until their definite requirements are known.

It has been arranged to instal three projectors and one spot lantern. To control these the projector room switchboard will consist of sindanyo panel built on angle iron frame (Fig. 4), having mounted on it the following :—

(*a*) 4—ammeters, one for each projector and one for spot.
(*b*) 1—voltmeter with voltmeter switch.
(*c*) 3—pilot lights showing which of the two projector generators is working and also if talkie generator is functioning properly.
(*d*) 1—double pole circuit breaker with time lag. The purpose of this is that if at any time during the performance an overload is put on the generator over and above the load of two arcs at once, it will trip. This will save pulling out the overload starter coil in motor generator room. This breaker also acts as a main switch for the board.
(*e*) 8—single pole Home Office fuses.
(*f*) 4—double pole dead hinge back of board type switches, one for each projector and one for spot.
(*g*) 4—resistance controls, one for each projector and one for spot, the resistances being separately mounted in dimmer room.
(*h*) 2—shunt regulators, for projector motor generators.

The operating box board above referred to will be situated in the operating box, the generators being erected in a separate room. In the motor generator room there will be an angle iron frame on which will be mounted all the necessary control gear for the four machines with their main switches and fuses. In this room will also be situated the battery charging board which will consist of a sindanyo panel built on angle iron frame, having mounted on it the following :—

1—charge ammeter.
1—discharge ammeter.
1—voltmeter.
1—voltmeter switch and fuse.
1—5-way charge and discharge switch.
4—single pole fuses.
2—double pole dead hinge switches.
Shunt regulators.
1—battery cut-out switch.

Adjoining the motor generator room will be the battery room, which will not only house the secondary lighting battery but also the sound reproduction battery.

Again referring to the single line diagrams it will be seen that four mains are being run from the main 230 V lighting boards, two to auditorium section of dimmers and two to stage section of dimmers, terminating in each case in an iron-clad switch. This bank of dimmers, which will be fixed in

Digitized by Google

the dimmer and resistance room adjoining the operating box, will be built to the following specification :—

The dimmer bank will be built up in one combined dead front bank with switchboard arranged in two sections, one for stage and one for auditorium. The dimmers will be arranged for individual and master control by self-releasing clutches, which will lock on to the master shafts as required. The master shafts will be arranged for slow motion, grand master and cross control. With this arrangement it will be possible to raise any combination of dimmers on one shaft and at the same time lower any combination of dimmers on the other shaft or shafts, that is, it will be possible to raise all the stage dimmers and at the same time lower all the auditorium dimmers. Each master shaft will be fitted with a selector lever coupling it to the grand master control and each selector lever will have three positions—" raise," " lower " and " off." The switches and fuses will be mounted on black enamel slate panels 1 in. thick and the panels will be insulated from the framework. Each dimmer will be controlled by a single pole twin break back of board type knife switch with dead front operating handle. The switches will be bussed on one side for the main incoming leads as required (Figs. 5 and 6).

The fuses will be Home Office pattern, the outgoing fuses being mounted immediately above the switches and the return fuses immediately below the dimmers. The outgoing fuses will be provided with cable sockets for outgoing load leads and the return fuses will be bussed on one side for the main return lead. A pilot light will be provided in each dimmer circuit and connected so as to show the state of dim of its circuit.

The dimmers will be open coil radial lever type, each having 100 contacts; they will be graded for dimming gasfilled lamps. Quick break off positions will not be provided as they are not necessary.

The wattages of the dimmers will be as follows :—

	W each.
Auditorium wings, red, blue, green, white ..	10 000
Auditorium ceiling under balcony, red, blue, green, white	3 000
Auditorium proscenium, red, blue, green, white ..	5 000
Footlight, red, blue, amber, white	2 500
No. 1 batten, red, blue, amber, white	2 900
No. 2 batten, red, blue, amber, white	2 500

The dimmer switchboard will be complete with necessary back connections, busbars, cable sockets, labels and insulating

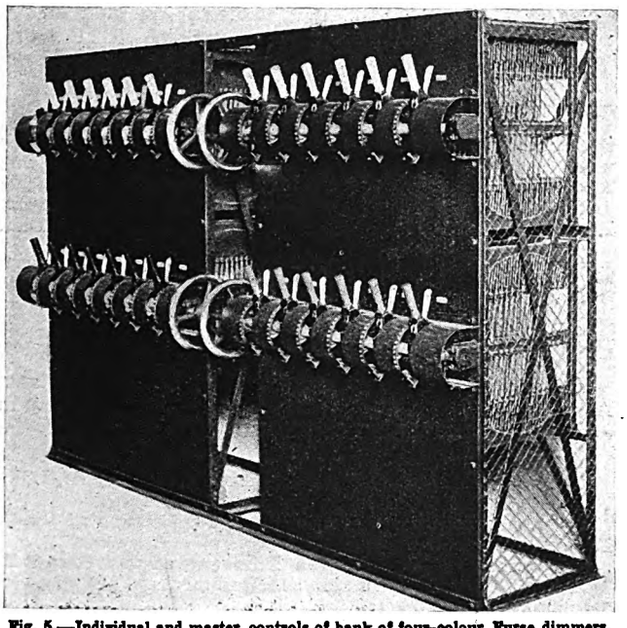

Fig. 5.—Individual and master controls of bank of four-colour Furse dimmers. (Front view.)

fillets and suitable for 230/460 V, 3-wire d.c. supply. The auditorium lighting will be split up to form an equal balance but it will not be possible to do this with the stage equipment owing to the regulation which does not permit of a higher voltage than 250 in the battens. The footlight and No. 2 batten will be balanced against No. 1 batten.

Between the operating box and dimmer room a signalling device is being arranged. This will consist of a 5-way colour indicator with five switches in the dimmer room connected to 5-way colour indicator and buzzer in the operating box. By this means it will be possible for the dimmer operator to notify the spot lantern operator what colour spot he requires. There will also be a two-colour indicator and buzzer in the dimmer room operated by two switches in the operating room. By this it will be possible for the projector operator to give warning to the dimmer operator of end and start of picture.

An efficient automatic telephone system will be installed connecting up the following positions in the house :—

General office (P.O. telephone), manager, assistant manager, all female staff rooms, all male staff rooms, all payboxes, advance booking office, all café managers, all

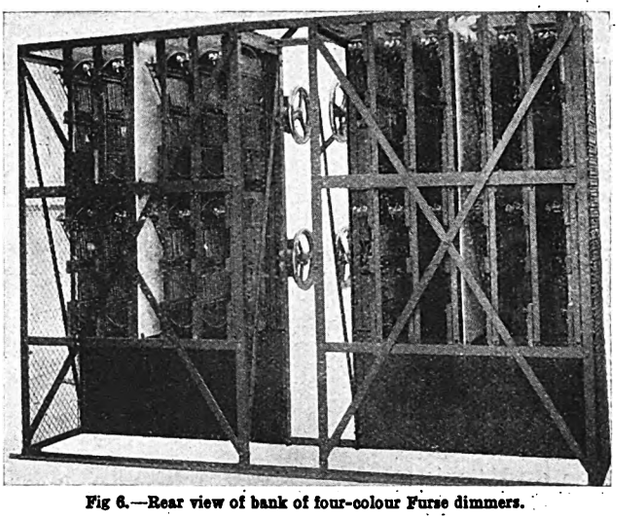

Fig 6.—Rear view of bank of four-colour Furse dimmers.

kitchens, stage, orchestra, organ console, garage, operating room, dimmer room, generator room, battery room, non-synchronous room, intake room, engineers' room, rewind room, boiler house, plenum room, vacuum room.

In addition there will be three spare lines for further extensions if required.

(*To be concluded in our issue of May 16th.*)

SUPPLY IN RURAL AREAS.

Injustice of Charging on Unit Basis—Advantages of Block System.

Lecturing to members of the Western Centre of the Institution of Electrical Engineers on the subject of " Economics of Rural Electricity Supply for Domestic Purposes," at the University College of the South-West, Exeter, recently Miss Margaret M. Partridge, B.Sc., A.M.I.E.E., said that under the Central Board's South-Western Area scheme she thought that purchasing costs would in the future average ½d. a unit. On this basis they would have to charge more than ½d. to the consumer to pay for the cost of distribution. It was a fallacy and injustice to charge for electricity on the unit basis because actual costs per unit varied.

She would say to the engineer : " When in doubt, keep prices low in order to get a large demand and a fair return on capital ; " to the consumer : " Use electricity for all purposes to obtain it cheaply."

Mr. W. C. Bache (Cheltenham), in moving a vote of thanks, said that although perhaps five years ago it might have been correct to say that municipalities were loth to extend their electricity undertakings to rural areas, he did not think that was the case to-day. Dealing with the question of the point of saturation for the purely domestic load, he thought it would be difficult for the majority of consumers to-day to use more than 2 000 units per head per annum, but this might probably not be the case in the near future. Until they got rid of the method of charging solely by the unit he did not think they would get the consumer greatly interested in his own consumption.

Mr. Howard (Taunton), asked whether the lecturer recommended selling current at just over ½d. per unit (if it was bought cheaply from the grid) to disrticts where, for every 1 000 supplied, 500 units were taken up in iron losses in the transformers.

Miss Partridge, in reply, said she thought the American block system was quite the fairest way of charging for electricity. She thought it unfair to charge the same tariff to people who used electricity for all purposes as to those who only used it for lighting.

MODERN "ATMOSPHERIC" LIGHTING.

Installation at the "Apollo" Picture Playhouse, Birmingham—Sunrise and Sunset Effects—Curtain and Screen Colour Lighting.

THE "Apollo" Playhouse, Tyburn Road, Birmingham, which was opened on March 31st, provides a good example of modern lighting methods applied to an atmospheric decorative scheme. The lighting effects depend very largely on the use of daylight colour-sprayed lamps controlled by dimmers.

A distinguishing feature of the front is the very wide entrance portico and the large two-storied window above which, when illuminated at night, can be seen from a great distance.

The interior lighting has been designed not only to give the decorative and atmospheric effects desired, but also to ensure a restful diffusion of light. The auditorium lighting is carried out by means of two rows, each consisting of ten large indirect fittings with burnished aluminium reflectors. Each fitting measures 8 ft. long by 2 ft. 8 in. wide, and is fitted above a panel opening in the ceiling, thus forming part of the ceiling decoration.

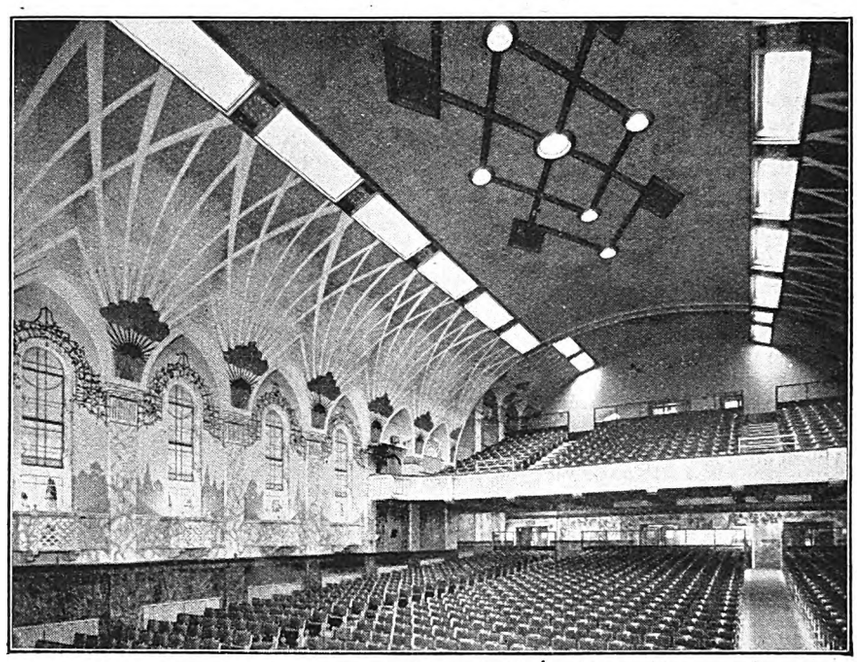

Fig. 1.—Auditorium lighting, "Apollo" Picture Playhouse, Birmingham.

On either side of the auditorium are five painted windows, each with a plaster balcony in the foot. The auditorium decorations are designed to give an outdoor impression with fields and trees in the distance, and the amber lamps in the balconies, by means of the dimmer control, are made to give a very charming sunrise or sunset effect, according as they are switched up or down. During the intervals the ceiling lighting, in combination with the mural decorations, gives an impression of a shady wood on a hot summer's day, while during the performances the daylight lamps in the ceiling panels produce an effect of twilight, which is extremely attractive.

Stage lighting is carried out by means of 32 X-ray reflectors fitted with 32 200 watt lamps, the reflectors being equipped with Geligniite colour screens. Four different colours are employed and each colour consisting of eight lamps is controlled through a separate motor driven dimmer, the reflectors being fitted over the proscenium arch.

The sound equipment is of B.T.H. manufacture and was specially designed to suit the acoustics of the theatre. This equipment, which employs Mazda exciter lamps, can be used either for sound on film, or sound on disc. The sound equipment is used in conjunction with Ross projectors. The whole of the electrical installation work was carried out by Mr. B. French, A.M.I.E.E., of Mill Street Electrical Works, Kidderminster.

I.E.E. SUMMER MEETING.

Arrangements for Irish Visit—Inspection of Shannon Works.

THE Council of the I.E.E. have accepted the invitation of the Committee of the Irish Centre to hold the 1930 summer meeting in Ireland, and the following tentative programme has been arranged :—

MONDAY, JUNE 2ND.

Assemble in the evening at the Gresham Hotel. Light refreshments. Music.

TUESDAY, JUNE 3RD.

Motor trip in Co. Wicklow, including inspection of overhead transmission lines. Lunch and tea at Glendalough. Dance at the Gresham Hotel, Dublin.

WEDNESDAY, JUNE 4TH.

Proceed by special train to Limerick for visit to the Shannon Scheme. (Lunch and tea there.) Return to Dublin, arriving about 10 p.m. Dinner on train.

THURSDAY, JUNE 5TH.

Visit the brewery of Messrs. A. Guinness, Sons and Co. Lunch by invitation of the Company. Leave Dublin by special train for Belfast (arrive about tea-time). Reception by the Lord Mayor of Belfast, the Rt. Hon. Sir William Coates, at the City Hall. Dancing.

FRIDAY, JUNE 6TH.

Morning—Assemble at Queen's Bridge. After a tour of the Harbour on s.s. "Musgrave," the party will split into two groups for alternative visits as follows : Group 1 will land and visit the harbour power station and then leave for a visit to Messrs. Harland and Wolff's shipyard. Group 2 will remain on board the steamer, and, after a trip down Belfast Lough, will proceed to Harland and Wolff's wharf to pick up Group 1. The whole party will then return to the City. Afternoon—Assemble at York Street Mills and visit the power house, spinning, weaving, finishing, and manufacturing departments of the mills. Tea will be provided at the mills. For those who do not wish to visit the mills a motor-coach excursion will be provided. The route for this excursion will be through Antrim and Ballymena to Glenariffe and home by the Coast Road. Tea will be provided at the Olderfleet Hotel, Larne. Evening—Reunion and Dinner at the Grand Central Hotel, Belfast. Dancing.

E.C.A. CONVENTION.

Provisional Programme for the Llandudno Meeting.

The provisional programme for the Electrical Contractors' Association's fifth annual conference, to be held at Llandudno on June 25th, 26th and 27th, is as follows :—

WEDNESDAY, JUNE 25TH.

10 a.m. Meeting of the Council of E.C.A., N.E.C.T.A., Ltd., and N.F.E.A. at the Town Hall.

2—10 p.m. Arrival of delegates and Registration at the Grand Hotel.

7.30 p.m. Reception by the President at the Grand Hotel. Dancing in the ballroom and light refreshments.

THURSDAY, JUNE 26TH.

9.30 a.m. Annual General Meeting at Town Hall.

11.30 a.m. to 1 p.m. Opening of conference at the Town Hall. Civic welcome and reply by the President. Presidential address by Mr. H. Willoughby-Ellis. (12.30 p.m. Official photograph.)

2.30 p.m. to 5.30 p.m. First conference paper and discussion.

8 p.m. Smoking concert in the Grand Hotel.

FRIDAY, JUNE 27th.

9.30 a.m. Second conference paper and discussion.

12 noon to 1 p.m.—Votes of thanks ; installation of new President ; short address by new President.

2.30 p.m. Garden party.

9 p.m. Ball and supper at the Grand Hotel.

Arrangements for golf, drives and so on, will be made for those desiring to stay in Llandudno over the week-end.

Digitized by Google

THE ENGINEERING PROFESSION.

Scientific Spirit Essential to National Efficiency.

WE give below the inspiring introductory portion of the presidential address delivered by Colonel Sir Thomas F. Purves to the Students and Graduates of the Institution of Electrical Engineers on April 11th.

The Institution realises very fully that its future is essentially bound up with the health and the vitality of the Students' Section. It is to you, who are students and graduates to-day, that it must look to carry on its work throughout the next generation and to hand it on to your successors.

We who are in charge of its destinies for the moment are doing our best to maintain its actions and its policy in harmony with the rapidly developing conditions and needs of the electrical industry. We are striving to make it, and to keep it, a real asset and a power for good in the nation, by helping and encouraging those engaged in all branches of research and industrial activity based upon applications of electrical science.

So far as I am able to judge, the policy of maintaining a comprehensive electrical engineering institution, and of extending its fields of action to take in all the new aspects of the subject as they arise, is being justified by results. It will be for you to judge how long and how far this process can be continued.

We may take it for granted that the scope of electrical engineering, in the broad sense of the term, will increase indefinitely, and that the importance of its contribution to the welfare of mankind will be more and more widely realised.

It may be that it will ultimately become impossible for a single institution to cover the whole field of the practical utilisation of electrical forces, but I confess that I cannot in my own mind see why it should ever fail to do so; nor can I at present imagine any future conditions that would make it undesirable to maintain the common co-operation of all electrical engineers in the nation-wide professional institution such as ours.

Wise sectionalisation, both territorial and functional; the utmost possible executive freedom for each constituent part; a properly representative governing authority; and a constitution sufficiently flexible to conform without strain to great changes in the groupings of personnel and of subject matter; are, I think, the conditions essential to success; and I venture to recommend you to keep these points in the forefront of your minds after you become corporate members and are called upon to help in settling the many difficult problems which arise in the life and progress of our great Institution.

To those younger men amongst you who have recently joined our ranks, and made up their minds to become electrical engineers, I should like to extend a hearty welcome. I congratulate them upon having entered a profession which, whatever its drawbacks may be, is at least a real live profession and one with limitless possibilities of progress in front of it. You need never doubt that it will be fully capable of absorbing all the initiative and all the energy you can bring to bear upon it.

Intellectual Honesty.

It should comfort you to feel that the engineering profession is a profession conducive to intellectual honesty and to the preservation of self-respect. The engineer, like the scientist, must found his conclusions and his actions upon reality if he is to achieve results. It has its pitfalls no doubt—you may have to give expert evidence in the witness box some day—but it is in its very essence a profession which discourages dishonesty. I hope you will have plenty of occasion to realise the *confidence* which honest men extend to those who are honest, and to appreciate in your own experience the convincing power and success of honesty and singleness of purpose, and of thought for others, in a man's career.

I daresay you already know from experience that the monetary rewards of engineering are not great. I think they are likely to improve, and that the prospects of engineering in connection with the higher directing positions in industry are likely to improve. The extraordinary idea that the study of engineering tends to incapacitate a man for a directing position has been hard to kill, but it is now giving place to recognition of the fact that the spirit of science and engineering in the highest quarters of industry is essential to national efficiency. In any case the advantage of possessing surplus money is much over-rated. It is far better to have interesting work than to be rich. What, in the last resort, can money buy that is worth having except *mental states?* The man who has a real interest in his work is rich already.

E.D.A. CONFERENCE.

Discussions on Aspects of Publicity and Propaganda Work.

AN important Conference of Electricity Supply Undertaking Sales and Publicity Managers, organised by E.D.A., was held on April 9th and 10th. The following subjects were discussed:—

NATIONAL NEWSPAPER AND MAGAZINE ADVERTISING, introduced by Mr. S. E. Gullick and Mr. A. W. Hulbert, who pointed out that the combined circulation of the newspapers used in the E.D.A. scheme was approximately 4 000 000, and that the cost of one 4 in. single-column advertisement in all these papers worked out at roughly £180 or $\frac{1}{1000}$d. per reader.

LOCAL ADVERTISING, introduced by Mr. V. W. Dale, who stressed the importance of obtaining expert guidance from a competent agency or from E.D.A.

POSTER SERVICE, introduced by Lieut.-Colonel W. A. Vignoles. It was mentioned that the cost of a poster scheme embracing 121 towns containing 52½ per cent. of the population of Great Britain and Northern Ireland, for 13 weeks would be £10 038.

CINEMATOGRAPH FILMS, introduced by Mr. J. I. Bernard, who gave an estimate of £3 500 as the cost of a film publicity campaign covering 500 bookings of six days each over a period of six months, and showing a film to 5 000 000 people—less than ¼d. per person. He believed that the time had come when much greater use could be made of E.D.A. films.

LECTURE WORK, introduced by Mr. G. S. Francis. Mr. Francis pointed out the importance of careful selection of the points to be included, and of treating the subject in an objective rather than a subjective manner.

E.D.A. LITERATURE FOR LOCAL DISTRIBUTION, introduced by Mr. V. W. Dale, who deplored the exploitation of the industry for the benefit of spurious advertising adventurers. He recommended the preparation of efficient mailing lists of logical prospects as much more economical than general advertising for certain lines.

FINDING NEW MARKETS, introduced by Lieut.-Colonel W. A. Vignoles, who dealt with the work of the Industrial Heating, Rural and Agricultural Electrification, Refrigeration, Water Heating, Exhibition, and Electric Vehicle Committees.

LINKING LOCAL ADVERTISING AND PUBLICITY SCHEMES WITH E.D.A. CAMPAIGNS, introduced by Mr. V. W. Dale, who said that aloofness from the policy of a central organisation was of no use to anybody. Whole-hearted co-operation in arriving at the right policy was required.

HOW TO APPROACH THE PUBLIC WITH TARIFFS, introduced by Lieut.-Colonel Vignoles, who urged the advantages of uniformity of tariffs and an endeavour to get the whole country to adopt a two-part tariff with the same running charge throughout the country This would greatly facilitate the work of the Association.

In his introductory address to the Conference Lieut.-Colonel Vignoles said that they owed to Mr. W. Williamson, of the Clyde Valley Company the first definite suggestion that this Conference should be held. They had in the last twelve months noted an increase of some 50% in the sales of E.D.A. literature and posters, and he thought this was an indication of the greater interest being taken in the efforts made at headquarters to assist undertakings. He trusted that the Conference would help them to produce more nearly what the bulk of undertakings required, and to make undertakings appreciate more what E.D.A. had to offer.

Considering the general question of publicity by supply undertakings, he would like to say how important it was that every undertaking should prepare definite schemes of publicity work on the basis of an annual, or other periodical, allocation of money for the purpose; this money should be allocated to definite items, and the effect of the scheme visualised as a whole.

The Conference was attended by representatives of more than forty municipal undertakings and supply companies, in addition to E.D.A. area officers and members of the headquarters staff.

BOOK-KEEPING FOR ELECTRICAL CONTRACTORS—VI.

Recording Orders for Stock—Electrical Goods Received and Issued—Materials Rejected and Returned—The Stock Ledger.

By S. HOWARD WITHEY, F.C.I.

TO find that the stock of wire, lamps, batteries, or table fires, etc. needs replenishing, and then to set down one's requirements on a memo. tablet or in a diary is no system at all. It is true that the electrical contractor is often compelled to stock only those particular goods or products which he knows can be readily sold, and is forced by insufficient working capital to limit his sphere of activity, but this only serves to emphasise the need for the discriminate placing of orders, and the need for a systematic control over the stock from the time of its arrival on the premises.

Directly the stock under any heading threatens to reach the minimum known to be essential, the person in charge of the stores should make an entry in a stock order book, sometimes referred to as the requisition book. To give the best results, this book should be provided with separate columns or sections for the insertion of the date; the department, shop, or person requiring the stock; a description of the goods, materials, or stores needed, including the number, quantity, or weight; the existing stock on hand under that particular heading; and the signature or initials of the person authorising the placing of the order. A separate section for office use, to be filled in by the contractor or the order clerk, will be found very useful, this section being ruled to show the date on which each order was placed; the name and address of the suppliers; particulars of the goods, etc., ordered; the date on which they arrived on the contractor's premises, including their general condition upon arrival; and the page on which the necessary entry has been made in the inwards book kept in the shop, stores, or receiving department.

Until such time as an order has been actually authorised by the contractor or his departmental manager, the official order form should not be forwarded to the suppliers or agents. A good method of making out orders consists of using a duplicate book on the pen or the pencil carbon-copy principle whereby two copies are produced, the original form being forwarded or handed to the suppliers, in every instance, and the copy retained in the book to facilitate all future references to details. If more than two copies are needed, it will be better to use a manifold order book consisting of thin tissue leaves, and one of the copies should be passed on to the office for use when checking the accuracy of the details stated on the invoice or other debiting document when it comes to hand.

Before the stock is transferred to its allotted place, the storekeeper should examine the delivery or advice note which accompanies the goods, and should carefully check the quantity and the quality with the copy of the official order which has been retained. When this has been done, and providing the stock is not rejected for any reason, an entry can be made on the left-hand or receipts side of a stock book, giving the date of receipt; the official order number; the name and address of the senders; a description of the goods or articles supplied and any special observations or remarks. The right-hand side of the stock book should be reserved for particulars of all goods, articles, materials, and stores issued from stock, each entry showing the date of issue; the requisition number; the number or quantity issued; and such a description of the goods, etc., as will enable them to be identified.

Treatment of Rejected Goods.

It sometimes happens that after taking certain accessories or components into stock, they are discovered to be inferior to those actually specified in the order, or are found unacceptable for another good reason. If such rejected stock is returned by the contractor to the suppliers or agents, details should be recorded in an outwards book ruled on similar lines to the stock book, the various columns being used for the insertion of the date of return; the original order number; and the quantity and description of the goods, articles, or materials, etc., rejected. This book should also be used for recording particulars of empty boxes, cases, crates, etc., returned by the contractor from time to time.

To make room for electrical products for which there is an obvious demand, certain goods will often be disposed of, and as it is usually much easier to buy goods than to sell, cash is exchanged for goods more readily than goods are exchanged for cash. Broadly speaking, a large turnover takes less capital to finance than does a relatively small turnover, and the same amount of capital will bring back more in the form of net profit when it is utilised intelligently in the direction of turnover expansion.

The amount of capital locked up in the form of stock must necessarily be considerable, and if only for this reason the contractor should be able to reconcile the stocks on hand from time to time. To be in a position to readily ascertain the quantity and the value of the stock on hand under any heading at any time, a stock ledger should be kept. This ledger may consist of cards kept in a drawer, or loose leaves, or a bound book of the ordinary type, and providing the ledger can be indexed; the outstanding advantages of the card or the loose leaf system are that the constant opening of new accounts for the same electrical products and accessories is avoided; each account will maintain its position in the ledger, and there will be no blank cards or leaves to turn over. Moreover, the utilisation of a division for "closed accounts" will ensure that only current stock accounts are handled by the staff.

Personal Care of Stock Ledger.

Each stock ledger account will have its debit and its credit side, each of which will be provided with a cash column. To avoid errors, irregularities and fraud, this ledger should not be kept by the person in charge of the stores, but should be entered up either by the contractor himself or a responsible assistant. Each item recorded on the debit side of the stock book should be transferred to the debit side of its respective account opened in the ledger, showing the date, the name of the suppliers, the stock book folio, the quantity received, and the rate or price; the cost being extended into the cash column. As soon as a stock book item has been recorded in the ledger, the ledger folio should be inserted against it. Each item recorded on the credit side of the stock book should be transferred to the credit side of its proper ledger accouut, giving the date, the name of the department or shop to which the goods, etc. were issued; the stock book folio; the quantity issued; and the rate or price; the cost price of the goods issued being extended into the cash column. Some care will have to be exercised to guarantee that all items entered on the credit side of the ledger are priced out at invoiced cost. In like manner, each item recorded in the outwards book will be transferred to the credit side of its particular account kept in the ledger, and by keeping this work up to date the value of the stock under any heading may be ascertained by balancing the cash columns of that account. The following is a good general ruling for the stock ledger:—

STOCK LEDGER.

(Left-hand or Debit Side).

Date.	Received from	Folio.	Quantity.	Rate or Price.	£	s.	d.

(Right-hand or Credit Side).

Date.	Issued to	Folio.	Quantity.	Rate or Price.	£	s.	d.

The next instalment of this series will show the correct method of keeping and classifying the purchases transactions.

"ELECTROCUTION."

An Electric Iron Fatality—Responsibilities of Supply Authorities or Contractors—Attitude of the Coroner—What is the Legal Position?

By "CRITIQUE."

THE writer has been greatly interested in reading the newspaper reports of a most regrettable fatality, caused by a man being electrocuted in a North of England city a few weeks ago, whilst handling an electric iron, and of the coroner's enquiries into the matter.

It appears, from the evidence, that this unfortunate man detached the connector from an electric iron, which, by the way, was fitted with a three-core flex and duly earthed, and, without withdrawing the plug from the three-pin socket, commenced to carry out some operation on the flexible cord with a pair of scissors. The iron connector, being fitted with an earthing strip, was apparently held in one hand, thus forming a good "earth," the scissors came in contact with the live flexible wire, and the shock, with 230 V alternating current, caused death.

Whether the switch, single pole, controlling the iron plug, was switched off or not, does not appear to matter for the moment, as one gathers that the switch was in circuit on the neutral wire, so that whether the switch was on or off the flexible cord would still be "alive," and by tampering with this "live" wire, at the same time being well "earthed" through the medium of the iron connector earthing strip, anyone could get a severe shock. I think it must be admitted, although one is bound to feel extremely sorry for the victim and his relatives, that it was a very foolish thing to do. Had the plug been withdrawn from the three-pin socket, and completely isolated and disconnected from the supply, no harm could have come to him, and for anyone, either amateur, ordinary householder, or even a skilled man, to start dabbling about with live wires as this man unfortunately did, is asking for trouble. What are plugs and sockets made for? To connect and disconnect apparatus easily and conveniently; and yet this very simple and elementary precaution is not taken.

From the evidence given at the inquest, one gathers that when the installation was first put in, the switch was in circuit with the live wire, but owing to a main switch being replaced with a new one, the wires apparently got crossed, with the result that the single-pole switch controlling the ironing plug was then on the neutral wire. Is any responsibility for such happening to be attached to anyone? as, by the number of adjournments of the inquest and the number of fresh witnesses called, one was almost inclined to think that an endeavour was being made to place legal responsibility either on the supply authority or on the man who changed the faulty main switch.

The supply authority's representatives who were called as witnesses appeared to be handled severely by the coroner, especially for visiting the house without obtaining authority from him. Personally, I consider they were perfectly justified in doing so, in spite of having no authority from the coroner; because it was very necessary, on learning that someone had been electrocuted, to go at once to find out the reason why. Otherwise something might have happened that would be a danger to other people. It was, therefore, very essential that the supply authority's representatives should go at once to see that matters were safe as far as other people in the house were concerned.

Case of Street Explosions.

Would the coroner, in the case of the London streets which were blown up some months ago, have insisted that the gas authority's men should not go on to the job without his authority because a man had been killed? If an accident occurs, electrical or otherwise, surely it is very important that safety be assured at the earliest possible moment, whether the coroner authorises it or not. A case might arise in which it was necessary to withdraw the supply authorities' main fuses to make the place safe. Must electric supply people await the coroner's pleasure before they act?

If a legal contributor to this journal can state whether any liability rests either on the supply authorities or contractors in reference to accidents occurring where switches are still in circuit with the neutral wire instead of the "live" wire, it would be of great interest to the trade. A single-pole switch is used to break a circuit, and whilst we are fully aware that it is distinctly advisable to insert the switch in the "live" wire section of the circuit, I do not know of any law which does or can demand that this be done, except in so far as various specifications call for it. Even if it is not done, the electric supply can be quite satisfactory from a working point of view, and I do not see where any legal liability rests, either on a supply authority or a contractor, should an accident occur in circumstances such as are detailed. There must be hundreds of thousands of switches in use at the present time that are on the neutral side of the circuit, and have been so for 10, 15 or 20 years or more, but no accidents have arisen as a result.

Generally speaking, if a man puts his hand in a fire, he will get burnt, or if he puts his hand in or among moving machinery, he will get seriously hurt. The same thing applies if a man deliberately dabbles about with live electric wires; he is liable to get a severe shock.

In the case previously mentioned, provision was made for disconnection by means of the plug in the socket, and also at the main switch, but neither precaution was taken. I therefore ask, what is the legal position? Is it likely that any claim for damages would succeed in the case of accident or death brought about by circumstances that might arise through a single-pole switch being inserted on the neutral side instead of the "live" side of the circuit? Could a contractor be held responsible, or, alternatively, could a supply authority be held responsible for connecting up an installation where such a condition existed?

This appears to have been a case in which an "unearthed" iron would have been safer than an "earthed" one, but I will not dwell on this part of the subject.

[*A legal view of the points raised in the foregoing article is to the effect that the position as regards liability must depend to a very large extent on the particular circumstances of each individual case. In such special cases as interference with a live wire by anyone with a pair of scissors, the person doing so would probably be defeated in any claim that he or his representatives might make by a defence of contributory negligence.*—ED.]

TRANSPORT FOR CONTRACTORS.

The One-ton Lorry—Running Costs—Comparison with the 7 h.p. Van—Types of Body for Electrical Dealers—Need for Periodical Inspection.

By W. A. GIBSON MARTIN.

IN a previous article* it was shown how the 7 H.P. vehicle could be used as a service van, or as a tender to a fleet of larger vehicles, and detailed running costs were given to prove that the small delivery van would cost a fraction over 3½d. per mile if the annual mileage was 20 000. The electrical contractor who requires an all-round general service vehicle, however, may decide that a vehicle with a larger capacity, and capable of accommodating a heavier and more bulky load, may be of more utility, in which case the one-ton van will demand consideration. A table of running costs for the one-ton vehicle, compiled in exactly the same way as the previous table for the 7 H.P. van, is given below :—

RUNNING COSTS FOR THE ONE-TON VEHICLE.

Petrol : 12 m.p.g., 1s. 5d. per gallon.
Oil : 700 m.p.g., 5s. per gallon.
Tyres : 15 000 miles per set for five :
Replacement cost, £21 per set, 32 × 4½

Original Cost .. £245
Painting 15
Total cost .. £260
20% depreciation per annum .. £52

	Number of Miles per Annum.								
	5 000			10 000			20 000		
	Actual Cost		Cost per Mile	Actual Cost		Cost per Mile	Actual Cost		Cost per Mile
Running Expenses :	£ s. d.		d.	£ s. d.		d.	£ s. d.		d.
Petrol	28 8 8		1·36	56 17 7		1·36	113 15 2		1·36
Oil	1 15 0		·08	3 10 0		·08	7 0 0		·08
Tyres	7 0 0		·33	14 0 0		·33	28 0 0		·33
	37 3 8		1·77	74 7 7		1·77	148 15 2		1·77
Standing Charges :	£ s. d.		d.	£ s. d.		d.	£ s. d.		d.
Government Tax ..	15 0 0		·72	15 0 0		·36	15 0 0		·18
Insurance	15 2 6		·72	15 2 6		·36	15 2 6		·18
Garage	26 0 0		1·24	26 0 0		·62	26 0 0		·31
Depreciation ..	52 0 0		2·49	52 0 0		1·24	52 0 0		·62
	108 2 6		5·17	108 2 6		2·58	108 2 6		1·29
Totals :	£ s. d.		d.	£ s. d.		d.	£ s. d.		d.
Running Expenses	37 3 8		1·77	74 7 7		1·77	148 15 2		1·77
Standing Charges ..	108 2 6		5·17	108 2 6		2·58	108 2 6		1·29
Driver's Wages ..	156 0 0		7·48	156 0 0		3·74	156 0 0		1·87
Allow for Repairs ..	10 0 0		·48	15 0 0		·36	20 0 0		·14
Total	311 6 2		14·91	353 10 1		8·45	432 17 8		5·07

Reference to the table will show that on a 20 000 mile basis, the one-ton van will cost practically 5d. per mile as against the 3½d. of the smaller vehicle, while on the minimum mileage of 5 000 per annum, the figures are 1s. 3d. (14·91d.) and 11½d. (11·68d.) respectively. It is obvious that if the electrician has heavy enough loads, and has a large enough area to cover, the one-ton vehicle is, on the whole, the more useful type of transport, as the running costs are only approximately a third more, while the larger vehicle will convey more than twice the load.

First Cost.

The one-ton chassis, on which the figures are based, is a British production that has proved a reliable and economical unit, well up to its work and capable of giving long periods of service without extensive overhaul. It has been adopted in large numbers for Post Office transport, as well as by other large concerns with a fleet running into the hundreds. The engine is a four-cylinder water-cooled unit developing 31.5 B.H.P. A 6 V lighting set supplies current for three lamps, or if long journeys are anticipated after dark, a 12 V circuit with five lamps (and an electric starter) can be fitted at an extra cost of £15. The price appearing in the table of running costs is inclusive of a spare wheel and tyre, an engine-driven tyre pump, speedometer, full kit of tools and driving mirror. The chassis price is £170, but several types of body are standardised at £205, £210 and £220, plus the cost of adding the electrical dealer's name and address to the body panels.

For the purpose of giving a fair estimation of running costs, the price of the vehicle in priming grey has been taken at £245, in order to allow a margin for any alterations or additions to body work that may be desired in connection with the electrical trade, and the sum of £15 has been allowed for painting, making the total cost £260. Depreciation, at the rate of 20% per annum, has been calculated, thus writing off the vehicle in the books at the end of five years. This is the simplest method of arriving at depreciation, and is on the generous side. The income tax authorities will only pass depreciation at 20% per annum on the diminishing value, but in the event of the electrical dealer being able to prove a greater amount of depreciation than has been allowed for income tax purposes, the authorities will pass a further amount on the vehicle being sold for scrap, or on exchange in part payment for a new model.

The efficiency of the one-ton van can be greatly improved if the electrical contractor will give some thought to the body-work. First of all, the general outline has to be considered. Is a completely enclosed body the most suitable? or will the open type be more useful in conveying material to the job? The box-van body can be an exceptionally useful type of vehicle, giving perfect protection from the weather, and allowing fragile goods to be packed securely. On the other hand, the flat-platform body allows the load to project to a certain extent at the sides, and lengths of pipe, ladders, and scaffolding can be allowed to project over the tailboard. The drop-side lorry may be useful for some purposes, while there is always the van with fabric sides that roll up, a compromise between the open body and the box van.

Spare Wheel and Tools.

Having decided upon the most useful, all-round body, arrangements must be made to accommodate the spare wheel, tools and any packing materials in frequent use. On the chassis described, the spare wheel is placed between the frame members at the rear, and is exposed to all the mud and dust thrown up by the rear wheels. In this position, the spare wheel is out of sight and is therefore overlooked when the vehicle is being washed down. The result is that the spare tyre is constantly wet, the canvas soon rots through, and even although the tyres may be changed over every 5 000 miles—as they should be if they are to give the maximum service—every cover deteriorates sooner than it should, and the tyre bill is higher than it ought to be. Any body builder, or even the local joiner, will be able to enclose the spare wheel in a stout wooden cupboard lined with waterproof material, thus protecting the spare wheel, and lowering operating costs.

The modern engine is very reliable, and if properly looked after there will be few roadside adjustments required. But such adjustments as are necessary, always seem to occur when time is pressing ; and so the electrical contractor should adopt some means of housing tools and spares conveniently so that when a halt is compulsory, delay may be minimised.

The essential equipment for the road may be divided into three sections, and they should be housed separately if possible. These sections are : (*a*) small, fragile parts, easily damaged, such as carburetter jets, magneto file, spare lamp bulbs, fuse wire, insulating tape and spare sparking plugs ; (*b*) the heavier tools supplied as standard kit, such as adjustable and box spanners, hammer, screwdriver and hub-cap spanner ; and (*c*) tools for wheels changing, i.e., wheel brace, jack and jack handle. Group (*a*) may be accommodated in a cupboard placed under the instrument board, or in a stout leather bag, well protected from the jolts and jars of the road, below the driver's seat. Group (*b*) may be housed in a tool box, placed on the running board and fitted with lock and key. Group (*c*) must be instantly accessible without interfering with the load, or with any other tools, and may be stored in another toolbox on the opposite running board, or in a wooden box lined with felt below the driver's seat, or in a separate division of the cupboard suggested for the accommodation of the spare wheel. All three groups should be inspected at irregular intervals by some responsible member of the firm or departmental head, and all drivers should be instructed that no journey must be started unless tools are in their places and in good order.

The secret of good service lies to a large extent in regular inspection. When the electrical staff are working at high pressure all the week, it is difficult to find time when the vehicle and the inspector are both free. The difficulty may be overcome in many cases by arranging the transport schedule so that there is little work to be done on Saturday forenoon. The driver can then make any adjustments that are necessary, thoroughly wash down the body and clean up the engine, while the inspector can find time in which to check over details and ensure trouble-free service during the following week.

ELECTRIC COOKING IN THE HOME.

Varying Types of Hotplates—Slow Boiling Problem—Advantages of Electric Kettles and Saucepans—Thermal Storage Cooking.

By HILDA L. DOVER, B.Sc.(London).

TO-DAY there are so many good and reliable electric cookers on the market that the deciding factor in the choice of a cooker is just a matter of individual taste as to design and finish. Of course, the cost has to be borne in mind, and until a more reasonably priced cooker with all the necessary additions included is put on the market, the electric cooker industry will not progress as rapidly as is desired. Such a cooker should be advertised in the daily newspapers on the women's page and in women's magazines, not once, but time after time with varying slogans such as :—Electric Cooking means Coolness, Cleanliness and Comfort in the Kitchen—Electri ccooking, means Joints more Juicy—Electric Cooking means Reliability of Results.

In spite of the attractive appearance of many electric cookers. there are some which are more practical in use than others, and it is advisable to keep these merits in mind when selecting a cooker. Every cooker manufacturer has his own particular method of construction of hotplate. Their efficiencies appear to be very good under ideal conditions but vary from

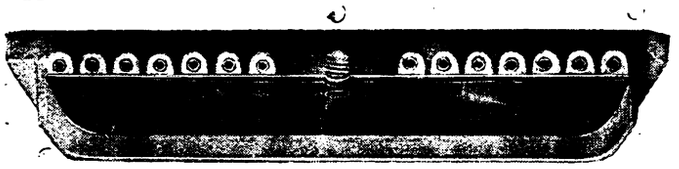

Fig. 1.— Section of Sadia hotplate.

time to time chiefly due to moisture. To ensure drying out any moisture the Hotpoint Company keep their hotplates at a temperature of 120° F. for several months before fitting them on their cookers. The most extensively used hotplate is the Sadia type, in which nichrome wire is imbedded in cement and fixed under a cast iron plate. The heat is transferred to the plate by conduction, and loss of heat downwards is reduced by a mica sheet held in place by a clamping plate. In this type of hotplate 35 watts per sq. inch can be dissipated with safety. Hotplates so constructed have an average life of at least two years. It was when the open type of hotplate was much more widely used that breakdowns were so frequent, and unfortunately the general public learned these facts and have not yet been educated up to the use of the enclosed type, or realised their reliability without any maintenance costs. Sadia plates can be obtained from 4½ to 11¾ in. in diameter as well as in square and rectangular shapes. These plates have three-heat regulation.

Many important cooker manufacturers use a similarly constructed type of hotplate. The Revo Company's latest enclosed hotplate simply plugs in and can easily be removed if defective. The Universal type merely requires a screwing motion and fits flush, thus no liquid can get between the element and the cooker. The Berry-McClary hotplate is clamped in, whilst the Magnet hotplate is fixed by a central bolt and wing nut. The average time for heating half a pint of water from 158° F. to boiling point on an enclosed cement filled plate of 1 600 watts loading was 6 minutes 50 seconds, and for one pint 8 minutes 45 seconds. This is rather loo long for the rush of civilisation of to-day so the cooker manufacturers are trying hard to reduce this time. The Revo Company with the Superspeed boiling plate of 2 000 watts loading can heat a half a pint of water from 156° F. to boiling point in 2 minutes 48 seconds, and one pint in 4 minutes 5 seconds. But this has only been effected by an additional cost of £5 per cooker. A transformer is fitted under the cooker and a very low pressure is used. Besides the cumbersomeness of the transformer there is an annoying buzz. In spite of these objections many hundreds of these plates are in use in various parts of the country—the Shropshire, Worcestershire and Staffordshire Electric Power Company hire out this plate in connection with the Revo cookers that they purchase.

To overcome the slow boiling problem an electric kettle should always be supplied with the electric cooker. At the Ideal Home Exhibition at Olympia the Hotpoint Company have been showing a new Calrod kettle with an automatic device for disconnecting the current when the water boils away. In addition to the electric kettle, a small saucepan with self-contained elements for boiling small quantities of milk, eggs, etc., is a valuable time-saving appliance. It is almost a necessity where no permanent help is kept.

However efficient the hotplate may be, good results will not be obtained unless suitable cooking utensils are used. When adopting electricity for cooking it is advisable to buy a new complement of saucepans. It will save much time and money in the long run. Supply companies should urge this when connecting an electric cooker for a new consumer and try to meet them with hire, hire-purchase or discount rates. The correct size of the utensil is the size of the hotplate ; heavy aluminium or cast iron is preferable, machine turned with perfectly flat bottoms, as 75% efficiency can be obtained from utensils with flat bottoms against 30% if the bottom is warped. In fact, a 20% saving in time and current can be made by using good saucepans of correct size. There is an urgent necessity for education in the actual method of cooking by electricity. This is apparent from the large variations which are obtained from consumers' meter readings. Cases are on record where the average energy consumption varies as much as 3 : 1 for similar households and apparatus.

It is generally accepted that heating by the enclosed or open hotplate is too slow—improvements in efficiency have been made since the war, but the expense has been enormous. An efficient hotplate is in use in Sweden by means of which two pints of water at ordinary temperature can be boiled in less than three minutes.

A little money spent by the manufacturers in educating women in the more scientific method of cooking, as with the Thermal Storage Cooker, would be more profitably spent than in gaining a small increase in hotplate efficiency.

The grill in most British made cookers is of the open type of element nichrome wire twisted in spirals is wound on porcelain. These elements are placed on the top of the cooker with the hotplates and in some case can be used for boiling as well as grilling. After about five minutes preheating the grill is ready for use. When the grill is on the top part of the cooker a door should be provided with a safety catch to prevent the door falling straight down and thus causing breakages. This cupboard can be very effectively used for warming plates and dishes. When grilling has to be done by means of the top element of the oven —as in the Universal and the Berry-McClary cooker—a plate rack or warm cupboard should be included in the equipment for the warming of plates when the oven is not being used or when it is being used for a roast. The disadvantage of the grill in the oven is that cakes and pastry cannot be cooked at the same time as the grill is being used. Breakfast cookers, as they are sometimes called, consist only of hotplates and grill. The Universal Portable Electric Cooker is an ideal cooker for a small flat or where the kitchen space is limited. It will cook perfectly a complete meal for four persons, only using 1½ units per hour full on.

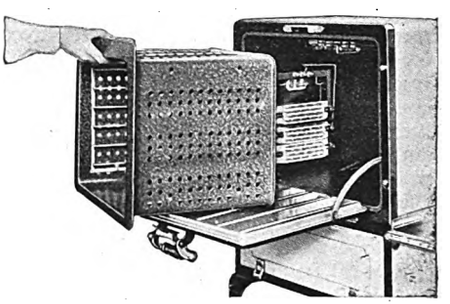

Fig. 2.—Interior of "Magnet" oven withdrawn, showing elements.

There are two schools of thought on the position of the elements in the oven, side and bottom heating, and top and bottom heating. The oven should be efficiently lagged. The facility with which the whole of the interior of the Magnet cooker oven is removed for cleaning is a great asset : the rounded corners and enamelled finish all add to its labour-saving properties. Most ovens are now fitted with a thermometer or temperature gauge. For small cookers a thermometer is far from essential, in fact, the automatic controlling device on the Universal Cooker is of much more use. It is essential that fuses be supplied for separate elements. The main switch should be put in a convenient place so that tall saucepans or steamers can be used or a plate rack can easily be removed for cleaning.

SAVINGS AND PENSION SCHEMES.

The National Savings Committee's New Model Schemes.

SINCE the new model schemes 9 and 10 were introduced about a year ago by the National Savings Committee more than two hundred associations have adopted scheme 9 or a combination of 9 and 10. In the gas industry alone there are now over 80 such associations. In the belief that a number of firms and undertakings in the electrical industry will be interested in this method of providing for the old age of their staffs we give some particulars of these schemes.

The schemes have been designed so that the cost to the employer can be extremely low, so that even the smaller firms can participate. A feature of the schemes is that employees are left in complete control of their savings and of the interest earned; they can withdraw their certificates from the association at any time at their full value, and it is left entirely to them whether or not they join the scheme.

Scheme 9 includes a measure of group insurance. The weekly contribution of the employee can be fixed at any agreed amount not exceeding 4s. a week. On the basis of a weekly subscription of 1s. with an employers' guarantee to make up the member's savings to £200 in the event of death before his savings amount to that sum the employer's liability would diminish from £49 at the end of the first year to zero at the end of 15 years. This liability can be covered by a "Group Insurance" policy. The premium per individual on the above basis would range in the first year from 5s. 2d. for those aged 20 at entry to 11s. 1d. for those aged 45. These amounts would dwindle yearly to 2d. and 9d. respectively for the fifteenth year. Against these payments to the insurance company the income tax rebate allowable to the employer must be set. Assuming normal age distribution the average net cost to the employer over the 15 years would be about 4s. per annum for each employee or less than 1d. per week.

At the meeting of the executive of the Home Counties Alliance of the Federation of Master Printers—the printing trade has taken a particularly strong interest in these schemes—on April 1st it was unanimously decided to go forward with a scheme of group insurance for members of the Alliance, and that the Alliance would arrange insurance cover for firms which so desired.

Scheme 10 does not incorporate the insurance benefits guaranteed under scheme 9, the employers' contribution being applied to give one savings certificate for every agreed number of certificates purchased through the association by its members with their own money. The scheme has advantages where a large number of women or young people are concerned, and can be used as a means of accumulating a long service fund. This scheme was originally limited to employees whose pay does not exceed £300 a year or £6 a week, but this regulation has recently been amended so that the higher paid employees can, under certain conditions, now be included. Combinations of schemes 9 and 10 can be arranged to suit the needs of firms.

Several engineering firms, including some of the electrical manufacturing companies, have adopted savings and insurance schemes in conjunction with the National Savings Committee; the Isle of Thanet Electric Supply Co. is another instance.

A postcard, which need not be stamped, addressed to the National Savings Committee, Sanctuary Buildings, Westminster, S.W.1, will bring full particulars, or, if desired, a call from a representative competent to give full explanations.

BOOK REVIEWS.

The Electric Wiring of Buildings. By F. CHARLES RAPHAEL. (London: Sir Isaac Pitman and Sons.) Pp. 258. 10s. 6d. net.

After a period during which text-books on the subject of electric wiring were very few and far between, we seem to be entering now upon a period of a large number of such publications. There is, however, room for them all. This book by Mr. Raphael contains a preface in which the author refers to "patient reviewers of the technical Press who, failing some guidance from the author, would feel compelled with noble self-sacrifice to read the volume through from cover to cover before passing their opinion upon it." I, for one, have read this volume through from cover to cover, and feel grateful to one who, writing with very considerable authority upon a very important subject, has been the means of adding a valuable reference book to my shelves. This book embraces, all the details which the electrical contractor comes across in his everyday work, including a chapter on weak-current work, such as bells, telephones, fire alarms and radio—subjects which are too often omitted altogether from books which pretend to cater for the electrical contractor.

D. W. T.

Electrical Wiring and Contracting. Edited by H. MARRYAT. Vols. I, II and III. (London: Sir Isaac Pitman and Son.) Issued in weekly parts, price 1s. each part, and in volumes at 6s. each,

This is a work which should fill a long-felt want in the electrical contracting industry. It is, in particular, a happy idea to publish it in monthly parts at a shilling each.

The subjects to be dealt with will cover not only the practice of electrical wiring itself, but practically all the subjects which are in any way associated with this trade: Workshop science, drawing, electricity and magnetism, and alternating current work are dealt with in Vol. I, while Vol. II is concerned with d.c. generators and motors, mathematics, a.c. generators and motors, wires and cables, Further sections will combine to make what will ultimately be a most useful work of reference. Each section is written by an author especially competent in the subject under consideration.

The work is adequately illustrated by line blocks and half-tone blocks, while the sub-titles and page headings facilitate quick reference to any particular point. I have tested the book with several of the many problems with which the electrical contractor is apt to be confronted, and in every case I have found a reference to the matter. If the finished work is well-indexed—and, if the name of the publishers counts for anything, it will be—then eight very useful volumes will, I hope, be on the bookshelves of every contractor and consulting engineer and of many architects.

I think the most important aspect of the work, however, is one to which I have already made reference. The small and compact size of the monthly parts—crown 8vo.—coupled with the moderate price of one shilling, ought to make all apprentices, who are keen on their job, subscribe to this. In fact, contractors may go so far as to suggest to their apprentices that these books will help them on in their craft. Incidentally, the work has been arranged to follow as closely as possible the course of training drawn up by the Apprenticeship Committee of the City and Guilds of London Institute in conjunction with the Electrical Contractors' Association.

Finally, it is to be hoped that the existence of such a work of reference which is within everyone's means will materially assist in spreading the knowledge of electrical installation work to all those who should have some knowledge of the subject, and yet, owing to the absence of any satisfactory book, are left in ignorance.

Volume III opens with a section on Practical Wiring Work; is divided into two parts; it occupies just half of the volume and is in itself a very complete treatise on the subject. Section XII is on the subject of fittings and the last section in this volume, is on Primary and Secondary Cells.

D. W. T.

A First Electrical Theory. By H. W. HECKSTALL-SMITH. (London: J. M. Dent and Sons.) Pp. 372. 4s. net.

I believe that all schoolboys will like this book, and it is for schoolboys that it is written by a man who thoroughly understands their psychology. I myself should very much like to be in Mr. Heckstall-Smith's class at Stowe School. The author describes it as a text-book covering the school certificate, Matriculation and first M.B. examinations. It is, in fact, purely elementary, though even the elements of a subject like electricity can be very baffling to the student unless they are set forth in a particularly lucid way. The book is certainly lucid and it is full of humour. Perhaps the most striking thing about it is that the author tears himself away from the conventional water analogy for all things electrical, though he makes full use of analogies, some serious, some whimsical and some definitely comic. Beginning as he should with a highly readable chapter on molecules, atoms, electrons, protons etc., he follows the natural sequence of events until he bids good-bye to his reader—I sincerely trust it is only *au revoir*—on the platform of dynamos and motors and modern physics. The author treats us to what is really a sort of epilogue which he describes as a very short history of electrical science. The book is well illustrated and is handy in size. D. W. T.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Brilliancy Control of Electric Gramophones

[To the Editor.]

Sir,—In your editorial columns on April 4th, dealing with De Luxe Electric Gramophones, reference is made to "brilliancy control—for emphasising either high or low notes as desired." It may be of interest to state the reasons for such control. The upper musical register is sometimes defective due to a reduction in output from loud speakers and pick-ups, whilst the register below the middle of the pianoforte is represented at gradually decreasing strength on the record.

To secure equal response over the range 5 000 to 50 cycles, the lateral motion of the pick-up needle should increase inversely as the frequency. In practice, this occurs from 5 000 to 250 cycles, but from 250 to 50 cycles the lateral motion is constant. Hence at 50 cycles the voltage from the pick-up is $\frac{1}{5}$ its proper value and therefore the sound output is reduced to $\frac{1}{25}$.

Limitation of the sideways motion is essential to avoid increasing the diameter of the record. Also with grooves of the correct width the majority of pick-ups jump like performing fleas below 100 cycles, owing to the large lateral excursion.

At the National Radio Exhibition in 1929 Gambrell Radio introduced an instrument which, used with pick-ups like the B.T.H., Celestion, etc., gives perfect compensation in the lower register. In this instrument—due to the writer and known as the Novotone—a brilliancy or scratch control is incorporated so that the upper register can be adjusted by a 50 ohm rheostat to suit any taste.

This apparatus—the first of its kind—is connected between the pick-up and the amplifier. It can be used with any radio gramophone, whatever its price, with results which can best be described as "Realism from Records."—I am, etc.,

N. W. McLachlan.

Coventry Street, W.1.
April 8th.

Safety in Domestic Electrification.

[To the Editor.]

Sir,—On page 394 of The Electrician of March 28th at the bottom of the second column, Mr. T. C. Gilbert quotes a remark I made in your issue of August 15th, 1929, alluding to the hazards of independent earthing of portable domestic appliances in particular. In this connection it is of interest to note that the wiring system discussed in the writer's book* (also quoted by Mr. Gilbert) purposes to do away with independent earth-connections.

As a general rule, new installations are not passed by the supply undertaking until they satisfy the required insulation test, which test-figure usually represents the best condition of the insulation. "Ideal" insulation, referred to by Mr. Gilbert of the system and installation (which must be taken together), is commercially beyond the engineer's expectations.

A "complete" *permanent* system—insulation for new or old systems and installations for normal and abnormal operating conditions is what we should like, but as we are unable to guarantee this desired state, engineers must seek to do the remaining best thing for the safety of the public—effectively earth the system and installation.

Making every exposed part of fixed or portable appliances, fittings or apparatus, of insulation in place of metal does not guarantee the public a permanently danger-proof installation. As there can very rarely (or ever) be any such thing as a permanent fool- and danger-proof "ideal" insulated system and installation, experience has forced engineers to adopt the best-safest practice—namely, effective earthing.

For safety in domestic electrification we have to contend with three main and distinct sources of danger; those coming from the outside conductive system, from the inductive system, and from the domestic installation. In discussing the problem of safety or danger, Mr. Gilbert would seem to be under the impression that all dangers start in the domestic installation. And he would appear to specially condemn the earthed system instead of the earthing methods used.

For d.c. generation with underground distribution we have the simplest and safest conditions with the origin of danger nearest to the domestic electrification. For th ea.c. generated, transformed, and overhead (combined primary and secondary) distribution lines, we get a varied distinct set of danger conditions originating far from the domestic electrification.

System, operation and safety cannot be allied with "riding the earthing idea to death." Earthing is a real practical necessity, not an "idea"—it leads to safety, not to "death." And earthing should never follow fads, fancies, parrot practice nor the practice of cranks.

As a general rule, it is found cheaper and easier to maintain a sound, efficient and permanently earthed-neutral system than to maintain a sound and permanent highly-insulated system. For a.c. step-down supply, earthing is the cheapest, most permanent safe method for general public use.

The installation of improved domestic-installation *insulation* does not definitely solve the danger problem—many of the possible and probable dangers to domestic installations come from without. Earthing does definitely solve the danger problem, and it is up to the engineer to mitigate the failure of earthing devices and adopt that system of wiring requiring a minimum of such devices for a complete domestic electrification.

Troubles and misunderstandings should more often centre around the defective installation and not the system to which it is connected. Instead of blaming the wiring, fittings, method of earthing, the high domestic voltage, etc., Mr. Gilbert apparently throws the blame on the earthed system. He admits that: "A large proportion of accidents are due to the failure of earthing devices." But he prefers scrapping the earthing system to correcting the defective installations. He would sooner centre attention on increasing domestic *insulation*. Of course, all engineers are in favour of increasing the insulation on the insulated part of a system or/and installation. Installing a 230 V (insulated) circuit with, say, 3 300 V insulation is in the direction of better protection, but such a precaution is unwarranted, and, where an overhead supply steps-down from 6 600 V or higher voltage, this unnecessary and commercially-impracticable insulation may not guarantee absolute safety for all time under prevailing portable-appliance conditions any more than the ordinary-insulated 230 V-to-earth system would do. In the book* referred to by Mr. Gilbert, many possible dangers are discussed and the writer hopes that every interested electricity supply engineer will find time to study the discussion on earthing of systems and installations given therein.

It certainly is the duty of the industry to study more of, and evolve, methods of protection. The writer has no hesitation in saying that proper wiring installation and earthing of the domestic services and the system will provide the best and surest method of protection. In the book quoted* the writer proposes a new method of domestic electrification for affording better protection with a cheaper installation.—I am, etc.,

William T. Taylor.

Worthing.
April 3rd, 1930.

[*Further letters on this subject have had to be held over until next week owing to exigencies of space.*—Ed.]

Zweigberk's Multiple Unit Train Control.

[To the Editor.]

Sir,—May I be permitted to add to your references to the greatly lamented T. Von. Zweigberk's contribution to electric traction?

Your own remarks omit reference to his multiple unit system of train control in which the main feature was the use of solenoid contactors with *series* as distinct from shunt magnets. These units were energised by the return current from the train motors, which was either passed through all the control magnets on the train to earth at the rear of the train or diverted to earth in front of the train.

The immense advantages of this system were that no current was broken in the controller, but only by the contactors with the metallic shield blow-outs, and that the control wires were at earth potential at all times.

When I inspected this system in 1907 and prepared a description for my old paper The Electrician, which was published on April 19th and 26th of that year, the opinion was expressed that this system would be universally adopted on d.c. trains. It seems strange that our prophecy has not been fulfilled.—I am, etc.,

W. E. Warrilow.

Oxhey,
April 12th.

NEWS IN BRIEF.

Electrical Vote-Recording—Press Telephone Communication with Russia—Czechoslovakia's Electrical Imports—Road Traffic Signals for Bradford.

THE number of hired cookers connected to Manchester Corporation's mains in February, 1930, was 75, making a total of 6 019.

Telephone communication between Paris and Saigon (French Indo-China) was made available to the public last Saturday.

The annual general meeting and luncheon of the South Wales and Monmouthshire E.D.A Area will be held at the Royal Hotel, Cardiff, on May 1st.

The annual general meeting and luncheon of the South-West E.D.A. Area will be held at the Royal Hotel, Bristol, on April 24th. The principal guest will be Mr. H. Marryat.

The revised estimate of the surplus on the past year's operation of the London County Council's tramways department is £52 570, and it is estimated that the surplus for the current year (1930–1931) will be £89 411.

Eastbourne Electricity Committee has decided that inquiries be made into "wireless transmission of electrical energy."

A suggestion that electric vote recording apparatus should be used at London County Council meetings is to be considered.

Glamis Castle, the home of the Earl and Countess of Strathmore, is to be fitted for electric lighting. The work has been entrusted to Lowden Brothers and Co., Ltd.

At Maesteg Police Court last week, three defendants were find for obtaining electricity without payment, by attaching a wire on the mains' side of the meter.

The 15th Highland Light Infantry, which was mainly recruited from the Glasgow tramway employees, held a commemoration service at the Cenotaph, George Square, Glasgow, last Sunday.

The Post Office has compiled geographical statistics of wireless licence holders. There are 541 000 in London, 304 000 in Lancashire, 252 000 in Yorkshire, and only 195 000 in Scotland and 30 000 in Northern Ireland.

The Heriot Watt College, Edinburgh, provides full-time day diploma courses in mechanical, electrical and mining engineering. The entrance examination will take place on April 22nd and 23rd, and the courses commence in October.

Lt.-Col. A. A. Jayne, postmaster-surveyor for the Leeds and West Riding district, stated at a meeting of the Leeds Rotary Club, last Friday, that the Leeds office was to be equipped with the latest high-speed telegraph apparatus, at a cost of some thousands of pounds.

Mr. J. A. Crabtree will speak at the annual dinner of the Business Research and Management Association, to be held at Anderton's Hotel, London, on May 1st. His subject will be "Research the Foundation of Successful Business Building," and tickets can be obtained from Mr. H. A. Haylett, hon. sec., 50, Bushey Avenue, Snaresbrook, London, E.18.

At a meeting of Birmingham "Safety First" Council, on April 10th, Mr. O. C. Power said the only solution of the trouble of glaring headlights on vehicles was that all such vehicles should be fitted with dip and swivel lamps. Mr. J. Howell mentioned that Birmingham tramways department was experimenting with automatic signalling at the rear of tramcars and omnibuses.

Preliminary arrangements are in hand for a direct London-New York submarine cable, and it is stated, in the annual report on telephone and telegraph progress which was approved by Glasgow Chamber of Commerce Telephone Advisory Committee last week, that the new cable which it is proposed to lay between Glasgow, Ayr and Stranraer will form a link in this service.

The City telephone exchange, London, was closed down for six minutes on one day of last week, while the staff carried out fire drill.

Dundee Transport Committee has granted the tramwaymen two extra days' holiday with pay. This concession is to be made at once.

A tender amounting to £1 233 has been accepted for the supply of X-ray apparatus for the new out-patients' department of the Herefordshire General Hospital, Hereford.

It is stated that the Russian Government authorities have now rescinded the restrictions which were at first imposed regarding press communications through the newly-opened Berlin-Moscow telephone service.

Czechoslovakia's imports of electrical machinery and apparatus, in January and February of this year, were valued at 70 000 000 crowns, compared with 50 000 000 in January and February, 1929.

The electric lighting at London County Council's Plumstead and District Hospital is to be improved, at a cost of £815.

Bradford Watch Committee has authorised the provision of automatic road-traffic signals, and will invite tenders for their installation and maintenance.

Cheltenham Corporation has informed Mr. Shakespere Shenton, who requires a 60-cycle supply for the exhibition of sound films at the Winter Garden, that the Corporation is not yet in a position to complete the change over.

The Hull City Analyst has advised the City Engineer that he is of opinion that if a Ringrose electric lamp detector is employed, it will give valuable information as to the safety of air in sewers. The City Engineer has been authorised to purchase such a lamp.

It is stated that the overhead transmission of electricity in connection with Doncaster's railless trolley vehicle system is interfering with wireless reception in the district. The Borough Electrical Engineer has devised means which it is believed will remedy the trouble.

Recently published statistics show that machinery installed in industry in South Africa in 1921 amounted to about 700 000 H.P., of which 21% was electrically operated. In 1928, the total was 1 050 000 H.P., the electrical percentage being 27. Electricity generated in 1927 was approximately 1 900 000 000 kWh. Electrical apparatus and machinery imported in 1928 was valued at £2 493 365, compared with £984 369 in 1922.

Imports into the Irish Free State in February, 1930, included electrical goods valued at £41 402, compared with £30 886 in February, 1929. For the two months ended February 28th, 1930, the value of such imported goods was £91 497, against £71 690 in the corresponding months of last year. Exports from the I.F.S. in January and February last included machinery and electrical goods amounting to £119 596, against £14 287 in the same months of 1929.

At last week's meeting of the Society of Engineers, Mr. R. Borlase Matthews read a paper on "Rural Electrification and Electro-Farming in Great Britain." Electricity supply for farms, he said, would mean a considerable addition to the amenities of country life, and would induce many urban industries to migrate to the countryside. The mains of large towns should be extended until they met the mains of the neighbouring towns. There were many localities which had not supplies, although authority to supply had been given. Supplies had been given by 95 local authorities in 521 parishes, out of 1 397 authorised and by companies in 914, out of 3 085 authorised!

LOOKING BACKWARD.

FIFTY years ago THE ELECTRICIAN *of April 17th, 1880, contained a reference to possibly the first attempt in this country to use the telephone for summoning cabs. "We understand (the paragraph read) that the Sheffield Telephone Exchange Company intend applying to the Corporation for permission to fix in the immediate vicinity of one of the central cab stands a small signal box so that subscribers may be able to call a cab or a hansom at any moment."*

The application of the electrotyping process to the making of statues in bronze was recorded in the same issue.

* * *

TWENTY-FIVE years ago, in THE ELECTRICIAN *of April 21st, 1905, it was recorded that a conference attended by over 100 delegates had decided to form a "Society of Post Office Engineers."*

The Governor of the Upper Senegal and Niger Territories, French West Africa, arrived in Paris, his visit being partly in connection with plans for constructing a telegraph line across the Sahara from Algiers to Timbuctu and Lake Chad.

PERSONAL.

MR. R. A. Parsons has been elected President of the Gloucester Chamber of Trade.

Watford Town Council has fixed the maximum salary of Mr. A. W. Barham, chief electrical engineer, at £1 250 per annum, the sum he is at present receiving.

Estate of the gross value of £26 596, with net personalty £20 789, was left by the late Mr. Walter Fearnside, Irvine, consulting electrical engineer Cape Electric Tramways, Ltd.

Carnarvon Corporation, which recently took over the local electricity generating station from the National Electric Construction Co., has appointed Mr. A. C. Pike as resident manager.

Mr. Charles James Barker has retired from the firm of Barker Bros., electrical and general engineers, of 91 and 92, Westgate, Grantham, and the business will be continued by Mr. J. W. W. Barker.

Mr. John A. Sumner, assistant engineer to the Mid-Cheshire Electricity Supply Company, Northwich, has accepted the position of distribution engineer on the staff of the chief engineer and manager of the West Midlands Joint Electricity Authority.

The London County Council Highways Committee recommends that Mr. J. F. Sinclair be appointed rolling stock engineer in the tramways department, at an inclusive salary of £1 000 per annum, rising by annual increments of £50 to £1 200 a year.

Mr. Ben Turner, Secretary for Mines, has appointed Mr. R. W. Glass and Mr. Frank Lee to be members of the Safety in Mines Research Board to fill the vacancies caused by the retirement from the Board, under the rotational scheme of retirement, of Sir John Cadman and Mr. A. M. Henshaw.

Mr. Douglas Hays, general manager and director, the Scottish General Omnibus Co., Ltd., has resigned, following the acquisition of the concern by the Scottish Motor Traction Co., Ltd., and has been appointed manager of the transport undertakings owned by the Midland Counties Electric Supply Co., Ltd.

Application has been made by the Mersey Tunnel Joint Committee for the services of Mr. P. J. Robinson, city electrical engineer, Liverpool, in a consultative capacity in connection with the lighting and power supply of the new Mersey Tunnel. The Electricity Committee has adopted a resolution granting the request and authorising Mr. Robinson to retain any fees which might accrue.

Mr. J. K. Bruce, general manager of London County Council Tramways, who has been in ill-health for some time, has been certified by the Council's medical examiner as permanently unfit to carry out his duties. The General Purposes Committee recommends that Mr. Bruce's retirement shall take effect from June 30th, with a pension of approximately £805 per annum, plus a lump sum of £2 426.

Capt. H. G. Bell has been appointed by the Central Electricity Board to be technical assistant to Mr. Robert Blackmore, chief engineer for the North-Western England Electricity Scheme. Capt. Bell received his technical training at the Manchester College of Technology, including a post-graduate course of research work on commutator problems at heavy overloads. Since the war he has had a variety of interesting experiences with the Metropolitan-Vickers Electrical Company. For two years he was the company's liaison engineer with the Westinghouse Company in America, and on his return was made responsible under Mr. A. P. M. Fleming for the design and operation of the original 2ZY at Trafford Park. Subsequently Capt. Bell was chief assistant designer of the radio apparatus developed by the Metropolitan-Vickers Company. For the last four years he has been engaged on the design and application of protective equipment for power transmission systems, and is joint author, with Mr. T. W. Ross of a paper on this subject presented to the I.E.E. during the present session.

Obituary.

MR. JAMES M. INGLIS on April 6th, aged 67 years. He had for many years been in business as an electrician in Edinburgh.

MR. JOHN JAMES ARMSTRONG, on April 8th, aged 58 years. He was for many years connected with the Eastern Telegraph Co.

MR. SYDNEY LUKE SMITH who, 15 years ago, joined the Western Electric Co., now Standard Telephones and Cables, Ltd. Recently he spent several months in reorganising the telephone system in Madrid.

BUSINESS ITEMS.

THE Birmingham address of the FOSTER ENGINEERING CO., LTD., has been changed to 12, Newmarket Street.

The LONDON ELECTRIC FIRM, Brighton Road, South Croydon, is now in process of increasing the size of its works.

The Birmingham address of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., is "Wellington House," 39, Bennetts Hill, Birmingham.

The London office of DANIEL ADAMSON AND CO., LTD., turbine and boiler engineers, has been moved to Craven House, 16, Northumberland Avenue, W.C.2.

W. F. DENNIS AND CO., 70, Queen Victoria Street, London, E.C.4, have resumed the sale of solid and flexible copper rail bonds, "Neptune" brand, manufactured by Messrs. Felten und Guilleaume, Carlswerk, A.G.

The CURTIS MANUFACTURING CO., LTD., wish us to state that their only works and offices are at Conduit Place, Paddington, W.2, and 32, Spring Street, Paddington, W.2, respectively, and that they have no connection with any other firm of similar name.

The Aktiebolaget Separator, of Sweden, has concluded an agreement for co-operation with the General Electric Company of New York, whereby the Swedish company has taken over the agency for Sweden for the electrical refrigerating apparatus Santo.

Confidential reports on the market for secondary and primary batteries in Uruguay and Colombia have been prepared by the Department of Overseas Trade, and issued to firms whose names are entered on its special register. United Kingdom firms desirous of receiving a copy of the reports, with particulars of the special register service and form of application for registration should communicate with the Department of Overseas Trade, 35, Old Queen St., London.

The Greek Government has ordered from MARCONI'S WIRELESS TELEGRAPH CO., LTD., three of the latest type duplex telephony and high-speed telegraphy Marconi stations, to be erected, one in or near Athens, with duplicate plant, one on the island of Crete, and the other on Chios. A similar Marconi station, but working on telegraphy only, is also to be installed to exchange messages with ships. The equipment of this station will include a direction finder.

A report on the market for secondary and primary batteries in Australia has been prepared by the Department of Overseas Trade from information furnished by the Trade Commissioner in Australia and issued to firms whose names are entered on its Special Register. United Kingdom firms desirous of receiving a copy of the report, together with particulars of the Special Register service, should communicate with the Department at 35, Old Queen Street, London, S.W.1.

H.M. Senior Trade Commissioner in Canada and Newfoundland has forwarded to the Department of Overseas Trade copies of the Canadian Electrical Code, Part I, Second Edition, giving the essential requirements of minimum standards governing electrical installations for buildings, structures and premises in Canada at voltages up to 5 000. A copy of the code is available for inspection at the Department of Overseas Trade, London, or the Department will obtain further copies for firms at a cost of 1s. 3d.

"MOVIE" ENGINEERS.

First Annual Dinner—Electrical Development in the Film Industry.

THE London Section of the Society of Motion Picture Engineers held their first annual dinner on April 10th, at the May Fair Hotel, London, when Sir Oliver Lodge, F.R.S., was the guest of honour. Mr. S. Rowson, chairman of the Society, presided, and, following the dinner, an historical display of films was shown illustrating the progress made from 1896, when the first public exhibition is recorded, up to the present time, represented by "Mickey's Choo Choo." Included in this display was a lecture film explaining and illustrating the principles of sound recording and reproduction by the Western Electric Co., Ltd.

There was also included an exhibition of apparatus relative to the film industry, including an optical magnifier for the examination of records, a model of a photographer's sound recording system, a magnetically operated mercury-vapour clock, double turntable cinema musical equipment, a rapid visual method of measuring the reverberation in a hall, and high-power amplification equipment.

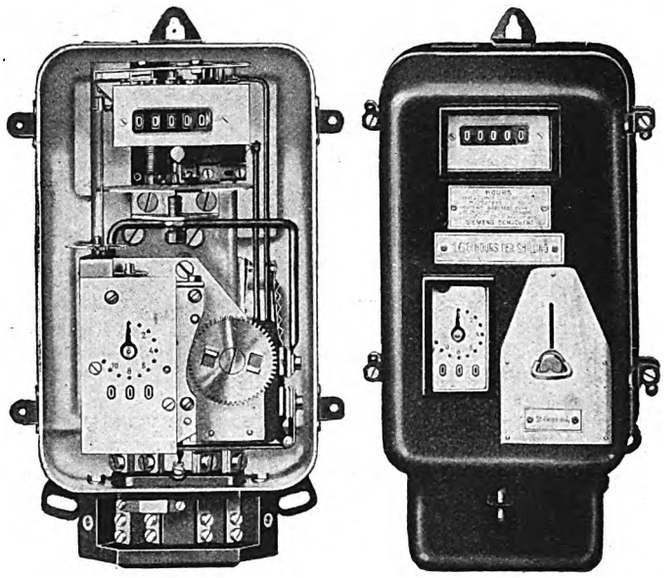
AUTOMATIC COLLECTION.

New Apparatus for Collection of Fixed Charge.

AN apparatus has been designed by Robert Hornby and Co., Ltd., 77, Dean Street, London, W.1, to permit of a house service being connected to the supply authority's



Internal and external views of the Hornby automatic collector.

mains for a definite period for each shilling inserted in the slot. If, for example, the agreed amount to be prepaid is 1s. per week, then on the insertion of one shilling into the automatic collector the house service is connected to the supply mains for a period of 168 hours, and at the end of this time the switch automatically opens and the house remains disconnected from the mains until the insertion of another shilling.

Should the charge be, for example, 1s. 6d. or 2s. per week, the automatic collector is so calibrated that for each 1s. at the 1s. 6d. per week rate 112 hours will be obtained, and for 2s. per week 84 hours per shilling, and so on, to perhaps 6s. per week. The automatic collector as at present is only suitable for a.c. supply up to 20 A connected load, although it is contemplated making the apparatus suitable for 50 A connected load.

One object of the apparatus is to enable supply authorities to have capital charges prepaid, and they can sell either through a slot meter, or an ordinary quarterly meter, the current consumed at a flat rate, irrespective of the purpose for which the current is used. The collector is also useful in connection with the hire purchase of expensive electrical apparatus, as for example:—A consumer buys some current consuming apparatus worth £15 or £20, and the hire purchase rate agreed to is 2s. 6d. per week, then this amount can be added to the capital charge, which is, say, 1s. per week, the collector being set to collect 3s. 6d. per week, or 48 hours use of the installation for each shilling inserted in slot.

It must be clearly understood that the automatic collector takes no account whatsoever of the amount of load. It merely connects the installation to the mains for a definite period from the time of the insertion of the shilling, and this fact must be borne in mind in fixing the capital charge per week. In the case of very small consumers, where the standing charges are out of all proportion to the possible consumption of units, the automatic collector could very well take the place of the house service meter if used in conjunction with either a current limiter or fuses designed to limit the maximum demand; then the consumer can be given a supply at a fixed sum per week, this sum covering the overhead or standing charges and its probable consumption within the limits of the fuses or other device for limiting the maximum demand. The collector as at present designed is uniform with the standard slot meter as regards dimensions and outward appearance, and is provided with one counter which integrates the hours, and a second counter indicating the total number of shillings passed through the slot, besides an indicator showing the number of shillings to the user's credit at any particular time.

TELEVISION EXHIBITION.

Number of Exhibits Nearly Four Times Greater than Last Year.

THE second annual exhibition of the Television Society was opened at University College, London, for one day, on April 9th, when over 20 Fellows, Members and Associates exhibited. A number of televisors were shown, constructed for the most part on the Baird principle of mechanical exploration. One of the exhibitors, Capt. R. Wilson, in collaboration with Mr. E. L. Gardiner and Mr. A. A. Wates, operated a transmitter of his own design and this by means of land lines enabled a number of televisors to be shown under working conditions. During the afternoon the Tuke trophy was awarded to the three exhibitors named in connection with the transmitter referred to.

Complete receivers were shown by Mr. H. J. Peachey (Associate), Mr. C. E. C. Roberts (Student), Mr. Colin P. Garside (Student), Mr. S. G. Foord (Student), and Mr. Ian Vaughan-Jones (Student). Mr. Peachey's exhibit was perhaps the most ambitious. It consisted of a 3-valve set for speech and a 4-valve set for vision signals, both loose-coupled to one aerial and earth. Mr. Garside's machine was fitted with a phonic-wheel synchroniser; Mr. Foord paid particular attention to motor speed control, using rheostats with coarse and fine adjustment; Mr. Vaughan-Jones used two driving motors, each being a four-volt machine, working in parallel.

Mr. C. E. C. Roberts also showed a new television system dispensing with mechanical parts, consisting of a model transmitter and a number of receiving valves. Mr. H. S. Ryland (Fellow) specialised in selenium and his exhibit consisted of a "Selenium Organ" together with a range of selenium cells which he had made. Mr. G. G. Cato (Associate) showed working a simplified form of transmitter and receiver, on the Baird principle, but with the difference that the receiving disc had one more hole than the transmitting disc and was run at a slightly slower speed. Mr. R. W. Corkling (Associate) exhibited an apparatus of his own invention named a "Televidascope"; it was a compact form of television receiver utilising drum exploring, which, when connected to the output of an ordinary vision receiver, enabled a number of people to see at once. A darkened room was not essential when using this form of receiver and it is suggested that it is also suitable for the cock-pit of an aeroplane. A colour televisor, worked on the Baird principle and movie picture apparatus for use with talking-pictures of the "Fox" movietone type were shown by Mr. Martin Woodroffe (Fellow). Among other exhibits were various models of synchronising apparatus by Mr. C. P. Garside (e.g. synchronising two d.c. motors by coupling small magneto alternators to each); a pendulum synchronised disc shown by Mr. John Woolley (Associate); wireless receivers specially designed for television signals by Mr. W. C. Fox (Fellow) and Mr. W. J. Richardson. Honourable mention in the competiton for the Tuke trophy was awarded to the Southend Circle, represented by Mr. R. I. Cowley, Mr. D. L. Plaistowe, and Mr. A. R. Knife, for a variety of exhibits, and to Mr. H. J. Peachey. The judges were Professor F. J. Cheshire, Dr. Clarence Tierney, and Dr. H. Monteagle Barlow. The president of the society, Professor Sir Ambrose Fleming, visited the exhibition in the course of the day and paid tribute to the progress of which it gave evidence. The attendance, we understand, was considerably greater than was the case at last year's exhibition.

THE SOCIAL SIDE.

ON Friday, April 4th, a large number of the staff and workpeople of the Liverpool Electric Cable Co., Ltd., met to see the final game of the company's Billiards Spring Handicap. After presenting the cup to the winner, and other prizes, Mr. T. H. Tweedle, the works manager, handed a gold watch to Mr. Charles Moloney, the honorary secretary of the Sports Club, which had been subscribed for by all departments, and congratulated him on his 21 years of hard work, cheerfully undertaken in the interests of sport. In acknowledging, Mr. Moloney, who was received with much enthusiasm, briefly reviewed the work which had started in pre-war days with a football team only, whereas now there were also strong cricket and bowling teams in the field, and what had been particularly gratifying to him was the fact that he had always been fortunate in getting the whole-hearted support of the members, and further, that it was a great satisfaction to record the successes attained and the high standing in the local league contests.

IN PARLIAMENT.

L.C.C. Charing Cross Bridge Bill before a House of Commons Committee.

A HOUSE of Commons Select Committee has proceeded with the consideration of London County Council's Charing Cross Bridge Bill during the past fortnight. Mr. Frank Pick, managing director of the Underground railway companies and the London General Omnibus Co., said the District Railway station to be constructed at the Embankment would be in one of the arches of the new bridge. In 1929, 36 378 000 passengers used the Charing Cross District Railway station. Sir Felix Pole, chairman of Associated Electrical Industries, Ltd., and formerly general manager of the Great Western Railway Co., said, from a purely passenger traffic point of view he did not think the Southern Railway Charing Cross station should be moved. The Lion Brewery site (at the Lambeth end of the present Charing Cross bridge) was better than any of the alternatives that had been discussed. He would like a Royal Commission to consider the whole question of the London railway termini. On Thursday of last week the Chairman announced that while the Committee were prepared to find the preamble of the Bill proved, they would accept the scheme on the north side of the river provided that Westminster City Council and the London County Council agreed to terms by which the necessary widening of St. Martin's Lane was accomplished before the bridge was opened. So far as the Southern Railway are concerned, they are in a sense the promoters of the Bill and yet not the actual promoters. The Committee fully accepted the position of the Southern Railway that they would rather remain where they were and not have to move. The Committee thought the best course was to adjourn for, say, a month—the London County Council to consider with the Southern Railway whether they could find some different site for the railway. The Committee will meet again on May 6th.

Scottish Central Power Company's Bill.

The Unopposed Bills Committee of the House of Lords considered last week the Bill promoted by the Scottish Central Electric Power Co. for an increase of capital and other purposes. The Bill, which was passed for third reading, seeks authority to increase the existing capital by £400 000 to £1 000 000 and the borrowing powers of the company from £200 000 to £500 000.

Replies to Questions in Parliament.

In reference to the inquiry held last July into the Dorking Electricity Order, the Minister of Transport says he is not satisfied that the proposals of the Order as it stands are in the best interests of the development of the electricity supply in Dorking and neighbouring areas, and at his request the position is being discussed by the Electricity Commissioners with the promoters and other parties concerned with a view to making further proposals.

In reference to an inquiry in the House of Lords whether the Government would give every possible facility to Imperial and International Communications for research and experimental work in connection with wireless telephony, Earl Russell said the Postmaster-General had certain obligations to see that experiments did not cause interference with other wireless stations. Subject to that, he was willing to do all he could to assist or permit research of that nature.

The total overall cost of providing public telephone services with Canada, South Africa, India and Australia, by means of the Post Office radio stations at Rugby and Baldock, is estimated at £43 000 a year. This cost includes £4 000 a year for existing costs at Rugby and Baldock, making a net additional cost for the Dominions services of £39 000 a year. With regard to the questions that were put to the two experts consulted on the subject of oversea wireless telephony—broadly, the questions were intended to elicit whether the high aerial system or the lower aerial system as used at Rugby was likely to prove the more effective—the experts reported that both systems were probably equally capable of providing satisfactory telephonic communication between two points for a given number of hours a day. As regarded future development, the adoption of the more elastic system—the Rugby system, with the lower masts—would be advantageous, since equally satisfactory results could be attained with a smaller expenditure of money, and the provision of alternative wave-lengths was likely to be more cheaply made with the relatively low mast system.

"E.T.B.I." HOUSE.

Further Novel Competition in Aid of Electrical Charity.

SO successful did last year's Cable Competition prove to be that the Electrical Trades Benevolent Institution has decided to launch another competition. This year the competition bears the title E.T.B.I. House and takes the form of "brick" buying. Each book of bricks contains forty sixpenny bricks, each brick representing a donation of 6d. to the funds of the Institution. Each purchaser of a brick is entitled to one free entry in the competition for which a number of valuable prizes have been given. To win a prize all that is necessary is to forecast the district in which the most bricks will have been sold by October 1st next, and also the total number of bricks which will be sold in all districts. Full particulars are given on the back of the bricks.

The closing date of the competition is October 1st and all particulars can be obtained from Capt. J. T. Keeping, secretary, E.T.B.I., 9, Southampton Street, London, W.C.1.

PRELIMINARY PRIZE LIST.

	Presented by
Terminals, Battery Cord, etc.	Belling and Lee, Ltd.
Brownie No. 2 Crystal Receiver; Wave Trap and Selectivity Unit	Brownie Wireless Co., of G.B., Ltd.
Magnum Wave Trap	Burne-Jones and Co., Ltd.
Celestion A2 Ebony Loud Speaker	Celestion, Ltd.
Cryselco Goods value £3 3s.	Cryselco, Ltd.
Six prizes each of a Durham-Duplex Razor	Durham-Duplex Razor Co., Ltd.
Godwinex (1930) Model Eliminator	J. Dyson and Co., Ltd.
Ediswan Raymond Fire; Ediswan Kettle; Electric Iron	Edison Swan Electric Co., Ltd.
Electrolux Model XI Portable Cleaning Outfit	Electrolux, Ltd.
Eltron Electric Heater	Eltron, Ltd.
Audio Frequency Transformer	Ferranti, Ltd.
Electric Iron (6 lb.)	J. Fotheringham.
Pedestal Cone Loud Speaker; Lamp Standard	General Electric Co., Ltd.
L.F. Transformer or Mains Choke	Graham Farish, Ltd.
Noritake Table Standard Lamp with Hand-painted shade	L. G. Hawkins and Co., Ltd.
Six Prizes each of 1 dozen Henley Tennis Balls	W. T. Henley's Telegraph Works Co., Ltd.
Ensign All Distance Folding Camera	Houghton-Butcher Mfg. Co., Ltd.
Mahogany Loud Speaker	L.E.S. Distributors, Ltd.
Italian Alabaster Bowl	Marryat and Place.
Two Prizes each of a Mullard Speaker type "C"; Two Prizes each of a Mullard Speaker type "H"	Mullard Wireless Service Co., Ltd.
Ormond Loud Speaker	Ormond Engineering Co., Ltd.
Two Prizes each of Loud Speaker (No. 2026)	Philips Lamps, Ltd.
Players Cigarettes	John Player and Sons.
Electric Iron	Francis Polden and Co., Ltd.
Electric Iron	Premier Electric Heaters, Ltd.
Electric Iron	John Shaw and Son (Wolverhampton), Ltd.
Six Prizes each of a Waterman's Fountain Pen	L. G. Sloan, Ltd.
Stuart Model Electric Launch "Magician"	Stuart Turner, Ltd.
Ultra Violet Ray Lamp No. 4	Sun-Vi-Lite, Ltd.
Set of 2V Tungsram Barium Valves	Tungsram Electric Lamp Works, Ltd.
Two Prizes each of a 2 V Accumulator	Van Raden and Co., Ltd.
Stop Watch	Venner Time Switches, Ltd.
Radio Components value £3 3s.	Ward and Goldstone, Ltd.
100 W Lamp Fitting	Wardle Engineering Co., Ltd.
Slow Motion Condenser	Wingrove and Rogers, Ltd.
Table Standard Lamp with Fittings	Wood Fittings and Standards, Ltd.
Three Prizes each of an Electric Warming Bottle; Electric Heating Pad	A. E. G. Electric Co., Ltd.

INDIVIDUALIST LUNCHEON.

Sir Arthur Balfour on Home Influences and the British Empire.

THE characteristic of "individualism" which existed in British life was traced to the influence of mother and home by Sir Arthur Balfour when he presided over the 33rd "Individualism" Luncheon at the Hotel Cecil, London, on April 9th. There would be no British Empire, he claimed, but for this individualism, and he honestly believed that unless we went back to old conditions and spent more time at home, thus preparing to face the difficulties of the day, those difficulties were likely to increase rather than decrease.

Sheffield, whence he came, had suffered more than any other town in the country from post-war readjustment, but the businesses which were maintaining their trade were nearly all family businesses. Some great amalgamations had failed, he thought, because at the critical moment the individual big and broad enough to guide those amalgamations through their teething stage did not exist. We in Britain had to face the very grave problem of adjusting our production costs to a point at which the world would buy from us freely. During the time when the nation was the biggest centre of production in the world we tied round our necks all kinds of millstones in the form of demarcation problems and social services. These were well enough in themselves, but nowadays unless we could face the competition of the world we should not maintain our trade or standard of living.

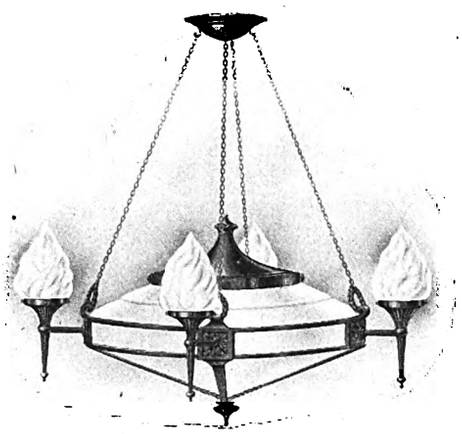
DOMESTIC ELECTRICAL APPLIANCES.

New Items of Interest in the Domestic Range—Tungsten-Cored Filament Valves—Further Spring Trade Possibilities.

AMONG the new appliances of interest to the electrical contractor and supply authority may be mentioned a new design of "Xcel" fire of outstanding merit and cheap in price called "The Homely." It is made by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., 38, Upper Thames Street, London, E.C.4, in 1 and 2 kW sizes, standard finish black stove enamel, and is also supplied in porcelain enamelled finish in six different colours. All the fires are fitted with earth terminals and 6 ft. of flex. They are useful models to put forward for some of the bigger schemes such as municipal housing, etc., and they are also particularly suitable for hotels and similar work.



One of the new fittings by Hailwood and Ackroyd, Ltd.

Two new lighting fittings have been introduced by HAILWOOD AND ACKROYD, LTD., of Morley, Leeds, in the shape of a wall fitting with silk hanging cord and tassel, the design being raised in relief on a frosted base: the second fitting is made up of a "Hailwood" bowl, supported and enclosed in ornamental metalwork with four flambeau lights incorporated. The design is original and a very pleasing effect is obtained whether the glassware is plain, tinted or decorated. The metalwork can be obtained in any finish of brass, bronze or oxidised metal.

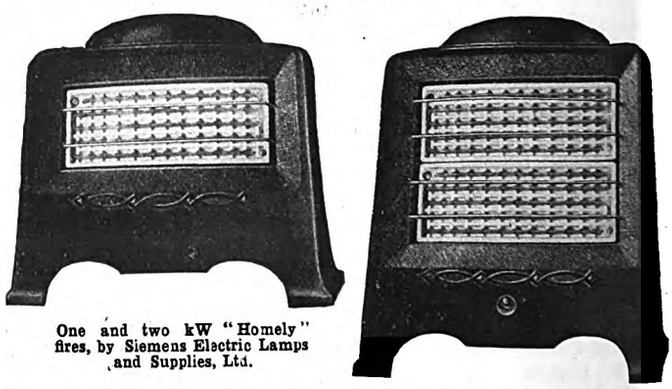
A new h.t. radio battery is announced by the EVER READY CO. (GREAT BRITAIN), LTD., of Hercules Place, Holloway, London, N.7. It is known as the "High Power Sixty," and is claimed to give 40% greater service on high emission receiving sets than the company's "popular power" batteries, though the increase of price is only slight. The battery is sold in 60 V units only, intermediate tappings being at 15, 27, 39 and 51 V. The size is 13¾ in. by 5½ in. by 3⅞ in., the weight is 14 lb., and the battery is designed for 20–25 milliamp discharge.

We have obtained details from the MIDLAND ELECTRIC MANUFACTURING CO., LTD. (Barford Street, Birmingham) of their "M.E.M. small fuseboard." This board has been designed to eliminate the trouble and expense of drilling iron cases or end plates, and it can be handed to the workman ready for erection upon any type of installation. Each board is drilled with two holes for mains, one top and one bottom, and the hinging of the door is reversible, so that it is possible to adapt the standard boards to any of the following arrangements:—All circuits and mains at top; all circuits and mains at bottom; all circuits at top, mains at bottom; all circuits at bottom, mains at top; all circuits at top, mains at top and bottom; and all circuits at bottom, mains at top and bottom. All holes are stopped by a pressed steel disc, and, as the cases are enamelled after assembly, the holes remain dustproof and watertight. It is only necessary to knock out the discs as required—the holes are clearance size for conduit, which is fixed by internal and external lock-nuts. When special cables, such as C.T.S. or lead-covered, are used without conduit, the holes are suitable for standard nipples and nuts. Other features of the fuseboard include direct-pressure contact between main cable and busbar, swivel movement of fuse banks for ease in wiring and provision of indicator way labels. It is stated that the "Kantark" fuses used in these boards are tested as d.p. fuses, and have successfully cleared short circuits up to 6 500 A on a pressure of 240 V.

During the past year the PULSOMETER ENGINEERING CO., LTD., of Nine Elms Iron Works, Reading, have added several new designs to their refrigeration and ice-making section. One of the most noteworthy of these is a small self-contained ice-making machine designed to meet the requirements of the resident in hot countries. It is solidly constructed on the same principle and on the same mechanical lines as the ordinary larger-sized machines employed in the tropics. The plant can be worked by a 1 H.P. electric motor, requiring an input of approximately ¾ H.P. It is capable of an output of approximately 240 lb. of ice (in 10 lb. blocks 2½ in. thick) in a continuous working day of 24 hours. If necessary the same plant can be used for a cold store capacity of 200–250 cubic feet if hand controlled. If automatically controlled the capacity may be up to 400 cubic feet.

The basis of the latest output of valves produced by A. C. COSSOR, LTD. (Cossor Works, Highbury Grove, London, N.5) is the tungsten-cored filament. It is claimed that this filament is remarkably strong and that its emission qualities are unique. Its construction is stated by the manufacturers to contribute substantially to non-microphonic qualities. The process of manufacture now employed by the firm is said to ensure mathematical alignment of electrodes. Among recently introduced valves are three special types—the 620 T, the 680 H.F. and the 41 X.P. The 620 T is an efficient output valve for large amplifiers, and it may also be used as drive valve for a large bank of power valves. Used as a transmitting valve it may be run on full wattage on wave-lengths of 80 m. and upwards. The overall dimensions are, length 5 in., and width 3⅛ in. (127 and 80 mm.). The 680 h.f. is intended for use as first amplifier valve in apparatus using high voltage, and is also useful as the first amplifier after a gramophone pick-up. It is very suitable as anode bend detector and will handle the output from two stages of S.G. amplification on loud signals. The 680 H.F. used as a transmitting valve will operate successfully on full dissipation on wave-lengths down to 40 m. The valve is also suitable as frequency doubler for M.O.P.A. type transmitters. Its length and width are respectively 5 5/16 and 2¼ in. (135 and 57 mm.). The 41 X.P. is of the power type. It is stated to provide ample volume for address work, on a small scale, and where only comparatively low h.t. voltage is available. In dimensions it is the same as the 680 H.F.

The range of domestic appliances marketed by LIGHTING TRADES, LTD. (30–31, Farringdon Street, London, E.C.4), includes electric irons, kettles, toasters, saucepans, tea infusers and coffee percolators. The No. E 75595 iron is a nickel-plated unit with thumb-rest and bakelite connector, 5½ in. high, 5⅝ in. long and 4 in. wide, and weighing 6 lb. A smaller iron is the E 77166, with a weight of 4¼ lb. Both are rated at 450 W. An attractive kettle is the E 76661; it is of polished copper, with a capacity of 2 pints. Adaptor and connector



One and two kW "Homely" fires, by Siemens Electric Lamps and Supplies, Ltd.

are of bakelite, and the consumption is 750 W. The toaster offered by the firm is made for toasting two pieces of bread simultaneously, and is rated at 500 W. Saucepan No. E 77089 is nickel-plated, is 6⅞ in. high by 12½ in. long by 6⅝ in. wide, weighs 3½ lb., and has a consumption of 750 W. The tea infuser has a capacity of 6 cups, and a rating of 420 W.

ERRATUM.

With reference to the line on page 332, March 14th issue, towards the end of the second column, which reads "the suspension of the conductor being dependent on the bind," the word "not" has been missed out. The principle of the new patent bracket is that the conductor weight is *not* taken on the bind.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given when available.

EDINBURGH EDUCATION AUTHORITY, April 21st.—Electrical installations at Dean, Gorgie (Infant), Longstone, St. Patrick's, Torpichen Street, and Dr. Bell's Schools. Specifications, etc., from the Authority's Offices, Castle Terrace, Edinburgh.

COMMISSIONERS OF HIS MAJESTY'S WORKS, ETC., April 22nd.—Supply of incandescent lamps. Forms of tender, etc., from the Controller of Supplies, His Majesty's Office of Works, etc., King Charles Street, Westminster, S.W.1.

DUNDEE EDUCATION AUTHORITY, April 22nd.—Electric lighting and central heating installations in new Central School at Rockwell, Lawton Road, Dundee. Specifications, etc., from Messrs. Allan and Friskin, architects, 26, Castle Street, Dundee.

GLASGOW CORPORATION, April 22nd.—One year's supply of materials for the Lighting department, including electrical fittings and accessories, etc. Specifications and forms of tender from the office of the department, 20, Trongate, Glasgow.

GLASGOW CORPORATION, April 22nd.—Supply and erection of steam piping at Pinkston power station. Specification, etc., from Mr. L. Mackinnon, general manager, Transport Department, 46, Bath Street, Glasgow.

DUNDEE CORPORATION, April 23rd.—One year's supply of stores and materials to the tramways department. Specifications, etc., from the General Manager, Transport Office, Dundee.

BIRMINGHAM CORPORATION, April 25th.—May 8th.—Electric light and power wiring of City Sanatorium, Rednal Road, West Heath, Birmingham. Specification, etc., from Mr. F. H. C. Wiltshire, town clerk, Council House, Birmingham, until April 25th; deposit £1 1s.

LIVERPOOL CORPORATION, April 25th.—Supply of tramway rails and fishplates (schedule No. 1); fishbolts (No. 2) and tiebars (No. 3). Applications for tender forms, stating No. of schedule, to the City Engineer, Municipal Buildings, Dale Street, Liverpool.

DARTFORD URBAN DISTRICT COUNCIL, April 26th.—Supply of approximately, 785 yds. of 0·1 sq. in. h.t., three-core, and 640 yds. of l.t. four-core lead covered and armoured cable. Further particulars from the Electrical Engineer, Electricity Works, Dartford.

NEWTOWNARDS (CO. DOWN) GUARDIANS, April 26th.—Electrical plant and wiring, etc., in connection with conversion of workhouse into a district hospital. Specification from Mr. John Warden, clerk to the Guardians; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, April 28th.—Supply and erection of 33 kV, 11 kV and 6·6 kV switchgear, for connecting Board's supply to electricity supply undertakings, under N.W. England and North Wales scheme. Specification (No. N.W.E.—G.S. 4) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit, £2 2s.

ILFORD CORPORATION, April 28th.—Supply and erection of (*a*) rotary convertor plant of 500 kW capacity, with automatic control; (*b*) rectifier plant. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Ley Street, Ilford.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, April 30th.—Supply and erection of h.t. and l.t. switchgear. Specification, etc., from Mr. David J. Keep, Town Clerk; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 5th.—Supply and erection of 33 kV transmission line crossing of the river Witham, Boston, under Mid-East England scheme. Specification (No. M.E.E.–S.L. 3) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, May 6th.—Supply and erection of induction voltage regulator. Specification from Mr. R. W. Willis, 37, High Street, Cheadle; deposit £2 2s.

DUNDEE CORPORATION, May 10th.—Supply and erection of two electrically driven, vertical spindle, main circulating water pumps, in pump room, in connection with Carolina Port generating station. Specification, etc., from Mr. D. H. Bishop, Electricity Supply Department, Dudhope Crescent Road, Dundee; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage switchgear. Specification (No. M.E.E.–G.S. 1) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, May 12th.—Supply and erection of 66 kV and lower voltage transmission lines, under the Mid-East England scheme. Specification (No. M.E.E.–S.L. 2) from Mr. Richard H. Fox, secretary and solicitor, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 22nd.—Supply of braided switchboard cable. (Reference B.X. 6 201.)

ORADEA MARE (RUMANIA) MUNICIPALITY, April 24th.—Lead covered, double steel tape armoured underground cables. (Reference B.X. 6 298.)

CHRISTCHURCH (N.Z.) MUNICIPALITY, April 25th.—Supply of electricity meters. (Reference B.X. 6 309.)

ST. GILLES (BRUSSELS) MUNICIPALITY, April 26th.—Supply of 6 000 metres of 10 sq. mm. armoured cable, 100 metres of 35 sq. mm. and 1 000 metres of 70 sq. mm. Cahier des Charges (fr. 5) from Service de l'Electricité, 40, Rue de Bethléem, St. Gilles, Brussels.

ANTWERP MUNICIPALITY, April 28th.—Supply of cables and junction boxes. (Reference B.X. 6 312.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, April 28th.—Supply and erection of electrically driven high lift and low lift pumping plants, etc., for South-West Tableland Water Supply (tender No. 51, 1929/1930). Reference A.X. 9 219.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 10 000 kVA synchronous condenser and accessories, for Lake Coleridge power scheme, section 218. (Reference B.X. 6 034.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of single-phase transformers, with accessories, for Lake Coleridge power scheme, section 219. (Reference B.X. 6 035.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 29th.—Supply of 11 000 V switchgear for water rheostats, Waitaki power scheme, section 8. (Reference B.X. 6 048.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, April 30th.—Supply and erection of h.t. overhead transmission lines in isolated basins of Upper Egypt. Specifications, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1; £10 5s., not returnable.

VICTORIAN ELECTRICITY COMMISSION, May 5th.—Supply of current limiting reactors, suitable for use on three-phase, 50 cycle, 22 000V circuit (specification No. 30/19). (Reference B.X. 6 226.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 6th.—Supply of 750 kVA, oil immersed, self-cooled, single-phase transformers. (Reference B.X. 6 095.)

CAPE TOWN MUNICIPALITY, May 7th.—Supply of l.t. iron-clad switchgear. (Specification No. 492/1930.) (Reference B.X. 6 293.)

COPENHAGEN MUNICIPALITY, May 10th.—Supply of switchgear and rectifier plant for Eskildsgade sub-station (Reference B.X. 6 271.)

COPENHAGEN MUNICIPALITY, May 12th.—Supply and erection of two turbo-generators. (Reference B.X. 6 297.)

VICTORIAN ELECTRICITY COMMISSION, May 12th.—Supply of 22 000 V pin type supporting insulators for the year 1930–31 (specification No. 30/12). (Reference B.X. 6 179.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 13th.—Supply of 110 kV, single-phase, oil immersed self-cooled, transformers, suitable for outdoor service. (Reference B.X. 6 096.)

Digitized by Google

NEW ZEALAND POSTS AND TELEGRAPHS, May 13th.—Supply of terminal strips (P. and T. 151/2,000). (Reference B.X. 6 209.)

CHILEAN MINISTRY OF MARINE, May 15th.—Supply of three metric ton travelling electric crane and four-metric ton stationary electric revolving crane. (Reference A.X. 9 186.)

POWER SECURITIES CORPORATION, May 15th.—Works and materials in connection with Pykara hydro-electric scheme, including transmission line towers (specification E2; price 22s. 6d.); (insulators E5; 7s. 6d.); steel-cored aluminium conductors (E6; 4s. 6d.); steel earth wire (E7; 4s. 6d.; guying materials (E13; 4s. 6d.); generating plant (E14; 37s. 6d.); crane (E16; 7s. 6d.); and transformers (E18; 7s. 6d.). General conditions, 3s. 6d. Specifications, etc., from Messrs Balfour, Beatty and Co., Ltd., 66, Queen Street, London, E.C.4

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 20th.—Supply and erection of one 25 kVA, three-phase, 400/230 V 50 cycle generator. (Reference B.X. 6 307.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of terminal strips (schedule No. C. 578). (Reference B.X. 6 247.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, May 20th.—Supply of telegraph instruments (schedule C. 579). (Reference B.X. 6 248.)

ARGENTINE DEPARTMENT OF SANITARY WORKS, May 22nd.—Supply of three electric horizontal centrifugal pumping sets, piping, control switchboard, etc. (Reference A.X. 9 212.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators, for Mangahao power scheme, section 215B. (Reference B.X. 6 300.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of cable clamps, for 110 kV suspension insulators, for Waitaki power scheme—section 54. (Reference B.X. 6 217.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, May 27th.—Supply of 110 kV suspension insulators, for Waitaki power scheme—section 53. (Reference B.X. 6 216.)

CAPE TOWN MUNICIPALITY, June 4th.—Supply of heavy current d.c. testing motor generator, and starting gear (specification No. 494/1930). (Reference B.X. 6 341.)

BULAWAYO MUNICIPALITY, June 13th.—One 5 000 kW turbo-alternator, condensing plant, switchgear, transformers, etc. (Reference B.X. 6 321).

SOUTH AFRICAN IRON AND STEEL INDUSTRIAL CORPORATION, LTD., June 14th.—(1) Ore crushing plant; (2) buildings and wagon hoists; (3) electrical equipment. Specifications from the office of the High Commissioner for South Africa, South Africa House, Trafalgar Square, London, W.C.2; deposit £25, returnable to tenderers for at least sections (1) and (2).

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, June 17th.—Supply of indicators (schedule No. C.588). (Reference B.X. 6 333.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, June 24th.—Supply of 110 kV outdoor steelwork and switchgear, for Waitaki power scheme—section 71. (Reference B.X. 6 238.)

NEW ZEALAND POSTS AND TELEGRAPHS, June 25th.—Supply of condensers (P. and T. 151/2 240). (Reference B.X. 6 308.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, July 8th.—Supply of earthing transformers, for Arapuni power scheme. (Reference B.X. 6 304.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, July 15th.—Supply and erection in Northern Nile Delta of 15 electric pumping stations, with machinery, etc. Specification, etc., from the Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1. (£10 5s., not returnable.)

Tenders Accepted.

WATFORD GUARDIANS.—J. W. Russell, Ltd., supply of electric lamps for six months.

CHESTER GUARDIANS.—F. J. Jones, electrical materials required at poor law institution.

HOVE CORPORATION.—Edison Swan Electric Co., Ltd., supply of electric lamps for 12 months.

ILFORD CORPORATION.—D. P. Battery Co., Ltd., supply of battery for electric vehicle, £195 16s. 6d.

SOUTHERN RAILWAY.—British Insulated Cables, Ltd., 150 000 rail bonds, £20 000. (Approximate).

FORFAR SHERIFF COURT HOUSE.—W. Milne and Son, electric light installation, £245. (Recommended.)

EASTBOURNE CORPORATION.—W. T. Henley's Telegraph Works Co. Ltd., low tension lines, £2 646. (Revised tender.)

PORT OF LONDON AUTHORITY.—British Thomson-Houston Co., Ltd., six months' supply of Mazda electric lamps.

OLDHAM CORPORATION.—W. J. Furse and Co. (Manchester), Ltd., overhead line equipment; Union Cable Co., Ltd., supply of l.t. cable.

BERMONDSEY (LONDON) BOROUGH COUNCIL.—Arthur Lyon and Co., installation of synchronised clocks at municipal offices, £314 15s. 6d.

KETTERING URBAN DISTRICT COUNCIL.—British Electric Transformer Co., Ltd., and Crompton, Parkinson, Ltd., supply of transformers.

BASINGSTOKE CORPORATION.—General Electric Co., Ltd. —Supply of a 950 kW three-phase Diesel alternator, £12 997. (Recommended.)

SMETHWICK EDUCATION COMMITTEE.—Young, Osmond and Young, electric heating system at Uplands school, £3 856. (Recommended.)

Pump Motors.

GUILDFORD CORPORATION.—Harland Engineering Co., provision of pump motors etc. at Millmead water works, £792 5s. (Recommended)

MANCHESTER CORPORATION.—A. Loudon, electric lighting at St. Philip's school; C. A. Parsons and Co., Ltd., supply of two 750 kVA transformers.

BARKING URBAN DISTRICT COUNCIL.—Metropolitan Cable Co. (£680 10s.), and Edison Swan Cables, Ltd. (£114), supply of cable. (Both recommended.)

PLYMOUTH CORPORATION.—Supply of cables: British Insulated Cables, Ltd., Derby Cables, Ltd., and Metropolitan Cable Co. (Both recommended.)

BATTERSEA (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., two 500 kVA transformers, £467; J. G. Statter and Co., switchgear, £115.

COLCHESTER CORPORATION.—F. S. Slater and Co., 140 kW motor-generator, £220; Crompton, Parkinson, Ltd., 18 kW motor-generator, £95. (Both recommended.)

ARGYLL EDUCATION AUTHORITY.—Kinniard and Co., electric light installation at Dunoon Grammar School, £326; Small and M'Donald, wiring Kirn School, £49.

STOKE-ON-TRENT CORPORATION.—Supply of electric lamps for 12 months, Blackburn, Starling and Co., Ltd., Barnett and Soans, and Robinson and Hands Electric Co., Ltd.

ALSAGER URBAN DISTRICT COUNCIL.—Electricity Distribution of North Wales and District, Ltd., public lighting with 95 lamps, including maintenance, £322 per annum.

HULL CORPORATION.—Devonport Engineering Co., Ltd., natural draught cooling tower, £15 193; Jas. V. Coonan Co., electric light installation at golf house, £135 17s. 6d.

ILFORD CORPORATION.—Metropolitan Electric Cable Construction Co., Ltd., and Union Cable Co., Ltd., 12 months' supply of cable. (Both recommended for renewal).

POPLAR (LONDON) BOROUGH COUNCIL. Davenport Engineering Co., provision of further cooling tower, £4 402; and construction of cooling pond, £5 498. (Recommended.)

LEEDS GUARDIANS.—Marshall and Kelly, extension of electric lighting and bell installation at the Vagrant Wards, Holbeck Institution, 2, Lane End Place, Holbeck, Leeds.

WOKING URBAN DISTRICT COUNCIL.—Wallwin Engineering Co., Ltd., electric machinery at Mayford and Goldsworth pumping stations, alterations, etc., £2 200 (approximate).

SANDBACH URBAN DISTRICT COUNCIL.—Electricity Distribution of North Wales and District, Ltd., public lighting at Hightown, High Street, and The Square, £90 per annum.

WIMBLEDON CORPORATION.—A. Reyrolle and Co., Ltd., alterations and additions to switchboards, £3 285 5s.; Siemens Bros. and Co., Ltd., replacement of h.t. main, £3 808 11s. 8d.

BRITISH BROADCASTING CORPORATION.—Radio Communication Co., Ltd., supply and erection of three 500 ft. lattice steel masts at North Regional broadcasting transmitter, Slaithwaite, near Huddersfield.

LEEDS CORPORATION.—Supply of cable: W. T. Henley's Telegraph Works Co., Ltd., £1 441; Enfield Cable Works, Ltd., £2 460 15s.; Macintosh Cable Co., £4 557; Croydon Cable Works, Ltd., £2 683.

SHEFFIELD CORPORATION.—British-Thomson-Houston Co., Ltd., 36 tramcar controllers, £41 each; British Insulated Cables, Ltd., 800 copper bands, £8 12s. per 100; 1 000 at £10 18s.; 100 at £15 19s.; and 300 at £16 17s. (Both recommended.)

HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Supply of cables: Enfield Cable Works, Ltd., 3 500 yds. of 0·15 by 0·08 by 0·15 sq. in. three core, £1 977; 200 yds. of 0·25 by 0·15 by 0·25 sq. in. three core, £178; 500 yds. of 0·25 sq. in., £132; 550 yds. of 0·06 by 0·04 by 0·06 sq. in. three core, £177 13s.; 800 yds. of 0·15 four core, £636.

Digitized by Google

METROPOLITAN ASYLUMS BOARD.—Schall and Son, Ltd., installation of X-ray apparatus at High Wood Hospital, £250; Jones Sewing Machine Co., Ltd., installation of electric sewing machines at Southern Hospital, £204 17s.; Read and Partners, Ltd., installation of electric motors at workshops, Darenth training colony, £235; T. Clarke and Co., Ltd., installation of automatic telephone system at Grove Hospital, £1 231; Synchronome Co., Ltd., installation of synchronised clocks at Joyce Green Hospital, £579 7s. 6d. (All recommended).

GLASGOW CORPORATION.—T. B. and J. A. Mathieson, electrical installation work at City Hall, £828 7s. 6d.; English Electric Co., Ltd., five motors, new, £102; Jas. Keith and Blackman and Co., Ltd., one fan motor, new; eight fan motors, exchanged, £113; A.S.E.A. Co. Century Motors, 51 motors, new, £427; A. and P. Stevens, Ltd., three lift motors, reconditioned, and two lift motors, new, including fitting, £143. Hobart Manufacturing Co., two motors, exchanged; three motors, new, £118. Barber and Colman, Ltd., supply of three two-way three-colour electric signals for attaching to existing tramway standards, and one two-way three-colour electric signal for attaching to a plain steel tube, with controlling cabinet and plain steel post, £129.

HAMMERSMITH (LONDON) BOROUGH COUNCIL.—British Electric Transformer Co., Ltd., supply of two Scott-connected sets of transformers, each of 2 000 kVA, £1 772 (recommended). An alternative tender by the same company, £1 590, and tenders by the English Electric Co., Ltd., £1 300; Foster Engineering Co., Ltd., £1 698; and Hackbridge Electric Construction Co., Ltd., £1 710, were not in accordance with specification. In the case of the tender of the Yorkshire Electric Co., Ltd., £1 540, details of plant were not submitted. Also tendered: Bruce Peebles and Co., Ltd., £1 596, and General Electric Co., Ltd., £1 856. General Electric Co., Ltd., supply of switchgear, £2 890 16s. 3d. (recommended). Also tendered: Switchgear and Cowans, Ltd., £2 700 10s.; A. Reyrolle and Co., Ltd., £2 876 16s. 6d.; Ferguson, Pailin, Ltd., £2 895 14s. 6d.; English Electric Co., Ltd., £2 896 7s. 3d.; Park Royal Engineering Co., Ltd., £2 897 2s.; J. G. Statter and Co., £3 200; Superheater Co., Ltd., supply of three new superheaters, £1 515 (recommended). Also tendered: Stirling Boiler Co., Ltd., £1 575. Macintosh Cable Co., Ltd., supply of 550 yards of lead covered and 100 yards of lead covered and armoured three-core 0·2 sq. in. cable, £598 (recommended). Also tendered: Croydon Cable Co., Ltd., £584; Standard Telephones and Cables, Ltd., £606 12s.; Union Cable Co., Ltd., £608 10s.; Hackbridge Cable Co., Ltd., £609; Siemens Bros. and Co., Ltd., £610; W. T. Henley's Telegraph Works Co., Ltd., £612; Pirelli-General Cable Works, Ltd., £616; British Insulated Cables, Ltd., £617; Enfield Cable Works, Ltd., £620; Callender's Cable and Construction Co., Ltd., £624; Johnson and Philips, Ltd., £626 15s.

THE NATIONAL REGISTER.

Further Thirteen Names Added During March and April.

MEETINGS of the Executive Committee of the National Register of Electrical Installation Contractors were held on March 7th and April 4th, when twenty-two applications from electrical installation contractors for registration were considered. At the first meeting four applications of the eight received were declined, while at the April meeting five out of fourteen were declined.

The names and addresses of the successful applicants are given below:—

MARCH 7TH.—Winters, B., and Son, 85, Digby Road, Finsbury Park, London, N.4; Booth Bros., 1/5, Norton Street, Middlesborough; Osbaldestone and Bancroft, Grosvenor Square, Ashton-on-Mersey; Crawford, James, 4A, Dublin Road, Belfast.

APRIL 4TH.—Bowden, Joseph, Carlisle Works, Water Street, Stalybridge; Lewis's, Ltd., Market Street, Manchester; Sturgeon, E. P., Hart Street, Hartlepool; Ramsbottom, J. S., and Co., Ltd., Bow Street, Keighley; Casse, H. H., 29, Chapel Street, Bradford; Jago and Thurlow, 10, Walton Vale, Aintree, Liverpool; Marr, Robert, 51, Victoria Street, Blackburn; Jones, T., and Co., 7, Charles Street, Whitechapel, Liverpool; Northern Electric Light and Power Co., 61, West Street, Oldham.

"Realism from Records" is the title of a new issue by GAMBRELL RADIO, LTD., Buckingham House, Buckingham Street, London, W.C.2, concerning the "Novotone" compensator, by Dr. N. W. McLachlan.

OVERSEAS TRADE.

Three Months' Exports Over £2 500 000 in Excess of Imports.

SHIPMENTS of electrical machinery and apparatus from the United Kingdom during March last amounted to £1 602 993 as against £1 372 691 for the same month of 1929, representing an increase of £230 302. Exports for the three months of this year at £5 003 408 showed an increase, over the same period of 1929, of £554 051.

Imports of electrical apparatus and machinery during March amounted to £783 179, as compared with £572 024 during 1929, an increase of £211 155. Similar imports for the three months of this year amounted to £2 501 335, or £822 400 more than during the same period of 1929.

Export items, which showed increases during March 1930, when compared with the March, 1929, returns included motors other than railway and tramway motors, increase £74 768; motors, all other sorts, £45 901; rubber insulated wires and cables other than telegraph and telephone wires, £18 813; wires and cables other than rubber insulated, not being telegraph and telephone wires, £57 913; electric glow lamps, £2 656; and batteries and accumulators, £6 575.

On the import side the same comparison shows that during the month under review acceptances of electrical machinery increased by £9 649; electrical instruments other than telegraph and telephone, £192 303; and various electrical apparatus, £19 976.

These figures show that the favourable balance of exports over imports for the month of March, 1930, was £819 814, while for the three months the balance was £2 502 073.

During the three months, exports of electrical machinery, when compared with the same period of 1929, increased from £1 661 461 to £1 734 786, while by the same comparison rubber insulated wires and cables improved by £24 747. Shipments of submarine cables also improved during the first quarter of this year, the return showing an increase of £57 452 over the corresponding period of 1929. Import figures for the three months show by comparison with the same quarter of last year increases in electrical machinery, various wires and cables, glow lamps, batteries and accumulators.

We give below detailed figures for the three months ended March 31st contrasted with the same periods of 1929 and 1928:—

	Three Months.		
IMPORTS.	1928 £	1929 £	1930 £
Electrical Machinery	446 244	427 237	490 705
Electric Wires and Cables, Insulated—			
Rubber Insulated (not being Telegraph or Telephone Wires or Cables)	43 859	47 088	52 124
Insulation other than Rubber (not being Telegraph or Telephone Wires or Cables)	135 032	145 291	211 367
Telegraph and Telephone Wires and Cables (not being Submarine Cables)	29 451	15 804	9 695
Submarine Telegraph and Telephone Cables	—	—	—
Telegraph and Telephone Instruments and Apparatus (except Wireless Valves)	150 582	317 446	262 959
Carbons, Electric	34 372	44 749	58 854
Electric Lamps and Parts thereof—			
Electric Glow Lamps	169 231	92 350	137 209
Arc Lamps and Electric Searchlights	1 185	3 107	908
Parts thereof (except Carbon Rods)	3 303	2 876	6 839
Batteries, complete, and Accumulators (including parts)	129 301	144 102	157 888
Electrical Instruments (other than Telegraphic and Telephonic), Commercial (including Ammeters, Voltmeters, etc.), House Service Meters, and Scientific	71 853	62 303	664 994
Switchboards, other than Telegraph and Telephone	394	1 208	412
Electrical Goods and Apparatus, all other Sorts	353 968	375 374	445 381
Total	1 568 775	1 678 935	2 501 335
EXPORTS.			
Generators and Motors—			
Railway and Tramway Motors	174 714	109 763	59 545
Other Motors, and Generators	618 253	582 852	628 517
All Other Sorts	942 733	968 856	1 046 724
Electric Wires and Cables, Insulated—			
Rubber Insulated (not being Telegraph or Telephone Wires or Cables)	354 830	360 899	385 646
Insulation other than Rubber (not being Telegraph or Telephone Wires or Cables)	382 284	359 938	580 707
Telegraph and Telephone Wires and Cables (not being Submarine Cables)	295 252	187 161	226 058
Submarine Telegraph and Telephone Cables	71 008	20 813	78 265
Telegraph and Telephone Instruments and Apparatus (except Wireless Valves)	813 351	671 061	607 768
Carbons, Electric	6 835	1 730	1 251
Electric Lamps and Parts thereof—			
Electric Glow Lamps	118 554	137 003	141 676
Arc Lamps and Electric Searchlights	3 569	3 088	6 310
Parts thereof (except Carbon Rods)	560	1 941	1 493
Batteries, complete, and Accumulators (including Parts)	262 693	258 814	258 301
Electrical Instruments (other than Telegraphic and Telephonic), Commercial (including Ammeters, Voltmeters, etc.), House Service Meters, and Scientific	97 788	83 655	89 453
Switchboards, other then Telegraph and Telephone	27 276	19 774	26 760
Electrical Goods and Apparatus, all other Sorts	604 117	682 009	864 9348
Total	4 773 817	4 449 357	5 003 408

ELECTRICITY SUPPLY.

Stepney's Loan for Feeders—Ontario Power Commission's Expansion—Big American Power Projects—Bulk Supply for Southwark—Gillingham Rejects Hire and Purchase Scheme—Electricity in Yugoslavia.

ELECTRICITY supply is expected to be available in Dunoon by June next.

Cheltenham Electricity Committee is to relay a cable on the Promenade at a cost of £822.

The Ayrshire Electricity Board has inaugurated an electric street lighting scheme at Catrine.

Watford T.C. is to apply for a loan of £20 000 for the provision of new mains and for extensions.

Chatburn Council has protested against Clitheroe Corporation's proposal to proceed with the overhead system.

Accrington Electricity Committee has received sanction to borrow £33 174 to effect the change-over from d.c. to a.c.

Croydon Electricity Committee estimates that £6 540 will be required for the provision of posts and lanterns for street lighting for the next three years.

Gillingham (Kent) T.C. has rejected a recommendation that domestic electrical apparatus be purchased for supply to consumers on sale and hire-purchase.

Manchester electricity department has agreed to the proposal of Cheadle and Gatley U.D.C. to supply electricity under a Fringe Order to premises in Northern Etchells.

The agreement for the supply of electricity by the Liverpool Corporation to the Mersey Docks and Harbour Board has been renewed for a further five years on revised terms.

Manchester Electricity Committee has adopted a report of the Chief Engineer in regard to extensions to l.t. distributors and will submit an application to the Unemployment Grants Committee.

Stepney (London) Finance Committee recommends the B.C. to adopt an estimate of £39 307 for e.h.t. and l.t. feeders, and to apply to the Electricity Commissioners for sanction to borrow that amount.

Conway R.D.C. has decided to approach Colwyn Bay U.D.C. with suggestions that electrical connections to houses in the village of Glan Conway, which is much frequented by artists, should be made underground.

Luton T.C. has received from the Ministry of Transport sanction to the placing of overhead lines between Woburn and Toddington for the transmission of energy at 22 000 V, but the Minister reserves power to review the situation after five years.

The Ontario Hydro-Electric Power Commission has acquired extensive tramway and electric power services, mainly in the Niagara district, owned by the Dominion Power Transmission Co., of Hamilton. The cost of the acquisition is $21 250 000.

Eastbourne electricity department is to erect three sub-stations, in Ashford Road, Silverdale Road and Grange Road, at a cost of £7 940.—The Central Electricity Board has promised a partial bulk supply to the undertaking from the grid by October 1st.

Macclesfield R.D.C. has consented to the erection of an overhead transmission line from Macclesfield to Gawsworth, Siddington and Chalford, by the Macclesfield New Electricity Co. A supply of electricity is to be given at once to the parishes of Chalford and Snelson.

Hull Electricity Committee has received a report from the City Electrical Engineer that the supply to several industrial consumers and suburban areas has been affected, due to wilful interference with the apparatus on one of the department's e.h.t. overhead lines near the National Radiator Company's works.

The West Kootenay Power Co. has prepared plans for the erection of a dam 350 ft. in height close to the junction of the Pend d'Oreille and Columbia rivers. The plans of the company contemplate the development of 350 000 H.P., at a total expenditure of $18 000 000, and construction work is estimated to take three or four years.

The hydro-electric development of New England Power Association at the Lower Fifteen Mile Falls site is the largest hydro-electric development due for completion in the United States this year. This 200 000 H.P. plant will be the second largest hydro-electric station east of Niagara Falls and is expected to be in operation by October 1st.

In connection with the proposed laying of extra cables for bulk supply into the works, Bromley T.C. has decided to replace the 11 000 V switchboard, at an estimated cost of £2 050, and to add an extra panel to the 3 300 V switchboard to control the new transformer at an estimated cost of £130. It is proposed to spend £5 000 on general sub-station equipment and transformers.

Application will be made to the Secretary of State for Scotland on or before April 17th by the Grampian Electricity Supply Co. for a Provisional Order to extend the powers granted and the periods limited by the Grampian Electricity Supply Act, 1922, as extended by the Order of 1927, for compulsory purchase of lands, construction and completion of works, payment of interest out of capital, etc.

The New England Power Association, controlled by the International Hydro-Electric System, a division of the International Paper and Power Co., had 125 construction jobs under way during 1929, of which 90, involving the expenditure of more than $20 000 000, were finished. The most important single construction project under way during 1929 was a 200 000 H.P. hydro-electric plant on the upper Connecticut River at the Lower Fifteen Mile Falls site, which is expected to be in operation by October 1st.

In regard to Plymouth Corporation's application for sanction to borrow £106 300 for a new turbo-alternator, foundations and boilers, etc., the Electricity Commissioners have intimated that they are prepared to consider forthwith the application so far as it relates to the provision of two boilers and four main feeder switches, the application in respect of the remainder of the plant, etc., to be reviewed in the autumn. The Electricity Committee has decided to seek sanction to borrow £26 168 for two boilers and four main feeder switches.

The Central Electricity Board will complete the section of their main transmission system between Rayleigh and Colchester by October, 1931, and a supply from this course will be available to Colchester Corporation by that date; consequently the Electricity Commissioners are of opinion that it is unnecessary for the Corporation to give further consideration to the question of the installation of additional plant in the generating station. Colchester Electricity Committee proposes to report again to the Commissioners as to the development in output after the September meeting of the Committee.

The Electricity Commissioners have expressed the opinion that Southwark (London) B.C. should take bulk supply of electricity to the extent of 2 000 to 2 400 kW throughout the year, and use its own generating plant to meet any demand in excess of the amount of bulk supply during the winter peak load. The Electricity Committee recommends that the suggested procedure be adopted, that an arrangement be made to take a bulk supply from the City and London Electric Lighting Co., and that application be made for sanction to a loan of £35 000 to meet capital expenditure involved in the proposals with regard to the bulk supply.

Dover Corporation recently considered a report regarding a request by a local firm for a considerable supply of electricity. The Electricity Committee reported that the firm's demand was likely to be approximately 150 H.P. and their annual consumption 700 000 kWh, and suggested, on the assumption that the Corporation is able to obtain a bulk supply from the Central Electricity Board next year, that the following terms be offered, viz.: £5 per annum per kVA of maximum demand, paid quarterly, plus ½d. per kWh, with a rebate of 10% if current is metered on the 6 600 V supply at the customer's works. The Corporation referred the matter back to committee.

A correspondent of "The Times Trade Supplement" says many important electricity supply concessions have recently been granted in Yugoslavia. The French company "La Dalmatienne," which has sunk important sums in harnessing the Krka and Cetina for the purpose of electrifying Dalmatia, is planning to raise its capacity; so also is the Swiss "Falla" group in Slovenia. The Belgrade station is being reorganised with Swiss capital, and a number of power stations in the north are being erected with Swedish capital. Many municipalities are installing plant with money obtained from the United States. The probability is that within a year or two electrical production in Yugoslavia will be at least doubled.

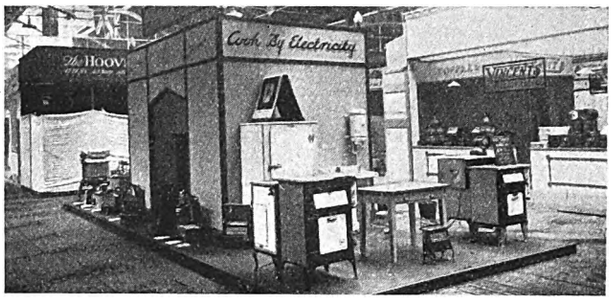
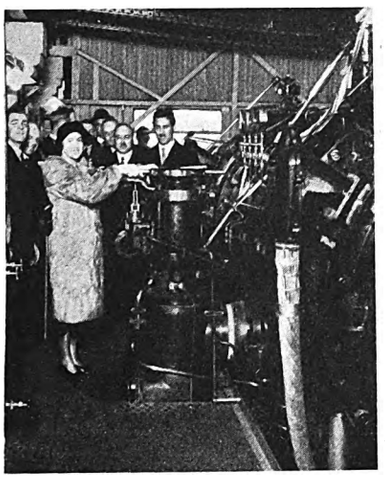
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

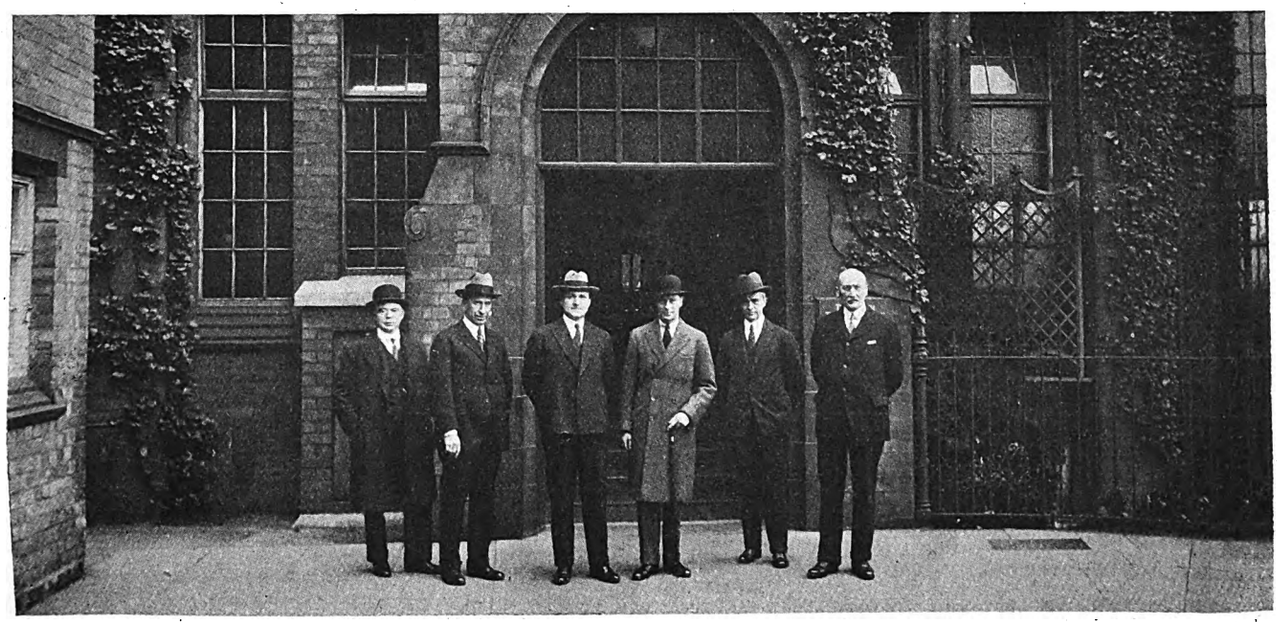
A party of electrical contractors, station engineers and representatives of firms using electricity in the Cambridge area, photographed at the Research Laboratories, Wembley, where they were the guests of the General Electric Co., Ltd. The party first visited the Osram Lamp Works, where Mr. C. Wilson occupied the chair at a luncheon.



The Birmingham Electric Supply Department is occupying a large stand at the Birmingham National Trades and Industrial Exhibition, which is being held at Bingley Hall during April. The stand contains a complete range of domestic electrical appliances, special prominence being given to water heating apparatus.



These pictures, taken at Kingston-on-Thames, on the occasion of the opening of the new extension on April 9th, show, on the left, Lady Brooke starting up the new 3 750 kW turbo-alternator, and on the right, a group taken outside the power house.



On April 8th, the Duke of York visited the Rugby Works of the British Thomson-Houston Co., Ltd., as President of the Industrial Welfare Society. He was accompanied by the Rev. Robert R. Hyde, Director of the Society. After being received by Mr. W. C. Lusk (chairman of the company) and Mr. G. M. Campbell, Mr. F. Fraser, Mr. J. L. Wilson, directors, and Mr. A. P. Young, manager, Rugby, the Duke commenced a tour of the works. A feature of the tour was the presentation to His Highness of employees with long service, there being quite a number who have been with the company for over a quarter of a century. This group, at the main office entrance, shows from left to right, the Rev. Robert R. Hyde, Mr. G. M. Campbell, Mr. A. P. Young, the Duke of York, Mr. W. C. Lusk, and Mr. F. Fraser.

The following tables, showing the principal features of the recently submitted accounts of the City of London Electric Lighting Co., Ltd., and of the Isle of Thanet Electric Supply Co., afford a comparison of the figures with those relating to the previous financial period :—

CITY OF LONDON ELECTRIC LIGHTING CO., LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Net Revenue	£473 972	£462 221
Net Profit	264 638	253 341
Consumers' Benefit (London Electricity (No. 1) Act, 1925)	348 253	275 937
Co-partners' Share of Benefit	39 277	31 695
Company's Share of Benefit	58 042	45 989
Special Reserves	243 138	185 096
5% First Debenture Stock	400 000	400 000
4½% Second Debenture Stock	48 499	48 499
5% Consolidated Debenture Stock	553 925	553 925
6% First Cum. Pref. Shares	400 000	400 000
8% Second Cum. Pref. Shares	300 000	300 000
Ordinary Shares	1 200 000	1 200 000
Carried forward	6 971	7 657
Dividend	10%	10%

At 33s. 6d. the ordinary shares yield nearly 6%, and at 22s. 6d. the first preference yield 5⅛%. The second preference at 28s. 6d., return about 5⅛%.

ISLE OF THANET ELECTRIC SUPPLY CO. LTD.

	Dec. 31, 1929.	Dec. 31, 1928.
Gross Receipts—Tramways	£90 033	£87 550
Do. Light and Power	88 604	83 757
Net Earnings	73 930	73 416
Net Profit	59 074	58 416
General Reserve and Depreciation Account	154 605	128 470
4% Deb. Stock	282 194	282 194
6% Cum. Partg. Pref. (£1)	282 000	282 000
Ordinary Shares (£1)	150 000	150,000
Carried forward	8 358	6 203
Dividend	4%	4%

During the year the sum of £15 270 was expended, mainly in the development of the lighting undertaking. At 77 the debenture stock yields 5⅛%, and the preference shares at 23s. also return 5⅛%. Recently the ordinary shares were quoted at 30s., at which price they yield 2⅘%. After the ordinary receive 6% the two classes rank equally.

COMPANY NEWS.

British Thomson-Houston Co's. Increased Profit—American Loan for German Company—Chairman of Chelsea Co. on Charges for Energy—Directors' Reports, etc.

BABCOCK AND WILCOX, LTD.—Fin. div. of 8% tax free, on ord. shs. is recommended, makg. 15% for year.

SCOTTISH POWER CO., LTD.—Subscriptions were invited last week for an issue of 650 000 £1 ord. shs. at 27s. p. sh.

ASSOCIATED ELECTRICAL INDUSTRIES, LTD.—Divs. of 6% on ord. and 8% on pref. shs. (both same as last year) are recommended.

ANGLO-AMERICAN TELEGRAPH CO., LTD.—Qrtrly. divs. of 15% on ord. and £1 10s. % on pfd. shs., less tax, are announced.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Fin. div. of 5½%, less tax, is recommended on ord. shs., makg. 10% for year. Fwd. £5 765, agst £5 761.

BAIRD TELEVISION DEVELOPMENT AND BAIRD INTERNATIONAL TELEVISION COMPANIES.—The result of the poll taken last week regarding the scheme of arrangemt. and amalgamatn. is that all classes of shhldrs. of the Baird Television Development Co. voted in favour of the scheme, and of the votes of the "A" class of shhldrs. of the Baird International Television Co. 448 563 were for the scheme and 400 agst.

LONDON ELECTRIC WIRE CO. AND SMITHS, LTD.—Net pft. for 1929, £111 854; blce. from last acct., £22 760. To directors' fees, £1 250; to special res. acct., £25 000; div. on 7½% cum. pref. shs. for year ended Dec. 31, 1929, £30 000. Fin. div. on ord. shs. of 6¼%, less tax, recommended, makg., w. intm. div. paid in June, 1929, 7½%, less tax, for year. Fwd., £30 075. Business has increased throughout the past year, although, owing to keen competition, average prices obtained were lower.

ENGLISH ELECTRIC CO., LTD.—Pft. for 1929, after provisn. for depreciatn. and charging expenditure on tools, patterns, drawings, etc., £71 343. Int. on 5½% 1st mtge. debs., £37 480 and on 6% convertible deb. stk. £78 681; directors' fees, £2 034, and trustees' fees, £360. Loss in respect of year, £47 211, agst. £33 617. Scheme of financial reorganisatn. recently approved by shhldrs. and deb. hldrs. had not taken effect at end of 1929, and reconstructed blce. sht. will, if scheme is sanctioned by Court, be prepared at a later date.

BRITISH THOMSON-HOUSTON CO., LTD.—Tradg. pft. for 1929, £458 381, agst. £422 729. After provisn. for deb. and loan int., depreciatn., etc., net pft. is £166 196, agst. £150 554. Div. of 5%, agst. 4%, recommended on ord. shs. Fwd. £205 262, agst. £203 066. Results for year were better than those for 1928 both as regards volume of orders secured and factory output, but excessive competitn. at home and abroad continued to keep prices at unreasonably low levels, and therefore earngs., while better than those for 1928, were still inadequate. Amt. of orders on hand at end of the year was greater than at end of 1928.

BERLIN CITY ELECTRIC CO. (BEWAG).—An American banking group, headed by Dillon Read and Co., of New York, has concluded negotiatns. for the issue of $15 000 000 (£3 000 000) 6% 25-year debs. of the Berlin City Electric Co. The loan, it is understood, will be priced at slightly over 90, and a substantl. portn. will be reserved for placing in Europe. An unusual feature of the issue, indicatg. the extent to which German credit has improved since the acceptance of the Young Plan, is the fact that, in place of the usual obligatory sinkg. fund provisns., a purchase fund of $310 000 (£62 000) per annum, to be exercised only when the bonds are at or below par, has been substituted for redemptn. purposes.

Company Meetings.

HARLAND AND WOLFF, LTD.—Lord Kylsant, presiding at the meeting last week, said in regard to the electric propulsion of ships which was developing in certain directions, he did not suppose there was another shipbuilding company in the world that was in a better position to carry through the whole installation on this principle. Having their own electric manufacturing department, they were peculiarly well equipped, both as to appliances and technical staff, to deal with the problems connected with this form of propulsion, in conjunction with either steam or motor engines. Notwithstanding the prolonged shipping depression, he had no doubt as to the ultimate recovery of prosperity.

CARMARTHEN ELECTRIC SUPPLY CO., LTD.—At the recent general meeting Mr. J. B. Arthur, chairman, said that the year 1929 had been the most successful since the company was formed. The profit amounted to £3 242 17s. 2½d., to which was added the balance of £1 245 11s. 11¼d. brought forward. The directors proposed to transfer £1 046 4s. 10d. to depreciation fund and £100 12s. 1d. to capital reserve fund. Interim and final dividends on the preference, second preference and ordinary shares amounted to £2 073 15s. 9d., leaving a balance of £1 267 16s. 5¾d. to carry forward. The directors had decided to reduce the price of current for lighting from 8d. to 7d. The directors had been approached by certain gentlemen regarding a sale of the shares of the undertaking. No definite offer had been made, and he was not in a position to make any further statement, but the shareholders would, of course, be communicated with when something definite was known by the directors. The directors wished it to be known that they were not responsible for the negotiations regarding any scheme projected in this area. The report and accounts were adopted.

CHELSEA ELECTRICITY SUPPLY CO., LTD.—At the meeting on April 10th, Mr. W. R. Davies, chairman, referred to the fact that the company's maximum price was now 5d. per kWh and 1½d. for power. Unfortunately, he said, it had not been possible to reduce the lighting price to 4½d., and the power rate to 1d., as he had hoped. The balance carried to net revenue was only £61 594, against £69 021 in 1928. Two customers had recently addressed complaints to the Borough Council, comparing their rates with those of neighbouring municipal undertakings. This was not a proper comparison, as municipal undertakings were not out to earn profits beyond sufficient to pay interest and sinking fund on their borrowed capital. The proper comparison was with other London companies. In three cases of London companies which were favoured by exceptionally good areas, rates were lower, while in 10 which were at least as well situated as themselves, lighting rates varied from 5d. to 5½d., and power rates, with one exception, from 1½d. to 2½d. The company was almost, if not quite, the first London company to give a public supply. Like all pioneers, they suffered from early mistakes, large scrapping of inefficient plant became necessary, and for many years dividends were negligible. Now their dividends were limited by Act of Parliament they had the right to earn these dividends, and they must charge rates to enable them to earn them. After paying the shareholders' proportion of consumers' benefit, and paying the co-partners their share, the carry forward was reduced by £2 221. The report and the dividends of 6% per annum on the preference shares and 8·833% on the ordinary shares were approved.

BROMPTON AND KENSINGTON ELECTRICITY SUPPLY CO., LTD.—Mr. H. R. Beeton, presiding at the meeting on April 10th, said the past year was the first complete year in which they had been able to enjoy the benefit of bulk supply under the 1925 Act. They were precluded from distributing any additional dividend in excess of the standard dividend until they had reduced their price sufficiently to confer a benefit six times greater on their consumers. To formulate a successful tariff policy under such conditions was no easy matter, because if they ventured, as they did last year, on a too generous reduction in price, they had to wait in some uncertainty for a restoration of equilibrium. At such times the directors must look for bouquets from consumers to compensate them for brickbats from shareholders. They sold 10 393 000 kWh in 1929, against 8 646 000 in 1928, but as the average price charged was 3·04d., against 3·95d., a reduction of upwards of 20% (representing a saving to their 11 000 consumers of nearly £40 000), receipts amounted to only £131 700, against £142 000, or about 7½% less, and yet, in spite of this, they were able to buy current so much cheaper than they had been able to generate it that they suffered little loss of profit. The combined figures of the London Power Co.'s four generating stations at present in operation showed a saving in cost per kWh of about 12½% compared with the previous year. To meet the requirements of flats, they were extending vertical service mains, to save the owners the expense of paying for inside cables; and in order to encourage the use of electricity by occupiers for other than lighting purposes, they had instituted a scheme for the hire of cookers and radiators with a tariff of 1d. per kWh, and for water heaters with a still lower rate. The report and the dividends recommended therein were approved.

NEW COMPANIES.

H. A. BOOTH, LTD.—Cap., £1 000. Electrical engineers, ventilating and heating specialists, etc. Solicitors :—John Hand and Son, 97, Gresham Street, London, E.C.2.

PERFECT BATTERY CO., LTD.—Cap., £100. Electrical engineers, manufacturers of and dealers in electrical appliances, etc. Reg. Office :—11, Fitzroy Square, London, W.1.

BLUCK ELECTRIC WELDING MACHINES, LTD.—Cap., £1 000. Engineers, electric welding machine manufacturers, etc. Reg. Office :—21 and 22, Hatherton Street, Walsall.

SCENE-IN-ACTION, LTD.—Cap., £1 000. Manufacturers of, and dealers in, electrical and mechanical signs, electrical, mechanical and radio engineers, etc. Reg. Office : 202X, Abbey House, Westminster, S.W.1.

W. D. FOSTER AND CO., LTD.—Cap., £5 000. To acquire the business of manufacturers and sellers of magnetos and batteries, as formerly carried on by W. D. Foster and Co., at 26, Hampstead Road, London, N.W.1.

JOHN A. H. HUNT, LTD.—Cap., £10 000. To acquire business of electrical fittings manufacturer, etc., as formerly carried on by the late J. A. H. Hunt, at 233, Bradford Street, Birmingham. Reg. Office :—233, Bradford Street, Birmingham.

HOWELLS (ELECTRIC MOTORS), LTD.—Cap., £13 000. To acquire business of manufacturers of electric motors and accessories and electric appliances carried on by H. F. Howells and E. C. Howells as Howells and Co., at York Street, Hanley, Stoke-on-Trent.

STANDARD RADIO CO., LTD.—Cap., £400. Manufacturers of and dealers in electrical apparatus, wireless, broadcasting and television instruments and apparatus, etc. Solicitors : Harrington, Edwards and Cobban, 33, Southampton Street, Strand, London, W.C.2.

REFRIGERATING ECONOMISER CO., LTD.—Cap., £1 000. To acquire inventions known as Schneiders Economiser of Frigories and to carry on business of makers and repairers of refrigerating plant, electrical and general engineers, etc. Reg. Office : 65-68, Merchants Exchange, Cardiff.

HARLIE BROS. (EDMONTON), LTD.—Cap., £1 000. To acquire business of Harlie Bros., carried on by C. Watson and H. J. Camp at Balham Road, Edmonton, and to carry on business of manufacturers of and dealers in wireless and electrical apparatus and goods, etc.

J. L. EVE CONSTRUCTION CO., LTD.—Cap., £50 000. To construct works and conveniences of all kinds, including tramways, electrical works, cables, etc. ; to carry on business of electrical and general engineers and contractors, etc. Solicitors :—Cardew-Smith and Ross, 27, Ely Place, London, E.C.1.

HAMILTON BEACH SWEEPERS, LTD.—Cap., £20 000. To adopt agreement with Electric Sweepers, Ltd., and to carry on the business of manufacturers of and dealers in electrical or other sweepers, irons, kettles, heaters, radiators, lamps, wireless apparatus, etc. Reg. Office :—405, Oxford Street, London, W.1.

CABLES AND WIRELESS PENSION FUND TRUSTEE.—Cap., £50. To act as custodian trustee of funds for provision of pensions, superannuation allowances, or other benefits for employees, ex-employees, or the widows and dependents and connections of employees or ex-employees, of Cables and Wireless, Ltd., Imperial and International Communications, Ltd., Eastern Telegraph Co., Ltd., Eastern Extension, Australasia and China Telegraph Co., Ltd., Western Telegraph Co., Ltd., African Direct Telegraph Co., Ltd., West African Telegraph Co., Ltd., Direct Spanish Telegraph Co., Ltd., West Coast of America Co., Ltd., Pacific and European Telegraph Co., Ltd., Marconi's Wireless Telegraph Co., Ltd., and Pacific Cable Board. Reg. Office :—Electra House, Moorgate, London, E.C.2.

METAL AND CHEMICAL PRICES.

MONDAY, April 14th.

		Price.	Inc.	Dec.
Copper—				
Best Selected	per ton	£73 15 0	—	£1 os. od.
Electro Wirebars	,,	£83 10 0	—	5s. od.
H.C. Wire, basis	per lb.	11 1/16d.	—	—
Sheet	,,	11 11/16d.	—	—
Phosphor Bronze—				
Wire (Telephone), basis	per lb.	1s. 2 1/16d.	—	—
Brass (60/40)—				
Rod, basis	per lb.	9d.	—	—
Sheet ,,	,,	10 1/2d.	—	—
Wire ,,	,,	10 1/16d.	—	—
Pig Iron—				
Cleveland Warrants	per ton	£3 10 0	—	—
Galvanised Steel Wire, basis 8 S.W.G.	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£20 0 0	5s. od.	—
Foreign or Colonial	,,	£18 12 6	7s. 6d.	—
Tin—				
Ingot	per ton	£167 12 6	£5 5s. od.	—
Wire, basis	per lb.	2s. 3 1/2d.	1d.	—
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£18 2 6	—	2s. 6d.
Mercury	per bottle	£22 15 0	—	—

Sulphur—Flowers, Ton £12 0 0 *Copper Sulphate* .. Ton £25 to £25 10s.
,, Roll, ,, £10 10 0 *Boric Acid* (Crystals) ,, £32 0 0

Sulphuric Acid (168° Tw.) Ton £6 15 0 *Sodium Chlorate*—per lb., 2 1/2d.
Sodium Bichromate—Per lb., 3 1/2d.

Rubber—Para fine, 8 1/2d. ; plantation, 1st latex, 7 7/16d.

∴ The metal prices are supplied by British Insulated Cables, Ltd.

COMMERCIAL INFORMATION

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

CALLINGTON MOTOR AND ENGINEERING CO., 6, Fore Street, Callington, wireless dealers. £10 9s. 1d. January 31st.

COPE, Mr. V., 3, Powis Gardens, Golders Green, wireless dealer. £93 16s. 10d. February 6th.

HASSAN, Mr. (trading as Texo Products), 2/3, Titchfield Street, Dean Street, W., wireless dealer. £44 os. 7d. February 5th.

RAYMOND, Mrs. K., 27 and 28A, Lisle Street, Leicester Square, W.C., wireless stores proprietress. £13 7s. 8d. February 10.

SCHOFIELDS, The Arcade, Waterfoot, wireless dealers. £20 18s. 8d. March 6th.

SHAW, T. R., (trading as Shaw, Fletcher and Co.), King Street, Wrexham, electrical engineer. £19 1s. 5d. February 4th.

SUMMERS, Mr. E., The Parade, Perranporth, electrical engineer. £13 7s. 8d. February 25th.

THOMAS, Dennis, 41, Bridgend Road, Aberkenfig, wireless dealer. £24 18s. 8d. February 13th.

Receiverships.

DAKOL ELECTRIC, LTD.—Sir Albert W. Wyon, of 3, Frederick's Place, Old Jewry, E.C.2, was appointed Receiver or Manager by Order of Court dated March 21st, 1930.

K.N. ELECTRICAL PRODUCTS, LTD. J. M. Ferguson, C.A., of Staple Inn Buildings, W.C., was appointed Receiver on March 6th, 1930, under powers contained in debentures dated December 7th, 1928, and May 30th and August 10th, 1929.

W. ROBSON AND SONS, LTD.—P. Taggart, of 30, Lord Street, Liverpool, was appointed Receiver on March 8th, 1930, under powers contained in debenture dated March 31st, 1926.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced.*]

BARNETT (C.), LTD., London, W.C., wireless accessory dealers.—Registered March 21st, series of £2 000 3rd debentures, present issue £1 250 ; general charge. *£1 940. December 31st, 1929.

PONTYPOOL ELECTRIC LIGHT AND POWER CO., LTD.—Registered March 21st, £350 debentures, part of £15 000 ; general charge. *£8 200. January 2nd, 1930.

SHAW, FLETCHER AND CO., LTD., Wrexham, electrical engineers.—Registered March 21st, £360 debenture, to T. R. Shaw, Moniaive, Chester Road, Wrexham, electrical engineer ; general charge.

VOLTRON CO., LTD., London, W.C., wireless manufacturers. Registered March 27th, £3 000 2nd debentures, to S. B. Causer, 240 Baring Road, Lee ; general charge. *£2 500. December 31st, 1929.

Satisfactions.

CLEVELAND AND DURHAM ELECTRIC POWER, LTD., Newcastle-on-Tyne.—Satisfaction registered March 18th, £13 500, part of amount registered October 23rd, 1913 and January 17th, 1919.

GENT AND CO., LTD., Leicester, manufacturing electricians.—Satisfactions registered March 22nd, £6 500, registered June 6th, 1905, and June 25th, 1906 and £1 000, registered February 26th, 1908.

London Gazette, etc.

Notice of Dividend.

PEACE, Ernest Everitt, rear of 230, High Street, Erdington, Birmingham, trading as PEACE AND CO., manufacturing electrical engineer. First and final dividend, 1s. 4 1/2d. per £, payable April 23rd, Official Receiver's office, 191, Corporation Street, Birmingham.

Partnerships Dissolved.

DOOLEYS (Henry Hugo DOOLEY and Robert Stanley WRIGHT), wireless instrument dealers, 33, Broomfield Road, by mutual consent as from February 1st, 1930. Debts received and paid by H. H. Dooley.

SOUTHERN RADIO SUPPLY CO. (Aaron HITNER and Samuel COHEN) wireless factors and dealers, 22, Francis Street, London, W.C.1, by mutual consent as from March 31st, 1930. Debts received and paid by A. Hitner.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., *Patent and Trade Marks Agents, 51 and 54, Chancery Lane, London, W.C.2, from whom further information may be obtained.*

FRIG-O-MATIC. 508 373. Class 6. Electric refrigerating machines. Dominion Blower Co., Ltd., Morrell Street, Brantford, Ontario; manufacturers. December 2nd 1929.

LIMIPHONIC. 510 140. Class 8. Sound reproducing apparatus and parts thereof, wireless telephone apparatus and parts thereof, and wireless telephonic apparatus in combination with gramophones. Limit Engineering Co., Ltd., 17, Albion Street, London, N.1; manufacturers. February 6th, 1930.

PALADIN. 510 278. Class 8. Instruments and apparatus for radio signalling, thermionic valves, thermionic amplifiers, and sound reproducers, gramophones, gramophone pick-ups, and parts of same. The Mullard Radio Valve Co., Ltd., 45, Nightingale Lane, Balham, London, S.W.12; manufacturers. February 11th, 1930.

LIVER. 508 130. Class 13. Metal goods for electrical purposes, but not including lamps and not including any goods of a like kind to lamps. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. November 23rd, 1929. To be associated with No. 472 163 (2 536) and others.

TIME-O-STAT. 504 961. Class 8. Automatic controlling devices for gas, oil and coal burners, for electric refrigerators, mechanical stokers, furnace fans, industrial ovens, ice machines and for electric heaters and water heaters; automatic circuit breakers and makers for operating advertising signs; and mercury switches. Time-o-Stat Controls Co., McNaughton Street, Elkhart, Indiana; manufacturers. July 31st, 1929.

LIVER. 508 129. Class 8. Philosophical instruments, scientific instruments and instruments and apparatus for teaching; all being goods for use in connection with electricity, but not including cables or kinematograph films, and not including any goods of a like kind to kinematograph films. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. November 23rd, 1929. To be associated with No. 503 394 (2681) and others.

FOTOS. 509 331. Class 8. Parts of wireless telephonic apparatus. Concerton Radio and Electrical Co., Ltd., 256 and 257, Bank Chambers, 329, High Holborn, London, W.C.1; manufacturers. January 8th, 1930.

FRANKLIN (sign). 509 558. Class 8. Apparatus for use in wireless telegraphy or telephony. Ethel Winifred Johnston, 43, Cleveland Road, Ilford, Essex; merchant. January 16th, 1930. Registration of this trade mark shall give no right to the exclusive use of the word "Franklin."

BERO (sign). 509 676. Class 8. Electrical resistances, electrical measuring instruments, electrical relays and automatic electrical switches. The British Electric Resistance Co., Ltd., Ohmic Works, Queensway, Ponders End, Middlesex; manufacturers. January 21st, 1930.

GOLDEN FLAME. 509 725. Class 8. Electric batteries (not for medical purposes). S. Kalisky (Aldgate), Ltd., 75, High Street, Aldgate, London, E.C.3; merchants. January 23rd, 1930.

DIOLITE. 505 147. Class 13. Electric lamps (ordinary), electric lighting fittings and sparking plugs, tubing, staples, screws, bolts and nuts, all being metal goods not included in other classes. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. August 8th, 1929. To be associated with No. 505 146 (2 710) vi and another.

FENO (sign). 502 862. Class 18. Electric fires. Johannes Schleper, trading as J. Schleper and Zonen, 217, Heerengracht, Amsterdam; manufacturer of electrical appliances. May 17th, 1929.

DIOLITE. 505 148. Class 18. Electrical heating apparatus. The General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2; manufacturing electrical engineers. August 8th, 1929. To be associated with No. 505 146 (2 710) v, and another.

LIVER. 508 135. Class 39. Paper for electrical insulating purposes. November 23rd, 1929. To be associated with No. 472 195 (2 536) and others. 508 136. Class 50. Electric lighting, heating, telephonic, telegraphic and wireless telephonic, telegraphic and television fittings, all being goods of material covered by Class 50, and not included in other classes. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers. November 23rd, 1929. To be associated with No. 472 197 (2 536) and others.

PACENT RECORDER (sign).—505 901. Class 8. Sound reproducing and recording apparatus. Pacent Reproducer Corporation, 630, 9th Avenue, New York; manufacturers. September 9th, 1929. (By consent.)

SONESTRA.—508 191. Class 8. Gramophones and wireless telephonic apparatus. Ewing and McIntosh, Ltd., 425-427, Sauchiehall Street, Glasgow, C.2; musical instrument merchants. November 26th, 1929.

VAR-LAC.—509 525. Class 8. Electric cables. Flexible Electric Cords, Ltd., 7, Queensway, Ponder's End, Middlesex; electric cable manufacturers. January 15th, 1930.

FONOTIPIA.—509 163. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes, instruments and apparatus for teaching. Societa, Italiana di Fonotipia, 37, Viale Umbria, Milan; manufacturers. December 31st 1929. To be associated with No. 509 244 (2 712).

RHODOPHONE.—510 064. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Arthur Charles Lawler, trading as A. C. Lawler, 1-32, Linden Gardens, Notting Hill Gate, London, W.2; manufacturer. February 4th, 1930. To be associated with No. 510 065 (2 712), xli. (By consent).

PORCUPINE.—510 317. Class 8. Electric cables. The Enfield Cable Works, Ltd., Lincoln House, 296 to 302, High Holborn, London, W.C.1; manufacturers February 12th, 1930.

SINGER.—500 781. Class 13. Sewing machine needles, oil cans, screw drivers, pliers, stillettos, stools, electric switches (ordinary) and switch covers; and electric lamp fittings not forming parts of or accessories for motor vehicles and cycles; all being goods of ordinary metal not included in other classes. The Singer Manufacturing Co., 149, Broadway, New York; sewing machine manufacturers and dealers. March 8th, 1929. To be associated with No. 157 890 (716) and others. Advertised before acceptance, the applicants alleging distinctiveness.

POLIFLOR (sign).—B505 142. Class 6. Electric floor polishing machines. C.C.A (Vacuum Cleaners), Ltd., Swinton House, 324, Gray's Inn Road, London, W.C.1, manufacturers. August 8th, 1929. User claimed from October 8th, 1926. The applicants undertake that this mark, when registered, and the mark No. 505 143 (not yet advertised) shall be assigned or transmitted only as a whole and not separately.

BURCO (sign).—502 849. Class 6. Electric washing and wringing machines. Burnley Components, Ltd., Accrington Road, Rose Grove, Burnley, Lancashire; engineers. May 17th, 1929. To be associated with No. 426 132 (2 328).

REGENTONE.—506 511. Class 8. Wireless telephonic apparatus and parts thereof. Robert Henry Nunn, trading as Regent Radio Supply Co., 21, Bartlett's Buildings, Holborn, London, E.C.4; manufacturer. September 30th, 1929. Concurrent user claimed from September, 1925, Section 21.

WAVERLEY (sign).—508 050. Class 8. Wireless telephonic receiving sets. Harold Fratton Gidfrey, trading as the Waverley Wireless Co., 77, Great Titchfield Street, London, W.1; manufacturer. November 22nd, 1929. Registration of this mark shall give no right to the exclusive use of the word "Waverley."

PHILIFLOOD.—509 636. Class 13. Electric lamps and electric lighting fittings, all being metal goods not included in other classes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, 13D, Emmasingel, Noord-Brabant, Eindhoven; manufacturers. January 20th, 1930. (Date claimed under International Convention, November 15th, 1929.) To be associated with No. 505 341 (2 703) and others.

THE LEAD MARKET.

Following the reduction in the American price from 5.75 to 5.50 cents per lb., the market according to James Forster and Co., opened weak, April lead selling down to £18 2s. 6d., and forward to £18 7s. 6d. Closing prices on April 11th were £18 12s. 6d for April, £18 13s. 9d. for May and June, and £18 15s. for July, or unchanged on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

293 387 SIEMENS-SCHUCKERTWERKE AKT.-GES. Arrangements for increasing the sensitiveness of alternating-current instruments. (5/7/27.)
292 617 M. URBINATI. Apparatus for the transformation of electric alternate currents into direct currents, and *vice versa*. (23/6/27.)
323 244 O. GERHARDT. Systems for reducing the disturbances caused by apparatus capable of producing high-frequency interference with radio-receiving apparatus. (18/7/28.)
323 245 O. TANTS. Wireless-message transmission. (23/7/28.)
323 206 W. STAFFORD. Electric sign controllers. (20/8/28.)
323 184 SIEMENS-SCHUCKERTWERKE AKT.-GES., and A. CALLSEN. Distant control plant utilizing electric resonance relays. (20/8/28.)
323 186 GENERAL ELECTRIC CO., LTD., and F. FORREST. Electrical precipitation of dust from gases. (23/8/28.)
323 190 H. H. BERRY. Electric imitation fires. (21/9/28.)
323 191 E. ALMEIDA and ALMEIDA ACCUMULATORS, LTD. Secondary electric cells. (21/9/28.)
323 192 L. A. LEVY and ALMEIDA ACCUMULATORS, LTD. Electrodes for electric batteries, electrolytic cells, and the like. (21/9/28.)
314 786 E. VION. Electromagnetic apparatus for the observation and correction of travel of aerial and marine craft. (2/7/28.)
323 194 A. D. FERGUSON, and ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Electric traction-control systems. (21/9/28.)
304 646 HERAEUS VACUUMSCHMELZE AKT.-GES. and H. HIEMENZ. Electric furnaces. (23/1/28.)
323 255 A. E. BOWYER-LOWE. Tuning devices for oscillatory circuits. (21/9/28.)
323 200 H. GREEN and CELEBRITONE, LTD. Microphones. (22/9/28.)
323 222 W. E. BEATTY (BELL TELEPHONE LABORATORIES, INC.) Magnetic materials. (24/9/28.)
323 228 DR. M. WILDERMAN. Electric batteries. (25/9/28.)
297 747 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (20/9/27.)
298 078 L. MELLERSH-JACKSON. (TELEFONAKTIEBOLAGET L. M. ERICSSON.) Telephone receivers. (26/9/28.)
323 237 G. MARCONI. Wireless signalling apparatus. (27/9/28.)
323 265 C. J. NESBITT-DUFORT and O. AND S. OILLESS BEARING CO., LTD. Wireless receiving-apparatus. (28/9/28.)
323 268 J. A. CRABTREE and B. G. HARRISON. Electrical ceiling-roses, lampholders, suspension switches, couplings, and the like. (29/9/28.)
298 474 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (8/10/27.)
323 282 COVENTRY AUTOMATIC TELEPHONES, LTD., and J. ERIKSEN. Devices for the measurement of mechanical forces. (9/10/28.)
323 285 CHAMBERLAIN AND HOOKHAM, LTD., and S. JAMES. Prepayment electricity and other meters. (11/10/28.)
323 291 ELECTRIC FURNACE CO., LTD., and D. F. CAMPBELL. Electric melting-furnaces. (17/10/28.)
323 292 H. LABORENZ. Electrodes for use in dental surgery. (18/10/28.)
303 349 CONDUIT ELECTRICAL MANUFACTURING CORPORATION. Electric current-limiting reactors. (31/12/27.)
303 741 J. DIEUX. Thermionic valve circuits. (7/1/28.)
323 311 SIEMENS-SCHUCKERTWERKE AKT.-GES., R. J. PICK and P. STERN. Thermo-electric switches. (12/11/28.)
300 653 S. J. ZIEMBINSKI. Means for operating or controlling the ignition advance in internal-combustion engines. (18/11/27.)
323 329 A. WOLF. Railway signalling systems. (23/11/28.)
301 464 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Control systems for electric motors. (30/11/27.)
323 331 S. G. S. DICKER. (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Aerials for transmitting wireless signals. (26/11/28.)
301 505 L. SEGUIN and A. SEGUIN. Plug-and-socket electric couplings. (2/12/27.)
301 435 INTERNATIONAL GENERAL ELECTRIC CO., INC. Earth-fault protective arrangements for alternating-current generators. (29/11/27.)
301 746 BRITISH THOMSON-HOUSTON CO., LTD. Refrigerating-machines. (3/12/27.)
323 342 E. D. T. NORRIS and FERRANTI, LTD. Lightning or surge absorbers. (6/12/28.)
323 343 MICANITE AND INSULATORS CO., LTD., and G. E. HAEFELY. Electric insulators. (8/12/28.)
303 114 BRITISH THOMSON-HOUSTON CO., LTD. Incandescent electric lamps and mountings therefor. (28/12/27.)
323 363 ENGLISH ELECTRIC CO., LTD., and C. T. SCARF. Cam-operated electric contactor switches and like devices. (28/12/28.)
303 369 SOC. DES ETABLISSEMENTS INDUSTRIELS DE E. C. ET DE A. GRAMMONT. Cathode for electron-discharge devices. (31/12/27.)
323 370 A. W. G. TUCKER and FERRANTI, LTD. Electric transformers. (3/1/29.)
323 385 F. A. KIRSTEN. Electric immersion heaters. (21/1/29.)
318 221 WICO ELECTRIC CO. Magnetos. (31/8/28.)
304 790 K. MANGER. Electric lighter for pipes, cigars, and cigarettes specially for motor-cars. (27/1/28.)
305 944 MARCONI'S WIRELESS TELEGRAPH CO., LTD. Energy-supply systems for thermionic valves. (11/2/28.)
323 404 L. MELLERSH-JACKSON (SIEMENS AND HALSKE AKT.-GES.). Apparatus for the supervision of electric power-distributing systems. (14/2/29.)
323 408 E. FRIES. Device for determining the temperature of the oil contained in oil-immersed transformers. (5/12/28.)
323 410 O. SCHNEIDER and A. WEIFFENBACH. Electric switch. (18/2/29.)
323 420 E. SCHARPENBERG. Cable-eyes or sockets for electric cables. (4/3/29.)
323 424 N. V. PHILIPS' GLOELAMPENFABRIEKEN. Electron-discharge tubes or thermionic valves. (4/12/28.)
309 486 FELTEN AND GUILLEAUME CARLSWERK AKT.-GES. Submarine cables. (11/4/28.)
323 431 E. L. WILDY and LONDON ELECTRIC WIRE CO. AND SMITHS, LTD. Method of and means for distinguishing electric cables. (20/3/29.)
308 366 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (8/10/27.)
323 440 R. SCHULTZ. Clamps for electric conductors. (25/4/29.)
315 757 GENERAL ELECTRIC CO., LTD. Luminous electric discharge tubes. (17/7/28.)
311 819 ASSOCIATED ELECTRICAL INDUSTRIES, LTD. Dynamo-electric machines. (17/5/28.)
323 271 HERAEUS VACUUMSCHMELZE AKT.-GES. Electric furnaces. (21/9/28.)
323 498 B. C. VON PLATEN and L. A. G. REILAND. Dynamo-electric machines. (3/7/28.)
323 499 S. Z. DE FERRANTI, J. TURNER, and FERRANTI, LTD. Radiators or coolers. (3/7/28.)
323 520 E. W. C. RUSSELL (C. B. SAWYER). Piezo-electric devices. (6/7/28.)
323 477 STATE RAILWAYS RADIO CO., LTD., and L. ZOLTAN. Means for the elimination of disturbances in radio-receiving sets for railway trains caused by the lighting system of the carriages. (21/9/28.)
301 062 SIEMENS-SCHUCKERTWERKE AKT.-GES. Non-interchangeable screw-plug electric fuses. (24/11/27.)
313 584 ELECTRICAL RESEARCH PRODUCTS, INC. Magnetic materials. (15/6/28.)
323 479 P. H. L. LEPAS. Electrical resistances and reactances. (26/9/28.)
323 491 G. T. S. DICKSON and J. A. CRABTREE. Switch-gear for controlling electric house-lighting plant and similar electrical installations. (27/9/28.)
323 492 T. DICKINSON. Apparatus to prevent the radiation of oscillations from dynamos, motors, and the like machines. (27/9/28.)
323 506 W. BREFFIT. Electric heating-elements or radiators. (29/9/28.)

Digitized by Google

299 040 Automatic Signal Corporation. Self-regulating automatic traffic-control systems. (20/10/27.)
300 608 E. Granat and Compagnie des Forges et Acieries de la Marine et d'Homecourt. Distant electric control device. (16/11/27.)
323 486 L. Miller, C. Filmer, and Associated Electrical Industries, Ltd. Control systems of electric machines. (1/10/28.)
298 232 Siemens-Schuckertwerke Akt.-Ges. Electric switches. (6/10/27.)
299 041 Electrical Research Products, Inc. Electrical transmission systems. (21/10/27.)
323 533 Standard Telephones and Cables, Ltd., J. C. Chaston, and J. P. Johns. Manufacture of magnetic cores or like magnetic structures. (4/10/28.)
298 164 Standard Telephones and Cables, Ltd. Telephone systems. (4/10/27.)
298 165 Standard Telephones and Cables, Ltd. Telephone systems. (4/10/27.)

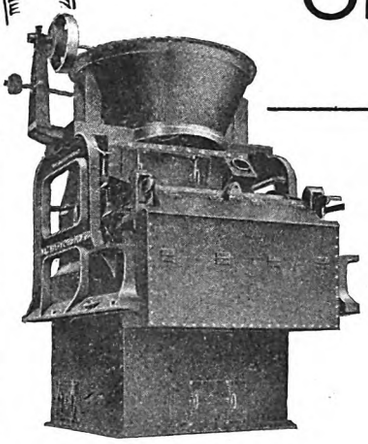
AVERY

ECONOMY IS BORN OF KNOWLEDGE.



AVERY PATENT
AUTOMATIC WEIGHER
FOR PULVERISED FUEL
LIST 1177.

The Avery No. 52 Automatic Weigher for Pulverised Fuel gives without dust escape, correct records of fuel consumption. The machine illustrated weighs 50 tons per hour from an Overhead Storage Hopper, and delivers to the pump. Thus, accurate records of fuel consumption are automatically kept, losses are instantly detected and economy achieved.

The Specialists in handling, weighing and blending machinery. Complete plants supplied.

Progress of the Grid.

NEXT Wednesday will be a notable occasion in the history of electric power transmission in Great Britain. On that day Lieut.-Col. the Right Hon. WILFRID ASHLEY, M.P., who was Minister of Transport in the late Government, is to open important extensions to the Portobello generating station of the Edinburgh Corporation, which is the selected station in the Lothians, and this ceremony will be followed by the official inauguration of the transmission system of the Central Scotland area of the Grid by Mr. HERBERT MORRISON, M.P., the present Minister of Transport. Central Scotland is the first of the ten areas into which England, Wales and Scotland have been divided by the Electricity Commissioners in connection with the National Grid scheme to reach a degree of completion which justifies an official celebration. Its main framework, which includes three notable river crossings —that over the Forth is carried on towers 338 ft. high, and has a span of 3 050 ft.—is constructed and at work. The extension linking up the main grid with the Grampian hydro-electric stations should be finished by the end of this year.

Central Scotland is at present a self-contained area, and is likely to remain so for some time to come, although the map of the National Grid, in its completed form, which we give on page 515, shows connections *via* Berwick and Carlisle respectively, between the Central Scotland and the North-East England and North-West England areas. It is not likely that these connections will be effected for several years to come. The linking of Central Scotland with the English grid depends on the possibility of elaborating a scheme for the difficult South Scotland and North England border region, which, like North Scotland, has few important centres of consumption. North Scotland may remain in the position of an outlying appanage of Central Scotland for an indefinite period, but South Scotland, being athwart the track of routes between Central Scotland and England, must, we imagine, find itself traversed by at least two main transmission lines in the comparatively near future.

In England there is still one area—the East Anglian peninsula, less Essex—for which no scheme has yet been made public. We understand that the proposals of the Electricity Commissioners for this region, which includes Norfolk and Suffolk, and will probably be known as the East England area, have reached an advanced stage, and are likely to be issued very shortly. The map of the Grid in its eventual form indicates Norwich as the primary selected station for this area, with a secondary station at Lowestoft, and 132 000 V transformer stations at King's Lynn and Yarmouth. The main transmission lines indicated on the map extend from Peterborough (S.E. England) *via* King's Lynn, to Norwich and Yarmouth, along the coast to Lowestoft, and thence direct to Ipswich (S.E. England). With the publication of details of the East England scheme, the plans of the Electricity Commissioners in regard to the Grid for some time to come will have been announced. Actual construction is well under way in many parts of the country. Whether it is far enough advanced to justify the withholding of consent to applications for power station extensions is at present a matter of controversy. At the general meeting of the County of London Electric Supply Co., last week, it was stated that consent had not yet been received to extensions at Barking for which the approval of the Electricity Commissioners had been sought. We understand that other London supply companies are in a similar position. Mr. QUIGLEY, in a further article in the "Financial Times," suggests that too high a percentage of old and uneconomic plant is being maintained in service all over the country, and that in calculating the percentage of spare plant only a.c. 50-cycle plant should be regarded as of significance. This is, perhaps, too drastic a restriction at the moment, but it is certainly necessary to give full weight to classification of generating plant when estimating the actual percentage in reserve.

Current Topics.

National Register Progress.

APPLICATIONS to the number of 139 were accepted by the Executive Committee of the National Register of Electrical Installation Contractors during 1929 and the net number on the Register at December 31 last was 1 290. This had been increased to 1 318 by April 4. The nomination by the London and Home Counties Joint Electricity Authority of Mr. F. W. PURSE to represent the Authority on the Registration Board is a matter for congratulation, as Mr. PURSE'S valuable experience as a member of the Scrutinising Committee will in this way remain at the service of the Registration Board and the Executive Committee. At the request of Mr. P. V. HUNTER, the Central Electricity Board has also decided to support the Register and has nominated Mr. J. A. LEE as its representative, so that the authority of the Register has been further strengthened. Its finances also appear to be in a very healthy condition.

Hire Purchase.

THE extent to which the system of hire purchase has been developed makes it inevitable that occasional cases of hardship should occur. These affect both the suppliers and purchasers of goods. Dishonest individuals change their residences and endeavour to conceal their tracks from the dealer; others, the victims of unforeseen misfortune, are unable to go on paying and sometimes lose both the goods and the money they have already paid. Attempts to meet the latter difficulty by fixing a surrender value in hire-purchase agreements have been made from time to time but have been rejected as impracticable for good reasons. Yet it seems probable that a further effort of a more determined character is to be made to introduce legislation with this object. Miss ELLEN WILKINSON, M.P., who is drafting a Bill on the subject, recently received a deputation from the Hire Traders' Protection Association, which included representatives of the piano trade and branches of the furnishing and machine trades, and made it clear that she was inclined to favour the adoption of a surrender value in connection with hire-purchase agreements. The position will obviously bear watching by electrical and radio manufacturers and dealers.

Standardisation of Supply Voltages.

MANUFACTURERS of mains operated radio receivers will read with some apprehension one part of the statement issued by the Council of the Institution of Electrical Engineers in regard to standardisation of supply voltages. The Council feel that the best results in this direction will accrue from calling the attention of all undertakers who are supplying at a voltage near the standard to the power which the Commissioners possess of modifying the statutory voltage variation of $\pm$ 4 %. The Electricity Commissioners have agreed to exercise this power in the case of undertakings which may desire to work at a wider range of variation for the definite object of accelerating standardisation of voltage. Yet although at first glance it would seem that an extension of the permissible variation would add a good deal to the difficulties of designers of mains receivers and cause numerous complaints from users of existing sets, in actual practice the variation encountered frequently exceeds the permissible percentage, so that a moderate increase in the latter would not greatly alter the conditions within which mains receivers now have to work.

Cheaper Lamps.

AS it is estimated that, on a 30 W lamp basis, the number of non-standard voltage lamps in use in this country is between three and four times the number of standard voltage lamps, it is very evident that a greater measure of standardisation means a very important step towards cheaper lamps. In fact, manufacturers have agreed to offer a preferential discount on standard voltage lamps and parts of apparatus required for replacement in connection with standardisation of voltage. These benefits will far outweigh any temporary inconveniences that may be caused to owners and manufacturers of radio receivers to whom the sympathy due to sufferers in a good cause must be extended. The present chaotic conditions—there are 16 different supply voltages ranging from 100 to 250 in use in this country and the power voltage position is quite as bad—are as uneconomic as the multiplicity of railway gauges to be found in Australia and Chile.

Transformer Sizes for Rural Lines.

IN a circular addressed by the Electricity Commissioners to authorised undertakers having rural areas of supply and to various interested associations, attention is drawn to the desirability of constructing transmission and distribution lines in anticipation of demand, adopting suitable two-part tariffs which will encourage extended use of electricity when a supply is available, and providing assisted wiring and hire or hire-purchase schemes. The necessity for active propaganda is also mentioned. In connection with the adoption of standard technical practice it is suggested in the circular that in most cases the requirements of small villages and isolated consumers would be met by the adoption as standard sizes of pole transformers of 50, 20 and 10 kVA for 3-phase and 20, 10 and 5 kVA for single-phase supplies.

Triumphs of Telephony.

THE present year will always be considered notable in the history of the telephone. The first British experiments in commercial ship-to-shore telephony have been quickly followed by the establishment of a regular service. Elsewhere in this issue we give the first part of Col. Sir THOMAS PURVES'S account of how the technical problems involved have been solved. Ship and shore facilities are now being extended gradually to various countries in Europe. Last week successful conversations were held between Geneva and passengers on the " Majestic," and it seems likely that before very long Europe, America and the Atlantic will be regarded almost as forming one telephone network. Next Wednesday the wireless telephone service between Australia and England will be opened, and in the last few weeks the telephone has linked Spain with Chile and Paris with French Indo-China. It seems, too—to descend from the great to the small—that a new refinement of the telephone has been devised for homes and offices. For those who dislike using an intercommunicating telephone for giving orders, on the ground that the hands are not free or that it takes up valuable space, an arrangement has been devised that enables the caller to speak into the air after pressing a button, and to receive a reply from a concealed loud speaker. Transmitter and receiver are hidden behind a small panel in the wall.

SHIP AND SHORE TELEPHONY.*

Wavelengths and Aerials—Baldock Receiving Station—Tuning and Amplification—Method of Overcoming Fading.

By COL. SIR THOMAS F. PURVES, President of the Institution of Electrical Engineers.

THE ship and shore telephonic services and experiments which are now being carried on are based on the use of short waves and, so far, consideration has been given only to the problem of communication with Transatlantic liners. In the case of the experiments made from America, effort was concentrated first of all upon securing reliable communication when the ship is comparatively near to the land. This is the most troublesome part of the problem. The attenuation of the "ground" wave is very rapid in the case of short waves and the "sky wave" does not materialise until a certain distance from the transmitter has been reached.

Fig. 1 shows the ground wave dying away at "A," and the first effective reflection of the sky wave reaching the earth's

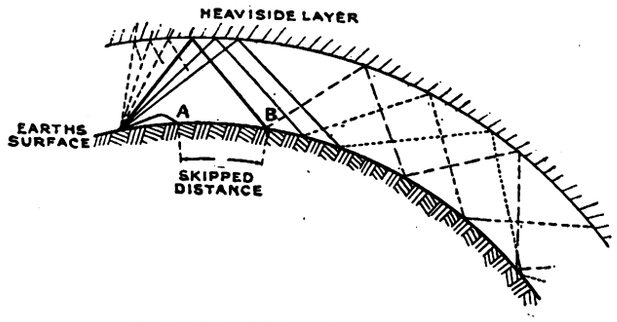

Fig. 1.—Skipped distance in radio transmission.

surface at "B." Between these two points "A" and "B" we get what is known as the "skipped distance" and it is this distance which is difficult to cover. This, however, has been done successfully in America :—

(*a*) By the use of longer wavelengths than those used for the longer ranges of distance. Frequencies of the order of 4 200 and 8 700 kilo-cycles (71 and 35 m.) are employed for the shorter ranges.

(*b*) By erecting the station quite close to the water's edge, so reducing the ground attenuation as much as possible, since the attenuation of the "ground" waves when travelling over sea is much less than over land.

Furthermore, the land transmitting station has been erected at a point where the direction of the ship's travel, while near the land, will intersect the coast line and thus make the transmission strongly directive for that portion of the voyage. Owing to the difference between the summer and winter routes normally taken by liners crossing the Altantic the direction of transmission from Rugby is far from constant.

Experiments made from this country have approached the problem from a point of view which differs somewhat from that of the Americans. The first steps taken were designed to cover the major portion of the voyage, leaving the short range problem for solution later. Moreover the conditions in this country differ appreciably from those on the other side of the Atlantic. There are several important ports to be considered, instead of one, and it is hardly possible, even if desirable, to locate the land radio stations where the near-in route direction intersects the land as in the American case.

Three principal wavelengths, of the order of 16, 24 and 36 m., are in use and experiments are also being carried out with wavelengths of the order of 70 and 100 m. The longer wavelengths (36, 70 or 100 m.) are used for short range transmission. They are radiated from plain (non-directional) aerials in order that they may communicate with ships near any British port. The two shortest waves (16 and 24 m.) are used for long range work and are radiated from directional aerial arrays which concentrate the transmitter energy into a "beam" in the required direction.

Unfortunately the wide bearings necessary to cover the ocean route prevent the use of a highly directional system, and a beam spreading at an angle of about 30 deg. has been provided. The 24 m. array is so directed that the beam covers the average position of the ship for the first 2 000 miles or so, while the 16 m. wavelength is arranged to cover the more distant portions of the voyage.

In order to radiate a given wavelength directionally, wires spaced at separating distances corresponding to calculated fractions of the wavelength are arranged, either horizontally or vertically, and are supplied with high frequency current. When correctly spaced the fields due to the various radiators add together vectorially, and in this way the resultant field strength in different directions can be effectively controlled.

By using an array of 16 similar vertical wires arranged in a line, with a space separation of one half the wavelength between adjacent wires, in preference to a single wire aerial, the distant field strength can be increased more than fourfold. With such an array the line of maximum field strength extends in opposite directions from the transmitting point.

The field strength in the desired direction may, however, be further increased by suppressing the field in the opposite direction, thereby obtaining an effect analogous to reflection. This is done by placing a curtain of similar wires one quarter of a wavelength behind the excited curtain. Their lengths should be adjusted to produce the best results. In practice, if the exciter wires of a transmitting array are half a wavelength long, the reflector wires should usually be a few inches longer. When correct adjustments have been made, the currents induced in the reflector wires lag approximately three quadrants (270 deg.) behind the currents in the exciter wires. Owing to this phase difference and the quarter wave space displacement between the exciter and reflector curtains the forward fields in a direction normal to the array will be 360 deg. apart, and therefore in phase ; whilst the backward fields will be 180 deg. apart, and therefore of opposite phase. Thus if the exciter and reflector curtains have equal currents, the forward field will be doubled whilst the backward fields will cancel out.

Fig. 2 is roughly symbolic of the conditions obtaining when an exciter wire "E" and a reflecting wire "R" are erected a quarter of a wavelength apart. The full line shows the forward and backward waves radiated by the exciter wire, and the dotted line shows the secondary waves emitted by the reflecting wire as a result of the absorption and re-radiation of the energy reaching it from "E." It will be seen that the latter waves reinforce the primary waves of the exciter wire in the forward and cancel them in the opposite direction.

Since "E" and "R" are a quarter of a wavelength apart each negative half-wave from "E" will excite the two secondary positive half-waves shown as emanating from "R." But since such excitation is a quarter of a period behind "E" in time, the phase relationship of the wave train in the forward direction will be the same as if "R" had been shifted to a position half a wavelength behind "E" producing phase superposition in that direction. For the same reason the origin of the backward train emanating from "R" must be assumed to coincide with "E," producing phase opposition behind the system. This ideal condition is not realised in practice, although a close approximation to it can be obtained. The "Marconi," "Koomans" and "Sterba" arrays utilise wires excited as half-wave or multiple half-wave radiators.

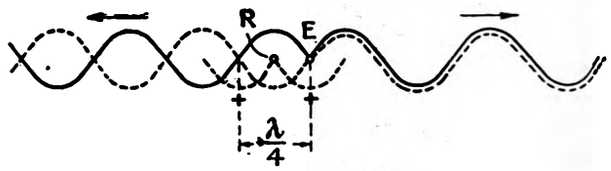

Fig. 2.—Directional radiation.

A type of aerial used extensively as a receiving aerial in the United States, and to a less extent in England, is the "Bruce" aerial. Each vertical and horizontal member is a quarter of a wavelength long, an exception being made in the case of the two end horizontal members, which are each an eighth of a wavelength long. The vertical members have all currents in the same direction, but the horizontal members have nodes of current at their centres and opposing currents at each side of the nodes. By this arrangement an incoming wave,

* Abstract of the presidential address to the Students' and Graduates' Section of the I.E.E., delivered on April 11.

Digitized by Google

received from a direction normal to the array, produces currents in correct phase simultaneously in the verticals.

Recently the British Post Office has used an array (Fig. 3) having half-wave sections of the exciter wires in two planes, separated half a wavelength from each other. The currents in each plane have, therefore, a phase difference of 180 deg. in time, plus an equivalent separation in space, and the waves emitted by both are in phase. A reflecting curtain is built a quarter of a wavelength behind one exciter curtain, and, therefore, three-quarters of a wavelength behind the other. The object of arranging the exciter in two planes is economy in space and in the cost of the supporting towers. The array is known as the " T.W." aerial, from the initials of its inventor,

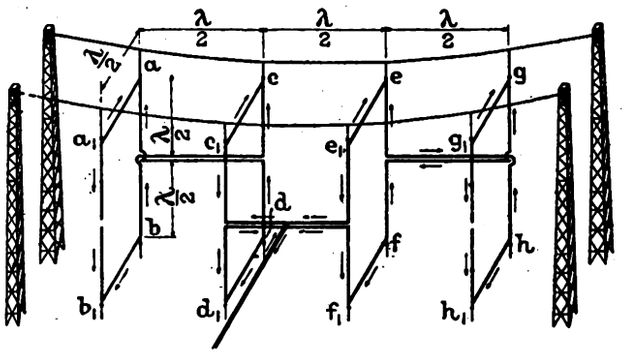

Fig. 3.—T.W. short-wave aerial (single vertical unit.)

" Tommy " Walmsley, of the Post Office Engineering Department.

In general, the field strength due to a single-plane array increases with the area enclosed by the boundary radiators, but the " T.W." aerial effects a considerable improvement as compared with other arrays occupying the same space.

The " T.W." array is built up of units of 16 radiators, which can be arranged either vertically, as shown in the figure, or horizontally. The complete array includes eight such units. At present the " Koomans " horizontal single-plane exciter types of array (in which groups of horizontal wires each half a wavelength long are energised), with reflectors, are being used for ship and shore telephony.

Fig. 4 gives some idea of the method of suspending arrays such as have been described. The array there shown is one of the " Sterba " type, at Rugby. The " Sterba " type utilises wires bent in half wavelengths, with the horizontal half-wave sections arranged in pairs, so as to neutralise each other.

The British main receiving station for the ship and shore service is situated near Baldock, about 30 miles north of London. The buildings and antennæ are placed in the middle of a large, flat site, in choosing which it was carefully observed that no roads were nearer than a quarter of a mile from any of the proposed array positions. This was necessary in order to prevent interference from short waves radiated from the ignition systems of motor-cars. For a similar reason, no rotating electrical machinery is placed in the vicinity of the receivers.

The operating wavelength of the ship and shore radio receiver is continuously variable over the range 10 to 100 m., and the tuning is effected by means of variable condensers in conjunction with interchangeable plug-in coil units. The frequency band width passed on over the land lines extends from 200 to 5 000 cycles. The receiver is of the double detection type, allowing of amplification on three frequency bands.—i.e., high (radio) frequency, intermediate frequency and audio frequency. The antenna arrays at Baldock consist of a number of vertical or horizontal elementary aerials of the " Koomans " and " Bruce " types. Carefully balanced transmission lines connect the arrays to the receivers.

The receiving connections are arranged so that the transmission lines are terminated at the receiving apparatus in their " characteristic " impedances, on an " antenna input " panel, so that reflection losses are prevented. The radio signals are then amplified at the radio signal frequency by a two-stage transformer coupled high frequency amplifier.

The frequency of the incoming signals is of the order of 10 000 kilo-cycles, and before subjecting them to further amplification and control they are heterodyned by means of a beating oscillator, and reduced to a rectified intermediate frequency of about 450 kilo-cycles.

In order that the receiver may be easy to operate, it is necessary that the tuning operations of the first detector grid circuit and of the beating oscillator should be independent. The beating oscillator voltage is, therefore, introduced into the anode circuit and the signal voltage into the grid circuit of the first detector, the grid to anode capacity being neutralised by means of a small condenser. The beating oscillator is of the push-pull type, and it must be carefully designed to give good frequency stability, since a variation of frequency of 0·05% is all that is required to tune into a neighbouring band. After being thus changed in frequency, the signal is amplified by means of a seven-stage intermediate frequency amplifier having a maximum amplification of approximately 100 decibels—i.e., a voltage amplification of 100 000 times. This amplifier is arranged to pass a band of frequencies about 10 000 cycles wide.

In order to overcome the effects of the " fading " which is experienced on short waves, an automatic gain control is provided. After passing the second detector, the signals enter a band pass filter, passing a band of frequencies from 200 to 5 000 cycles. This filter is followed by a standard telephone repeater, which introduces a gain variable up to 40 decibels. A volume indicator, which gives readings on a milli-ammeter of the strength of the speech passed to line, is provided so that the correct level of speech is sent into the cable circuit between Baldock and London. The receiver is equipped with long-life valves, and the total filament current is of the order of 10 A. The plate battery supply is at 130 V, and the current taken is approximately 0·15 A. Alarm fuses and relays are provided in the anode circuits of all valves (except the detectors).

An intermediate frequency oscillator is supplied for checking the band passed by the intermediate frequency amplifier, and in order to adjust the beating oscillator so that the intermediate frequency corresponding to the carrier wave of the distant station lies in the middle of the frequency band of the amplifier. In order to facilitate exact tuning of the receiver a signal frequency oscillator is also provided. If this oscillator is not employed, it is difficult to tune the set when fading is

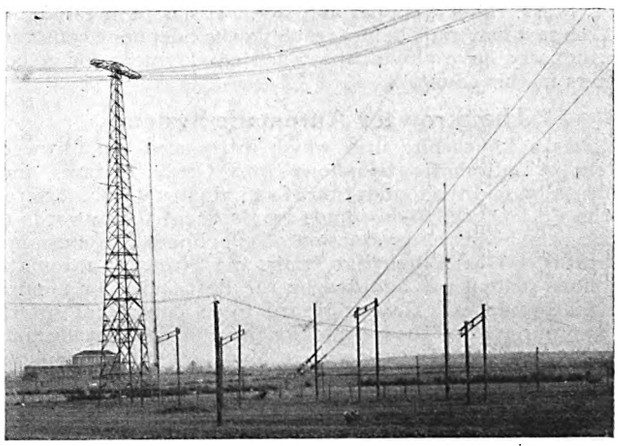

Fig. 4.—" Sterba " array at Rugby.

occurring, since the automatic gain control must be cut out during this operation, for obvious reasons.

As the incoming carrier, after being heterodyned by the beating oscillator, produces an audible output note when heterodyned by the intermediate frequency oscillator, it is easy to adjust the signal frequency oscillator to give the same beat note. The signal frequency oscillator is strong enough to swamp the incoming waves and tuning is effected on this local signal.

An audio-frequency oscillator (1 000 cycles) is also provided as a local source of energy for checking the performance of the audio-frequency amplifiers and of the land lines.

The automatic gain control device contains a high impedance valve operationg as a third detector, and connected in parallel with the second detector. A resistance of 100 000 Ω is connected in the anode circuit of this third detector, and the the varying drop in voltage across it, due to the variations of anode current, is applied as a variable negative bias to the grid of the first detector and first amplifying valve, the bias thus varying in accordance with the signal strength. An increase in the strength of the received carrier signal causes an increase in anode current of the gain control valve, and consequently an increase in the negative grid bias of the detector and amplifying valves. This increase in bias reduces the gain of the receiver, and thus maintains a fairly constant output level.

(To be concluded.)

TELEPHONE MANUFACTURING INDUSTRY.

Effects of Post Office Policy—Employment given to 100 000 British Workers—Large Export Trade Built Up.

(CONTRIBUTED.)

THE policy consistently pursued by the Post Office over a long series of years in the encouragement of home industry has made the manufacture of telephonic apparatus one of the important private industries in this country, with a substantial export business. About 30 years ago the Post Office began the task of extending the telephone service in London, partly in competition and partly in co-operation with the National Telephone Company. Previously the bulk of telephonic apparatus was purchased in America and Sweden. At the outset the Post Office had to import its equipment, but as a result of pressure to foster home industries, the American Western Electric Company was induced to establish a factory at Woolwich, so that supplies might be made by British labour, and, as far as possible, from British materials. British firms were encouraged to undertake this work, and among the pioneers was a Lancashire firm, British Insulated Cables Ltd. At their instrument works at Helsby, and later in Liverpool, was manufactured the Post Office trunk exchange equipment for London, Manchester, Cardiff, Newcastle and Birmingham. At the present time exchange equipment is being manufactured and installed by five important companies in this country, viz.: Standard Telephones and Cables, Southall; Siemens Bros. and Co., Woolwich; Automatic Telephone Manufacturing Co., Liverpool; General Electric Co., Coventry; and Ericsson Telephones, Beeston.

Telephone apparatus is also obtained from other British companies, while very large supplies of cables and other line plant are obtained from British companies. Manufactured cotton plays an important part in the make-up of telephone cables and equipment, as well as steel, glass, ebonite, nickel-silver, brass, rubber, copper and silk. It has been estimated that the raw materials before reaching the telephone construction industry have already provided employment for 20 000 workers in this country.

The Strowger Automatic System.

It was a Lancashire firm which introduced the Strowger system of automatic telephony into Great Britain, and, incidentally, laid the foundation of an industry which, fostered by the Post Office, to-day finds employment for upwards of 16 000 persons in the production of telephones and exchange apparatus. After exhaustive trials, the Strowger automatic telephone system was adopted by the Post Office for London and the provinces. Having regard to its county of origin, it is appropriate that the contract for the equipment of the main automatic telephone exchange in Manchester, at Telephone House, should have been allotted to the Automatic Telephone Manufacturing Co., Liverpool, the value of the contract being upwards of £400 000. The other Strowger automatic exchanges in the Manchester area are being equipped respectively as follows: Ardwick, by Siemens Brothers and Co.; Collyhurst, by Standard Telephones and Cables; Moss Side, by the General Electric Co. These firms, together with Ericsson Telephones, manufacture Strowger automatic telephone equipment under licence from the Automatic Telephone Manufacturing Company, an agreement having been entered into for the pooling of essential patents, whereby the resources of the entire industry are placed at the disposal of the State, and there is no question of a monopoly in the manufacturing field. By a recent agreement with these firms, the Post Office has laid down a programme of telephone construction for a number of years. As a result, the contractors have been able to organise their works with the prospect of regular work assured, and the Post Office has reaped the advantage of a considerable reduction in the price of telephone apparatus.

The telephone manufacturing companies not only cater for the home market, but the main organisations, which have been built up largely as a result of encouragement by the Post Office administration, are able to do a thriving export business. It is estimated that half of the production of telephonic apparatus by the five firms mentioned is used in this country, the other half being exported. When it is remembered that the telephone manufacturing industry, with its suppliers and auxiliary services, employs about 100 000 persons, the significance of the fact that half of the product is exported cannot be overlooked in days of widespread unemployment.

There is a further benefit, although an indirect and unexpected one, which has accrued from this State encouragement of the telephone industry. Thanks to the ingenuity and flexibility of Strowger automatic exchange apparatus, it has been possible to adapt it to the requirements of totalisator working, and two of the firms previously mentioned, the Automatic Telephone Manufacturing Co. and Ericsson Telephones, are supplying such equipment to the British Racecourse Betting Control Board. It is probable that the successful functioning of this equipment will result in another outlet for British products overseas. Another application of Strowger automatic switches is for the selective supervisory control of power sub-stations from a central control point, and good foreign business has already resulted. Both these adaptations may justly be said to have sprung from State encouragement of the British telephone industry.

The matter of an augmented export business is all-important; without the home demand it would have been impossible for British manufacturers to have competed in the world's markets for telephone material, and from negligible figures in 1911, British exports of telephones and associated equipment now rank in a class apart, and appear independently in the official returns of the country's foreign trade. One firm alone exported upwards of £500 000 worth of telephone equipment during the past twelve months, and that in direct competition with American and Continental suppliers.

In any review of the telephone industry the production of cable and line equipment must not be overlooked. Under private enterprise, most of the telephone circuits of the country were above ground, and the demand for underground telephone cable was small. The consistent policy of the Post Office in putting all circuits, as far as practicable, underground, has encouraged the design and development of multi-core air-space cables, many thousands of miles of which have been manufactured and laid by British cable makers.

In the matter of research and development, too, the Post Office, in addition to first-hand activity on a considerable scale in its own laboratories, has consistently encouraged British manufacturers to keep abreast of American and Continental progress.

I.M.E.A. CONVENTION.

Provisional Programme for May 26-30 Meetings at Eastbourne.

THE provisional programme for this year's I.M.E.A. Convention, to be held at Eastbourne from May 26 to 30. is as follows:—

Monday, May 26.—Delegates assemble. President's Reception in Winter Garden, 8.15.

Tuesday, May 27.—Paper by Ald. R. S. Chatfield, Chairman of the Eastbourne Electricity Committee, on "The Obligations of Electricity Committees."

Reception by the Mayor in the Winter Garden, 8.15.

Wednesday, May 28.—Paper by Mr. G. H. Lake, A.M.I.E.E., on "Pulverised Fuel Firing in relation to Economic Boiler Operation."

Visit to Brighton Electricity Works. Tea will be provided by the Brighton Corporation.

Thursday, May 29.—Paper by Mr. J. W. Burr, M.I.E.E., M.I.Mech.E., on "Electrical Heating of Buildings." Informal discussion, which will probably be introduced by Mr. A. E. McKenzie, M.I.E.E., M.I.Mech.E., on "Domestic Water Heating.

Annual Dinner, Grand Hotel.

Friday, May 30.—Coach trip, visiting Bexhill, Hastings. Winchelsea and Rye.

As in past years, an electrical exhibition will be held (in Devonshire Park), comprising electrical cooking, water heating and refrigeration, with other apparatus and appliances of interest to supply authorities.

The Faraday Medal (Ninth Award) will be presented to Sir Ernest Rutherford, F.R.S., at the ordinary meeting of the I.E.E. to be held on May 1 at 6 p.m. The presentation will precede the Twenty-First Kelvin Lecture, which will be delivered by Mr. R. H. Fowler, F.R.S., on "Some Recent Advances in the Electron Theory of Metals." This will be followed by a dinner at the Waldorf Hotel at 7.45 p.m.

ELECTRICITY ON THE FARM.*

Equipment in Lincolnshire—Tariffs—Agricultural Machinery—The Farm Load—Economics of Electric Farming.

By R. BORLASE MATTHEWS. Wh.Ex., A.M.I.C.E., M.I.E.E., F.R.Ae.S.

FOR educational purposes the Supply Authority operating in a rural area should earmark at least one per cent. of its total annual revenue to carry out this work in the form of newspaper advertising, distribution of suitable literature, direct mail publicity, liberal use of posters, exhibitions and demonstrations, travelling exhibition vans equipped with cinema and lantern lectures by fully qualified persons. This activity should be developed systematically from district to district. For such educational work to have its maximum effect it is essential to render available hire, hire purchase and deferred payment schemes for electric services, wiring, motors cookers, and other current-consuming devices. The Power Supply Authority, when providing assisted wiring schemes, should pay special attention to the wiring of the contumers' houses. By accepting financial responsibility to the contractor, it will be in a position to see that the wiring and apparatus are of a robust and simple character.

The author proposes, in the Lincolnhire area, to provide each consumer not only with five lighting points and two outlets, but also with a flat iron, a thermal storage cooker, a thermal storage water heater and one 500 W bowl type radiator. The whole of these accessories will be supplied at one inclusive charge, the consumer to repay the capital charges over a period of years. In the case of a farm, a novel general utility machine on the disintegrator principle (described and illustrated on pp. 404 and 405 of THE ELECTRICIAN of March 28) will also be included, and at the same time a special effort will be made to induce the farmer to install a water pump, chaff cutter and electric motor on a hire-purchase basis. The thermal storage cooker will be of a 750 W long hour use type, as opposed to the present English practice of installing cookers of 6-8 kW demand—a type that is almost unknown on the Continent. The general arrangement of the cooker is shown in Fig. 1. The thermostatic control operates as follows :—

(*a*) The block is kept at a temperature of 932 deg. F. (500 deg. C.) by electric heaters totalling 750 W.

(*b*) When the above temperature is attained the low temperature cooking oven is raised to 194 deg. F. (90 deg. C.).

(*c*) When the temperature of the low temperature oven is raised to 194 deg. F. (90 deg. C.) the current is automatically switched on to the thermal storage water heater.

(*d*) By means of a two-way switch the current can be switched off the block on to the roasting and baking and grilling oven. Also additional heat can be switched on this oven. When the required temperature is attained the current is thermostatically switched back on to the heating block.

To provide as good a load factor as possible, one of two methods will be adopted ; (*a*) an automatic relay or load levelling switch will be provided, whereby when several lights are turned on in a house, the cooker will be switched off, or (*b*) relay switches on each premises wil be controlled by a load dispatcher during hours of peak load on the whole system, by means of relays operated by a superimposed current in the distribution system. The apparatus for the latter method has not yet been fully developed, hence the alternative. In both systems time clocks are eliminated. Owing to the introduction of the thermal storage principle, the consumer will not be inconvenienced at all by the cutting off of the current on his cooker and water heater.

Pre-payment Meters.

For small consumers it will be found advisable to install pre-payment meters, so calibrated that the consumer can pay for his electricity at the ordinary rate per unit, and, at the same time pay the additional charge in respect of the cost of the wiring. In the case of current-consuming devices it is of importance that the hire-purchase terms should be so based that the rate at which the consumer pays for them is spread over a period of not less than three years.

An ever-present difficulty in the case of equipping a farm on the hire-purchase system is the number of potential consumers who are tenants and not owners. The author suggests an agreement between owners of buildings and tenants whereby the former agree to recoup the tenant farmer subject to depreciation at 10% per annum if the tenancy is terminated within ten years from the installation of equipment. He has been experimenting with an easily installed and removable wiring system which would be a tenant's fixture. The Supply Undertaking should, if possible, earmark a sum of about one-tenth of its total capital for the financing of wiring and equipment facilities.

It is essential to supply current on a suitable two-part tariff. The author proposes to adopt the following tariff for the Lincolnshire area :—

(*a*) A sum payable quarterly or monthly in advance of 15s. per living room, omitting bedrooms, per annum, and an additional 1d. per unit for all units supplied for purposes other than apparatus consuming current, continuously or on off-peak periods, for which the additional rate is to be ½d. per unit.

(*b*) The rate for agricultural purposes on farms of over 50 acres will be 2s. 6d. to 3s. per acre per annum, payable in advance in monthly instalments, in addition to 1d. per unit for all current supplied.

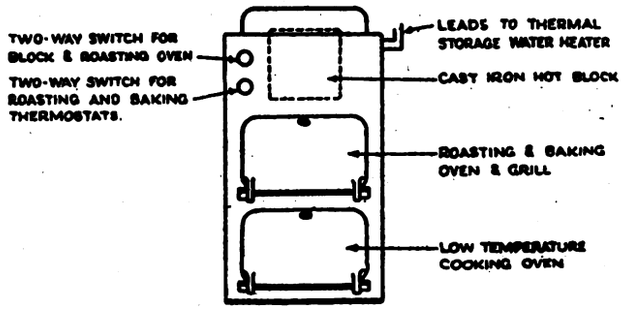

Fig. 1.—Lincolnshire thermal storage cooker.

(*c*) A flat rate of 8d. per unit, accounts to be rendered monthly where slot meters are not installed. The meters will be made weatherproof and fitted outside the houses to economise the time of meter readers.

Experience has shown that the substitution of electricity for horse and manual labour lowers the cost of production. It will also enable the farmer to bring under cultivation those large areas which are to-day only half cultivated, and thus, not only will it increase production, but also give additional employment. The number of uses to which electricity can be put on a farm is very large, in fact, the author has compiled a list of over three hundred uses (while on his own 600-acre farm at East Grinstead he uses it for sixty-seven different purposes).

Even to-day it is a difficult matter to obtain really suitable equipment for electro-farming work. It is refreshing to note, however, that one of the largest British electrical manufacturing companies has now formed a separate agricultural department, one of the largest agricultural machinery making firms has an electrical manufacturing department, and another electrical firm is now associated with a large group of manufacturers of agricultural machinery. Progress, therefore, though slow, is actually being made. There are in Great Britain to-day over 2 000 farms connected to public supply mains, and in the whole world there are well over a million farmers using electricity on their farms.

Experience shows that the annual consumption of electricity in farm buildings alone is proportionate to the arable acreage of the farm, the load being concentrated at the farm buildings. Hence the need for basing calculations on the length of route instead of the area supplied. The only correct basis of comparison between rural and urban loads is on the kWh supplied per mile of distribution. In Great Britain consumption by farms is usually under 10 units per acre, but this figure is increasing. On the European Continent 20 units is a usual figure. In 35 areas in Germany it is about 40 units, the record being 100 units (without electric ploughing). A farm of 300 acres equipped with ordinary machines would consume at least 6 000 units per annum. Ploughing and

* Abstract of a paper read to the Society of Engineers (Inc.) on April 7.

Digitized by Google

cultivation would add 4 500 units, and threshing from 2 000 to 3 000 units.

Electric ploughing has a number of outstanding advantages over all other methods. Most of the successful electric ploughing equipments in use to-day are of the large size, capable of ploughing up to thirty acres per day. These equipments are so expensive and the areas, which they plough in a season so large, that they are suitable only for contractors or co-operative societies. There are a few small ploughs available, but the demand for these is not yet great as the farmer has not been properly educated up to use them. The author employs a small electric plough on his farm at East Grinstead. This plough operates on the roundabout system and is driven by a 15 H.P. motor. With this equipment it is possible to plough about five acres a day with a current consumption of about 15 units per acre on heavy land with a furrow six inches deep, and 25 units with a ten inch deep furrow. Several electric ploughs have been built in England recently. There should also be a considerable field for developing the small types of ploughs for use in market gardens. A number of these are to be seen in use in the South of France to-day. The rotary tiller also lends itself conveniently to an electric drive and it seems probaqle that there will be a future for this type of machine.

Savings on a 70 Acre Farm.

The following is a typical example of the economies that can be effected on a comparatively small farm, say, of about 70 acres when electricity is installed. The cost of electricity is taken at 4d. per unit, which is quite a reasonable figure.

LIGHT.—About 60 gallons of paraffin oil would be consumed on a farm of this size per annum, the cost of which would be about 1s. per gallon, i.e., £3. To this must be added about 150 hours of labour at 6d. per hour for cleaning and trimming, making the total cost £6 15s. From 15 to 20 electric light points would be necessary on such a farm and the consumption of electricity would be about 260 units, costing £4 6s. 8d., leaving a gross profit of £2 8s. 4d. This figure would be much higher if it were possible to attach a money value to the many indirect advantages of electric lighting.

MILKING.—The time taken for hand milking would be about 3½ hours per day, whereas machine milking would cut down this time to 1¼ hours. The cost for labour per annum at 6d. per hour would therefore be £31 13s. and £15 16s. 6d. respectively. To the latter must be added the cost of electric current which would be about £4 (240 units at 4d. per unit). Mechanical milking would therefore show a gross profit of £11 16s. 6d., with greater convenience and cleanliness.

CREAM SEPARATING.—It is assumed that 7 000 gallons of milk are separated during the year. When done by hand it would take about 300 hours at 6d. per hour. this would cost £7 10s. An electrically driven separator would take about 40 hours of a man's time and consume about 70 units of electricity, the total cost of which would be £2 3s. 4d. showing a gross profit of £5 6s. 8d. An electrically driven separator owing to its steady drive also works at a higher efficiency.

PUMPING.—On a farm of this size at least 350 hours per annum would be spent on pumping water. This would cost £8 15s. in labour and a great deal more in backache. An electrically operated pump would eliminate all manual work; it would consume about 80 units costing £1 6s. 8d., thus showing a gross profit of £7 8s. 4d.

CHAFF CUTTING.—The electrically operated chaff cutter can be operated by one man while it is often necessary to employ two for the hand-operated machine. When the latter is used, about 150 hours would be taken to do the work as against 50 hours with the former, showing a saving of 100 hours at 6d. per hour, £2 10s. From this amount must be deducted 60 units of electricity at 4d. per unit, or £1, leaving a gross profit of £1 10s.

GROSS PROFIT.—The total gross profit shown when electricity is used for carrying out these simple everyday farm operations is £28 10s. 8d. The cost of the electrical installation would be about £121. After allowing 15% on this figure for interest and depreciation there would be a net profit of £10 7s.

Such a farm as the one described could hardly be termed an electrified one, but even with a minimum of equipment a good profit is shown.

In addition to the importance of electricity to the farming industry, its effect on the development of rural industries must also be taken into consideration. Many of the industries to-day located in the towns should, from an economic point of view, be situated in the countryside, providing an ample supply of power was available.

WANING OF TRAMWAYS.

Result of Unfair Rating Policy—Financial Juggling.

By THEODORE RICH.

HALF a century ago horse tramways came into being, and those in charge of the then government, encouraged by many municipal authorities, insisted that the companies operating the tramways on the public highway should pay not merely for the upkeep of the rails but also for the upkeep of a section of roadway between and alongside them, a very heavy burden, although a great deal of traffic was being put on to steel rails and not on to road metalling.
